## **Chapter 6: System Configuration and Monitoring Commands..... 199**

|                                      |     |
|--------------------------------------|-----|
| Introduction.....                    | 201 |
| banner display external-manager..... | 202 |
| banner exec.....                     | 203 |
| banner external-manager.....         | 205 |
| banner login (system).....           | 207 |
| banner motd.....                     | 208 |
| clock set.....                       | 210 |
| clock summer-time date.....          | 211 |
| clock summer-time recurring.....     | 213 |
| clock timezone.....                  | 216 |
| crypto secure-mode.....              | 217 |
| debug core-file.....                 | 218 |
| ecofriendly button enable.....       | 219 |
| ecofriendly led.....                 | 220 |
| ecofriendly lpi.....                 | 221 |
| findme.....                          | 223 |
| findme trigger.....                  | 225 |

|                                       |     |
|---------------------------------------|-----|
| hostname.....                         | 226 |
| low-memory restart.....               | 228 |
| max-fib-routes.....                   | 229 |
| max-static-routes.....                | 230 |
| no debug all.....                     | 231 |
| reboot.....                           | 233 |
| reload.....                           | 234 |
| show banner external-manager.....     | 235 |
| show clock.....                       | 236 |
| show cpu.....                         | 238 |
| show cpu history.....                 | 241 |
| show debugging.....                   | 243 |
| show ecofriendly.....                 | 244 |
| show interface memory.....            | 246 |
| show memory.....                      | 248 |
| show memory allocations.....          | 250 |
| show memory history.....              | 252 |
| show memory pools.....                | 254 |
| show memory shared.....               | 255 |
| show process.....                     | 256 |
| show reboot history.....              | 259 |
| show router-id.....                   | 260 |
| show secure-mode.....                 | 261 |
| show system.....                      | 262 |
| show system environment.....          | 263 |
| show system environment counters..... | 264 |
| show system interrupts.....           | 266 |
| show system mac.....                  | 267 |
| show system serialnumber.....         | 269 |
| show tech-support.....                | 270 |
| speed (asyn).....                     | 273 |
| terminal monitor.....                 | 275 |
| undebg all.....                       | 276 |

## **Chapter 7: Pluggables and Cabling Commands.....277**

|                                           |     |
|-------------------------------------------|-----|
| Introduction.....                         | 278 |
| clear fiber-monitoring interface.....     | 279 |
| clear test cable-diagnostics tdr.....     | 280 |
| debug fiber-monitoring.....               | 281 |
| fiber-monitoring action.....              | 283 |
| fiber-monitoring baseline.....            | 285 |
| fiber-monitoring enable.....              | 287 |
| fiber-monitoring interval.....            | 288 |
| fiber-monitoring sensitivity.....         | 289 |
| show system fiber-monitoring.....         | 291 |
| show system pluggable.....                | 294 |
| show system pluggable detail.....         | 296 |
| show system pluggable diagnostics.....    | 301 |
| show test cable-diagnostics tdr.....      | 304 |
| test cable-diagnostics tdr interface..... | 305 |

## **Chapter 8: Connectivity Fault Management Commands..... 306**

|                   |     |
|-------------------|-----|
| Introduction..... | 307 |
| cc interval.....  | 308 |
| cc multicast..... | 310 |

|                                                      |     |
|------------------------------------------------------|-----|
| cc unicast.....                                      | 312 |
| clear (MEP Attribute).....                           | 313 |
| clear ethernet cfm errorlog.....                     | 314 |
| clear mep counter.....                               | 315 |
| ethernet cfm domain-name.....                        | 316 |
| ethernet cfm mep.....                                | 320 |
| mep (FNG attributes).....                            | 323 |
| mep active.....                                      | 325 |
| mep ccm-ltm-priority.....                            | 327 |
| mep crosscheck.....                                  | 329 |
| service ma-name.....                                 | 332 |
| show ethernet cfm details.....                       | 336 |
| show ethernet cfm domain.....                        | 340 |

| show ethernet cfm maintenance-points local mep.....  | 346 |
| show ethernet cfm maintenance-points remote mep..... | 351 |
| show ethernet cfm service.....                       | 355 |
| show mep-alarm status.....                           | 358 |

## **Chapter 9: Logging Commands.....360**

|                            |     |
|----------------------------|-----|
| Introduction.....          | 362 |
| clear exception log.....   | 363 |
| clear log.....             | 364 |
| clear log buffered.....    | 365 |
| clear log external.....    | 366 |
| clear log permanent.....   | 367 |
| copy buffered-log.....     | 368 |
| copy permanent-log.....    | 369 |
| default log buffered.....  | 370 |
| default log console.....   | 371 |
| default log email.....     | 372 |
| default log external.....  | 373 |
| default log host.....      | 374 |
| default log monitor.....   | 375 |
| default log permanent..... | 376 |
| log buffered.....          | 377 |
| log buffered (filter)..... | 378 |
| log buffered exclude.....  | 383 |
| log buffered size.....     | 387 |
| log console.....           | 388 |
| log console (filter).....  | 389 |
| log console exclude.....   | 394 |
| log email.....             | 398 |
| log email (filter).....    | 399 |
| log email exclude.....     | 404 |
| log email time.....        | 408 |
| log external.....          | 410 |
| log external (filter)..... | 412 |
| log external exclude.....  | 417 |
| log external rotate.....   | 422 |
| log external size.....     | 424 |
| log facility.....          | 425 |
| log host.....              | 427 |
| log host (filter).....     | 429 |
| log host exclude.....      | 434 |
| log host source.....       | 439 |

|                                                                      |            |
|----------------------------------------------------------------------|------------|
| log host startup-delay.....                                          | 440        |
| log host time.....                                                   | 442        |
| log monitor (filter).....                                            | 444        |
| log monitor exclude.....                                             | 449        |
| log permanent.....                                                   | 453        |
| log permanent (filter).....                                          | 454        |
| log permanent exclude.....                                           | 459        |
| log permanent size.....                                              | 463        |
| log-rate-limit nsm.....                                              | 464        |
| log trustpoint.....                                                  | 466        |
| show counter log.....                                                | 468        |
| show exception log.....                                              | 470        |
| show log.....                                                        | 471        |
| show log config.....                                                 | 473        |
| show log external.....                                               | 476        |
| show log permanent.....                                              | 477        |
| show running-config log.....                                         | 479        |
| unmount.....                                                         | 480        |
| <b>Chapter 10: Scripting Commands.....</b>                           | <b>481</b> |
| Introduction.....                                                    | 482        |
| activate.....                                                        | 483        |
| echo.....                                                            | 485        |
| wait.....                                                            | 486        |
| <b>Chapter 11: Interface Commands.....</b>                           | <b>487</b> |
| Introduction.....                                                    | 488        |
| description (interface).....                                         | 489        |
| interface (to configure).....                                        | 490        |
| mtu.....                                                             | 492        |
| platform jumboframe.....                                             | 494        |
| service statistics interfaces counter.....                           | 495        |
| show interface.....                                                  | 496        |
| show interface brief.....                                            | 499        |
| show interface memory.....                                           | 500        |
| show interface status.....                                           | 502        |
| shutdown.....                                                        | 505        |
| <b>Chapter 12: Port Mirroring and Remote Mirroring Commands.....</b> | <b>506</b> |
| Introduction.....                                                    | 507        |
| mirror interface.....                                                | 508        |
| remote-mirror interface.....                                         | 511        |
| show mirror.....                                                     | 514        |
| show mirror interface.....                                           | 515        |
| show remote-mirror.....                                              | 516        |
| switchport remote-mirror-egress.....                                 | 519        |
| vlan mode remote-mirror-vlan.....                                    | 520        |
| <b>PART 2: Interfaces and Layer 2.....</b>                           | <b>522</b> |
| <b>Chapter 13: Switching Commands.....</b>                           | <b>523</b> |
| Introduction.....                                                    | 525        |
| clear loop-protection action.....                                    | 526        |

|                                                            |     |
|------------------------------------------------------------|-----|
| clear loop-protection counters.....                        | 527 |
| clear mac address-table dynamic.....                       | 528 |
| clear mac address-table static.....                        | 530 |
| clear port counter.....                                    | 531 |
| clear port-security intrusion.....                         | 532 |
| debug loopprot.....                                        | 535 |
| debug platform packet.....                                 | 536 |
| duplex.....                                                | 538 |
| linkflap action.....                                       | 540 |
| linkflap enable-stable-time.....                           | 541 |
| loop-protection loop-detect.....                           | 542 |
| loop-protection action.....                                | 544 |
| loop-protection action-delay-time.....                     | 546 |
| loop-protection timeout.....                               | 547 |
| mac address-table acquire.....                             | 548 |
| mac address-table ageing-time.....                         | 549 |
| mac address-table logging.....                             | 550 |
| mac address-table static.....                              | 551 |
| mac address-table thrash-limit.....                        | 552 |
| platform control-plane-prioritization rate.....            | 553 |
| platform jumboframe.....                                   | 555 |
| platform l2mc-overlap.....                                 | 556 |
| platform l2mc-table mode.....                              | 557 |
| platform load-balancing.....                               | 560 |
| platform multicast-address-mismatch-action.....            | 562 |
| platform multicast-ratelimit.....                          | 564 |
| platform stop-unreg-mc-flooding.....                       | 565 |
| platform vlan-stacking-tpid.....                           | 567 |
| polarity.....                                              | 568 |
| show debugging loopprot.....                               | 569 |
| show debugging platform packet.....                        | 570 |
| show flowcontrol interface.....                            | 571 |
| show interface err-disabled.....                           | 572 |
| show interface switchport.....                             | 574 |
| show loop-protection.....                                  | 575 |
| show mac address-table.....                                | 577 |
| show mac address-table thrash-limit.....                   | 579 |
| show platform.....                                         | 580 |
| show platform classifier statistics utilization brief..... | 583 |
| show platform port.....                                    | 587 |
| show port-security interface.....                          | 589 |
| show port-security intrusion.....                          | 590 |
| show storm-control.....                                    | 591 |
| speed.....                                                 | 592 |
| storm-control level.....                                   | 596 |
| switchport block unicast-flooding.....                     | 598 |
| switchport port-security.....                              | 600 |
| switchport port-security aging.....                        | 602 |
| switchport port-security maximum.....                      | 604 |
| switchport port-security violation.....                    | 606 |
| thrash-limiting.....                                       | 608 |
| undebg loopprot.....                                       | 610 |
| undebg platform packet.....                                | 611 |

|                                       |            |
|---------------------------------------|------------|
| <b>Chapter 14: VLAN Commands.....</b> | <b>612</b> |
| Introduction.....                     | 614        |

|                                                     |     |
|-----------------------------------------------------|-----|
| debug private-vlan ufo.....                         | 615 |
| platform vlan-stacking-tpid.....                    | 616 |
| port-vlan-forwarding-priority.....                  | 617 |
| private-vlan.....                                   | 620 |
| private-vlan association.....                       | 622 |
| private-vlan ufo trap.....                          | 623 |
| show debugging private-vlan.....                    | 624 |
| show interface switchport vlan translation.....     | 625 |
| show port-vlan-forwarding-priority.....             | 627 |
| show vlan.....                                      | 628 |
| show vlan access-map.....                           | 629 |
| show vlan filter.....                               | 630 |
| show vlan private-vlan.....                         | 631 |
| show vlan private-vlan ufo.....                     | 632 |
| switchport access vlan.....                         | 634 |
| switchport mode access.....                         | 635 |
| switchport mode private-vlan.....                   | 636 |
| switchport mode private-vlan trunk promiscuous..... | 637 |
| switchport mode private-vlan trunk secondary.....   | 639 |
| switchport mode private-vlan ufo.....               | 641 |
| switchport mode trunk.....                          | 643 |
| switchport private-vlan host-association.....       | 644 |
| switchport private-vlan mapping.....                | 645 |
| switchport trunk allowed vlan.....                  | 646 |
| switchport trunk native vlan.....                   | 649 |
| switchport vlan translation.....                    | 651 |
| switchport vlan translation default drop.....       | 653 |
| switchport vlan-stacking (double-tagging).....      | 654 |
| switchport voice dscp.....                          | 656 |
| switchport voice vlan.....                          | 657 |
| switchport voice vlan priority.....                 | 660 |
| vlan.....                                           | 661 |
| vlan access-map.....                                | 663 |

| vlan mode stack-local-vlan.....                     | 667 |
| vlan mode transmit-local-vlan.....                  | 669 |

## **Chapter 15: Spanning Tree Commands.....670**

|                                                             |     |
|-------------------------------------------------------------|-----|
| Introduction.....                                           | 672 |
| clear spanning-tree statistics.....                         | 673 |
| clear spanning-tree detected protocols (RSTP and MSTP)..... | 674 |
| debug mstp (RSTP and STP).....                              | 675 |
| instance priority (MSTP).....                               | 679 |
| instance vlan (MSTP).....                                   | 681 |
| region (MSTP).....                                          | 683 |
| revision (MSTP).....                                        | 684 |
| show debugging mstp.....                                    | 685 |
| show spanning-tree.....                                     | 686 |
| show spanning-tree brief.....                               | 689 |
| show spanning-tree mst.....                                 | 690 |
| show spanning-tree mst config.....                          | 691 |
| show spanning-tree mst detail.....                          | 692 |
| show spanning-tree mst detail interface.....                | 694 |
| show spanning-tree mst instance.....                        | 696 |
| show spanning-tree mst instance interface.....              | 697 |

|                                                       |     |
|-------------------------------------------------------|-----|
| show spanning-tree mst interface.....                 | 698 |
| show spanning-tree statistics.....                    | 699 |
| show spanning-tree statistics instance.....           | 701 |
| show spanning-tree statistics instance interface..... | 702 |
| show spanning-tree statistics interface.....          | 704 |
| show spanning-tree vlan range-index.....              | 707 |
| spanning-tree autoedge (RSTP and MSTP).....           | 708 |
| spanning-tree bpdu.....                               | 709 |
| spanning-tree cisco-interoperability (MSTP).....      | 711 |
| spanning-tree edgeport (RSTP and MSTP).....           | 712 |
| spanning-tree enable.....                             | 713 |
| spanning-tree errdisable-timeout enable.....          | 715 |
| spanning-tree errdisable-timeout interval.....        | 716 |
| spanning-tree force-version.....                      | 717 |
| spanning-tree forward-time.....                       | 718 |
| spanning-tree guard root.....                         | 720 |
| spanning-tree hello-time.....                         | 721 |
| spanning-tree link-type.....                          | 722 |
| spanning-tree max-age.....                            | 723 |
| spanning-tree max-hops (MSTP).....                    | 724 |
| spanning-tree mode.....                               | 725 |
| spanning-tree mst configuration.....                  | 726 |
| spanning-tree mst instance.....                       | 727 |
| spanning-tree mst instance path-cost.....             | 729 |
| spanning-tree mst instance priority.....              | 731 |
| spanning-tree mst instance restricted-role.....       | 733 |
| spanning-tree mst instance restricted-tcn.....        | 735 |
| spanning-tree path-cost.....                          | 737 |
| spanning-tree portfast (STP).....                     | 738 |
| spanning-tree portfast bpdu-filter.....               | 740 |
| spanning-tree portfast bpdu-guard.....                | 742 |
| spanning-tree priority (bridge priority).....         | 744 |
| spanning-tree priority (port priority).....           | 745 |
| spanning-tree restricted-role.....                    | 746 |
| spanning-tree restricted-tcn.....                     | 747 |
| spanning-tree transmit-holdcount.....                 | 748 |
| undebg mstp.....                                      | 749 |

## **Chapter 16: Link Aggregation Commands..... 750**

|                                      |     |
|--------------------------------------|-----|
| Introduction.....                    | 751 |
| channel-group.....                   | 752 |
| clear lacp counters.....             | 754 |
| debug lacp.....                      | 755 |
| lacp global-passive-mode enable..... | 756 |
| lacp port-priority.....              | 757 |
| lacp system-priority.....            | 758 |
| lacp timeout.....                    | 759 |
| platform load-balancing.....         | 761 |
| show debugging lacp.....             | 763 |
| show diagnostic channel-group.....   | 764 |
| show etherchannel.....               | 766 |
| show etherchannel detail.....        | 768 |
| show etherchannel summary.....       | 769 |
| show lacp sys-id.....                | 770 |
| show lacp-counter.....               | 771 |
| show port etherchannel.....          | 772 |

|                                |     |
|--------------------------------|-----|
| show static-channel-group..... | 773 |
| static-channel-group.....      | 774 |
| undebg lacp.....               | 776 |

## **Chapter 17: Power over Ethernet Commands..... 777**

|                                            |     |
|--------------------------------------------|-----|
| Introduction.....                          | 778 |
| clear power-inline counters interface..... | 779 |
| debug power-inline.....                    | 780 |
| power-inline allow-legacy.....             | 782 |
| power-inline autotclass.....               | 783 |
| power-inline description.....              | 785 |
| power-inline enable.....                   | 787 |
| power-inline hanp.....                     | 788 |
| power-inline max.....                      | 789 |
| power-inline pair max.....                 | 791 |
| power-inline priority.....                 | 792 |
| power-inline usage-threshold.....          | 794 |
| service power-inline.....                  | 795 |
| show debugging power-inline.....           | 796 |
| show power-inline.....                     | 797 |
| show power-inline counters.....            | 801 |
| show power-inline interface.....           | 804 |
| show power-inline interface detail.....    | 807 |

## **PART 3: Layer 3 Switching..... 810**

## **Chapter 18: IP Addressing and Protocol Commands..... 811**

|                                              |     |
|----------------------------------------------|-----|
| Introduction.....                            | 813 |
| arp-aging-timeout.....                       | 814 |
| arp-mac-disparity.....                       | 815 |
| arp.....                                     | 818 |
| arp log.....                                 | 820 |
| arp opportunistic-nd.....                    | 824 |
| arp-loose-check.....                         | 825 |
| arp-reply-bc-dmac.....                       | 827 |
| clear arp-cache.....                         | 828 |
| debug ip packet interface.....               | 829 |
| debug ip irdp.....                           | 832 |
| ip address (IP Addressing and Protocol)..... | 834 |
| ip forwarding.....                           | 836 |
| ip gratuitous-arp-link.....                  | 837 |
| ip irdp.....                                 | 839 |
| ip icmp error-interval.....                  | 840 |
| ip icmp-timestamp.....                       | 841 |
| ip irdp address preference.....              | 842 |
| ip irdp broadcast.....                       | 843 |
| ip irdp holdtime.....                        | 844 |
| ip irdp lifetime.....                        | 845 |
| ip irdp maxadvertinterval.....               | 846 |
| ip irdp minadvertinterval.....               | 848 |
| ip irdp multicast.....                       | 850 |
| ip irdp preference.....                      | 851 |
| ip redirects.....                            | 853 |

| undebg ip packet interface.....                 | 882 |
| undebg ip irdp.....                             | 883 |

## **Chapter 19: Domain Name Service (DNS) Commands.....884**

|                                     |     |
|-------------------------------------|-----|
| Introduction.....                   | 885 |
| ip dns forwarding domain-list.....  | 886 |
| ip domain-list.....                 | 887 |
| ip domain-lookup.....               | 888 |
| ip domain-name.....                 | 889 |
| ip name-server.....                 | 890 |
| ip name-server preferred-order..... | 892 |
| show hosts.....                     | 893 |
| show ip domain-list.....            | 894 |
| show ip domain-name.....            | 895 |
| show ip name-server.....            | 896 |

## **Chapter 20: IPv6 Commands..... 897**

|                                              |     |
|----------------------------------------------|-----|
| Introduction.....                            | 899 |
| clear ipv6 neighbors.....                    | 900 |
| ipv6 address.....                            | 901 |
| ipv6 address autoconfig.....                 | 903 |
| ipv6 address suffix.....                     | 905 |
| ipv6 enable.....                             | 906 |
| ipv6 eui64-linklocal.....                    | 908 |
| ipv6 forwarding.....                         | 909 |
| ipv6 icmp error-interval.....                | 910 |
| ipv6 multicast forward-slow-path-packet..... | 911 |
| ipv6 nd accept-ra-default-routes.....        | 912 |
| ipv6 nd accept-ra-pinfo.....                 | 913 |
| ipv6 nd current-hoplimit.....                | 914 |
| ipv6 nd dns search-list.....                 | 915 |
| ipv6 nd dns-server.....                      | 916 |
| ipv6 nd managed-config-flag.....             | 917 |
| ipv6 nd minimum-ra-interval.....             | 918 |
| ipv6 nd other-config-flag.....               | 919 |
| ipv6 nd prefix.....                          | 920 |
| ipv6 nd ra-interval.....                     | 923 |
| ipv6 nd ra-lifetime.....                     | 924 |
| ipv6 nd rguard.....                          | 925 |
| ipv6 nd reachable-time.....                  | 927 |

|                                  |     |
|----------------------------------|-----|
| ipv6 nd retransmission-time..... | 928 |
| ipv6 nd route-information.....   | 929 |
| ipv6 nd router-preference.....   | 931 |
| ipv6 nd suppress-ra.....         | 932 |
| ipv6 neighbor.....               | 933 |
| ipv6 opportunistic-nd.....       | 934 |
| ipv6 route.....                  | 935 |
| ipv6 unreachable.....            | 937 |
| optimistic-nd.....               | 939 |
| ping ipv6.....                   | 940 |
| show ipv6 forwarding.....        | 942 |
| show ipv6 interface.....         | 943 |
| show ipv6 neighbors.....         | 944 |
| show ipv6 route.....             | 945 |
| show ipv6 route summary.....     | 947 |
| traceroute ipv6.....             | 948 |

## **Chapter 21: Routing Commands..... 949**

|                              |     |
|------------------------------|-----|
| Introduction.....            | 950 |
| ip route.....                | 951 |
| ipv6 route.....              | 953 |
| max-fib-routes.....          | 955 |
| max-static-routes.....       | 956 |
| maximum-paths.....           | 957 |
| show ip route.....           | 958 |
| show ip route database.....  | 960 |
| show ip route summary.....   | 961 |
| show ipv6 route.....         | 962 |
| show ipv6 route summary..... | 964 |

## **Chapter 22: RIP Commands..... 965**

|                                          |     |
|------------------------------------------|-----|
| Introduction.....                        | 967 |
| accept-lifetime.....                     | 968 |
| alliedware-behavior.....                 | 970 |
| cisco-metric-behavior (RIP).....         | 972 |
| clear ip rip route.....                  | 973 |
| debug rip.....                           | 974 |
| default-information originate (RIP)..... | 975 |
| default-metric (RIP).....                | 976 |
| distance (RIP).....                      | 977 |
| distribute-list (RIP).....               | 978 |
| fullupdate (RIP).....                    | 980 |
| ip summary-address rip.....              | 981 |
| ip rip authentication key-chain.....     | 983 |
| ip rip authentication mode.....          | 985 |
| ip rip authentication string.....        | 987 |
| ip rip receive-packet.....               | 989 |
| ip rip receive version.....              | 990 |
| ip rip send-packet.....                  | 991 |
| ip rip send version.....                 | 992 |
| ip rip send version 1-compatible.....    | 994 |
| ip rip split-horizon.....                | 996 |

# Part 1: Setup and Troubleshooting

# 1

## CLI Navigation Commands

- Contents**
- **Introduction** on page 38
  - **configure terminal** on page 39
  - **disable (Privileged Exec mode)** on page 40
  - **do** on page 41
  - **enable (Privileged Exec mode)** on page 42
  - **end** on page 44
  - **exit** on page 45
  - **help** on page 46
  - **logout** on page 47
  - **show history** on page 48

# Introduction

**Overview** This chapter provides an alphabetical reference for the commands used to navigate between different modes. This chapter also provides a reference for the help and show commands used to help navigate within the CLI.

# configure terminal

**Overview** This command enters the Global Configuration command mode.

**Syntax** `configure terminal`

**Mode** Privileged Exec

**Example** To enter the Global Configuration command mode (note the change in the command prompt), enter the command:

```
awplus# configure terminal  
awplus(config)#
```

## disable (Privileged Exec mode)

**Overview** This command exits the Privileged Exec mode, returning the prompt to the User Exec mode. To end a session, use the **exit** command.

**Syntax** disable

**Mode** Privileged Exec

**Example** To exit the Privileged Exec mode, enter the command:

```
awplus# disable  
awplus>
```

**Related commands** **enable (Privileged Exec mode)**  
**end**  
**exit**

## do

**Overview** This command lets you to run User Exec and Privileged Exec mode commands when you are in any configuration mode.

**Syntax** do <command>

| Parameter | Description                             |
|-----------|-----------------------------------------|
| <command> | Specify the command and its parameters. |

**Mode** Any configuration mode

**Example** awplus# configure terminal  
awplus(config)# do ping 192.0.2.23

## enable (Privileged Exec mode)

**Overview** This command enters the Privileged Exec mode and optionally changes the privilege level for a session. If a privilege level is not specified then the maximum privilege level (15) is applied to the session. If the optional privilege level is omitted then only users with the maximum privilege level can access Privileged Exec mode without providing the password as specified by the **enable password** or **enable secret (deprecated)** commands. If no password is specified then only users with the maximum privilege level set with the **username** command can access Privileged Exec mode.

**Syntax** `enable [<privilege-level>]`

| Parameter                            | Description                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;privilege-level&gt;</code> | Specify the privilege level for a CLI session in the range <1-15>, where 15 is the maximum privilege level, 7 is the intermediate privilege level and 1 is the minimum privilege level. The privilege level for a user must match or exceed the privilege level set for the CLI session for the user to access Privileged Exec mode. Privilege level for a user is configured by <b>username</b> . |

**Mode** User Exec

**Usage notes** Many commands are available from the Privileged Exec mode that configure operating parameters for the device, so you should apply password protection to the Privileged Exec mode to prevent unauthorized use. Passwords can be encrypted but then cannot be recovered. Note that non-encrypted passwords are shown in plain text in configurations.

The **username** command sets the privilege level for the user. After login, users are given access to privilege level 1. Users access higher privilege levels with the **enable (Privileged Exec mode)** command. If the privilege level specified is higher than the users configured privilege level specified by the **username** command, then the user is prompted for the password for that level.

Note that a separate password can be configured for each privilege level using the **enable password** and the **enable secret (deprecated)** commands from the Global Configuration mode. The **service password-encryption** command encrypts passwords configured by the **enable password** and the **enable secret (deprecated)** commands, so passwords are not shown in plain text in configurations.

**Example** The following example shows the use of the **enable** command to enter the Privileged Exec mode (note the change in the command prompt).

```
awplus> enable  
awplus#
```

The following example shows the **enable** command enabling access the Privileged Exec mode for users with a privilege level of 7 or greater. Users with a privilege level of 7 or greater do not need to enter a password to access Privileged Exec mode. Users with a privilege level 6 or less need to enter a password to access Privilege Exec mode. Use the **enable password** command or the **enable secret (deprecated)** commands to set the password to enable access to Privileged Exec mode.

```
awplus> enable 7  
awplus#
```

**Related commands**

- disable (Privileged Exec mode)**
- enable password**
- enable secret (deprecated)**
- exit**
- service password-encryption**
- username**

# end

**Overview** This command returns the prompt to the Privileged Exec command mode, from any advanced command mode.

**Syntax** end

**Mode** All advanced command modes, including Global Configuration and Interface Configuration modes.

**Example** The following example shows how to use the **end** command to return to the Privileged Exec mode directly from Interface Configuration mode.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# end
awplus#
```

**Related commands** **disable (Privileged Exec mode)**  
**enable (Privileged Exec mode)**  
**exit**

# exit

**Overview** This command exits the current mode, and returns the prompt to the mode at the previous level. When used in User Exec mode, the **exit** command terminates the session.

**Syntax** exit

**Mode** All command modes, including Interface Configuration and Global Configuration modes.

**Example** The following example shows the use of the **exit** command to exit Interface Configuration mode and return to Global Configuration mode.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# exit
awplus(config)#
```

**Related commands** **disable (Privileged Exec mode)**  
**enable (Privileged Exec mode)**  
**end**

# help

**Overview** This command displays a description of the AlliedWare Plus™ OS help system.

**Syntax** `help`

**Mode** All command modes

**Example** To display a description on how to use the system help, use the command:  
`awplus# help`

**Output** The following shows typical output.

## Example output from the `help` command

```
When you need help at the command line, press '?'.

If nothing matches, the help list will be empty. Delete
characters until entering a '?' shows the available options.

Enter '?' after a complete parameter to show remaining valid
command parameters (e.g. 'show ?').

Enter '?' after part of a parameter to show parameters that
complete the typed letters (e.g. 'show ip?').
```

# logout

**Overview** This command exits the User Exec or Privileged Exec modes and ends the session.

**Syntax** logout

**Mode** User Exec and Privileged Exec

**Example** To exit the User Exec mode, use the command:  
awplus# logout

# show history

**Overview** This command lists the commands entered in the current session. The history buffer is cleared automatically upon reboot.

The output lists all command line entries, including commands that returned an error.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show history

**Mode** User Exec and Privileged Exec

**Example** To display the commands entered during the current session, use the command:

```
awplus# show history
```

**Output** The following shows typical output.

## Example output from the show history command

```
1 en
2 show ru
3 conf t
4 route-map er deny 3
5 exit
6 ex
7 di
```

  - **http trustpoint** on page 60
  - **log event-host** on page 62
  - **service http** on page 63
  - **show http** on page 64

# Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure the Device GUI. They also allow your device to be monitored and managed by Vista Manager EX™.

For more information, see [Getting Started with the Device GUI on Switches](#).

# atmf topology-gui enable

**Overview** Use this command to enable the operation of Vista Manager EX on the Master device.

Vista Manager EX delivers state-of-the-art monitoring and management for your Autonomous Management Framework™ (AMF) network, by automatically creating a complete topology map of switches, firewalls and wireless access points (APs). An expanded view includes third-party devices such as security cameras.

Use the **no** variant of this command to disable operation of Vista Manager EX.

**Syntax** atmf topology-gui enable  
no atmf topology-gui enable

**Default** Disabled by default on AMF Master and member nodes. Enabled by default on Controllers.

**Mode** Global Configuration mode

**Usage notes** To use Vista Manager EX, you must also enable the HTTP service on all AMF nodes, including all AMF masters and controllers. The HTTP service is enabled by default on AlliedWare Plus switches and disabled by default on AR-Series firewalls. To enable it, use the commands:

```
Node1# configure terminal
Node1(config)# service http
```

On one master in each AMF area in your network, you also need to configure the master to send event notifications to Vista Manager EX. To do this, use the commands:

```
Node1# configure terminal
Node1(config)# log event-host <ip-address> atmf-topology-event
```

**Examples** To enable Vista Manager EX on Node1, use the commands:

```
Node1# configure terminal
Node1(config)# atmf topology-gui enable
```

To disable Vista Manager EX on Node1, use the commands:

```
Node1# configure terminal
Node1(config)# no atmf topology-gui enable
```

**Related** **atmf enable**  
**commands** **log event-host**  
**service http**

# http check-api-content-type-header

**Overview** Use this command to make sure that all the web-based Device GUI HTTP/S requests coming into the device have the expected Content-Type HTTP header set to 'application/json'. This makes the device's HTTP request processing more secure.

Do not use this command if you use Vista Manager EX. Some of its requests use different header settings, and this command will cause the device to drop those requests.

Use the **no** variant of this command to disable this check.

**Syntax** `http check-api-content-type-header`  
`no http check-api-content-type-header`

**Default** Disabled

**Mode** Global Configuration

**Usage notes** We recommend you enable the HTTP header checking, unless you are using Vista Manager EX.

Note that it requires GUI version 2.19.0 or later.

**Example** To check the validity of device GUI HTTP requests, use the commands:

```
awplus# configure terminal
awplus(config)# http check-api-content-type-header
```

To disable the check again, use the commands:

```
awplus# configure terminal
awplus(config)# no http check-api-content-type-header
```

**Related commands** [show http](#)  
**Command changes**

Version 5.5.4-2.1: command added

# http log webapi-requests

**Overview** Use this command to log authenticated web API requests. These logs allow you to monitor and debug Vista Manager EX or Device GUI interactions with your device.

See the [Logging Feature Overview and Configuration Guide](#) for more information about the different types of logging and how to filter log messages.

Use the **no** variant of this command to disable authenticated web API request logging.

**Syntax** `http log webapi-requests {configuration|all}`  
`no http log webapi-requests`

| Parameter     | Description                              |
|---------------|------------------------------------------|
| configuration | Log PUT, POST, and DELETE requests.      |
| all           | Log PUT, POST, DELETE, and GET requests. |

**Default** Web API request logging is disabled.

**Mode** Global Configuration

**Example** To enable logging of all authenticated web API requests, use the following commands:

```
awplus# configure terminal
awplus(config)# http log webapi-requests all
```

To disable logging of authenticated web API requests, use the following commands:

```
awplus# configure terminal
awplus(config)# no http log webapi-requests
```

**Related commands** [http port](#)  
[service http](#)  
[show log](#)

**Command changes** Version 5.4.8-1.1: command added

# http port

**Overview** Use this command to change the HTTP port used to access the web-based device GUI, or to disable HTTP management.

Use the **no** variant of this command to return to using the default port, which is 80.

**Syntax** http port {<1-65535>|none}

no http port

| Parameter | Description                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <1-65535> | The HTTP port number                                                                                                                       |
| none      | Disable HTTP management. You may want to do this if you need to use port 80 for a different service or you do not need to use HTTP at all. |

**Default** The default port for accessing the GUI is port 80.

**Mode** Global Configuration

**Usage notes** Do not configure the HTTP port to be the same as the HTTPS port.

Note that the device will redirect from HTTP to HTTPS unless you have disabled HTTPS access, which we do not recommend doing.

**Example** To set the port to 8080, use the commands:

```
awplus# configure terminal
awplus(config)# http port 8080
```

To return to using the default port of 80, use the commands:

```
awplus# configure terminal
awplus(config)# no http port
```

To stop users from accessing the GUI via HTTP, use the commands:

```
awplus# configure terminal
awplus(config)# http port none
```

**Related commands** [http secure-port](#)  
[service http](#)  
[show http](#)

**Command changes** Version 5.4.7-2.4: command added on AR-Series devices  
Version 5.4.8-0.2: command added on AlliedWare Plus switches

# http secure-port

**Overview** Use this command to change the HTTPS port used to access the web-based device GUI, or to disable HTTPS management.

Use the **no** variant of this command to return to using the default port, which is 443.

**Syntax** http secure-port {<1-65535>|none}

no http secure-port

| Parameter | Description                                                                              |
|-----------|------------------------------------------------------------------------------------------|
| <1-65535> | The HTTPS port number                                                                    |
| none      | Disable HTTPS management. Do not do this if you want to use Vista Manager EX or the GUI. |

**Default** The default port for accessing the GUI is port 443.

**Mode** Global Configuration

**Usage notes** Do not configure the HTTPS port to be the same as the HTTP port.

Note that if you are using Vista Manager EX and need to change the HTTPS port, you must use certificate-based authorization in Vista Manager EX. See the [Vista Manager EX Installation Guide](#) for instructions.

**Example** To set the port to 8443, use the commands:

```
awplus# configure terminal
awplus(config)# http secure-port 8443
```

To return to using the default port of 443, use the commands:

```
awplus# configure terminal
awplus(config)# no http secure-port
```

To stop users from accessing the GUI via HTTPS, use the commands:

```
awplus# configure terminal
awplus(config)# http secure-port none
```

**Related commands** [http port](#)  
[service http](#)  
[show http](#)

**Command changes** Version 5.4.7-1.1: command added on AR-Series devices  
Version 5.4.7-2.4: **none** parameter added  
Version 5.4.8-0.2: command added on AlliedWare Plus switches

# http tls-version-minimum

**Overview** Use this command to set the minimum TLS version the device will use for all HTTP services running on the device. This includes the web-based GUI and RESTCONF.

Use the **no** variant of this command to return to the default minimum TLS version.

**Syntax** `http tls-version-minimum {1.2|1.3}`  
`no http tls-version-minimum`

| Parameter | Description               |
|-----------|---------------------------|
| 1.2       | Use a minimum of TLS 1.2. |
| 1.3       | Use a minimum of TLS 1.3. |

**Default** 1.2

**Mode** Global Configuration

**Example** To use a minimum of TLS 1.3, use the commands:

```
awplus# configure terminal
awplus(config)# http tls-version-minimum 1.3
```

To return to using a minimum of TLS 1.2, use the commands:

```
awplus# configure terminal
awplus(config)# no http tls-version-minimum
```

**Related commands** [show http](#)

**Command changes** Version 5.5.5-1.1: command added

# http trustpoint

**Overview** Use this command to set the PKI trustpoint to use for secure HTTP communication to an AlliedWare Plus device.

Use the **no** variant of this command to revert to using the default trustpoint 'default-selfsigned'.

**Syntax** http trustpoint <trustpoint-name>  
no http trustpoint

| Parameter         | Description        |
|-------------------|--------------------|
| <trustpoint-name> | Name of trustpoint |

**Default** By default, HTTP uses the 'default-selfsigned' trustpoint.

**Mode** Global Configuration

**Usage notes** Before using the **http trustpoint** command you will need to establish a trustpoint. For example, you can create a local self-signed trustpoint using the procedure outlined below.

Create a self-signed trustpoint called 'vista' with keypair 'vista\_key':

```
awplus# configure terminal
awplus(config)# crypto pki trustpoint vista
awplus(ca-trustpoint)# enrollment selfsigned
awplus(ca-trustpoint)# rsakeypair vista_key
awplus(ca-trustpoint)# exit
awplus(config)# exit
```

Create the root and server certificates for this trustpoint:

```
awplus# crypto pki authenticate vista
awplus# crypto pki enroll vista
```

For more information about the AlliedWare Plus implementation of Public Key Infrastructure (PKI), see the [Public Key Infrastructure \(PKI\) Feature Overview and Configuration Guide](#)

**Example** To configure HTTP to use the trustpoint 'vista', use the commands:

```
awplus# configure terminal
awplus(config)# http trustpoint vista
```

To configure HTTP to use the default trustpoint 'default-selfsigned', use the commands:

```
awplus# configure terminal  
awplus(config)# no http trustpoint
```

**Related commands**

- crypto pki trustpoint**
- show crypto pki certificates**
- show crypto pki trustpoint**

**Command changes** Version 5.5.1-2.1: command added

# log event-host

**Overview** Use this command to set up an external host to log AMF topology events through Vista Manager. This command is run on the Master device.

Use the **no** variant of this command to disable log events through Vista Manager.

**Syntax** log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event  
no log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event

| Parameter   | Description                    |
|-------------|--------------------------------|
| <ipv4-addr> | ipv4 address of the event host |
| <ipv6-addr> | ipv6 address of the event host |

**Default** Log events are disabled by default.

**Mode** Global Configuration

**Usage notes** Event hosts are set so syslog sends the messages out as they come.  
Note that there is a difference between log event and log host messages:

- Log event messages are sent out as they come by syslog
- Log host messages are set to wait for a number of messages (20) to send them out together for traffic optimization.

**Example** To enable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
```

```
Node1(config)# log event-host 192.0.2.31 atmf-topology-event
```

To disable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
```

```
Node1(config)# no log event-host 192.0.2.31 atmf-topology-event
```

**Related commands** [atmf topology-gui enable](#)

## service http

**Overview** Use this command to enable the HTTP (Hypertext Transfer Protocol) service.

This service is required to support Vista Manager EX™ and the Device GUI.

Use the **no** variant of this command to disable the HTTP feature.

**Syntax** service http  
no service http

**Default** Enabled

**Mode** Global Configuration

**Example** To enable the HTTP service, use the following commands:

```
awplus# configure terminal  
awplus(config)# service http
```

To disable the HTTP service, use the following commands:

```
awplus# configure terminal  
awplus(config)# no service http
```

**Related commands** [http port](#)  
[http secure-port](#)  
[show http](#)

# show http

**Overview** This command shows the HTTP server settings.

**Syntax** show http

**Mode** User Exec and Privileged Exec

**Example** To show the HTTP server settings, use the command:

```
awplus# show http
```

**Output** The following shows typical output.

## Example output from the show http command

```
awplus#show http
HTTP Server Configuration

# Introduction

**Overview** This chapter provides an alphabetical reference of AlliedWare Plus™ OS file and configuration management commands.

**Filename syntax and keyword usage** Many of the commands in this chapter use the placeholder 'filename' to represent the name and location of the file that you want to act on. The following table explains the syntax of the filename for each different type of file location.

| When you copy a file...                 | Use this syntax:                                                                                                                 | Example:                                                                                                                                              |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Copying in local flash memory           | <code>flash:[/][&lt;directory&gt;/]&lt;filename&gt;</code>                                                                       | To specify a file in the configs directory in flash:<br><code>flash:configs/example.cfg</code>                                                        |
| Copying to or from a USB storage device | <code>usb:[/][&lt;directory&gt;/]&lt;filename&gt;</code>                                                                         | To specify a file in the top-level directory of the USB stick:<br><code>usb:example.cfg</code>                                                        |
| Copying with HTTP                       | <code>http://[[&lt;username&gt;:&lt;password&gt;]@]{&lt;hostname&gt; &lt;host-ip&gt;}[/&lt;filepath&gt;]/&lt;filename&gt;</code> | To specify a file in the configs directory on the server:<br><code>http://www.company.com/configs/example.cfg</code>                                  |
| Copying with TFTP                       | <code>tftp://[&lt;location&gt;]/&lt;directory&gt;]/&lt;filename&gt;</code>                                                       | To specify a file in the top-level directory of the server:<br><code>tftp://172.11.1/example.cfg</code>                                               |
| Copying with SCP                        | <code>scp://&lt;username&gt;@&lt;location&gt;[/&lt;directory&gt;]/&lt;filename&gt;</code>                                        | To specify a file in the configs directory on the server, logging on as user 'bob':<br><br><code>e.g. scp://bob@10.10.0.12/configs/example.cfg</code> |
| Copying with SFTP                       | <code>sftp://[&lt;location&gt;]/&lt;directory&gt;]/&lt;filename&gt;</code>                                                       | To specify a file in the top-level directory of the server:<br><code>sftp://10.0.0.5/example.cfg</code>                                               |

**Valid characters** The filename and path can include characters from up to four categories. The categories are:

1. uppercase letters: A to Z
2. lowercase letters: a to z
3. digits: 0 to 9
4. special symbols: most printable ASCII characters not included in the previous three categories, including the following characters:

- -
- /
- .
- \_
- @
- "
- '
- \*
- :
- ~
- ?

Do not use spaces, parentheses or the + symbol within filenames. Use hyphens or underscores instead.

**Syntax for directory listings** A leading slash (/) indicates the root of the current file system location.

In commands where you need to specify the local file system's flash base directory, you may use **flash** or **flash:** or **flash:/**. For example, these commands are all the same:

- `dir flash`
- `dir flash:`
- `dir flash:/`

Similarly, you can specify the USB storage device base directory with **usb** or **usb:** or **usb:/**

You cannot name a directory or subdirectory **flash**, **nvs**, **usb**, **card**, **tftp**, **scp**, **sftp** or **http**. These keywords are reserved for tab completion when using various file commands.

In a stacked environment you can only access flash and nvs using the stack member filepath (e.g. `dir awplus-2/flash:/`). To access a USB storage device on a backup stack member, use the **remote-login** command.

# autoboot enable

**Overview** This command enables the device to restore a release file and/or a configuration file from a USB storage device.

When the Autoboot feature is enabled, the device looks for a special file called `autoboot.txt` on the external media. If this file exists, the device will check the key and values in the file and recover the device with a new release file and/or configuration file from the external media. An example of a valid `autoboot.txt` file is shown in the following figure.

**Example  
autoboot.txt  
file**

```
[AlliedWare Plus]
Copy_from_external_media_enabled=yes
Boot_Release=x240-5.5.5-2.1.rel
Boot_Config=network1.cfg
```

Use the **no** variant of this command to disable the Autoboot feature.

**Syntax** `autoboot enable`  
`no autoboot enable`

**Default** The Autoboot feature operates the first time the device is powered up in the field, after which the feature is disabled by default.

**Mode** Global Configuration

**Example** To enable the Autoboot feature, use the command:

```
awplus# configure terminal
awplus(config)# autoboot enable
```

**Related  
commands** [create autoboot](#)  
[show autoboot](#)  
[show boot](#)

## boot config-file

**Overview** Use this command to set the configuration file to use during the next boot cycle.

Use the **no** variant of this command to remove the configuration file.

**Syntax** boot config-file <filepath-filename>  
no boot config-file

| Parameter           | Description                                                                                                                                                                                    |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <filepath-filename> | Filepath and name of a configuration file.<br><br>The specified configuration file must exist in the specified filesystem.<br><br>Valid configuration files must have a <b>.cfg</b> extension. |

**Mode** Global Configuration

**Usage notes** You can only specify that the configuration file is on a USB storage device if there is a backup configuration file already specified in flash. If you attempt to set the configuration file on a USB storage device and a backup configuration file is not specified in flash, the following error message is displayed:

```
% Backup configuration files must be stored in the flash
filesystem
```

For an explanation of the configuration fallback order, see the [File Management Feature Overview and Configuration Guide](#).

**Examples** To run the configuration file "branch.cfg" the next time the device boots up, when "branch.cfg" is stored on the device's flash filesystem, use the commands:

```
awplus# configure terminal
awplus(config)# boot config-file flash:/branch.cfg
```

To stop running the configuration file "branch.cfg" when the device boots up, when "branch.cfg" is stored on the device's flash filesystem, use the commands:

```
awplus# configure terminal
awplus(config)# no boot config-file flash:/branch.cfg
```

To run the configuration file "branch.cfg" the next time the device boots up, when "branch.cfg" is stored on a USB storage device, use the commands:

```
awplus# configure terminal
awplus(config)# boot config-file usb:/branch.cfg
```

To stop running the configuration file "branch.cfg" when the device boots up, when "branch.cfg" is stored on a USB storage device, use the commands:

```
awplus# configure terminal
awplus(config)# no boot config-file usb:/branch.cfg
```

**Related commands**

- boot config-file backup**
- boot system**
- boot system backup**
- show boot**

# boot config-file backup

**Overview** Use this command to set a backup configuration file to use if the main configuration file cannot be accessed.

Use the **no** variant of this command to remove the backup configuration file.

**Syntax** boot config-file backup <filepath-filename>  
no boot config-file backup

| Parameter           | Description                                                                                                                                                                                     |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <filepath-filename> | Filepath and name of a backup configuration file.<br><br>Backup configuration files must be in the flash filesystem.<br><br>Valid backup configuration files must have a <b>.cfg</b> extension. |
| backup              | The specified file is a backup configuration file.                                                                                                                                              |

**Mode** Global Configuration

**Usage notes** For an explanation of the configuration fallback order, see the [File Management Feature Overview and Configuration Guide](#).

**Examples** To set the configuration file backup.cfg as the backup to the main configuration file, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# boot config-file backup flash:/backup.cfg
```

To remove the configuration file backup.cfg as the backup to the main configuration file, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no boot config-file backup flash:/backup.cfg
```

**Related commands** [boot config-file](#)  
[boot system](#)  
[boot system backup](#)  
[show boot](#)

# boot system

**Overview** Use this command to set the release file to load during the next boot cycle.

Use the **no** variant of this command to stop specifying a primary release file to boot from. If the device boots up with no release file set, it will use autoboot or the backup release file if either of those are configured. You can also use the boot menu to select a release file source. To access the boot menu, type Ctrl-B at bootup.

**Syntax** boot system <filepath-filename>  
no boot system

| Parameter           | Description                                                                                                                                                                                                           |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <filepath-filename> | Filepath and name of a release file.<br><br>The specified release file must exist and must be stored in the root directory of the specified filesystem.<br><br>Valid release files must have a <b>.rel</b> extension. |

**Mode** Global Configuration

**Usage notes** You can only specify that the release file is on a USB storage device if there is a backup release file already specified in flash. If you attempt to set the release file on a USB storage device and a backup release file is not specified in flash, the following error message is displayed:

```
% A backup boot image must be set before setting a current boot image on USB storage device
```

In a VCStack configuration, the stack only accepts a release file on a USB storage device if a USB storage device is inserted in all stack members and all stack members have a bootloader version that supports booting from it. If a stack member has a USB storage device removed an error message is displayed. For example, if stack member 2 does not have a USB storage device inserted the following message is displayed:

```
% Stack member 2 has no USB storage device inserted
```

**Examples** To boot up with the release file x240-5.5.5-2.1.rel the next time the device boots up, when the release file is stored on the device's flash filesystem, use the commands:

```
awplus# configure terminal
awplus(config)# boot system flash:/x240-5.5.5-2.1.rel
```

To run the release file x240-5.5.5-2.1.rel the next time the device boots up, when the release file is stored on a USB storage device, use the commands:

```
awplus# configure terminal
awplus(config)# boot system usb:/x240-5.5.5-2.1.rel
```

In a VCStack configuration, if there is not enough space to synchronize the new release across the stack, the boot system command has an interactive mode that prompts you to delete old releases.

```
awplus# configure terminal
awplus(config)# boot system x240-5.5.5-2.1.rel
```

```
Insufficient flash available on stack member-2 (11370496)
to synchronize file x240-5.5.5-2.1.rel (14821895).

List of release files on stack member-2
    x240-5.5.5-1.1.rel (14822400)

Select files to free up space,
Delete awplus-2/flash:/x240-5.5.5-1.1.rel? (y/n)[n]:y
```

Answering “y” at the prompt will cause the system to delete the specified file:

```
awplus(config)# y
```

```
Deleting selected files, please wait.....
Successful operation
VCS synchronizing file across the stack, please wait.....
File synchronization with stack member-2 successfully completed
[DONE]
```

**Related commands**

- boot config-file**
- boot config-file backup**
- boot system backup**
- show boot**

# boot system backup

**Overview** Use this command to set a backup release file to load if the main release file cannot be loaded.

Use the **no** variant of this command to stop specifying a backup release file.

**Syntax** boot system backup <filepath-filename>  
no boot system backup

| Parameter           | Description                                                                                                                                                            |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <filepath-filename> | Filepath and name of a backup release file.<br><br>Backup release files must be in the Flash filesystem.<br><br>Valid release files must have a <b>.rel</b> extension. |
| backup              | The specified file is a backup release file.                                                                                                                           |

**Mode** Global Configuration

**Examples** To specify the file x240-5.5.5-1.1.rel as the backup to the main release file, use the commands:

```
awplus# configure terminal
awplus(config)# boot system backup flash:/x240-5.5.5-1.1.rel
```

To stop specifying a backup to the main release file, use the commands:

```
awplus# configure terminal
awplus(config)# no boot system backup
```

**Related commands** [boot config-file](#)  
[boot config-file backup](#)  
[boot system](#)  
[show boot](#)

## cd

**Overview** This command changes the current working directory.

**Syntax** `cd <directory-name>`

| Parameter                           | Description                     |
|-------------------------------------|---------------------------------|
| <code>&lt;directory-name&gt;</code> | Name and path of the directory. |

**Mode** Privileged Exec

**Example** To change to the directory called `images`, use the command:

```
awplus# cd images
```

**Related commands** [dir](#)  
[pwd](#)  
[show file systems](#)

## copy (filename)

**Overview** This command copies a file. This allows you to:

- copy files from your device to a remote device
- copy files from a remote device to your device
- copy files stored on Flash memory to or from a different memory type, such as a USB storage device
- create two copies of the same file on your device

**Syntax** copy [force] <source-name> <destination-name>

| Parameter          | Description                                                                                                                                  |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| force              | This parameter forces the copy command to overwrite the destination file, if it already exists, without prompting the user for confirmation. |
| <source-name>      | The filename and path of the source file. See <a href="#">Introduction</a> for valid syntax.                                                 |
| <destination-name> | The filename and path for the destination file. See <a href="#">Introduction</a> for valid syntax.                                           |

**Mode** Privileged Exec

**Examples** To use TFTP to copy the file "bob.key" into the current directory from the remote server at 10.0.0.1, use the command:

```
awplus# copy tftp://10.0.0.1/bob.key bob.key
```

To use SFTP to copy the file "new.cfg" into the current directory from a remote server at 10.0.1.2, use the command:

```
awplus# copy sftp://10.0.1.2/new.cfg bob.key
```

To use SCP with the username "beth" to copy the file old.cfg into the directory config\_files on a remote server that is listening on TCP port 2000, use the command:

```
awplus# copy scp://beth@serv:2000/config_files/old.cfg old.cfg
```

To copy the file "newconfig.cfg" onto your device's Flash from a USB storage device, use the command:

```
awplus# copy usb:/newconfig.cfg flash:/newconfig.cfg
```

To copy the file "newconfig.cfg" to a USB storage device from your device's Flash, use the command:

```
awplus# copy flash:/newconfig.cfg usb:/newconfig.cfg
```

To copy the file "config.cfg" into the current directory from a USB storage device, and rename it to "configtest.cfg", use the command:

```
awplus# copy usb:/config.cfg configtest.cfg
```

To copy the file "config.cfg" into the current directory from a remote file server, and rename it to "configtest.cfg", use the command:

```
awplus# copy fserver:/config.cfg configtest.cfg
```

On an AMF network, to copy the device GUI file from the AMF master to the Flash memory of 'node\_1', use the command:

```
master# copy awplus-gui_549_13.gui node_1.atmf/flash:
```

- [copy zmodem](#)
- [copy buffered-log](#)
- [copy permanent-log](#)
- [show file systems](#)

## copy debug

**Overview** This command copies a specified debug file to a destination file.

**Syntax** `copy debug {<destination-name>|debug|flash|scp|tftp|usb}  
{<source-name>|debug|flash|scp|tftp|usb}`

| Parameter                             | Description                                                                                                                     |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;destination-name&gt;</code> | The filename and path where you would like the debug output saved. See <a href="#">Introduction</a> for valid syntax.           |
| <code>&lt;source-name&gt;</code>      | The filename and path where the debug output originates. See the <a href="#">Introduction</a> to this chapter for valid syntax. |

**Mode** Privileged Exec

**Example** To copy debug output to a file on flash called “my-debug”, use the following command:

```
awplus# copy debug flash:my-debug
```

To copy debug output to a USB storage device with a filename “my-debug”, use the following command:

```
awplus# copy debug usb:my-debug
```

**Output** The following shows typical output.

**CLI prompt after entering the copy debug command**

```
Enter source file name []:
```

**Related commands** [delete debug](#)  
[move debug](#)

# copy running-config

**Overview** This command copies the running-config to a destination file, or copies a source file into the running-config. Commands entered in the running-config do not survive a device reboot unless they are saved in a configuration file.

**Syntax** `copy <source-name> running-config`  
`copy running-config [<destination-name>]`  
`copy running-config startup-config`

| Parameter                             | Description                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;source-name&gt;</code>      | The filename and path of a configuration file. This must be a valid configuration file with a <b>.cfg</b> filename extension. Specify this when you want the script in the file to become the new running-config. See <a href="#">Introduction</a> for valid syntax.                                                                                                                            |
| <code>&lt;destination-name&gt;</code> | The filename and path where you would like the current running-config saved. This command creates a file if no file exists with the specified filename. If a file already exists, then the CLI prompts you before overwriting the file. See <a href="#">Introduction</a> for valid syntax. If you do not specify a file name, the device saves the running-config to a file called default.cfg. |
| <code>startup-config</code>           | Copies the running-config into the file set as the current startup-config file.                                                                                                                                                                                                                                                                                                                 |

**Mode** Privileged Exec

**Examples** To copy the running-config into the startup-config, use the command:

```
awplus# copy running-config startup-config
```

To copy the file 'layer3.cfg' into the running-config, use the command:

```
awplus# copy layer3.cfg running-config
```

To use SCP to copy the running-config as 'current.cfg' to the remote server listening on TCP port 2000, use the command:

```
awplus# copy running-config scp://user@server:2000/config_files/  
current.cfg
```

**Related commands** [copy startup-config](#)  
[write file](#)  
[write memory](#)

## copy startup-config

**Overview** This command copies the startup-config script into a destination file, or alternatively copies a configuration script from a source file into the startup-config file. Specify whether the destination is Flash or card when loading from the local filesystem.

**Syntax** copy <source-name> startup-config  
copy startup-config <destination-name>

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <source-name>      | The filename and path of a configuration file. This must be a valid configuration file with a <b>.cfg</b> filename extension. Specify this to copy the script in the file into the startup-config file. Note that this does not make the copied file the new startup file, so any further changes made in the configuration file are not added to the startup-config file unless you reuse this command. See <a href="#">Introduction</a> for valid syntax. |
| <destination-name> | The destination and filename that you are saving the startup-config as. This command creates a file if no file exists with the specified filename. If a file already exists, then the CLI prompts you before overwriting the file. See <a href="#">Introduction</a> for valid syntax.                                                                                                                                                                       |

**Mode** Privileged Exec

**Examples** To copy the file 'Layer3.cfg' to the startup-config, use the command:

```
awplus# copy Layer3.cfg startup-config
```

To copy the startup-config as the file 'oldconfig.cfg' in the current directory, use the command:

```
awplus# copy startup-config oldconfig.cfg
```

**Related commands** [copy running-config](#)

## copy zmodem

**Overview** This command allows you to copy files using ZMODEM using Minicom. ZMODEM works over a serial connection and does not need any interfaces configured to do a file transfer.

**Syntax** copy <source-name> zmodem  
copy zmodem

| Parameter     | Description                                                                                  |
|---------------|----------------------------------------------------------------------------------------------|
| <source-name> | The filename and path of the source file. See <a href="#">Introduction</a> for valid syntax. |

**Mode** Privileged Exec

**Example** To copy the local file 'asuka.key' using ZMODEM, use the command:

```
awplus# copy asuka.key zmodem
```

**Related commands** [copy \(filename\)](#)  
[show file systems](#)

# create autoboot

**Overview** Use this command to create an autoboot.txt file on an external storage device. This command will automatically ensure that the keys and values that are expected in this file are correct. After the file is created the **create autoboot** command will copy the current release and configuration files across to the external storage device. The external storage device is then available to restore a release file and/or a configuration file to the device.

**Syntax** create autoboot usb

**Mode** Privileged Exec

**Example** To create an autoboot.txt file on a USB storage device, use the command:  
awplus# create autoboot usb

**Related commands** [autoboot enable](#)  
[show autoboot](#)  
[show boot](#)

## crypto verify

**Overview** Use this command to compare the SHA256 checksum of a file with its correct checksum. This confirms that the file has not been corrupted or interfered with during download. You can verify any kind of file, but you cannot specify a file path, so the file must be stored in the top level of the device's flash memory.

**CAUTION:** *If a file fails to verify and you believe the file may have been interfered with, we recommend immediately performing a security audit of your network.*

Once the device has verified the file, you can use the **copy running-config startup-config** command to save the file/hash pair in the running configuration. If you do this, the device will verify the file every time it boots up and will take action if the verification fails.

The action taken when verification fails on boot-up depends on the type of file and whether the device is in Secure Mode:

- If the device is in Secure Mode and the boot-up firmware file fails verification, the device will not boot. Contact Allied Telesis support if this happens.
- If the device is not in Secure Mode and the boot-up firmware file fails verification, the device will display the following warning message after booting: "% Verification Failed". If this occurs because the saved hash is incorrect, use this command to replace the hash. If this occurs because the firmware file is corrupted or may have been interfered with, ensure that your device is secure, then replace the failed file with a known good file and reboot.
- If you use the **gui** parameter and the GUI fails verification, the device will boot up but the GUI will be disabled (the **service http** command will be disabled).
- If any other file fails verification, the device will display the following warning message after booting: "% Verification Failed"

You can use the **show hash** command to see the current hash of a file.

Use the **no** variant of this command to remove a verified filename/hash combination from the running configuration.

**Syntax** `crypto verify <filename> <hash-value>`  
`crypto verify gui <hash-value>`  
`no crypto verify <filename>`

| Parameter                       | Description                                                                                                                                                                         |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;filename&gt;</code>   | The AlliedWare Plus file that you want to verify                                                                                                                                    |
| <code>gui</code>                | Verify the current Device GUI file                                                                                                                                                  |
| <code>&lt;hash-value&gt;</code> | The known correct checksum of the file. For firmware and GUI files, the correct checksum is listed in the sha256sum file that is available from the Allied Telesis Download Center. |

**Default** No default

**Mode** Global Configuration

**Usage notes** All models of a particular series run the same firmware file and therefore have the same checksum for that firmware file. For example, all x930 Series switches have the same checksum.

If your network has extremely strict security requirements, such as FIPS compliance, you may need to verify the bootloader on boot-up and use signature verification for the firmware file. To configure these, use the commands **crypto verify bootrom** and **crypto verify signed**. These commands make it difficult to upgrade the bootloader or firmware, so only use them if necessary.

**Examples** To verify the firmware file for 5.5.3-0.1 on an x930 Series switch, use the commands:

```
awplus# configure terminal
awplus(config)# crypto verify x930-5.5.3-0.1.rel
7f22d8a30c991a4ddc0a2aed47246282b23b4e4a865e07f79795c0959c47de78
```

**Related commands** **crypto secure-mode**  
**crypto verify bootrom**  
**crypto verify signed**  
**show hash**  
**show secure-mode**

**Command changes** Version 5.5.5-1.1: command available on all AlliedWare Plus devices  
Version 5.5.3-0.1: **gui** parameter added; **<filename>** parameter expanded to cover all file types

# crypto verify bootrom

**Overview** Use this command to compare the SHA256 checksum hash value of a bootloader with its correct checksum. This confirms that the bootloader has not been corrupted or interfered with.

If the verification fails, contact Allied Telesis customer support.

If the device is in Secure Mode, running **crypto verify bootrom** also stores the hash value permanently. When in Secure Mode, we recommend only using this command in networks with extremely strict security requirements, such as in FIPS-compliant networks. This is because you can only remove the hash value by erasing flash memory (for example, by using the **erase factory-default** command).

If the device is not in Secure Mode, you can use the **write** command to save the hash value to the boot configuration file. The device will verify the checksum every time it boots up and will warn you if it fails the verification.

When not in Secure Mode, you can use the **no** variant of this command to remove the bootrom/hash combination from the running configuration.

**Syntax** `crypto verify bootrom <hash-value>`  
`no crypto verify <filename>`

| Parameter                       | Description                                                                                                                                                                                                      |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;hash-value&gt;</code> | The known correct checksum of the bootloader. To see the correct hash value, run the command <b>show hash bootrom</b> straight after you first boot the device up, or check the Deployment Guide for the device. |

**Default** No default

**Mode** Global Configuration

**Usage notes** Please use this command in accordance with the User Guidance documentation for your required security certification.

All models of a particular series run the same bootloader file and therefore have the same checksum. For example, all x930 Series switches have the same bootloader checksum.

**Examples** To verify the bootrom file, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# crypto verify bootrom  
5e80e70b6a2200965abf5f62f72af1bdc1654f3726bdf554afcbd76270c91
```

Note that the hash in this example is an example only; it is not the hash of the device's bootloader.

**Related commands**

- crypto secure-mode**
- crypto verify**
- crypto verify signed**
- show hash**
- show secure-mode**

**Command changes** Version 5.5.5-1.1: command available on all AlliedWare Plus devices

# crypto verify signed

**Overview** Use this command to compare the HMAC-SHA checksum hash value of a firmware file with its correct checksum. This confirms that the firmware has not been corrupted or interfered with. When the device is in Secure Mode, this command also forces the device to check the hash whenever it boots up, and prevents the device from booting if the verification fails.

**Caution:**

If the device is in Secure Mode, this command makes it difficult to upgrade the device's firmware file. Therefore, only use this command if the device is in Secure Mode and you have extremely strict security requirements, such as in FIPS-compliant networks. Otherwise, use the **crypto verify** command. See the Usage Notes below for more detail.

If the verification fails, contact Allied Telesis customer support.

**Syntax** `crypto verify signed <filename> <hash-value>`

| Parameter                       | Description                                                                                                                                                                  |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;filename&gt;</code>   | The AlliedWare Plus file that you want to verify                                                                                                                             |
| <code>&lt;hash-value&gt;</code> | The known correct checksum of the file. This is a keyed HMAC-SHA hash. This is available in a .sig file, which you can get from your Allied Telesis customer representative. |

**Default** No default

**Mode** Global Configuration

**Usage notes** **Caution:**

If the device is in Secure Mode, and if the firmware file verified is the boot release and signed verification succeeds, then the device stores the signed hash and uses it to verify the firmware file on all subsequent reboots. This means that if you change the firmware version, the switch will not boot up. You can only change the firmware version if you reset the switch to the factory defaults **before** changing the firmware version, by using the command **erase factory-default**.

If the device is not in Secure Mode, you can use the **write** command to save the hash value to the boot configuration file. The device will verify the checksum every time it boots up and will warn you if it fails the verification.

All models of a particular series run the same release file and therefore have the same checksum. For example, all x930 Series switches have the same checksum.

**Examples** To use signature verification to verify the firmware file for 5.5.3-0.1 on an x930 Series switch, use the commands:

```
awplus# configure terminal
awplus(config)# crypto verify signed x930-5.5.3-0.1.rel
3f50420644aebd277dd48b3aee30639801348896ffffce231fc5615995ecde5d9
```

**Related commands**

- [crypto verify](#)
- [crypto verify bootrom](#)
- [show hash](#)
- [show secure-mode](#)

**Command changes** Version 5.5.5-1.1: command available on all AlliedWare Plus devices

# delete

**Overview** This command deletes files or directories.

**Syntax** delete [force] [recursive] <filename>

| Parameter  | Description                                                                                     |
|------------|-------------------------------------------------------------------------------------------------|
| force      | Ignore nonexistent filenames and never prompt before deletion.                                  |
| recursive  | Remove the contents of directories recursively.                                                 |
| <filename> | The filename and path of the file to delete. See <a href="#">Introduction</a> for valid syntax. |

**Mode** Privileged Exec

**Examples** To delete the file temp.cfg from the current directory, use the command:

```
awplus# delete temp.cfg
```

To delete the read-only file one.cfg from the current directory, use the command:

```
awplus# delete force one.cfg
```

To delete the directory old\_configs, which is not empty, use the command:

```
awplus# delete recursive old_configs
```

To delete the directory new\_configs, which is not empty, without prompting if any read-only files are being deleted, use the command:

```
awplus# delete force recursive new_configs
```

**Related commands** [erase startup-config](#)  
[rmdir](#)

# delete debug

**Overview** Use this command to delete a specified debug output file.

**Syntax** delete debug <source-name>

| Parameter     | Description                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------|
| <source-name> | The filename and path where the debug output originates. See <a href="#">Introduction</a> for valid URL syntax. |

**Mode** Privileged Exec

**Example** To delete debug output, use the following command:

```
awplus# delete debug
```

**Output** The following shows typical output.

**CLI prompt after entering the delete debug command**

```
Enter source file name []:
```

**Related commands** [copy debug](#)  
[move debug](#)

# delete stack-wide force

**Overview** Use this command to delete files from all members of a stack.

**Syntax** delete stack-wide force [recursive] <name>

| Parameter | Description                                                                                                                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| recursive | Delete directories that match the name, including their contents.                                                                                                                                        |
| <name>    | The name of the files or directories to delete.<br><br>The filename can include the wildcard *. Use the wildcard with caution, because this command does not ask for confirmation before deleting files. |

**Mode** Privileged Exec.

**Usage notes** This is a non-interactive command, so if the specified file or files exist, they are deleted without question or warning. This is indicated by the mandatory **force** parameter.

You can use this command within an AMF working set.

**Examples** To delete a file "test.scp" that is located in flash memory on all stack members, use the following command:

```
awplus# delete stack-wide force test.scp
```

To remove directories "output1" and "output2" from an external USB memory device on all stack members, use the following command:

```
awplus# delete stack-wide force recursive usb:output*
```

**Related commands** **cd**  
**dir stack-wide**

**Command changes** Version 5.4.7-0.1: command added.

## dir

**Overview** This command lists the files on a filesystem. If you don't specify a directory or file, then this command lists the files in the current directory.

**Syntax** `dir [recursive] [sort [reverse] [name|size|time]] [<filename>|debug|flash|nvs|usb]`

| Parameter  | Description                                                                                                                              |
|------------|------------------------------------------------------------------------------------------------------------------------------------------|
| recursive  | List the contents of directories recursively.                                                                                            |
| sort       | Sort directory listing.                                                                                                                  |
| reverse    | Sort using reverse order.                                                                                                                |
| name       | Sort by name.                                                                                                                            |
| size       | Sort by size.                                                                                                                            |
| time       | Sort by modification time (default).                                                                                                     |
| <filename> | The name of the directory or file. If you don't specify a directory or file, then this command lists the files in the current directory. |
| debug      | Debug root directory.                                                                                                                    |
| flash      | Flash memory root directory.                                                                                                             |
| nvs        | NVS memory root directory.                                                                                                               |
| usb        | USB storage device root directory.                                                                                                       |

**Mode** Privileged Exec

**Examples** To list the files in the current working directory, use the command:

```
awplus# dir
```

To list the files in the root of the Flash filesystem, use the command:

```
awplus# dir flash
```

To list recursively the files in the Flash filesystem, use the command:

```
awplus# dir recursive flash:
```

To list the files in alphabetical order, use the command:

```
awplus# dir sort name
```

To list the files by size, smallest to largest, use the command:

```
awplus# dir sort reverse size
```

To sort the files by modification time, oldest to newest, use the command:

```
awplus# dir sort reverse time
```

**Output** The following shows typical output.

**Example output from the dir command**

```
awplus#dir
  630 -rw- Nov 25 2022 23:36:31 example.cfg
23652123 -rw- Nov 25 2022 03:41:18 x240-5.5.5-2.1.rel
  149 -rw- Nov 25 2022 00:40:35 exception.log
```

**Related commands**

- cd**
- dir stack-wide**
- mkdir**
- pwd**

## dir stack-wide

**Overview** This command lists the files on all stack members at once. If you don't specify a directory or file, then this command lists the files in the current directory.

**Syntax** `dir stack-wide [recursive] [sort [reverse] [name|size|time]]  
[<filename>|debug|flash|nvs|usb]`

| Parameter  | Description                                                                                                                              |
|------------|------------------------------------------------------------------------------------------------------------------------------------------|
| recursive  | List the contents of directories recursively.                                                                                            |
| sort       | Sort directory listing.                                                                                                                  |
| reverse    | Sort using reverse order.                                                                                                                |
| name       | Sort by name.                                                                                                                            |
| size       | Sort by size.                                                                                                                            |
| time       | Sort by modification time (default).                                                                                                     |
| <filename> | The name of the directory or file. If you don't specify a directory or file, then this command lists the files in the current directory. |
| debug      | Debug root directory                                                                                                                     |
| flash      | Flash memory root directory                                                                                                              |
| nvs        | NVS memory root directory                                                                                                                |
| usb        | USB storage device root directory                                                                                                        |

**Mode** Privileged Exec

**Examples** To list the files in the current directory across all stack members, use the command:

```
awplus# dir stack-wide
```

To list files in the root flash directory across all stack members, use the command:

```
awplus# dir stack-wide flash
```

To list files recursively in the root flash directory across all stack members, use the command:

```
awplus# dir stack-wide recursive flash
```

To list the files in alphabetical order, use the command:

```
awplus# dir stack-wide sort name
```

To list the files by size, smallest to largest, use the command:

```
awplus# dir stack-wide sort reverse size
```

To sort the files by modification time, oldest to newest, use the command:

```
awplus# dir stack-wide sort reverse time
```

**Output** The following shows typical output.

**Example output from using the `dir stack-wide` command to list files that start with `atmf`**

```
awplus#dir stack-wide atmf*

Stack member 1:
263 rw Nov 15 2017 15:22:52 flash:/atmfStableNodes.sh
3117 rw Nov 14 2017 13:26:31 flash:/atmf-find.sh
2346 rw Nov 14 2017 13:26:19 flash:/atmf-rec.sh

Stack member 2:
263 rw Nov 15 2017 15:22:52 flash:/atmfStableNodes.sh
3117 rw Nov 14 2017 13:26:31 flash:/atmf-find.sh
2346 rw Nov 14 2017 13:26:19 flash:/atmf-rec.sh
```

**Related commands**

**cd**

**dir**

**mkdir**

**delete stack-wide force**

**Command changes** Version 5.4.8-0.2: command added.

# edit

- Overview** This command opens a text file in the AlliedWare Plus™ text editor. Once opened you can use the editor to alter to the file.
- If you specify a filename and the file already exists, then the editor opens it in the text editor.
- If you do not enter a filename, the editor opens an empty file and prompts you for a name when you exit the editor.
- For information about using the editor, including control sequences, see the [File Management Feature Overview and Configuration Guide](#).

**Syntax** `edit [<filename>]`  
`edit <remote-file>`

| Parameter                        | Description                                                                                  |
|----------------------------------|----------------------------------------------------------------------------------------------|
| <code>&lt;filename&gt;</code>    | The name of a file in the local Flash filesystem.                                            |
| <code>&lt;remote-file&gt;</code> | The filename and path of the remote file. See <a href="#">Introduction</a> for valid syntax. |

**Mode** Privileged Exec

- Usage notes** Note that files in remote filesystems cannot be edited from the text editor (e.g. files on a TFTP server). Such files will open read-only.
- Before starting the editor make sure your terminal, terminal emulation program, or Telnet client is 100% compatible with a VT100 terminal. The editor uses VT100 control sequences to display text on the terminal.

- Examples** To create and edit a new text file, use the command:
- ```
awplus# edit
```
- To edit the existing configuration file myconfig.cfg stored on your device's Flash memory, use the command:
- ```
awplus# edit myconfig.cfg
```
- To edit the file example.cfg stored in a directory called backups on a USB stick, use the command:
- ```
awplus# edit usb:/backups/example.cfg
```
- To view the file bob.cfg stored in configs directory of a TFTP server, use the command:
- ```
awplus# edit tftp://configs/bob.cfg
```

**Related** **copy (filename)**  
**commands** **dir**  
**dir stack-wide**  
**mkdir**  
**show file**

# erase factory-default

**Overview** This command erases all data from flash **except** the following:

- the boot release file (a .rel file) and its release setting file
- all license files
- the latest GUI release file

The device is then rebooted and returned to its factory default condition. The device can then be used for AMF automatic node recovery.

**Syntax** erase factory-default

**Mode** Privileged Exec

**Usage notes** This command is an alias to the **atmf cleanup** command.

Note that you cannot use this command if you have **strict-user-process-control** enabled. Disable it before entering the **erase factory-default** command.

**Example** To erase data, use the command:

```
Node_1# erase factory-default
```

```
This command will erase all NVS, all flash contents except for  
the boot release, a GUI resource file, and any license files,  
and then reboot the switch. Continue? (y/n):y
```

**Related commands** **atmf cleanup**

# erase startup-config

**Overview** This command deletes the file that is set as the startup-config file, which is the configuration file that the system runs when it boots up.

At the next restart, the device loads the default configuration file, default.cfg. If default.cfg no longer exists, then the device loads with the factory default configuration. This provides a mechanism for you to return the device to the factory default settings.

**Syntax** erase startup-config

**Mode** Privileged Exec

**Example** To delete the file currently set as the startup-config, use the command:

```
awplus# erase startup-config
```

**Related commands**

- boot config-file backup**
- copy running-config**
- copy startup-config**
- show boot**

## ip tftp source-interface

**Overview** Use this command to manually specify the IP address that all TFTP requests originate from. This is useful in network configurations where TFTP servers only accept requests from certain devices, or where the server cannot dynamically determine the source of the request.

Use the **no** variant of this command to stop specifying a source.

**Syntax** `ip tftp source-interface {<interface>|<ip-add>}`  
`no ip tftp source-interface`

| Parameter   | Description                                                                                                                |
|-------------|----------------------------------------------------------------------------------------------------------------------------|
| <interface> | The VLAN that TFTP requests originate from. The device will use the IP address of this interface as its source IP address. |
| <ip-add>    | The IP address that TFTP requests originate from, in dotted decimal format.                                                |

**Default** There is no default source specified.

**Mode** Global Configuration

**Usage** This command is helpful in network configurations where TFTP traffic needs to traverse point-to-point links or subnets within your network, and you do not want to propagate those point-to-point links through your routing tables.

In those circumstances, the TFTP server cannot dynamically determine the source of the TFTP request, and therefore cannot send the requested data to the correct device. Specifying a source interface or address enables the TFTP server to send the data correctly.

**Example** To specify that TFTP requests originate from the IP address 192.0.2.1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip tftp source-interface 192.0.2.1
```

**Related commands** [copy \(filename\)](#)

## ipv6 tftp source-interface

**Overview** Use this command to manually specify the IPv6 address that all TFTP requests originate from. This is useful in network configurations where TFTP servers only accept requests from certain devices, or where the server cannot dynamically determine the source of the request.

Use the **no** variant of this command to stop specifying a source.

**Syntax** `ipv6 tftp source-interface {<interface>|<ipv6-add>}`  
`no ipv6 tftp source-interface`

| Parameter   | Description                                                                                                                    |
|-------------|--------------------------------------------------------------------------------------------------------------------------------|
| <interface> | The VLAN that TFTP requests originate from. The device will use the IPv6 address of this interface as its source IPv6 address. |
| <ipv6-add>  | The IPv6 address that TFTP requests originate from, in the format x:x::x:x, for example, 2001:db8::8a2e:7334.                  |

**Default** There is no default source specified.

**Mode** Global Configuration

**Usage** This command is helpful in network configurations where TFTP traffic needs to traverse point-to-point links or subnets within your network, and you do not want to propagate those point-to-point links through your routing tables.

In those circumstances, the TFTP server cannot dynamically determine the source of the TFTP request, and therefore cannot send the requested data to the correct device. Specifying a source interface or address enables the TFTP server to send the data correctly.

**Example** To specify that TFTP requests originate from the IPv6 address 2001:db8::8a2e:7334, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 tftp source-interface 2001:db8::8a2e:7334
```

**Related commands** [copy \(filename\)](#)

# mkdir

**Overview** This command makes a new directory.

**Syntax** `mkdir <name>`

| Parameter                 | Description                                               |
|---------------------------|-----------------------------------------------------------|
| <code>&lt;name&gt;</code> | The name and path of the directory that you are creating. |

**Mode** Privileged Exec

**Usage** You cannot name a directory or subdirectory **flash**, **nvs**, **usb**, **card**, **tftp**, **scp**, **sftp** or **http**. These keywords are reserved for tab completion when using various file commands.

**Example** To make a new directory called `images` in the current directory, use the command:

```
awplus# mkdir images
```

**Related commands** [cd](#)  
[dir](#)  
[pwd](#)

# move

**Overview** This command renames or moves a file.

**Syntax** `move <source-name> <destination-name>`

| Parameter                             | Description                                                                                       |
|---------------------------------------|---------------------------------------------------------------------------------------------------|
| <code>&lt;source-name&gt;</code>      | The filename and path of the source file. See <a href="#">Introduction</a> for valid syntax.      |
| <code>&lt;destination-name&gt;</code> | The filename and path of the destination file. See <a href="#">Introduction</a> for valid syntax. |

**Mode** Privileged Exec

**Examples** To rename the file `temp.cfg` to `startup.cfg`, use the command:

```
awplus# move temp.cfg startup.cfg
```

To move the file `temp.cfg` from the root of the Flash filesystem to the directory `myconfigs`, use the command:

```
awplus# move temp.cfg myconfigs/temp.cfg
```

**Related commands**

- [edit](#)
- [show file](#)
- [show file systems](#)

## move debug

**Overview** This command moves a specified debug file to a destination debug file.

**Syntax** `move debug {<destination-name>|debug|flash|usb}`

| Parameter                             | Description                                                                                                              |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;destination-name&gt;</code> | The filename and path where you would like the debug output moved to. See <a href="#">Introduction</a> for valid syntax. |

**Mode** Privileged Exec

**Example** To move debug output into Flash memory with a filename “my-debug”, use the following command:

```
awplus# move debug flash:my-debug
```

To move debug output onto a USB storage device with a filename “my-debug”, use the following command:

```
awplus# move debug usb:my-debug
```

**Output**

Enter source file name []:

**Related commands** [copy debug](#)  
[delete debug](#)

# pwd

**Overview** This command prints the current working directory.

**Syntax** pwd

**Mode** Privileged Exec

**Example** To print the current working directory, use the command:

```
awplus# pwd
```

**Related commands** **cd**

# rmkdir

**Overview** This command removes a directory. This command only works on empty directories, unless you specify the optional **force** keyword.

**Syntax** `rmkdir [force] <name>`

| Parameter | Description                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------|
| force     | Optional keyword that allows you to delete directories that are not empty and contain files or subdirectories. |
| <name>    | The name and path of the directory.                                                                            |

**Mode** Privileged Exec

**Examples** To remove the directory "images" from the top level of the Flash filesystem, use the command:

```
awplus# rmkdir flash:/images
```

To create a directory called "level1" containing a subdirectory called "level2", and then force the removal of both directories, use the commands:

```
awplus# mkdir level1
awplus# mkdir level1/level2
awplus# rmkdir force level1
```

**Related commands**

- [cd](#)
- [dir](#)
- [mkdir](#)
- [pwd](#)

# show autoboot

**Overview** This command displays the Autoboot configuration and status.

**Syntax** show autoboot

**Mode** Privileged Exec

**Example** To show the Autoboot configuration and status, use the command:

```
awplus# show autoboot
```

**Output** The following shows typical output.

## Example output from the show autoboot command

```
awplus#show autoboot
Autoboot configuration
-----
Autoboot status           : enabled
USB file autoboot.txt exists : yes

Restore information on USB
Autoboot enable in autoboot.txt : yes
Restore release file       : x240-5.5.5-2.1.rel (file exists)
Restore configuration file  : network_1.cfg (file exists)
```

## Example output from the show autoboot command when an external media source is not present

```
awplus#show autoboot
Autoboot configuration
-----
Autoboot status           : enabled
External media source     : USB not found.
```

**Related commands** [autoboot enable](#)  
[create autoboot](#)  
[show boot](#)

## show boot

**Overview** This command displays the current boot configuration.  
We recommend that the currently running release is set as the current boot image.

**Syntax** show boot

**Mode** Privileged Exec

**Example** To show the current boot configuration, use the command:  
awplus# show boot

**Output** The following shows typical output.

**Example output from show boot**

```
awplus#show boot
Boot configuration
-----
Current software   : x240-5.5.5-2.1.rel
Current boot image : flash:/x240-5.5.5-2.1.rel
Backup boot image  : flash:/x240-5.5.5-1.1.rel
Default boot config: flash:/default.cfg
Current boot config: flash:/my.cfg (file exists)
Backup boot config: flash:/backup.cfg (file not found)
Autoboot status    : disabled
```

**Parameters in the output from show boot**

| Parameter           | Description                                                                                                                                                      |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Current software    | The current software release that the device is using.                                                                                                           |
| Current boot image  | The boot image currently configured for use during the next boot cycle.                                                                                          |
| Backup boot image   | The boot image to use during the next boot cycle if the device cannot load the main image.                                                                       |
| Default boot config | The default startup configuration file. The device loads this configuration script if no file is set as the startup- config file.                                |
| Current boot config | The configuration file currently configured as the startup-config file. The device loads this configuration file during the next boot cycle if this file exists. |
| Backup boot config  | The configuration file to use during the next boot cycle if the main configuration file cannot be loaded.                                                        |
| Autoboot status     | The status of the Autoboot feature; either enabled or disabled.                                                                                                  |

# show hash

**Overview** Use this command to display the hash for a specified file on the device, or for the device's current bootloader.

**Syntax** show hash <filename>  
show hash bootrom

| Parameter  | Description                                   |
|------------|-----------------------------------------------|
| <filename> | The name of the file to display the hash for. |
| bootrom    | Display the hash for the current bootloader.  |

**Mode** Privileged Exec

**Examples** To show the hash for the GUI file named awplus-gui\_552\_27.gui, use the command:

```
awplus# show hash awplus-gui_552_27.gui
```

To show the hash for a file named 'example.txt', which is in the folder named 'example' in flash memory, use the command:

```
awplus# show hash flash://example/example.txt
```

To show the hash for the bootloader, use the command:

```
awplus# show hash bootrom
```

**Output** The following shows typical output.

## Example output from show hash

```
awplus#show hash awplus-gui_552_27.gui  
b793e2c7fc5580513472017f964316f3bb0e79fbf1ddfd6f3844a2a8311c5c64
```

**Command changes** Version 5.5.3-0.1: command added

# show file

**Overview** This command displays the contents of a specified file.

**Syntax** show file <filename>

| Parameter  | Description                                                                         |
|------------|-------------------------------------------------------------------------------------|
| <filename> | Name of a file on the local Flash filesystem, or name and directory path of a file. |

**Mode** Privileged Exec

**Example** To display the contents of the file `oldconfig.cfg`, which is in the current directory, use the command:

```
awplus# show file oldconfig.cfg
```

**Related commands** [edit](#)  
[show file systems](#)

# show file systems

**Overview** This command lists the file systems and their utilization information where appropriate.

**Syntax** show file systems

**Mode** Privileged Exec

**Examples** To display the file systems, use the command:  
awplus# show file systems

**Output** The following shows typical output.

```
awplus#show file systems
```

| Size(b) | Free(b) | Type     | Flags | Prefixes | S/D/V   | Lcl/Ntwk | Avail |
|---------|---------|----------|-------|----------|---------|----------|-------|
| 222.5M  | 180.6M  | flash    | rw    | flash:   | static  | local    | Y     |
| -       | -       | system   | rw    | system:  | virtual | local    | -     |
| 10.0M   | 9.7M    | debug    | rw    | debug:   | static  | local    | Y     |
| -       | -       | usbstick | rw    | usb:     | dynamic | local    | N     |
| -       | -       | fserver  | rw    | fserver: | dynamic | network  | N     |
| -       | -       | tftp     | rw    | tftp:    | -       | network  | -     |
| -       | -       | scp      | rw    | scp:     | -       | network  | -     |
| -       | -       | sftp     | ro    | sftp:    | -       | network  | -     |
| -       | -       | http     | ro    | http:    | -       | network  | -     |
| -       | -       | rsync    | rw    | rsync:   | -       | network  | -     |

### Parameters in the output of the show file systems command

| Parameter | Description                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------|
| Size (b)  | The total memory available to this file system. The units are given after the value and are M for Megabytes or K for kilobytes.       |
| Free (b)  | The total memory free within this file system. The units are given after the value and are M for Megabytes or K for kilobytes.        |
| Type      | The memory type used for this file system, such as:<br>flash<br>system<br>nvs<br>usbstick<br>tftp<br>scp<br>sftp<br>http.             |
| Flags     | The file setting options: rw (read write), ro (read only).                                                                            |
| Prefixes  | The prefixes used when entering commands to access the file systems, such as:<br>flash<br>system<br>nvs<br>usb<br>tftp<br>scp<br>sftp |

| Parameter  | Description                                                           |
|------------|-----------------------------------------------------------------------|
|            | http.                                                                 |
| S/D/V      | The memory type: Static, Dynamic, Virtual.                            |
| Lcl / Ntwk | Whether the memory is located locally or via a network connection.    |
| Avail      | Whether the memory is accessible: Y (yes), N (no), - (not applicable) |

**Related** [edit](#)  
**commands** [show file](#)

# show running-config

**Overview** This command displays the current configuration of your device. Its output includes all non-default configuration. The default settings are not displayed.

**NOTE:** You can control the output by entering *|* or *>* at the end of the command:

- To display only lines that contain a particular word, enter:  
*| include <word>*
- To start the display at the first line that contains a particular word, enter:  
*| begin <word>*
- To save the output to a file, enter:  
*> <filename>*

**Syntax** `show running-config [full|<feature>]`

| Parameter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |             |                   |           |                         |             |                           |         |                                             |                     |                                             |      |                                                   |     |                                             |                |                              |        |                                 |      |                    |     |                                      |        |                      |          |                        |           |                                                                                                 |    |                                      |                   |                      |                    |                      |          |                               |               |                             |     |                   |       |                                                  |      |                                                  |                  |                        |             |                                    |                  |                                |

**Mode** Privileged Exec and Global Configuration

**Example** To display the current configuration of your device, use the command:

```
awplus# show running-config
```

**Output** The following shows typical output.

**Example output from show running-config**

```
awplus#show running-config
!
service password-encryption
!
no banner motd
!
username manager privilege 15 password 8 $1$bJoVec4D$Jw0JGPr7YqoExA0GVasdE0
!
service ssh
!
no service telnet
!
service http
!
no clock timezone

...

line con 0
line vty 0 4
!
end
```

**Related commands** [copy running-config](#)  
[show running-config interface](#)  
[show running-config unencrypted](#)

# show running-config interface

**Overview** This command displays the current configuration of one or more interfaces on the device.

You can optionally limit the command output to display only information for a given protocol or feature. The features available depend on your device and will be a subset of the features listed in the table below.

**Syntax** show running-config interface  
 show running-config interface <interface-list>  
 show running-config interface <interface-list> <feature>  
 show running-config interface <interface-list> ip <feature>  
 show running-config interface <interface-list> ipv6 <feature>

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface-list>   | <p>The interfaces or ports to display information about. An interface-list can be:</p> <ul style="list-style-type: none"> <li>• a VLAN (e.g. vlan2)</li> <li>• a switchport (e.g. port1.0.4)</li> <li>• a static channel group (e.g. sa2)</li> <li>• a dynamic (LACP) channel group (e.g. po2)</li> <li>• the loopback interface (lo)</li> <li>• a continuous range of interfaces separated by a hyphen (e.g. vlan10-20)</li> <li>• a comma-separated list (e.g. vlan1,vlan10-20). Do not mix interface types in a list.</li> </ul> <p>The specified interfaces must exist.</p> |
| cfm                | Displays running configuration for CFM (Connectivity Fault Management) for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| dot1x              | Displays running configuration for 802.1X port authentication for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| lacp               | Displays running configuration for LACP (Link Aggregation Control Protocol) for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| ip igmp            | Displays running configuration for IGMP (Internet Group Management Protocol) for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| ip multicast       | Displays running configuration for general multicast settings for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ip pim sparse-mode | Displays running configuration for PIM-SM (Protocol Independent Multicast - Sparse Mode) for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| ip pim dense-mode  | Displays running configuration for PIM-DM (Protocol Independent Multicasting - Dense Mode) for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| mstp               | Displays running configuration for MSTP (Multiple Spanning Tree Protocol) for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ospf               | Displays running configuration for OSPF (Open Shortest Path First) for the specified interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Parameter            | Description                                                                                                            |
|----------------------|------------------------------------------------------------------------------------------------------------------------|
| rip                  | Displays running configuration for RIP (Routing Information Protocol) for the specified interfaces.                    |
| ipv6 rip             | Displays running configuration for RIPng (RIP for IPv6) for the specified interfaces.                                  |
| ipv6 ospf            | Displays running configuration for IPv6 OSPF (Open Shortest Path First) for the specified interfaces.                  |
| ipv6 pim sparse-mode | Displays running configuration for PIM-SM (Protocol Independent Multicast - Sparse Mode) for the specified interfaces. |
| rstp                 | Displays running configuration for RSTP (Rapid Spanning Tree Protocol) for the specified interfaces.                   |
| stp                  | Displays running configuration for STP (Spanning Tree Protocol) for the specified interfaces.                          |

**Mode** Privileged Exec and Global Configuration

**Default** Displays information for all protocols on all interfaces

**Examples** To display the current running configuration of your device for ports 1 to 4, use the command:

```
awplus# show running-config interface port1.0.1-port1.0.4
```

To display the current running configuration of a device for vlan2, use the command:

```
awplus# show running-config interface vlan2
```

**Output** The following shows typical output.

**Example output from a show running-config interface eth0 command**

```
awplus#show running-config interface eth0
!
interface eth0
  encapsulation dot1q 2
  encapsulation dot1q 3
!
```

**Related commands** [copy running-config](#)  
[show running-config](#)

# show running-config unencrypted

**Overview** Use this command to display the running configuration, with passwords in cleartext (unencrypted). Otherwise passwords are displayed in encrypted form. For security reasons, use this command with caution.

This command can only be entered by users who have a privilege level of 15.

**Syntax** show running-config unencrypted

**Mode** Privileged Exec

**Example** To display the running configuration with unencrypted passwords, use the command:

```
awplus# show running-config unencrypted
```

**Related commands** [show running-config](#)

**Command changes** Version 5.5.3-2.1: command added

# show startup-config

**Overview** This command displays the contents of the start-up configuration file, which is the file that the device runs on start-up.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show startup-config

**Mode** Privileged Exec

**Example** To display the contents of the current start-up configuration file, use the command:

```
awplus# show startup-config
```

**Output** The following shows typical output.

## Example output from the show startup-config command

```
awplus#show startup-config
!
service password-encryption
!
no banner motd
!
username manager privilege 15 password 8 $1$bJoVec4D$Jw0JGPr7YqoExA0GVasdE0
!
service ssh
!
no service telnet
!
service http
!
no clock timezone

...

line con 0
line vty 0 4
!
end
```

# show version

**Overview** This command displays the version number and copyright details of the current AlliedWare Plus™ OS your device is running.

**Syntax** show version

**Mode** User Exec and Privileged Exec

**Example** To display the version details of your currently installed software, use the command:

```
awplus# show version
```

**Related commands** [boot system backup](#)  
[show boot](#)

# strict-user-process-control

**Overview** Use this command to enable Strict User Process Control.

Strict User Process Control protects sensitive system resources from modification. It does this by preventing use of:

- some file and directory manipulation commands
- trigger scripting commands
- the **erase factory-default** command.

Use the **no** variant of this command to turn off Strict User Process Control.

**Syntax** `strict-user-process-control`  
`no strict-user-process-control`

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** When you enter the **strict-user-process-control** command, it prompts you for a password. Make the password different from any existing privileged management passwords. Store the password carefully and securely, because you will need it if you want to disable the feature.

In addition, the device will prompt you to save your configuration and reboot. This ensures the change takes effect correctly.

The command must be entered from a physical console; entering it from a remote login session is not allowed for extra security.

You can use the **show running-config** command to confirm whether Strict User Process Control is on or off. If the feature is running the output will contain the command **strict-user-process-control**.

**Example** To protect sensitive system files from access, use the commands:

```
awplus# configure terminal
awplus(config)# strict-user-process-control
```

**Related commands** [show running-config](#)  
[strict-user-process-control force](#)

**Command changes** Version 5.5.2-2.1: command added

# strict-user-process-control force

**Overview** Use this command to enable Strict User Process Control permanently, in a way that means it can never be disabled.

Strict User Process Control protects sensitive system resources from modification. It does this by preventing use of:

- some file and directory manipulation commands
- trigger scripting commands
- the **erase factory-default** command.

**CAUTION:** Only use this command if you have to do so for compliance with specific security certifications. Once you have turned this feature on, you will not be able to remove it.

**Syntax** `strict-user-process-control force`

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** When you enter this command, the device will prompt you to save your configuration and reboot. This ensures the change takes effect correctly.

Unlike the **strict-user-process-control** command, this **strict-user-process-control force** command enables Strict User Process Control without prompting for or saving a password. This means you cannot disable Strict User Process Control using the **no** variant of the command (or in any other way).

The command must be entered from a physical console; entering it from a remote login session is not allowed for extra security.

You can use the **show running-config** command to confirm whether Strict User Process Control is on or off.

**Example** To permanently protect sensitive system files from access, use the commands:

```
awplus# configure terminal
awplus(config)# strict-user-process-control force
```

**Related commands** [show running-config](#)  
[strict-user-process-control](#)

**Command changes** Version 5.5.4-1.8: command added

# unmount

**Overview** Use this command to unmount an external storage device. We recommend you unmount storage devices before removing them, to avoid file corruption. This is especially important if files may be automatically written to the storage device, such as external log files or AMF backup files.

**Syntax** unmount usb  
unmount usb member [<stack-ID>]

| Parameter         | Description                       |
|-------------------|-----------------------------------|
| usb               | Unmount the USB storage device.   |
| member <stack-ID> | Stack member number, from 1 to 8. |

**Mode** Privileged Exec

**Example** To unmount a USB storage device and safely remove it from the device, use the command:

```
awplus# unmount usb
```

**Related commands** [clear log external](#)  
[log external](#)  
[show file systems](#)  
[show log config](#)  
[show log external](#)

**Command changes** Version 5.4.7-1.1: command added

# write file

**Overview** This command copies the running-config into the file that is set as the current startup-config file. This command is a synonym of the **write memory** and **copy running-config startup-config** commands.

**Syntax** write [file]

**Mode** Privileged Exec

**Example** To write configuration data to the start-up configuration file, use the command:

```
awplus# write file
```

**Related commands** **copy running-config**  
**write memory**  
**show running-config**

# write memory

**Overview** This command copies the running-config into the file that is set as the current startup-config file. This command is a synonym of the **write file** and **copy running-config startup-config** commands.

**Syntax** write [memory]

**Mode** Privileged Exec

**Example** To write configuration data to the start-up configuration file, use the command:

```
awplus# write memory
```

**Related commands** [copy running-config](#)  
[write file](#)  
[show running-config](#)

# write terminal

**Overview** This command displays the current configuration of the device. This command is a synonym of the **show running-config** command.

**Syntax** write terminal

**Mode** Privileged Exec

**Example** To display the current configuration of your device, use the command:  
awplus# write terminal

**Related commands** **show running-config**

# Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure user access.

# aaa authentication enable default local

**Overview** This command enables local privilege level authentication.  
Use the **no** variant of this command to disable local privilege level authentication.

**Syntax** `aaa authentication enable default local`  
`no aaa authentication enable default`

**Default** Local privilege level authentication is enabled by default.

**Mode** Global Configuration

**Usage notes** The privilege level configured for a particular user in the local user database is the privilege threshold above which the user is prompted for an **enable (Privileged Exec mode)** command.

**Examples** To enable local privilege level authentication, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# aaa authentication enable default local
```

To disable local privilege level authentication, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no aaa authentication enable default
```

**Related commands** **aaa authentication login**  
**enable (Privileged Exec mode)**  
**enable password**  
**enable secret (deprecated)**

# aaa local authentication attempts lockout-time

**Overview** This command configures the duration of the user lockout period.

Use the **no** variant of this command to restore the duration of the user lockout period to its default of 300 seconds (5 minutes).

**Syntax** `aaa local authentication attempts lockout-time <lockout-time>`  
`no aaa local authentication attempts lockout-time`

| Parameter                         | Description                                                         |
|-----------------------------------|---------------------------------------------------------------------|
| <code>&lt;lockout-time&gt;</code> | <code>&lt;0-10000&gt;</code> . Time in seconds to lockout the user. |

**Mode** Global Configuration

**Default** The default for the lockout-time is 300 seconds (5 minutes).

**Usage notes** While locked out all attempts to login with the locked account will fail. The lockout can be manually cleared by another privileged account using the **clear aaa local user lockout** command.

**Examples** To configure the lockout period to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
```

```
awplus(config)# aaa local authentication attempts lockout-time 600
```

To restore the default lockout period of 5 minutes (300 seconds), use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no aaa local authentication attempts lockout-time
```

**Related commands** **aaa local authentication attempts max-fail**  
**aaa local authentication attempts max-fail remote-login-only**  
**clear aaa local user lockout**

# aaa local authentication attempts max-fail

**Overview** This command configures the maximum number of failed login attempts before a user account is locked out. Every time a login attempt fails the failed login counter is incremented.

Use the **no** variant of this command to restore the maximum number of failed login attempts to the default setting (five failed login attempts).

**Syntax** `aaa local authentication attempts max-fail <failed-logins>`  
`no aaa local authentication attempts max-fail`

| Parameter       | Description                                                         |
|-----------------|---------------------------------------------------------------------|
| <failed-logins> | <1-32>. Number of login failures allowed before locking out a user. |

**Mode** Global Configuration

**Default** The default for the maximum number of failed login attempts is five failed login attempts.

**Usage** When the failed login counter reaches the limit configured by this command that user account is locked out for a specified duration configured by the [aaa local authentication attempts lockout-time](#) command.

When a successful login occurs the failed login counter is reset to 0. When a user account is locked out all attempts to login using that user account will fail.

**Examples** To configure the number of login failures that will lock out a user account to two login attempts, use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts max-fail 2
```

To restore the number of login failures that will lock out a user account to the default number of login attempts (five login attempts), use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts max-fail
```

**Related commands**   **aaa local authentication attempts logout-time**  
**aaa local authentication attempts max-fail remote-login-only**  
**clear aaa local user logout**

## aaa login fail-delay

**Overview** Use this command to configure the minimum time period between failed login attempts. This setting applies to login attempts via the console, SSH and Telnet.

Use the **no** variant of this command to reset the minimum time period to its default value.

**Syntax** `aaa login fail-delay <1-10>`  
`no aaa login fail-delay`

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| <1-10>    | The minimum number of seconds required between login attempts |

**Default** 1 second

**Mode** Global configuration

**Example** To apply a delay of at least 5 seconds between login attempts, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa login fail-delay 5
```

**Related commands** [aaa authentication login](#)  
[aaa local authentication attempts lockout-time](#)  
[clear aaa local user lockout](#)

# clear aaa local user logout

**Overview** Use this command to clear the logout on a specific user account or all user accounts.

**Syntax** clear aaa local user logout {username <username>|all}

| Parameter  | Description                          |
|------------|--------------------------------------|
| username   | Clear logout for the specified user. |
| <username> | Specifies the user account.          |
| all        | Clear logout for all user accounts.  |

**Mode** Privileged Exec

**Examples** To unlock the user account 'bob' use the following command:

```
awplus# clear aaa local user logout username bob
```

To unlock all user accounts use the following command:

```
awplus# clear aaa local user logout all
```

**Related commands** [aaa local authentication attempts logout-time](#)

# clear line console

**Overview** This command resets a console line. If a terminal session exists on the line then the terminal session is terminated. If console line settings have changed then the new settings are applied.

**Syntax** clear line console 0

**Mode** Privileged Exec

**Example** To reset the console line (asyn), use the command:

```
awplus# clear line console 0
```

```
% The new settings for console line 0 have been applied
```

**Related commands**

- [clear line vty](#)
- [flowcontrol hardware \(asyn/console\)](#)
- [line](#)
- [show users](#)

## clear line vty

**Overview** This command resets a VTY line. If a session exists on the line then it is closed.

**Syntax** clear line vty <0-32>

| Parameter | Description |
|-----------|-------------|
| <0-32>    | Line number |

**Mode** Privileged Exec

**Example** To reset the first VTY line, use the command:

```
awplus# clear line vty 1
```

**Related commands**

- [privilege level](#)
- [line](#)
- [show telnet](#)
- [show users](#)

# enable password

**Overview** Use this command to set a local password to control access to elevated privilege levels.

Use the **no** version of the command to remove the password.

Note that the **enable secret (deprecated)** command is an outdated alias for the **enable password** command.

**Secure mode** In secure mode, the **enable password** command allows changing privilege level up to the level configured for the current user, and will require a password if one has been configured for that privilege level.

**Syntax** enable password [8] <password>  
enable password level <1-15> [8] <password>  
no enable password [level <1-15>]

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <password> | The password. The password can be up to 32 characters in length and include characters from up to four categories. The password categories are: <ul style="list-style-type: none"><li>• uppercase letters: A to Z</li><li>• lowercase letters: a to z</li><li>• digits: 0 to 9</li><li>• special symbols: all printable ASCII characters not included in the previous three categories. The question mark ? cannot be used as it is reserved for help functionality.</li></ul> |
| 8          | The parameter <b>8</b> means that the password that follows is in hashed form, not plain text. Do not type this 8 when creating a password with this command; it is only used in configuration files. In configuration files, the device prints 8 in front of passwords, to indicate that it is displaying the password in its hashed form.<br><br>Note that the user needs to enter the plain-text version of the password when logging in.                                   |
| level      | Privilege level <1-15>. Level for which the password applies. You can specify up to 16 privilege levels, using numbers 1 through 15. Level 1 is normal EXEC-mode user privileges for User Exec mode. If this argument is not specified in the command or the <b>no</b> variant of the command, the privilege level defaults to 15 (enable mode privileges) for Privileged Exec mode. A privilege level of 7 can be set for intermediate CLI security.                          |

**Default** Level 15

**Mode** Global Configuration

**Usage notes** This command enables the Network Administrator to set a password for entering the Privileged Exec mode when using the **enable (Privileged Exec mode)** command.

You can use this command to give a user an intermediate CLI security level (privilege level 7). Such users can access all the show commands in Privileged Exec mode and all the commands in User Exec mode, but not any configuration commands in Privileged Exec mode.

The device stores passwords in hashed form in configuration files, unless you disable **service password-encryption**.

**Related commands**

- enable (Privileged Exec mode)**
- enable secret (deprecated)**
- service password-encryption**
- privilege level**
- show privilege**
- username**
- show running-config**

# enable secret (deprecated)

**Overview** This command has been deprecated. It has been replaced by the **enable password** command.

# exec-timeout

**Overview** This command sets the interval your device waits for user input from either a console or VTY connection. Once the timeout interval is reached, the connection is dropped. This command sets the time limit when the console or VTY connection automatically logs off after no activity.

The **no** variant of this command removes a specified timeout and resets to the default timeout (10 minutes).

**Syntax** `exec-timeout {<minutes>} [<seconds>]`  
`no exec-timeout`

| Parameter | Description                                           |
|-----------|-------------------------------------------------------|
| <minutes> | <0-35791> Required integer timeout value in minutes   |
| <seconds> | <0-2147483> Optional integer timeout value in seconds |

**Default** The default for the **exec-timeout** command is 10 minutes and 0 seconds (**exec-timeout 10 0**).

**Mode** Line Configuration

**Usage notes** This command is used set the time the telnet session waits for an idle VTY session, before it times out. An **exec-timeout 0 0** setting will cause the telnet session to wait indefinitely. The command **exec-timeout 0 0** is useful while configuring a device, but reduces device security.

If no input is detected during the interval then the current connection resumes. If no connections exist then the terminal returns to an idle state and disconnects incoming sessions.

**Examples** To set VTY connections to timeout after 2 minutes, 30 seconds if there is no response from the user, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# exec-timeout 2 30
```

To reset the console connection to the default timeout of 10 minutes 0 seconds if there is no response from the user, use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no exec-timeout
```

**Related commands** **line**  
**service telnet**  
**show running-config**

# flowcontrol hardware (asyn/console)

**Overview** Use this command to enable RTS/CTS (Ready To Send/Clear To Send) hardware flow control on a terminal console line (asyn port) between the DTE (Data Terminal Equipment) and the DCE (Data Communications Equipment).

**Syntax** flowcontrol hardware  
no flowcontrol hardware

**Mode** Line Configuration

**Default** Hardware flow control is disabled by default.

**Usage notes** Hardware flow control makes use of the RTS and CTS control signals between the DTE and DCE where the rate of transmitted data is faster than the rate of received data. Flow control is a technique for ensuring that a transmitting entity does not overwhelm a receiving entity with data. When the buffers on the receiving device are full, a message is sent to the sending device to suspend the transmission until the data in the buffers has been processed.

Hardware flow control can be configured on terminal console lines (e.g. asyn0). For Reverse Telnet connections, hardware flow control must be configured to match on both the Access Server and the Remote Device. For terminal console sessions, hardware flow control must be configured to match on both the DTE and the DCE. Settings are saved in the running configuration. Changes are applied after reboot, clear line console, or after closing the session.

Use **show running-config** and **show startup-config** commands to view hardware flow control settings that take effect after reboot for a terminal console line. See the **show running-config** command output:

```
awplus#show running-config
!
line con 1
  speed 9600
  mode out 2001
  flowcontrol hardware
!
```

Note that line configuration commands do not take effect immediately. Line configuration commands take effect after one of the following commands or events:

- issuing a clear line console command
- issuing a reboot command
- logging out of the current session

**Examples** To enable hardware flow control on terminal console line asyn0, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# flowcontrol hardware
```

To disable hardware flow control on terminal console line asyn0, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no flowcontrol hardware
```

**Related commands** [clear line console](#)  
[show running-config](#)  
[speed \(asyn\)](#)

# length (asyn)

**Overview** Use this command to specify the number of rows of output that the device will display before pausing, for the console or VTY line that you are configuring.

The **no** variant of this command restores the length of a line (terminal session) attached to a console port or to a VTY to its default length of 22 rows.

**Syntax** length <0-512>  
no length

| Parameter | Description                                          |
|-----------|------------------------------------------------------|
| <0-512>   | Number of lines on screen. Specify 0 for no pausing. |

**Mode** Line Configuration

**Default** The length of a terminal session is 22 rows. The **no length** command restores the default.

**Usage notes** If the output from a command is longer than the length of the line the output will be paused and the '-More-' prompt allows you to move to the next screen full of data.

A length of 0 will turn off pausing and data will be displayed to the console as long as there is data to display.

**Examples** To set the terminal session length on the console to 10 rows, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# length 10
```

To reset the terminal session length on the console to the default (22 rows), use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no length
```

To display output to the console continuously, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# length 0
```

**Related** [terminal resize](#)  
**commands** [terminal length](#)

# line

**Overview** Use this command to enter line configuration mode for the specified VTYS or the console. The command prompt changes to show that the device is in Line Configuration mode.

**Syntax** `line vty <first-line> [<last-line>]`  
`line console 0`

| Parameter    | Description                                    |
|--------------|------------------------------------------------|
| <first-line> | <0-32> Specify the first line number.          |
| <last-line>  | <0-32> Specify the last line number.           |
| console      | The console terminal line(s) for local access. |
| vty          | Virtual terminal for remote console access.    |

**Mode** Global Configuration

**Usage notes** This command puts you into Line Configuration mode. Once in Line Configuration mode, you can configure console and virtual terminal settings, including setting **speed (asyn)**, **length (asyn)**, **privilege level**, and authentication (**login authentication**) or accounting (**accounting login**) method lists.

To change the console (asyn) port speed, use this **line** command to enter Line Configuration mode before using the **speed (asyn)** command. Set the console speed (Baud rate) to match the transmission rate of the device connected to the console (asyn) port on your device.

Note that line configuration commands do not take effect immediately. Line configuration commands take effect after one of the following commands or events:

- issuing a clear line console command
- issuing a reboot command
- logging out of the current session

**Examples** To enter Line Configuration mode in order to configure all VTYS, use the commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)#
```

To enter Line Configuration mode to configure the console (asyn 0) port terminal line, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)#
```

**Related commands**

- accounting login**
- clear line console**
- clear line vty**
- flowcontrol hardware (asyn/console)**
- length (asyn)**
- login authentication**
- privilege level**
- speed (asyn)**

# privilege level

**Overview** This command sets a privilege level for VTY or console connections. The configured privilege level from this command overrides a specific user's initial privilege level at the console login.

**Syntax** `privilege level <1-15>`

**Mode** Line Configuration

**Usage notes** You can set an intermediate CLI security level for a console user with this command by applying privilege level 7 to access all show commands in Privileged Exec and all User Exec commands. However, intermediate CLI security will not show configuration commands in Privileged Exec.

**Examples** To set the console connection to have the maximum privilege level, use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# privilege level 15
```

To set all VTY connections to have the minimum privilege level, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# privilege level 1
```

To set all VTY connections to have an intermediate CLI security level, to access all show commands, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# privilege level 7
```

**Related commands** [enable password](#)  
[line](#)  
[show privilege](#)  
[username](#)

# security-password history

**Overview** This command specifies the number of previous passwords that are unable to be reused. A new password is invalid if it matches a password retained in the password history.

The **no** variant of the command disables this feature.

**Syntax** security-password history <0-15>  
no security-password history

| Parameter | Description                                                                                                                                                                                                                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <0-15>    | The allowable range of previous passwords to match against. A value of 0 will disable the history functionality and is equivalent to the <b>no security-password history</b> command. If the history functionality is disabled, all users' password history is reset and all password history is lost. |

**Default** The default history value is 0, which will disable the history functionality.

**Mode** Global Configuration

**Examples** To restrict reuse of the three most recent passwords, use the command:

```
awplus# configure terminal
awplus(config)# security-password history 3
```

To allow the reuse of recent passwords, use the command:

```
awplus# configure terminal
awplus(config)# no security-password history
```

# security-password forced-change

**Overview** This command specifies whether or not a user is forced to change an expired password at the next login. If this feature is enabled, users whose passwords have expired are forced to change to a password that must comply with the current password security rules at the next login.

Note that to use this command, the lifetime feature must be enabled with the **security-password lifetime** command and the reject-expired-pwd feature must be disabled with the **security-password reject-expired-pwd** command.

The **no** variant of the command disables this feature.

**Syntax** security-password forced-change  
no security-password forced-change

**Default** The forced-change feature is disabled by default.

**Mode** Global Configuration

**Example** To force a user to change their expired password at the next login, use the command:

```
awplus# configure terminal
awplus(config)# security-password forced-change
```

**Related commands**

- security-password history**

# security-password lifetime

**Overview** This command enables password expiry by specifying a password lifetime in days.

Note that when the password lifetime feature is disabled, it also disables the **security-password forced-change** command and the **security-password warning** command.

The **no** variant of the command disables this feature.

**Syntax** security-password lifetime <0-1000>  
no security-password lifetime

| Parameter | Description                                                                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <0-1000>  | Password lifetime specified in days. A value of 0 will disable lifetime functionality and the password will never expire. This is equivalent to the <b>no security-password lifetime</b> command. |

**Default** The default password lifetime is 0, which will disable the lifetime functionality.

**Mode** Global Configuration

**Example** To configure the password lifetime to 10 days, use the command:

```
awplus# configure terminal
awplus(config)# security-password lifetime 10
```

**Related commands**

- security-password forced-change**
- security-password history**
- security-password min-lifetime-enforce**
- security-password minimum-categories**
- security-password minimum-length**
- security-password reject-expired-pwd**
- security-password warning**
- show running-config security-password**
- show security-password configuration**
- show security-password user**

# security-password min-lifetime-enforce

**Overview** Use this command to configure a minimum number of days before a password can be changed by a user. With this feature enabled, once a user sets the password, the user cannot change it again until the minimum lifetime has passed.

Use the **no** variant of this command to remove the minimum lifetime.

**Syntax** security-password min-lifetime-enforce <0-1000>  
no security-password min-lifetime-enforce

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| <0-1000>  | The minimum number of days before a password can be changed |

**Default** By default, no minimum lifetime is enforced.

**Mode** Global Configuration

**Usage notes** The minimum lifetime is helpful in conjunction with a security policy that prevents people from re-using old passwords. For example, if you do not allow people to re-use any of their last 5 passwords, a person can bypass that restriction by changing their password 5 times in quick succession and then re-setting it to their previous password. The minimum lifetime prevents that by preventing people from changing their password in quick succession.

**Example** To force users to wait at least 2 days between changing passwords, use the command:

```
awplus(config)# security-password min-lifetime-enforce 2
```

**Related commands**

**Command changes** Version 5.4.7-0.2: command added

# security-password minimum-categories

**Overview** This command specifies the minimum number of categories that the password must contain in order to be considered valid. The password categories are:

- uppercase letters: A to Z
- lowercase letters: a to z
- digits: 0 to 9
- special symbols: all printable ASCII characters not included in the previous three categories. The question mark (?) cannot be used as it is reserved for help functionality.

Note that to ensure password security, the minimum number of categories should align with the lifetime selected, i.e. the fewer categories specified the shorter the lifetime specified.

**Syntax** security-password minimum-categories <1-4>

| Parameter | Description                                                          |
|-----------|----------------------------------------------------------------------|
| <1-4>     | Number of categories the password must satisfy, in the range 1 to 4. |

**Default** The default number of categories that the password must satisfy is 1.

**Mode** Global Configuration

**Example** To configure the required minimum number of character categories to be 3, use the command:

```
awplus# configure terminal
awplus(config)# security-password minimum-categories 3
```

**Related commands**

- security-password warning**
- show running-config security-password**
- show security-password configuration**
- show security-password user**

# security-password minimum-length

**Overview** This command specifies the minimum allowable password length. This value is checked against when there is a password change or a user account is created.

**Syntax** security-password minimum-length <1-23>

| Parameter | Description                                        |
|-----------|----------------------------------------------------|
| <1-23>    | Minimum password length in the range from 1 to 23. |

**Default** The default minimum password length is 1.

**Mode** Global Configuration

**Example** To configure the required minimum password length as 8, use the command:

```
awplus# configure terminal
awplus(config)# security-password minimum-length 8
```

# security-password reject-expired-pwd

**Overview** This command specifies whether or not a user is allowed to login with an expired password. Users with expired passwords are rejected at login if this functionality is enabled. Users then have to contact the Network Administrator to change their password.

**CAUTION:** *Once all users' passwords are expired you are unable to login to the device again if the security-password reject-expired-pwd command has been executed. You will have to reboot the device with a default configuration file, or load an earlier software version that does not have the security password feature.*

*We recommend you never have the command line "security-password reject-expired-pwd" in a default config file.*

Note that when the reject-expired-pwd functionality is disabled and a user logs on with an expired password, if the forced-change feature is enabled with **security-password forced-change** command, a user may have to change the password during login depending on the password lifetime specified by the **security-password lifetime** command.

The **no** variant of the command disables this feature.

**Syntax** security-password reject-expired-pwd  
no security-password reject-expired-pwd

**Default** The reject-expired-pwd feature is disabled by default.

**Mode** Global Configuration

**Example** To configure the system to reject users with an expired password, use the command:

```
awplus# configure terminal
awplus(config)# security-password reject-expired-pwd
```

**Related commands**

- security-password forced-change**
- security-password history**
- security-password lifetime**
- security-password min-lifetime-enforce**
- security-password minimum-categories**
- security-password minimum-length**

# security-password warning

**Overview** This command specifies the number of days before the password expires that the user will receive a warning message specifying the remaining lifetime of the password.

Note that the warning period cannot be set unless the lifetime feature is enabled with the **security-password lifetime** command.

The **no** variant of the command disables this feature.

**Syntax** security-password warning <0-1000>  
no security-password warning

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <0-1000>  | Warning period in the range from 0 to 1000 days. A value 0 disables the warning functionality and no warning message is displayed for expiring passwords. This is equivalent to the <b>no security-password warning</b> command. The warning period must be less than, or equal to, the password lifetime set with the <b>security-password lifetime</b> command. |

**Default** The default warning period is 0, which disables warning functionality.

**Mode** Global Configuration

**Example** To configure a warning period of three days, use the command:

```
awplus# configure terminal
awplus(config)# security-password warning 3
```

- show security-password user**

## service advanced-vty

**Overview** This command enables the advanced-vty help feature. This allows you to use TAB completion for commands. Where multiple options are possible, the help feature displays the possible options.

The **no service advanced-vty** command disables the advanced-vty help feature.

**Syntax** service advanced-vty  
no service advanced-vty

**Default** The advanced-vty help feature is enabled by default.

**Mode** Global Configuration

**Examples** To disable the advanced-vty help feature, use the command:

```
awplus# configure terminal
awplus(config)# no service advanced-vty
```

To re-enable the advanced-vty help feature after it has been disabled, use the following commands:

```
awplus# configure terminal
awplus(config)# service advanced-vty
```

# service password-encryption

**Overview** Use this command to enable password encryption. This is enabled by default. When password encryption is enabled, the device displays passwords in the running config in encrypted form instead of in plain text.

Use the **no service password-encryption** command to stop the device from displaying newly-entered passwords in encrypted form. This does not change the display of existing passwords.

**Syntax** service password-encryption  
no service password-encryption

**Mode** Global Configuration

**Example** awplus# configure terminal  
awplus(config)# service password-encryption

**Validation** show running-config  
**Commands**

**Related** enable password  
**commands**

# service telnet

**Overview** Use this command to enable the telnet server. The server is disabled by default. Enabling the telnet server starts the device listening for incoming telnet sessions on the configured port.

The server listens on port 23, unless you have changed the port by using the **privilege level** command.

Use the **no** variant of this command to disable the telnet server. Disabling the telnet server will stop the device listening for new incoming telnet sessions. However, existing telnet sessions will still be active.

**Syntax** service telnet [ip|ipv6]  
no service telnet [ip|ipv6]

**Default** The IPv4 and IPv6 telnet servers are disabled by default.  
The configured telnet port is TCP port 23 by default.

**Mode** Global Configuration

**Examples** To enable both the IPv4 and IPv6 telnet servers, use the following commands:

```
awplus# configure terminal  
awplus(config)# service telnet
```

To enable the IPv6 telnet server only, use the following commands:

```
awplus# configure terminal  
awplus(config)# service telnet ipv6
```

To disable both the IPv4 and IPv6 telnet servers, use the following commands:

```
awplus# configure terminal  
awplus(config)# no service telnet
```

To disable the IPv6 telnet server only, use the following commands:

```
awplus# configure terminal  
awplus(config)# no service telnet ipv6
```

**Related commands** [clear line vty](#)  
[show telnet](#)  
[telnet server](#)

**Command changes** Version 5.5.5-2.1: Disabled by default

## service terminal-length (deleted)

**Overview** This command has been deleted in Software Version 5.4.5-0.1 and later.

## show aaa local user locked

**Overview** This command displays the failed attempts against each user account attempting to login into the device, along with the failure times and locations.

Use this command's output to see if a user is currently locked out or not. You can check:

- the number of login attempts that have a 'V' in the 'Valid' column, and
- if the last attempt happened within the lockout time. If the number of 'V' attempts exceeds the maximum allowed number of attempts, and the last attempt is within the lockout time, then the user is locked out.

The maximum number of attempts is 5 by default. You can change it using the command **aaa local authentication attempts max-fail**.

The lockout time is 5 minutes by default. You can change it using the command **aaa local authentication attempts lockout-time**.

Once a user's lockout status is cleared, this command will no longer display any failed attempts for that user. The status gets cleared by:

- being manually cleared by another privileged user, using the **clear aaa local user lockout** command, or
- the locked out user successfully logs into the system after waiting for the lockout time to pass.

In the Valid column:

- 'V' means this login attempt counts towards the maximum allowed number of attempts
- 'I' means this login attempt does not count towards the maximum allowed number of attempts, because it was more than 15 minutes ago.

**Syntax** show aaa local user locked

**Mode** User Exec and Privileged Exec

**Example** To display the current failed attempts for local users, use the command:

```
awplus# show aaa local user locked
```

**Output** The following shows typical output.

**Example output from the show aaa local user locked command**

```
awplus#show aaa local user locked
manager:
When                Type  Source                Valid

2023-02-09 11:47:58 TTY   /dev/ttyS0           V
2023-02-09 11:48:05 RHOST 192.168.5.1          V
2023-02-09 11:22:51 RHOST 192.168.5.1          I
2023-02-09 11:22:54 TTY   /dev/ttyS0           I
user3:
When                Type  Source                Valid
2023-02-09 11:38:58 TTY   /dev/ttyS0           V
2023-02-09 11:39:04 RHOST 192.168.5.1          V
2023-02-09 11:39:06 TTY   /dev/ttyS0           V
2023-02-09 11:39:22 RHOST 192.168.5.1          V
2023-02-09 11:39:26 TTY   /dev/ttyS0           V
```

This output example was run at 11:49. The lockout-time and max-fail settings are set to their defaults:

- manager: is not locked out because they only have 2 valid attempts.
- user1: is locked out because they have 7 valid attempts and the most recent was within the lockout time.
- user2: is not locked out because only 4 attempts are valid.
- user3: is not locked out. Even though they have 5 valid attempts, the most recent attempt is older than the lockout time of 5 minutes.

[aaa local authentication attempts max-fail](#)  
[clear aaa local user lockout](#)

# show privilege

**Overview** This command displays the current user privilege level, which can be any privilege level in the range <1-15>. Privilege levels <1-6> allow limited user access (all User Exec commands), privilege levels <7-14> allow restricted user access (all User Exec commands plus Privileged Exec show commands). Privilege level 15 gives full user access to all Privileged Exec commands.

**Syntax** show privilege

**Mode** User Exec and Privileged Exec

**Usage notes** A user can have an intermediate CLI security level set with this command for privilege levels <7-14> to access all show commands in Privileged Exec mode and all commands in User Exec mode, but no configuration commands in Privileged Exec mode.

**Example** To show the current privilege level of the user, use the command:  
awplus# show privilege

**Output** The following shows typical output.

## Example output from the show privilege command

```
awplus#show privilege
Current privilege level is 15
awplus#disable
awplus>show privilege
Current privilege level is 1
```

**Related commands** [privilege level](#)

# show security-password configuration

**Overview** This command displays the configuration settings for the various security password rules.

**Syntax** show security-password configuration

**Mode** Privileged Exec

**Example** To display the current security-password rule configuration settings, use the command:

```
awplus# show security-password configuration
```

**Output** The following shows typical output.

**Example output from the show security-password configuration command**

```
Security Password Configuration
Minimum password length ..... 8
Minimum password character categories to match ..... 3
Number of previously used passwords to restrict..... 4
Password lifetime ..... 30 day(s)
  Warning period before password expires ..... 3 day(s)
Reject expired password at login ..... Disabled
Force changing expired password at login ..... Enabled
```

# show security-password user

**Overview** This command displays user account and password information for all users.

**Syntax** show security-password user

**Mode** Privileged Exec

**Example** To display the system users' remaining lifetime or last password change, use the command:

```
awplus# show security-password user
```

**Output** The following shows typical output.

## Example output from the show security-password user command

| User account and password information |           |                 |                    |
|---------------------------------------|-----------|-----------------|--------------------|
| UserName                              | Privilege | Last-PWD-Change | Remaining-lifetime |
| -----                                 |           |                 |                    |
| manager                               | 15        | 4625 day(s) ago | No Expiry          |
| bob15                                 | 15        | 0 day(s) ago    | 30 days            |
| ted7                                  | 7         | 0 day(s) ago    | No Expiry          |
| mike1                                 | 1         | 0 day(s) ago    | No Expiry          |

- [telnet server](#)

# show users

**Overview** This command shows information about the users who are currently logged into the device.

**Syntax** show users

**Mode** User Exec and Privileged Exec

**Example** To show the users currently connected to the device, use the command:  
awplus# show users

**Output** The following shows typical output.

## Example output from the show users command

| Line  | User    | Host(s) | Idle     | Location    | Priv | Idletime | Timeout |
|-------|---------|---------|----------|-------------|------|----------|---------|
| con 0 | manager | idle    | 00:00:00 | ttyS0       | 15   | 10       | N/A     |
| vty 0 | bob     | idle    | 00:00:03 | 172.16.11.3 | 1    | 0        | 5       |

## Parameters in the output of the show users command

| Parameter | Description                                                                                |
|-----------|--------------------------------------------------------------------------------------------|
| Line      | Console port user is connected to.                                                         |
| User      | Login name of user.                                                                        |
| Host(s)   | Status of the host the user is connected to.                                               |
| Idle      | How long the host has been idle.                                                           |
| Location  | URL location of user.                                                                      |
| Priv      | The privilege level in the range 1 to 15, with 15 being the highest.                       |
| Idletime  | The time interval the device waits for user input from either a console or VTY connection. |
| Timeout   | The time interval before a server is considered unreachable.                               |

# strict-user-process-control

**Overview** Use this command to enable Strict User Process Control.

Strict User Process Control protects sensitive system resources from modification. It does this by preventing use of:

- some file and directory manipulation commands
- trigger scripting commands
- the **erase factory-default** command.

Use the **no** variant of this command to turn off Strict User Process Control.

**Syntax** `strict-user-process-control`  
`no strict-user-process-control`

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** When you enter the **strict-user-process-control** command, it prompts you for a password. Make the password different from any existing privileged management passwords. Store the password carefully and securely, because you will need it if you want to disable the feature.

In addition, the device will prompt you to save your configuration and reboot. This ensures the change takes effect correctly.

The command must be entered from a physical console; entering it from a remote login session is not allowed for extra security.

You can use the **show running-config** command to confirm whether Strict User Process Control is on or off. If the feature is running the output will contain the command **strict-user-process-control**.

**Example** To protect sensitive system files from access, use the commands:

```
awplus# configure terminal
awplus(config)# strict-user-process-control
```

**Related commands** [show running-config](#)  
[strict-user-process-control force](#)

**Command changes** Version 5.5.2-2.1: command added

# strict-user-process-control force

**Overview** Use this command to enable Strict User Process Control permanently, in a way that means it can never be disabled.

Strict User Process Control protects sensitive system resources from modification. It does this by preventing use of:

- some file and directory manipulation commands
- trigger scripting commands
- the **erase factory-default** command.

**CAUTION:** Only use this command if you have to do so for compliance with specific security certifications. Once you have turned this feature on, you will not be able to remove it.

**Syntax** `strict-user-process-control force`

**Default** Disabled.

**Mode** Global Configuration

**Usage notes** When you enter this command, the device will prompt you to save your configuration and reboot. This ensures the change takes effect correctly.

Unlike the **strict-user-process-control** command, this **strict-user-process-control force** command enables Strict User Process Control without prompting for or saving a password. This means you cannot disable Strict User Process Control using the **no** variant of the command (or in any other way).

The command must be entered from a physical console; entering it from a remote login session is not allowed for extra security.

You can use the **show running-config** command to confirm whether Strict User Process Control is on or off.

**Example** To permanently protect sensitive system files from access, use the commands:

```
awplus# configure terminal
awplus(config)# strict-user-process-control force
```

**Related commands** [show running-config](#)  
[strict-user-process-control](#)

**Command changes** Version 5.5.4-1.8: command added

# telnet

**Overview** Use this command to open a telnet session to a remote device.

**Syntax** `telnet {<hostname>|[ip] <ipv4-addr>|[ipv6] <ipv6-addr>} [<port>]`

| Parameter   | Description                                                                                                                                 |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <hostname>  | The host name of the remote system.                                                                                                         |
| ip          | Keyword used to specify the IPv4 address or host name of a remote system.                                                                   |
| <ipv4-addr> | An IPv4 address of the remote system.                                                                                                       |
| ipv6        | Keyword used to specify the IPv6 address of a remote system                                                                                 |
| <ipv6-addr> | Placeholder for an IPv6 address in the format x:x::x:x, for example, 2001:db8::8a2e:7334                                                    |
| <port>      | Specify a TCP port number (well known ports are in the range 1- 1023, registered ports are 1024-49151, and private ports are 49152- 65535). |

**Mode** User Exec and Privileged Exec

**Examples** To connect to TCP port 2602 on the device at 10.2.2.2, use the command:

```
awplus# telnet 10.2.2.2 2602
```

To connect to the telnet server host .example, use the command:

```
awplus# telnet host.example
```

To connect to the telnet server host .example on TCP port 100, use the command:

```
awplus# telnet host.example 100
```

# telnet server

**Overview** This command enables the telnet server on the specified TCP port. If the server is already enabled then it will be restarted on the new port. Changing the port number does not affect the port used by existing sessions.

**Syntax** telnet server {<1-65535>|default}

| Parameter | Description                         |
|-----------|-------------------------------------|
| <1-65535> | The TCP port to listen on.          |
| default   | Use the default TCP port number 23. |

**Mode** Global Configuration

**Example** To enable the telnet server on TCP port 2323, use the following commands:

```
awplus# configure terminal
awplus(config)# telnet server 2323
```

**Related commands** [show telnet](#)

# terminal length

**Overview** Use the **terminal length** command to specify the number of rows of output that the device will display before pausing, for the currently-active terminal only.

Use the **terminal no length** command to remove the length specified by this command. The default length will apply unless you have changed the length for some or all lines by using the **length (asyn)**.

**Syntax** terminal length <length>  
terminal no length [<length>]

| Parameter | Description                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------|
| <length>  | <0-512> Number of rows that the device will display on the currently-active terminal before pausing. |

**Mode** User Exec and Privileged Exec

**Examples** The following example sets the number of lines to 15:

```
awplus# terminal length 15
```

The following example removes terminal length set previously:

```
awplus# terminal no length
```

**Related commands** terminal resize  
**length (asyn)**

# terminal resize

**Overview** Use this command to automatically adjust the number of rows of output on the console, which the device will display before pausing, to the number of rows configured on the user's terminal.

**Syntax** `terminal resize`

**Mode** User Exec and Privileged Exec

**Usage notes** When the user's terminal size is changed, then a remote session via SSH or TELNET adjusts the terminal size automatically. However, this cannot normally be done automatically for a serial or console port. This command automatically adjusts the terminal size for a serial or console port.

**Examples** The following example automatically adjusts the number of rows shown on the console:

```
awplus# terminal resize
```

**Related commands** [length \(asyn\)](#)  
[terminal length](#)

## username

**Overview** This command creates or modifies a user to assign a privilege level and a password.

**NOTE:** *The default username privilege level of 1 is not shown in running-config output. Any username privilege level that has been modified from the default is shown.*

**Syntax** username <name> privilege <1-15> [password [8] <password>]  
 username <name> password [8] <password>  
 no username <name>

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           | Note that the user needs to enter the plain-text version of the password when logging in.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|           | <div>&lt;password&gt;</div> <p>The user's password. The password can be up to 32 characters in length and include characters from up to four categories. The password categories are:</p> <ul style="list-style-type: none"> <li>• uppercase letters: A to Z</li> <li>• lowercase letters: a to z</li> <li>• digits: 0 to 9</li> <li>• special symbols: all printable ASCII characters not included in the previous three categories. The question mark ? cannot be used as it is reserved for help functionality.</li> </ul> |

**Mode** Global Configuration

**Default** The privilege level is 1 by default. Note the default is not shown in running-config output.

**Usage notes** An intermediate CLI security level (privilege level 7 to privilege level 14) allows a CLI user access to the majority of show commands, including the platform show commands that are available at privilege level 1 to privilege level 6. Note that some show commands, such as **show running-configuration** and **show startup-configuration**, are only available at privilege level 15.

**Examples** To create the user "bob" with a privilege level of 15, for all show commands including show running-configuration and show startup-configuration and to access configuration commands in Privileged Exec command mode, and the password "bobs\_secret", use the commands:

```
awplus# configure terminal
awplus(config)# username bob privilege 15 password bobs_secret
```

To create a user "junior\_admin" with a privilege level of 7, which will have intermediate CLI security level access for most show commands, and the password "show\_only", use the commands:

```
awplus# configure terminal
awplus(config)# username junior_admin privilege 7 password
show_only
```

## Feature Licensing Commands

- Contents**
- **Introduction** on page 188
  - **license** on page 189
  - **show license** on page 191
  - **show license brief** on page 193
  - **show license brief member** on page 195
  - **show license member** on page 197

# Introduction

**Overview** This chapter provides an alphabetical reference for each of the Feature Licensing commands. Feature Licensing enables you to use advanced features such as Layer 3 routing.

**NOTE:** *crypto secure-mode*

To see which Feature Licenses are available for your device, see the [AlliedWare Plus Datasheet](#).

Allied Telesis Management Framework (AMF) requires a Subscription License. For information about Subscription Licensing commands, see the Subscription Licensing Commands chapter.

For step-by-step instructions about how to license AlliedWare Plus devices, see the [Licensing Feature Overview and Configuration\\_Guide](#).

# license

**Overview** This command activates the licensed software feature set on a standalone switch, or a stack of switches.

Use the **no** variant of this command to deactivate the licensed software feature set on a standalone switch, or a stack of switches.

For feature licenses, contact your authorized distributor or reseller. If a license key expires or is incorrect so the license key is invalid, then some software features will be unavailable.

**NOTE:** See the AlliedWare Plus™ datasheet for a list of current feature licenses available by product. Purchase licenses from your authorized dealer or reseller.

**NOTE:** The command is not available in Secure Mode (see the command.

In a live network, only install feature licenses during scheduled maintenance.

**Syntax** license <label> <key>  
no license <label>

| Parameter | Description                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <label>   | A name for the feature license. To determine names already in use, use the <b>show license</b> command. This can be the default name supplied for the feature, or a renamed feature name. |
| <key>     | The encrypted license key to enable a set of software features.                                                                                                                           |

**Mode** Privileged Exec

**Usage notes** You can change the license label using this command to make it specific to you when you initially add a license. Once a license is added, any change to the license label first requires removal of the license before adding a license again with a new license label.

The default feature license labels are issued along with encrypted license keys by e-mail for you to apply using this command to activate features. You can change default feature license labels, but they must be 15 characters or less.

For example, you may want to change the label of the premium license to "premium-license". You can check your new license label by using the **show license** command.

In a stacked configuration, the **license** command will add a license to all stack members and the **no license** command will remove a license from all stack members. If you introduce a new stack member and it lacks a feature license that is possessed by the other stack members, a warning message will be generated at bootup. If this occurs, use the **license** command to add the license to all stack members, including the new stack members.

If you add a feature license you will be prompted at the console that the feature needs to restart. Restarting of individual protocols in this manner could result in the loss of network traffic. Only install licenses in scheduled maintenance periods for devices in a live environment.

**Examples** To activate the license called "Premium" that has the key 12345678ABCDE123456789ABCDE, use the command:

```
awplus# license Premium 12345678ABCDE123456789ABCDE
```

To deactivate the license called "Premium", use the command:

```
awplus# no license Premium
```

**Related commands** **show license**  
**show license member**

# show license

**Overview** This command displays information about a specific software feature license, or all enabled software feature licenses on the device.

**Syntax** `show license [feature] [<label>|index <index-number>]`

| Parameter            | Description                                                                                                                             |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| feature              | Only display license information for any applied feature licenses.                                                                      |
| <label>              | The license name to show information about. This can be used instead of the index number to identify a specific license.                |
| index <index-number> | The index number of the license to show information about. This can be used instead of the license name to identify a specific license. |

**Mode** User Exec and Privileged Exec

**Usage notes** In a stacked configuration, this command will display licenses applied to a stack master only.

Use the **show license member** command instead if you need to display license information for a specific stack member or all stack members.

**Examples** To display full information about all enabled licenses, use the command:

```
awplus# show license
```

To display full information about the licenses with index number 1, use the command:

```
awplus# show license index 1
```

**Output** The following shows typical output.

**Example output from show license**

```
awplus#show license
Board region: Global
Software Licenses
-----
Index                : 1
License name         : Base License
Customer name        : Base License
Quantity of licenses : 1
Type of license       : Full
License issue date    : 20-Mar-2019
License expiry date   : N/A
Features included     : IPv6Basic, LAG-FULL, MLDSnoop, RADIUS-100, ...
```

**Parameters in the output of show license**

| Parameter            | Description                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------|
| Board region         | Name of the region for the Base License features.                                                   |
| Index                | Index identifying entry. The index is assigned automatically by the software. It is not configured. |
| License name         | Name of the license key bundle (case-sensitive).                                                    |
| Customer name        | Customer name.                                                                                      |
| Quantity of licenses | Quantity of licensed installations.                                                                 |
| Type of license      | Full or Trial.                                                                                      |
| License issue date   | Date the license was generated.                                                                     |
| License expiry date  | Expiry date for trial license.                                                                      |
| Features included    | List of features included in the feature license.                                                   |

# show license brief

**Overview** This command displays information about a specific software feature license, or all enabled software feature licenses on the device.

**Syntax** `show license brief`  
`show license [feature] [<label>|index <index-number>] brief`

| Parameter            | Description                                                                                                                             |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| feature              | Only display license information for any applied feature licenses.                                                                      |
| <label>              | The license name to show information about. This can be used instead of the index number to identify a specific license.                |
| index <index-number> | The index number of the license to show information about. This can be used instead of the license name to identify a specific license. |
| brief                | Displays a brief summary of license information.                                                                                        |

**Mode** User Exec and Privileged Exec

**Usage notes** In a stacked configuration, this command will display licenses applied to a stack master only.

Use the **show license brief member** command instead if you need to display license information for a specific stack member or all stack members.

**Examples** To display a brief summary of information about all licenses, use the command:

```
awplus# show license brief
```

**Output** The following shows typical output.

**Example output from show license brief**

```
awplus#show license brief
Board region: Global
Software Licenses
-----
Index License name      Quantity  Customer name
      Type              Version   Period
-----
1      Base License      1         Base License
      Full              N/A
Current enabled features for displayed licenses:
IPv6Basic, LAG-FULL, MLDSnoop ...
```

**Parameters in the output of show license brief**

| Parameter                                       | Description                                                                                         |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| Board region                                    | Name of the region for the Base License features.                                                   |
| Index                                           | Index identifying entry. The index is assigned automatically by the software. It is not configured. |
| License name                                    | Name of the license key bundle (case-sensitive).                                                    |
| Quantity                                        | Quantity of licensed installations.                                                                 |
| Customer name                                   | Customer name.                                                                                      |
| Type                                            | Full or Trial.                                                                                      |
| Period                                          | Expiry date for trial license.                                                                      |
| Current enabled features for displayed licenses | List of features included in the license.                                                           |

**Related commands**

- [license](#)

# show license brief member

**Overview** Use this command to display information about either a specific software license, or all software feature licenses enabled on either a specific stack member or all stack members.

**Syntax** `show license [<label>] brief member [1-8|all]`

| Parameter | Description                                           |
|-----------|-------------------------------------------------------|
| <label>   | The name of the license to show information about.    |
| brief     | Display a brief summary of license information.       |
| <1-8>     | The ID of the stack member to show information about. |
| all       | Display information about all stack members.          |

**Mode** User Exec and Privileged Exec

**Usage notes** Use the **show license brief member all** command for brief table output of all licenses per stack member.

**Examples** To display a brief summary of information about all enabled licenses on stack member 2, use the command:

```
awplus# show license brief member 2
```

To display a brief summary about all enabled licenses on all stack members, use the command:

```
awplus# show license brief member all
```

To display a brief summary about the license "name1" on all stack members, use the command:

```
awplus# show license name1 brief member all
```

**Output** The following shows typical output.

**Example output from show license brief member**

```
awplus#show license brief member 1

Board region: Global

Feature licenses on stack member 1:

-----
Index License name           Quantity Customer name
      Type                    Period
-----
1      Base License           -         Base License
      Full                    N/A

Current enabled features for displayed licenses:
IPV6Basic, LAG-FULL, MLDSnoop, ...
```

**Parameters in the output of show license brief member**

| Parameter                                       | Description                                                                                         |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| Board region                                    | Name of the region for the Base License features.                                                   |
| Index                                           | Index identifying entry. The index is assigned automatically by the software. It is not configured. |
| License name                                    | Name of the license key bundle (case-sensitive).                                                    |
| Quantity                                        | Quantity of licensed installations.                                                                 |
| Customer name                                   | Customer name.                                                                                      |
| Type                                            | Full or Trial.                                                                                      |
| Period                                          | Expiry date for trial license.                                                                      |
| Current enabled features for displayed licenses | List of features included in the license.                                                           |

**Related commands** [license](#)  
[show license](#)  
[show license member](#)

# show license member

**Overview** Use this command to display information about either a specific software license, or all software feature licenses enabled on either a specific stack member or all stack members.

**Syntax** `show license [<label>] member [1-8|all]`

| Parameter | Description                                           |
|-----------|-------------------------------------------------------|
| <label>   | The name of the license to show information about.    |
| <1-8>     | The ID of the stack member to show information about. |
| all       | Display information about all stack members.          |

**Mode** User Exec and Privileged Exec

**Usage notes** Use the **show license member all** command to display full list output of all licenses per stack member.

**Examples** To display full information about all enabled licenses on all stack members, use the command:

```
awplus# show license member all
```

To display full information about all enabled licenses on stack member 2, use the command:

```
awplus# show license member 2
```

To display full information about the license called "name1" on all stack members, use the command:

```
awplus# show license name1 member all
```

**Output** The following shows typical output.

**Example output from show license member**

```
awplus#show license member all
Board region: Global
Software Feature Licenses

**Parameters in the output of show license member**

| Parameter            | Description                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------|
| Board region         | Name of the region for the Base License features.                                                   |
| Index                | Index identifying entry. The index is assigned automatically by the software. It is not configured. |
| License name         | Name of the license key bundle (case-sensitive).                                                    |
| Customer name        | Customer name.                                                                                      |
| Quantity of licenses | Quantity of licensed installations.                                                                 |
| Type of license      | Full or Trial.                                                                                      |
| License issue date   | Date the license was generated.                                                                     |
| License expiry date  | Expiry date for trial license.                                                                      |
| Features included    | List of features included in the license.                                                           |

# Introduction

**Overview** This chapter provides an alphabetical reference of commands for configuring and monitoring the system.

# banner display external-manager

**Overview** Use this command to display the external-manager banner. The external-manager banner warns you that certain features are being managed by an external management system. For example, if you are using Vista Manager EX to manage your network, you will see a notification banner telling you what features are being managed after you enter Global Configuration Mode.

Use the **no** variant of this command to hide the external-manager banner.

**Syntax** banner display external-manager  
no banner display external-manager

**Default** The external-manager banner is displayed by default.

**Mode** User Exec

**Usage notes** The external-manager banner is displayed by default. In some instances it is desirable to hide it for the current session. You do this by using the **no** variant of this command. The banner will remain hidden until you either re-enable it, or log out and then log back in.

**Example** To hide the external-manager banner, use the command:

```
awplus> no banner display external-manager
```

To display the external-manager banner, use the command:

```
awplus> banner display external-manager
```

**Related commands** [banner external-manager](#)  
[show banner external-manager](#)

**Command changes** Version 5.5.1-1.1: command added

## banner exec

**Overview** This command configures the User Exec mode banner that is displayed on the console after you login. The **banner exec default** command restores the User Exec banner to the default banner. Use the **no banner exec** command to disable the User Exec banner and remove the default User Exec banner.

**Syntax** `banner exec <banner-text>`  
`banner exec default`  
`no banner exec`

**Default** By default, the AlliedWare Plus™ version and build date is displayed at console login, such as:

|                                              |
|----------------------------------------------|
| AlliedWare Plus (TM) 5.5.5 04/05/26 12:00:00 |
|----------------------------------------------|

**Mode** Global Configuration

**Examples** To configure a User Exec mode banner after login (in this example, to tell people to use the **enable** command to move to Privileged Exec mode), enter the following commands:

```
awplus#configure terminal
awplus(config)#banner exec Use enable to move to Priv Exec mode
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

Use enable to move to Priv Exec mode

awplus>
```

To restore the default User Exec mode banner after login, enter the following commands:

```
awplus#configure terminal
awplus(config)#banner exec default
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

AlliedWare Plus (TM) 5.5.5 04/05/26 12:00:00

awplus>
```

To remove the User Exec mode banner after login, enter the following commands:

```
awplus#configure terminal
awplus(config)#no banner exec
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

awplus>
```

**Related commands** [banner login \(system\)](#)  
[banner motd](#)

## banner external-manager

**Overview** Use this command to add an entry to the external-manager banner. The external-manager banner warns you that certain features are being managed by an external management system. For example, if you are using Vista Manager EX to manage your network, you will see a notification banner telling you what features are being managed after you enter Global Configuration Mode.

Use the **no** variant to remove an entry from the external-manager banner.

**Syntax** `banner external-manager <manager-name> feature <feature-name>  
note <feature-note>`  
`no banner external-manager <manager-name> [feature <feature-name> note <feature-note>]`

| Parameter                         | Description                                        |
|-----------------------------------|----------------------------------------------------|
| <code>&lt;manager-name&gt;</code> | A string that describes the management system.     |
| <code>&lt;feature-name&gt;</code> | A string that describes the feature being managed. |
| <code>&lt;feature-note&gt;</code> | A note for the feature.                            |

**Default** No external-manager banner entries are configured by default.

**Mode** Global Configuration

**Usage notes** When you run this command:

- if no entry exists for an external manager, the external manager, feature and note are added.
- if an entry already exists for an external manager, the feature and note are added to the existing manager.
- if the feature already exists for that manager, then the note is added to the existing feature.

The **no** variant of this command removes the specified note from the feature of the specified external manager.

- If there are no other notes for the feature, then the feature is removed.
- If the feature is removed and there are no other features for the external manager, then the external manager is removed.

Use the **no** variant with just the external manager name to remove an external manager and all its features and notes.

**Example** To add an external manager note for 'Vista Manager' for the feature 'traffic-control' with the note 'Dynamic Traffic Management', use the commands:

```
awplus# configure terminal
```

```
awplus(config)# banner external-manager "Vista Manager" feature  
"traffic-control" note "Dynamic Traffic Management"
```

To remove the external manager note 'Dynamic Traffic Management' from the feature 'traffic-control' of the external manager 'Vista Manager', use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no banner external-manager "Vista Manager"  
feature "traffic-control" note "Dynamic Traffic Management"
```

To remove all external manager features and notes for 'Vista Manager', use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no banner external-manager "Vista Manager"
```

**Related commands** **banner display external-manager**  
**show banner external-manager**

**Command changes** Version 5.5.1-1.1: command added

## banner login (system)

**Overview** This command configures the login banner that is displayed on the console when you login. The login banner is displayed on all connected terminals. The login banner is displayed after the MOTD (Message-of-the-Day) banner and before the login username and password prompts.

Use the **no banner login** command to disable the login banner.

**Syntax** banner login  
no banner login

**Default** By default, no login banner is displayed at console login.

**Mode** Global Configuration

**Examples** To configure a login banner of "Authorised users only" to be displayed when you login, enter the following commands:

```
awplus#configure terminal
awplus(config)#banner login
Type CNTL/D to finish.

Authorised users only

awplus(config)#exit
awplus#exit

Authorised users only

awplus login: manager
Password:

AlliedWare Plus (TM) 5.5.5 04/05/26 12:00:00

awplus>
```

To remove the login banner, enter the following commands:

```
awplus#configure terminal
awplus(config)#no banner login
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

AlliedWare Plus (TM) 5.5.5 04/05/26 12:00:00

awplus>
```

**Related commands** [banner exec](#)  
[banner motd](#)

## banner motd

**Overview** Use this command to create or edit the text MotD (Message-of-the-Day) banner displayed before login. The MotD banner is displayed on all connected terminals. The MotD banner is useful for sending messages that affect all network users, for example, any imminent system shutdowns.

Use the **no** variant of this command to delete the MotD banner.

**Syntax** banner motd <motd-text>  
no banner motd

| Parameter   | Description                                          |
|-------------|------------------------------------------------------|
| <motd-text> | The text to appear in the Message of the Day banner. |

**Default** By default, the device displays the AlliedWare Plus™ OS version and build date when you login.

**Mode** Global Configuration

**Examples** To configure a MotD banner of "System shutdown at 6pm today" to be displayed when you log in, enter the following commands:

```
awplus>enable
awplus#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
awplus(config)#banner motd System shutdown at 6pm today
awplus(config)#exit
awplus#exit

System shutdown at 6pm today
awplus login: manager
Password:

AlliedWare Plus (TM) 5.5.5 04/05/26 12:00:00

awplus>
```

To delete the login banner, enter the following commands:

```
awplus>enable
awplus#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
awplus(config)#no banner motd
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

AlliedWare Plus (TM) 5.5.5 04/05/26 12:00:00

awplus>
```

**Related** **banner exec**  
**commands** **banner login (system)**

# clock set

**Overview** This command sets the time and date for the system clock.

**Syntax** clock set <hh:mm:ss> <day> <month> <year>

| Parameter  | Description                                  |
|------------|----------------------------------------------|
| <hh:mm:ss> | Local time in 24-hour format                 |
| <day>      | Day of the current month, from 1 to 31       |
| <month>    | The first three letters of the current month |
| <year>     | Current year, from 2000 to 2035              |

**Mode** Privileged Exec

**Usage notes** Configure the timezone before setting the local time. Otherwise, when you change the timezone, the device applies the new offset to the local time.

**NOTE:** If Network Time Protocol (NTP) is enabled, then you cannot change the time or date using this command. NTP maintains the clock automatically using an external time source. If you wish to manually alter the time or date, you must first disable NTP.

**Example** To set the time and date on your system to 2pm on the 2nd of October 2016, use the command:

```
awplus# clock set 14:00:00 2 oct 2016
```

**Related commands** [clock timezone](#)

## clock summer-time date

**Overview** This command defines the start and end of summertime for a specific year only, and specifies summertime's offset value to Standard Time for that year.

The **no** variant of this command removes the device's summertime setting. This clears both specific summertime dates and recurring dates (set with the **clock summer-time recurring**).

By default, the device has no summertime definitions set.

**Syntax** `clock summer-time <timezone-name> date <start-day> <start-month> <start-year> <start-time> <end-day> <end-month> <end-year> <end-time> <1-180>`  
`no clock summer-time`

| Parameter                          | Description                                                                         |
|------------------------------------|-------------------------------------------------------------------------------------|
| <code>&lt;timezone-name&gt;</code> | A description of the summertime zone, up to 6 characters long.                      |
| <code>date</code>                  | Specifies that this is a date-based summertime setting for just the specified year. |
| <code>&lt;start-day&gt;</code>     | Day that the summertime starts, from 1 to 31.                                       |
| <code>&lt;start-month&gt;</code>   | First three letters of the name of the month that the summertime starts.            |
| <code>&lt;start-year&gt;</code>    | Year that summertime starts, from 2000 to 2035.                                     |
| <code>&lt;start-time&gt;</code>    | Time of the day that summertime starts, in the 24-hour time format HH:MM.           |
| <code>&lt;end-day&gt;</code>       | Day that summertime ends, from 1 to 31.                                             |
| <code>&lt;end-month&gt;</code>     | First three letters of the name of the month that the summertime ends.              |
| <code>&lt;end-year&gt;</code>      | Year that summertime ends, from 2000 to 2035.                                       |
| <code>&lt;end-time&gt;</code>      | Time of the day that summertime ends, in the 24-hour time format HH:MM.             |
| <code>&lt;1-180&gt;</code>         | The offset in minutes.                                                              |

**Mode** Global Configuration

**Examples** To set a summertime definition for New Zealand using NZST (UTC+12:00) as the standard time, and NZDT (UTC+13:00) as summertime, with the summertime set to begin on the 25th of September 2016 and end on the 2nd of April 2017:

```
awplus(config)# clock summer-time NZDT date 25 sep 2:00 2016 2  
apr 2:00 2017 60
```

To remove any summertime settings on the system, use the command:

```
awplus(config)# no clock summer-time
```

**Related commands** [clock summer-time recurring](#)  
[clock timezone](#)

## clock summer-time recurring

**Overview** This command defines the start and end of summertime for every year, and specifies summertime's offset value to Standard Time.

The **no** variant of this command removes the device's summertime setting. This clears both specific summertime dates (set with the **clock summer-time date**) and recurring dates.

By default, the device has no summertime definitions set.

**Syntax** clock summer-time <timezone-name> recurring <start-week> <start-day> <start-month> <start-time> <end-week> <end-day> <end-month> <end-time> <1-180>

no clock summer-time

| Parameter       | Description                                                                                                                                                                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <timezone-name> | A description of the summertime zone, up to 6 characters long.                                                                                                                                                                                                                |
| recurring       | Specifies that this summertime setting applies every year from now on.                                                                                                                                                                                                        |
| <start-week>    | Week of the month when summertime starts, in the range 1-5. The value 5 indicates the last week that has the specified day in it for the specified month. For example, to start summertime on the last Sunday of the month, enter 5 for <start-week> and sun for <start-day>. |
| <start-day>     | Day of the week when summertime starts. Valid values are mon, tue, wed, thu, fri, sat or sun.                                                                                                                                                                                 |
| <start-month>   | First three letters of the name of the month that summertime starts.                                                                                                                                                                                                          |
| <start-time>    | Time of the day that summertime starts, in the 24-hour time format HH:MM.                                                                                                                                                                                                     |
| <end-week>      | Week of the month when summertime ends, in the range 1-5. The value 5 indicates the last week that has the specified day in it for the specified month. For example, to end summertime on the last Sunday of the month, enter 5 for <end-week> and sun for <end-day>.         |
| <end-day>       | Day of the week when summertime ends. Valid values are mon, tue, wed, thu, fri, sat or sun.                                                                                                                                                                                   |
| <end-month>     | First three letters of the name of the month that summertime ends.                                                                                                                                                                                                            |
| <end-time>      | Time of the day that summertime ends, in the 24-hour time format HH:MM.                                                                                                                                                                                                       |
| <1-180>         | The offset in minutes.                                                                                                                                                                                                                                                        |

**Mode** Global Configuration

**Examples** To set a summertime definition for New Zealand using NZST (UTC+12:00) as the standard time, and NZDT (UTC+13:00) as summertime, with summertime set to start on the last Sunday in September, and end on the 1st Sunday in April, use the command:

```
awplus(config)# clock summer-time NZDT recurring 5 sun sep 2:00  
1 sun apr 2:00 60
```

To remove any summertime settings on the system, use the command:

```
awplus(config)# no clock summer-time
```

**Related commands** [clock summer-time date](#)  
[clock timezone](#)

# clock timezone

**Overview** This command defines the device's clock timezone. The timezone is set as a offset to the UTC.

The **no** variant of this command resets the system time to UTC.

By default, the system time is set to UTC.

**Syntax** `clock timezone <timezone-name> {minus|plus} [<0-13>|<0-12>:<00-59>]`  
`no clock timezone`

| Parameter       | Description                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <timezone-name> | A description of the timezone, up to 6 characters long.                                                                                                                  |
| minusorplus     | The direction of offset from UTC. The <b>minus</b> option indicates that the timezone is behind UTC. The <b>plus</b> option indicates that the timezone is ahead of UTC. |
| <0-13>          | The offset in hours or from UTC.                                                                                                                                         |
| <0-12>:<00-59>  | The offset in hours or from UTC.                                                                                                                                         |

**Mode** Global Configuration

**Usage notes** Configure the timezone before setting the local time. Otherwise, when you change the timezone, the device applies the new offset to the local time.

**Examples** To set the timezone to New Zealand Standard Time with an offset from UTC of +12 hours, use the command:

```
awplus(config)# clock timezone NZST plus 12
```

To set the timezone to Indian Standard Time with an offset from UTC of +5:30 hours, use the command:

```
awplus(config)# clock timezone IST plus 5:30
```

To set the timezone back to UTC with no offsets, use the command:

```
awplus(config)# no clock timezone
```

**Related commands** [clock set](#)  
[clock summer-time date](#)  
[clock summer-time recurring](#)

## crypto secure-mode

- Overview** Use this command to put the device into Secure Mode. When in Secure Mode, the following are disabled:
- Telnet
  - SSHv1
  - SNMPv1/v2
  - All privilege levels except 1 and 15
  - Algorithms that are not supported under FIPS, including MD5, RSA-1 and DSA
  - The ability to store passwords in cleartext and to specify an **enable** password.

In Secure Mode, the web server on the device (used by the Device GUI) only accepts AES128-SHA ciphers.

**NOTE:** *Note: Stacking is not supported in Secure Mode.*

Use the **no** variant of this command to leave Secure Mode. You should delete all sensitive information first; see the ["Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide](#).

**Syntax** crypto secure-mode  
no crypto secure-mode

**Default** By default, the device is not in Secure Mode.

**Mode** Global Configuration

**Example** For step-by-step instructions about how to enter and leave Secure Mode, see "How to Enable Secure Mode" in the ["Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide](#).

**Related commands** [boot system](#)  
[crypto key zeroize](#)  
[crypto pki trustpoint](#)  
[crypto verify](#)  
[show secure-mode](#)

**Command changes** Version 5.4.6-1.1: command added to x930 Series  
Version 5.4.8-1.2: command added to x220, XS900MX, x550 Series  
Version 5.4.8-2.1: command added to SBx908 GEN2, x950 Series

# debug core-file

**Overview** Use this command to enable the generation of crash core files.

Use the **no** variant of this command to disable the generation of crash core files.

**Syntax** debug core-file  
no debug core-file

**Default** Enabled.

**Mode** Global Configuration

**Usage notes** Core files may contain raw memory content. This may not be acceptable in a security certified network. Use the **no debug core-file** command to prevent such core files from being generated.

**Example** To prevent the generation of core files, use the commands:

```
awplus# configure terminal  
awplus(config)# no debug core-file
```

**Related commands** [show system](#)

**Command changes** Version 5.4.9-1.0: command added

# ecofriendly button enable

**Overview** Use this command to enable the eco-friendly button on the front panel of the device.

Use the **no** variant of this command to disable the eco-friendly button on the front panel of the device. This stops the eco-friendly button from being accidentally pressed. Pressing the eco-friendly button turns off LEDs, so pressing it accidentally can lead to confusion about the state of the device.

**Syntax** ecofriendly button enable  
no ecofriendly button enable

**Default** Enabled

**Mode** Global Configuration

**Usage notes** Use the command **show ecofriendly** to see whether the button is enabled or not.

**Example** To disable the button, use the commands:

```
awplus# configure terminal
awplus(config)# no ecofriendly button enable
```

To enable the button again, use the commands:

```
awplus# configure terminal
awplus(config)# ecofriendly button enable
```

**Related commands** **show ecofriendly**

**Command changes** Version 5.5.3-0.1: command added

# ecofriendly led

**Overview** Use this command to enable the eco-friendly LED (Light Emitting Diode) feature, which turns off power to the port LEDs.

You can also use the front-panel eco-switch button to enable or disable the eco-friendly feature. Using this button overrides the configuration set with the **ecofriendly led** command.

Note that it is possible to disable the eco-switch button, to prevent it from being accidentally pushed. To do this, use the command **ecofriendly button enable**.

Use the **no** variant of this command to disable the eco-friendly LED feature.

**Syntax** `ecofriendly led`  
`no ecofriendly led`

**Default** The eco-friendly LED feature is disabled by default.

**Mode** Global Configuration

**Usage notes** While the eco-friendly LED feature is enabled, a port's LED will not change if the port's status changes. Instead, the LED will stay turned off. When you disable the eco-friendly feature again, that will restore power to the port LEDs. The LEDs will correctly show the current state of the ports, even if that state changed while the LEDs were off.

In a stacked environment, enabling the eco-friendly LED feature on the stack master will apply the feature to every member of the stack.

For an example of how to configure a trigger to turn off power to port LEDs, see the **Triggers Feature Overview and Configuration Guide**.

**Examples** To enable the eco-friendly LED feature which turns off power to all port LEDs, use the following commands:

```
awplus# configure terminal
awplus(config)# ecofriendly led
```

To disable the eco-friendly LED feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no ecofriendly led
```

**Related commands** **ecofriendly button enable**  
**show ecofriendly**

## ecofriendly lpi

**Overview** Use this command to conserve power by enabling the eco-friendly LPI (Low Power Idle) feature. This feature reduces the power supplied to the ports by the switch whenever the ports are idle and are connected to IEEE 802.3az Energy Efficient Ethernet compliant host devices.

LPI is a feature of the IEEE 802.3az Energy Efficient Ethernet (EEE) standard. LPI lowers power consumption of switch ports during periods of low link utilization when connected to IEEE 802.3az compliant host devices. If no data is sent then the switch port can enter a sleep state, called Low Power Idle (LPI), to conserve power used by the switch.

Use the **no** variant of this command to disable the eco-friendly LPI feature.

**Syntax** `ecofriendly lpi`  
`no ecofriendly lpi`

**Default** The eco-friendly LPI feature is disabled by default.

**Mode** Interface Configuration for a switch port, or Interface Configuration for a range of switch ports.

**Usage notes** For an example of how to configure a trigger to enable the eco-friendly LPI feature, see the [Triggers Feature Overview and Configuration Guide](#).

All ports configured for LPI must support LPI in hardware and must be configured to auto negotiate by default or by using the **speed** and **duplex** commands as needed.

**Examples** To enable the eco-friendly LPI feature on a switch port, port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# ecofriendly lpi
```

To enable the eco-friendly LPI feature on a range of switch ports, port1.0.2- port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-port1.0.4
awplus(config-if)# ecofriendly lpi
```

To disable the eco-friendly feature on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no ecofriendly lpi
```

**Related commands**

- duplex**
- ecofriendly led**
- show ecofriendly**
- show interface**
- speed**

## findme

**Overview** Use this command to physically locate a specific device from a group of similar devices. Activating the command causes a selected number of port LEDs to alternately flash green then amber (if that device has amber LEDs) at a rate of 1 Hz.

Use the **no** variant of this command to deactivate the Find Me feature prior to the timeout expiring.

**Syntax** `findme [interface <port-list>|member <stack-ID>] [timeout <duration>]`  
`no findme`

| Parameter                                | Description                                                                                                                                                                                                                                                                                                    |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>interface &lt;port-list&gt;</code> | The ports to flash. The port list can be: <ul style="list-style-type: none"><li>• a switch port, e.g. port1.0.4</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.0.1-port1.0.4</li><li>• a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.3-port1.0.8.</li></ul> |
| <code>member &lt;stack-ID&gt;</code>     | Stack member number, from 1 to 8.                                                                                                                                                                                                                                                                              |
| <code>timeout &lt;duration&gt;</code>    | How long the LEDs flash, in seconds, in the range 5 to 3600 seconds.<br><br>If you specify this, normal LED behavior is restored automatically after the specified time has elapsed, or a <b>no findme</b> command is used.                                                                                    |

**Default** By default all port LEDs flash for 60 seconds.

**Mode** Privileged Exec

**Usage notes** The **interface** and **member** parameters are mutually exclusive.

**Example** To activate the Find Me feature for the default duration (60 seconds), use the following command:

```
awplus# findme
```

To activate the Find Me feature for 120 seconds, use the following command:

```
awplus# findme timeout 120
```

To activate the Find Me feature for the default duration (60 seconds) on switch port interfaces port1.0.2 through port1.0.4, use the following command:

```
awplus# findme interface port1.0.2-port1.0.4
```

In the example above, ports 2 to 4 will flash 4 times and then all ports will flash twice. Each alternate flash will be amber (if that device has amber LEDs). This pattern will repeat until **timeout** (default or set) or **no findme** commands are used.

To deactivate the Find Me feature, use the following command:

```
awplus# no findme
```

To activate the Find Me feature for the default duration on stack member 2, use the following command:

```
awplus# findme member 2
```

In the example above, all ports on member 2 will flash 4 times and then all ports in the stack will flash twice. Each alternate flash will be amber (if that device has amber LEDs). This pattern will repeat until the timeout (default or set) expires or the **no findme** command is used.

# findme trigger

**Overview** When this command is enabled, the LED flashing functionality of the **find-me** command is applied whenever any or all of the selected parameter conditions is detected.

Use the **no** variant to remove the findme trigger function for the selected parameter.

**Syntax** findme trigger {all|loopprot|thrash-limit}  
no findme trigger {all|loopprot|thrash-limit}

| Parameter    | Description                                                                              |
|--------------|------------------------------------------------------------------------------------------|
| all          | Enable the find-me function whenever any of the listed parameter conditions are detected |
| loopprot     | Enable the findme function whenever a loop protection condition is detected.             |
| thrash-limit | Enable the findme function whenever a MAC address thrash-limiting condition is detected. |

**Default** The findme trigger function is disabled.

**Mode** Global config

**Usage notes** Note that findme trigger is not available if you have set the switch to take the following actions in response to an event:

- For loop detection, the actions **log-only** and **none**
- For MAC address thrash-limiting, the actions **learn-disable** and **none**.

**Example** To enable action LED flashing for the loop protection function:

```
awplus# findme trigger loopprot
```

**Related commands** [findme](#)  
[loop-protection loop-detect](#)

# hostname

**Overview** This command sets the name applied to the device as shown at the prompt. The hostname is:

- displayed in the output of the **show system** command
- displayed in the CLI prompt so you know which device you are configuring

Use the **no** variant of this command to revert the hostname setting to its default. For devices that are not part of an AMF network, the default is "awplus".

**Syntax** `hostname <hostname>`  
`no hostname [<hostname>]`

| Parameter                     | Description                                                                                                     |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <code>&lt;hostname&gt;</code> | Specifies the name given to a specific device. This is also referred to as the Node name in AMF output screens. |

**Default** awplus

**Mode** Global Configuration

**Usage notes** Within an AMF network, any device without a user-defined hostname will automatically be assigned a name based on its MAC address.

To efficiently manage your network using AMF, we strongly advise that you devise a naming convention for your network devices and apply an appropriate hostname to each device.

The name must also follow the rules for ARPANET host names. The name must start with a letter, end with a letter or digit, and use only letters, digits, and hyphens. Refer to RFC 1035.

This command does not set the sysName MIB value. The hostname and the sysName MIB value are independent of each other. Use the **snmp-server system-name** command to set the MIB value.

**Example** To set the system name to HQ-Sales, use the commands:

```
awplus# configure terminal
awplus(config)# hostname HQ-Sales
```

This changes the prompt to:

```
HQ-Sales(config)#
```

To revert to the default hostname awplus, use the command:

```
HQ-Sales(config)# no hostname
```

This changes the prompt to:

```
awplus(config)#
```

**NOTE:**

*When AMF is configured, running the **no hostname** command will apply a hostname that is based on the MAC address of the device node, for example, **node\_0000\_5e00\_5301**.*

**Related commands** [show system](#)  
[snmp-server system-name](#)

**Command changes** Version 5.5.5-2.1: command no longer sets the sysName MIB value.

# low-memory restart

**Overview** Use this command to specify a process for the device to terminate if available memory is sufficiently low.

This command is intended for use in consultation with Allied Telesis customer support. Using this command will make the device produce a core dump when the process terminates, which makes it easier for Allied Telesis engineers to debug any issues.

Use the **no** variant of this command to stop specifying the process for termination.

**Syntax** low-memory restart <process-name>  
no low-memory restart <process-name>

| Parameter      | Description                                                                    |
|----------------|--------------------------------------------------------------------------------|
| <process-name> | The name of a process to terminate if the device memory gets sufficiently low. |

**Default** None. By default, the device will automatically terminate the non-critical process that has the highest memory consumption. Note that only a non-critical process will be terminated automatically, not a critical process.

**Mode** Global Configuration

**Usage notes** The process does not have to be running when you enter this command. If it is running at the time the available memory becomes sufficiently low, the device will terminate it.

**Example** To specify RIP as the process to terminate if memory gets too low, use the commands:

```
awplus# configure terminal
awplus(config)# low-memory restart ripd
```

**Related commands** [show memory](#)  
[snmp-server enable trap](#)

**Command changes** Version 5.5.4-2.3: command added

## max-fib-routes

**Overview** This command enables you to control the maximum number of FIB routes configured. It operates by providing parameters that enable you to configure preset maximums and warning message thresholds.

**NOTE:** For static routes use the command.

Use the **no** variant of this command to set the maximum number of FIB routes to the default of 4294967294 FIB routes.

**Syntax** max-fib-routes <1-4294967294> [<1-100>|warning-only]  
no max-fib-routes

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                  |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| max-fib-routes | This is the maximum number of routes that can be stored in the device's Forwarding Information dataBase. In practice, other practical system limits would prevent this maximum being reached.                                                                                                                                                |
| <1-4294967294> | The allowable configurable range for setting the maximum number of FIB-routes.                                                                                                                                                                                                                                                               |
| <1-100>        | This parameter enables you to optionally apply a percentage value. This percentage will be based on the maximum number of FIB routes you have specified. This will cause a warning message to appear when your routes reach your specified percentage value. Routes can continue to be added until your configured maximum value is reached. |
| warning-only   | This parameter enables you to optionally apply a warning message. If you set this option a warning message will appear if your maximum configured value is reached. Routes can continue to be added until your device reaches either the maximum capacity value of 4294967294, or a practical system limit.                                  |

**Default** The default number of FIB routes is the maximum number of FIB routes (4294967294).

**Mode** Global Configuration

**Examples** To set the maximum number of dynamic routes to 2000 and warning threshold of 75%, use the following commands:

```
awplus# config terminal
awplus(config)# max-fib-routes 2000 75
```

## max-static-routes

**Overview** Use this command to set the maximum number of static routes, excluding FIB (Forwarding Information Base) routes.

**NOTE:** For FIB routes use the command.

Use the **no** variant of this command to set the maximum number of static routes to the default of 1000 static routes.

**Syntax** max-static-routes <1-1000>  
no max-static-routes

**Default** The default number of static routes is the maximum number of static routes (1000).

**Mode** Global Configuration

**Example** To reset the maximum number of static routes to the default maximum, use the command:

```
awplus# configure terminal
awplus(config)# no max-static-routes
```

**NOTE:** Static routes are applied before adding routes to the RIB (Routing Information Base). Therefore, rejected static routes will not appear in the running config.

**Related commands** [max-fib-routes](#)

## no debug all

**Overview** This command disables the debugging facility for all features on your device. This stops the device from generating any diagnostic debugging messages.

You can optionally disable the debugging facility for only the given protocol or feature. The features available depend on your device and will be a subset of the features listed in the Syntax section below.

**Syntax** `no debug all [bgp|ipv6 ospf|ipv6 rip|dot1x|nsm|ospf|pim dense-mode|pim sparse-mode|rip|vrrp]`

| Parameter       | Description                                                                   |
|-----------------|-------------------------------------------------------------------------------|
| bgp             | Turns off all debugging for BGP (Border Gateway Protocol).                    |
| dot1x           | Turns off all debugging for IEEE 802.1X port-based network access- control.   |
| ipv6 ospf       | Turns off all debugging for IPv6 OSPF (Open Shortest Path First).             |
| ipv6 rip        | Turns off all debugging for IPv6 RIP (Routing Information Protocol).          |
| nsm             | Turns off all debugging for the NSM (Network Services Module).                |
| ospf            | Turns off all debugging for OSPF (Open Shortest Path First).                  |
| pim dense-mode  | Turns off all debugging for PIM (Protocol Independent Multicast) Dense Mode.  |
| pim sparse-mode | Turns off all debugging for PIM (Protocol Independent Multicast) Sparse Mode. |
| rip             | Turns off all debugging for RIP (Routing Information Protocol).               |
| vrrp            | Turns off all debugging for VRRP (Virtual Router Redundancy Protocol).        |

**Default** Disabled

**Mode** Global Configuration and Privileged Exec

**Example** To disable debugging for all features, use the command:

```
awplus# no debug all
```

To disable all 802.1X debugging, use the command:

```
awplus# no debug all dot1x
```

To disable all NSM debugging, use the command:

```
awplus# no debug all nsm
```

To disable all RIP debugging, use the command:

```
awplus# no debug all rip
```

**Related commands** **undebug all**

**Command changes** Version 5.4.7-1.1: **pim dense-mode**, **pim sparse-mode**, and **rip** parameters added

# reboot

**Overview** This command halts the device and performs a cold restart (also known as reload). It displays a confirmation request before restarting.

**Syntax** reboot  
reload

**Mode** Privileged Exec

**Usage notes** The **reboot** and **reload** commands perform the same action.

**Examples** To restart the device, use the command:

```
awplus# reboot
reboot system? (y/n): y
```

# reload

**Overview** This command performs the same function as the **reboot**.

# show banner external-manager

**Overview** Use this command to show the current external-manager banner. The external-manager banner warns you that certain features are being managed by an external management system. For example, if you are using Vista Manager EX to manage your network, you will see a notification banner telling you which features are being managed after you enter Global Configuration Mode.

**Syntax** show banner external-manager

**Mode** User Exec

**Example** To show the external-manager banner, use the command:

```
awplus# show banner external-manager
```

**Output** The following shows typical output.

## Example output from show banner external-manager

```
awplus#show banner external-manager
The following features are being managed by external systems.
Configuring these features may have unintended consequences.
Manager: Network Manager
  Feature: ACLs
  Filters

Manager: Vista Manager
  Feature: Traffic control
  Application Priority
  Dynamic Traffic Management
  Feature: Web control
  all features
```

**Related commands** [banner display external-manager](#)  
[banner external-manager](#)

**Command changes** Version 5.5.1-1.1: command added

# show clock

**Overview** This command displays the system's current configured local time and date. It also displays other clock related information such as timezone and summertime configuration.

**Syntax** show clock

**Mode** User Exec and Privileged Exec

**Example** To display the system's current local time, use the command:

```
awplus# show clock
```

**Output** The following shows typical output.

**Example output from the show c lock command for a device using New Zealand time**

```
Local Time: Mon, 17 Oct 2016 13:56:06 +1200
UTC Time: Mon, 17 Oct 2016 01:56:06 +0000
Timezone: NZST
Timezone Offset: +12:00
Summer time zone: NZDT
Summer time starts: Last Sunday in September at 02:00:00
Summer time ends: First Sunday in April at 02:00:00
Summer time offset: 60 mins
Summer time recurring: Yes
```

**Parameters in the output of the show c lock command**

| Parameter             | Description                                                                     |
|-----------------------|---------------------------------------------------------------------------------|
| Local Time            | Current local time.                                                             |
| UTC Time              | Current UTC time.                                                               |
| Timezone              | The current configured timezone name.                                           |
| Timezone Offset       | Number of hours offset to UTC.                                                  |
| Summer time zone      | The current configured summertime zone name.                                    |
| Summer time starts    | Date and time set as the start of summer time.                                  |
| Summer time ends      | Date and time set as the end of summer time.                                    |
| Summer time offset    | Number of minutes that summer time is offset from the system's timezone.        |
| Summer time recurring | Whether the device will apply the summer time settings every year or only once. |

## show cpu

**Overview** Test paragraph

This command displays a list of running processes with their CPU utilization.

For information on filtering and saving command output, see the **[“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)**.

**Syntax** show cpu [sort {thrds|pri|sleep|runtime}]

| Parameter | Description                                                                                                                                 |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------|
| sort      | Changes the sorting order using the following fields. If you do not specify a field, then the list is sorted by percentage CPU utilization. |
| thrds     | Sort by the number of threads.                                                                                                              |
| pri       | Sort by the process priority.                                                                                                               |
| sleep     | Sort by the average time sleeping.                                                                                                          |
| runtime   | Sort by the runtime of the process.                                                                                                         |

**Mode** User Exec and Privileged Exec

**Examples** To show the CPU utilization of current processes, sorting them by the number of threads the processes are using, use the command:

```
awplus# show cpu sort thrds
```

**Output** The following shows typical output.

**Example output from show cpu**

```
CPU averages:
 1 second: 12%, 20 seconds: 2%, 60 seconds: 2%
System load averages:
 1 minute: 0.03, 5 minutes: 0.02, 15 minutes: 0.00
Current CPU load:
 userspace: 6%, kernel: 4%, interrupts: 1% iowaits: 0%

```

**Parameters in the output of the show cpu command**

| Parameter            | Description                                                                  |
|----------------------|------------------------------------------------------------------------------|
| CPU averages         | Average CPU utilization for the periods stated.                              |
| System load averages | The average number of processes waiting for CPU time for the periods stated. |
| Current CPU load     | Current CPU utilization specified by load types.                             |
| pid                  | Identifier number of the process.                                            |
| name                 | A shortened name for the process                                             |
| thrds                | Number of threads in the process.                                            |
| cpu%                 | Percentage of CPU utilization that this process is consuming.                |
| pri                  | Process priority state.                                                      |
| state                | Process state; one of "run", "sleep", "zombie", and "dead".                  |
| sleep%               | Percentage of time that the process is in the sleep state.                   |

| Parameter | Description                                                                                                                             |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------|
| runtime   | The time that the process has been running for, measured in jiffies. A jiffy is the duration of one tick of the system timer interrupt. |

# show cpu history

**Overview** This command prints a graph showing the historical CPU utilization.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show cpu history

**Mode** User Exec and Privileged Exec

**Usage notes** This command’s output displays three graphs of the percentage CPU utilization:

- per second for the last minute, then
- per minute for the last hour, then
- per 30 minutes for the last 30 hours.

**Examples** To display a graph showing the historical CPU utilization of the device, use the command:

```
awplus# show cpu history
```

**Output** The following shows typical output.

**Example output from the show cpu history command**

```

# show debugging

**Overview** This command displays all debugging options in alphabetical order, indicating whether debugging is enabled or disabled for each feature.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show debugging

**Mode** User Exec and Privileged Exec

**Example** To find out what debugging is enabled, use the command:

```
awplus# show debugging
```

**Output** The following shows typical output.

## Example output from the show debugging command

```
awplus#show debugging
AAA debugging status:
  Authentication debugging is off
  Accounting debugging is off

% DHCP Snooping service is disabled

802.1X debugging status:

EPSR debugging status:
  EPSR Info debugging is off
  EPSR Message debugging is off
  EPSR Packet debugging is off
  EPSR State debugging is off

IGMP Debugging status:
  IGMP Decoder debugging is off
  IGMP Encoder debugging is off
...
```

# show ecofriendly

**Overview** This command displays the switch's eco-friendly configuration status, including the **ecofriendly led** configuration.

**Syntax** show ecofriendly

**Mode** Privileged Exec and Global Configuration

**Example** To display the switch's eco-friendly configuration status, use the following command:

```
awplus# show ecofriendly
```

**Output** The following shows typical output.

## Example output from the show ecofriendly command:

```
awplus#show ecofriendly
Front panel port LEDs      normal
Hardware button state      enabled

Energy efficient ethernet
Port      Name      Configured  Status
port1.0.1  Port 1      off        -
port1.0.2                off        off
port1.0.3                off        -
port1.0.4  Port 4      off        -
port1.0.5                off        -
...
```

**Parameters in the output of the show ecofriendly command:**

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Front panel port LEDs | <p>Whether the front panel ports show the port status or are turned off:</p> <ul style="list-style-type: none"> <li>• <b>normal</b> means the eco-friendly LED feature is disabled and port LEDs show the current state of the ports. This is the default setting.</li> <li>• <b>off</b> means the eco-friendly LED feature is enabled and power to the port LEDs is disabled.</li> <li>• <b>normal (configuration overridden by eco button)</b> means the eco-friendly LED feature has been disabled with the eco-switch button, overriding the setting of the <b>ecofriendly led</b> command. In this situation, the port LEDs show the current state of the ports.</li> <li>• <b>off (configuration overridden by eco button)</b> means the eco-friendly LED feature has been enabled with the eco-switch button, overriding the setting of the <b>ecofriendly led</b> command. In this situation, power to the port LEDs is disabled.</li> </ul> |
| Hardware button state | Displays whether the hardware button is enabled or has been disabled with the <b>ecofriendly button enable</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Port                  | Displays the port number as assigned by the switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Name                  | Displays the port name if a name is configured for a port number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Configured            | Because LPI is not supported, this entry always shows "off" or a dash (-).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Status                | Because LPI is not supported, this entry always shows "off" or a dash (-).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

# show interface memory

**Overview** This command displays the shared memory used by either all interfaces, or the specified interface or interfaces. The output is useful for diagnostic purposes by Allied Telesis authorized service personnel.

For information on filtering and saving command output, see the **[“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)**.

**Syntax** show interface memory  
show interface *<port-list>* memory

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;port-list&gt;</i> | Display information about only the specified port or ports. The port list can be: <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)</li><li>• a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list.</li></ul> |

**Mode** User Exec and Privileged Exec

**Example** To display the shared memory used by all interfaces, use the command:

```
awplus# show interface memory
```

To display the shared memory used by port1.0.1 and port1.0.3 to port1.0.4, use the command:

```
awplus# show interface port1.0.1,port1.0.3-port1.0.4 memory
```

**Output** The following shows typical output.

**Example output from the show interface memory command**

```
awplus#show interface memory
Vlan blocking state shared memory usage
-----
```

| Interface | shmid   | Bytes Used | nattch | Status |
|-----------|---------|------------|--------|--------|
| port1.0.1 | 491535  | 512        | 1      |        |
| port1.0.2 | 393228  | 512        | 1      |        |
| port1.0.3 | 557073  | 512        | 1      |        |
| ...       |         |            |        |        |
| lo        | 425997  | 512        | 1      |        |
| po1       | 1179684 | 512        | 1      |        |
| po2       | 1212453 | 512        | 1      |        |
| sa3       | 1245222 | 512        | 1      |        |

**Example output from show interface <port-list> memory for a list of interfaces**

```
awplus#show interface port1.0.1,port1.0.3-port1.0.4 memory
Vlan blocking state shared memory usage
-----
```

| Interface | shmid  | Bytes Used | nattch | Status |
|-----------|--------|------------|--------|--------|
| port1.0.1 | 589842 | 512        | 1      |        |
| port1.0.3 | 688149 | 512        | 1      |        |
| port1.0.4 | 327690 | 512        | 1      |        |

## show memory

**Overview** This command displays the memory used by each process that is currently running.

For information on filtering and saving command output, see the [Getting Started with the AlliedWare Plus Command Line Interface](#).

**Syntax** `show memory [<stack-ID>] [sort {size|peak|stk}]`

| Parameter  | Description                                                                                                                                |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <stack-ID> | Stack member number, from 1 to 8.                                                                                                          |
| sort       | Changes the sorting order for the list of processes. If you do not specify this, then the list is sorted by percentage memory utilization. |
| size       | Sort by the amount of memory the process is currently using.                                                                               |
| peak       | Sort by the greatest amount of memory ever used by the process.                                                                            |
| stk        | Sort by the stack size of the process.                                                                                                     |

**Mode** User Exec and Privileged Exec

**Example** To display the memory used by the current running processes, use the command:

```
awplus# show memory
```

**Output** The following shows typical output.

**Example output from show memory**

```
awplus#show memory

Stack member 1:

RAM total: 514920 kB; free: 382716; buffers: 16368 kB

```

**Parameters in the output of the show memory command**

| Parameter | Description                                                      |
|-----------|------------------------------------------------------------------|
| RAM total | Total amount of RAM memory free.                                 |
| free      | Available memory size.                                           |
| buffers   | Memory allocated kernel buffers.                                 |
| pid       | Identifier number for the process.                               |
| name      | Short name used to describe the process.                         |
| mem%      | Percentage of memory utilization the process is currently using. |
| size      | Amount of memory currently used by the process.                  |
| peak      | Greatest amount of memory ever used by the process.              |
| data      | Amount of memory used for data.                                  |
| stk       | The stack size.                                                  |

# show memory allocations

**Overview** This command displays the memory allocations used by processes.  
For information on filtering and saving command output, see the **[“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)**.

**Syntax** show memory allocations [<process>]

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| <process> | Displays the memory allocation used by the specified process. |

**Mode** User Exec and Privileged Exec

**Example** To display the memory allocations used by all processes on your device, use the command:

```
awplus# show memory allocations
```

**Output** The following shows typical output.

## Example output from the show memory allocations command

```
awplus#show memory allocations
Memory allocations for imi
-----
Current 15093760 (peak 15093760)

# show memory history

**Overview** This command prints a graph showing the historical memory usage.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show memory history [<stack-ID>]

| Parameter  | Description                       |
|------------|-----------------------------------|
| <stack-ID> | Stack member number, from 1 to 8. |

**Mode** User Exec and Privileged Exec

**Usage notes** This command’s output displays three graphs of the percentage memory utilization:

- per second for the last minute, then
- per minute for the last hour, then
- per 30 minutes for the last 30 hours.

**Examples** To show a graph displaying the historical memory usage for either a single unstacked device, or a complete stack, use the command:

```
awplus# show memory history
```

To show a graph displaying the historical memory usage for specific stack member (stack member 2 in this example) within a stack, use the command:

```
awplus# show memory history 2
```

**Output** The following shows typical output.

**Example output from the show memory history command**

```
STACK member 1:
Per minute memory utilization history
100
 90
 80
 70
 60
 50
 40*****
 30
 20
 10
   |...|...|...|...|...|...|...|...|...|...|...|...
   Oldest                                     Newest
      Memory utilization% per minute (last 60 minutes)
      * = average memory utilisation%.
...
```

# show memory pools

**Overview** This command shows the memory pools used by processes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show memory pools [*<process>*]

| Parameter              | Description                                              |
|------------------------|----------------------------------------------------------|
| <i>&lt;process&gt;</i> | Displays the memory pools used by the specified process. |

**Mode** User Exec and Privileged Exec

**Example** To show the memory pools used by processes, use the command:

```
awplus# show memory pools
```

**Output** The following shows typical output.

## Example output from the show memory pools command

```
awplus#show memory pools
Memory pools for imi

# show memory shared

**Overview** This command displays shared memory allocation information. The output is useful for diagnostic purposes by Allied Telesis authorized service personnel.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show memory shared

**Mode** User Exec and Privileged Exec

**Example** To display information about the shared memory allocation used on the device, use the command:

```
awplus# show memory shared
```

**Output** The following shows typical output.

## Example output from the show memory shared command

```
awplus#show memory shared
Shared Memory Status
-----
Segment allocated   = 39
Pages allocated     = 39
Pages resident      = 11

Shared Memory Limits
-----
Maximum number of segments           = 4096
Maximum segment size (kbytes)        = 32768
Maximum total shared memory (pages) = 2097152
Minimum segment size (bytes)         = 1
```

[show memory history](#)  
[show memory](#)

# show process

**Overview** This command lists a summary of the current running processes.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show process [*<stack-ID>*] [sort {cpu|mem}]

| Parameter               | Description                                                               |
|-------------------------|---------------------------------------------------------------------------|
| <i>&lt;stack-ID&gt;</i> | Stack member number, from 1 to 8.                                         |
| sort                    | Changes the sorting order for the list of processes.                      |
|                         | cpu                Sorts the list by the percentage of CPU utilization.   |
|                         | mem               Sorts the list by the percentage of memory utilization. |

**Mode** User Exec and Privileged Exec

**Usage notes** This command displays a snapshot of currently-running processes. If you want to see CPU or memory utilization history instead, use the commands [show cpu history](#) or [show memory history](#).

**Example** To display a summary of the current running processes on stack member 2, use the command:  
awplus# show process 2

**Output** The following shows typical output.

**Example output from the show process command**

```
Stack member 2:

CPU averages:

**Parameters in the output from the show process command**

| Parameter            | Description                                                                  |
|----------------------|------------------------------------------------------------------------------|
| Stack member         | Stack member number.                                                         |
| CPU averages         | Average CPU utilization for the periods stated.                              |
| System load averages | The average number of processes waiting for CPU time for the periods stated. |
| Current CPU load     | Current CPU utilization specified by load types                              |
| RAM total            | Total memory size.                                                           |
| free                 | Available memory.                                                            |
| buffers              | Memory allocated to kernel buffers.                                          |
| pid                  | Identifier for the process.                                                  |
| name                 | Short name to describe the process.                                          |
| thrds                | Number of threads in the process.                                            |
| cpu%                 | Percentage of CPU utilization that this process is consuming.                |
| mem%                 | Percentage of memory utilization that this process is consuming.             |

| Parameter | Description                                                        |
|-----------|--------------------------------------------------------------------|
| pri       | Process priority.                                                  |
| state     | Process state; one of "run", "sleep", "stop", "zombie", or "dead". |
| sleep%    | Percentage of time the process is in the sleep state.              |

**Related commands** [show cpu](#)  
[show cpu history](#)

# show reboot history

**Overview** Use this command to display the device's reboot history.

**Syntax** show reboot history [<stack-ID>]

| Parameter  | Description                       |
|------------|-----------------------------------|
| <stack-ID> | Stack member number, from 1 to 8. |

**Mode** User Exec and Privileged Exec

**Example** To show the reboot history of stack member 2, use the command:

```
awplus# show reboot history 2
```

**Output** The following shows typical output.

## Example output from the show reboot history command

```
awplus#show reboot history 2
Stack member 2:
<date>      <time>      <type>      <description>

failure!
2016-10-10  01:11:04  Unexpected  Rebooting due to critical process (network/nsm)
failure!
2016-10-09  20:46:40  Unexpected  Rebooting due to VCS duplicate member-ID
2016-10-09  19:56:16  Expected    User Request
2016-10-09  20:36:06  Unexpected  Rebooting due to VCS duplicate master (Continuous
reboot prevention)
2016-10-09  19:51:20  Expected    User Request
```

## Parameters in the output from the show reboot history command

| Parameter    | Description                         |
|--------------|-------------------------------------|
| Unexpected   | A non-intended reboot.              |
| Expected     | A planned or user-triggered reboot. |
| User request | User initiated reboot via the CLI.  |

**Related commands** [show tech-support](#)

## show router-id

**Overview** Use this command to show the Router ID of the current system.

**Syntax** show router-id

**Mode** User Exec and Privileged Exec

**Example** To display the Router ID of the current system, use the command:

```
awplus# show router-id
```

**Output** The following shows typical output.

### Example output from the show router-id command

```
awplus>show router-id  
Router ID: 10.55.0.2 (automatic)
```

## show secure-mode

**Overview** Use this command to see whether secure mode is enabled or not. Secure mode disables a number of insecure features, such as Telnet.

**Syntax** show secure-mode

**Mode** User Exec/Privileged Exec

**Example** To see if secure mode is enabled, use the command:

```
awplus# show secure-mode
```

**Output** The following shows typical output.

### Example output from show secure-mode

```
awplus#show secure-mode  
Secure mode is enabled
```

**Related commands** [crypto secure-mode](#)

# show system

**Overview** Use this command to display general system information about the device, including the hardware, memory usage, and software version. It also displays location and contact details when these have been set.

For information on filtering and saving command output, see the [Getting Started with the AlliedWare Plus Command Line Interface](#).

**Syntax** show system

**Mode** User Exec and Privileged Exec

**Example** To display configuration information, use the command:

```
awplus# show system
```

**Output** The following shows typical output.

## Example output from show system

**Parameters in the output from show system environment counters**

| Parameter          | Description                                                                                                            |
|--------------------|------------------------------------------------------------------------------------------------------------------------|
| Value readings     | Number of times that the value of this sensor has been read.                                                           |
| Threshold readings | Number of times that a threshold value related to this sensor has been read.                                           |
| Checked readings   | Number of times that this sensor has gone outside a threshold and has been re-read to confirm this is a genuine error. |
| Read errors        | Number of times that there was an error returned when reading this sensor or one of its threshold values.              |
| Alarm asserted     | Number of times that this sensor has entered the fault state.                                                          |
| Alarm cleared      | Number of times that this sensor has left the fault state.                                                             |

**Related commands** [show system](#)  
[show system environment](#)

**Command changes** Version 5.5.0-0.1: command added

# show system interrupts

**Overview** Use this command to display the number of interrupts for each IRQ (Interrupt Request) used to interrupt input lines on a PIC (Programmable Interrupt Controller) on your device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show system interrupts

**Mode** User Exec and Privileged Exec

**Example** To display information about the number of interrupts for each IRQ in your device, use the command:

```
awplus# show system interrupts
```

**Output** The following shows typical output.

## Example output from the show system interrupts command

```
awplus#show system interrupts
CPU0
27:1387835593      GIC Disabled  1  iproc_gtimer
29:              0      GIC Disabled  1  twd
62:              0      GIC Enabled   0  IDM
63:              0      GIC Enabled   0  IDM
64:              0      GIC Enabled   0  IDM
65:              0      GIC Enabled   0  IDM
66:              0      GIC Enabled   0  IDM
67:              0      GIC Enabled   0  IDM
68:              0      GIC Enabled   0  IDM
69:              0      GIC Enabled   0  IDM
70:              0      GIC Enabled   0  IDM
```

## show system mac

**Overview** This command displays the physical MAC address available on a standalone switch or a stack. This command also shows the virtual MAC address for a stack if the stack virtual MAC address feature is enabled with the **stack virtual-mac** command or the **stack enable** command.

**Syntax** show system mac

**Mode** User Exec and Privileged Exec

**Usage notes** For more information about the virtual MAC address feature, see the **VCStack Feature Overview and Configuration Guide**.

**Example** To display the physical MAC address enter the following command:

```
awplus# show system mac
```

**Output** The following shows typical output.

### Example output from the show system mac command

```
awplus#show system mac  
eccd.6d9d.4eed (system)
```

**Output** The following shows typical output.

### Example output showing how to use the stack virtual-mac command and the show system mac command

```
awplus#configure terminal  
Enter configuration commands, one per line. End with CNTL/Z.  
awplus(config)#stack virtual-mac  
% Please check that the new MAC 0000.cd37.0065 is unique within  
the network.  
% Save the config and restart the system for this change to take  
effect.

**commands**

# show system serialnumber

**Overview** This command shows the serial number information for the device.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show system serialnumber

**Mode** User Exec and Privileged Exec

**Example** To display the serial number information for the device, use the command:  
awplus# show system serialnumber

**Output** The following shows typical output.

## Example output from the show system serialnumber command

```
awplus#show system serialnumber
45AX5300X
```

# show tech-support

**Overview** This command generates system and debugging information for the device and saves it to a file.

This command is useful for collecting a large amount of information so that it can then be analyzed for troubleshooting purposes. The output of this command can be provided to technical support staff when reporting a problem.

You can optionally limit the command output to display only information for a given protocol or feature. The features available depend on your device and will be a subset of the features listed in the table below.

**Syntax** show tech-support {[all|atmf|auth|bgp|card|dhcpsn|epsr|firewall|igmp|ip|ipv6|mld|openflow|ospf|ospf6|pim|rip|ripng|stack|stp|system|tacacs+|update]} [outfile <filename>]

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| all       | Display full information                     |
| atmf      | Display ATMF-specific information            |
| auth      | Display authentication-related information   |
| bgp       | Display BGP-related information              |
| card      | Display Chassis Card specific information    |
| dhcpsn    | Display DHCP Snooping specific information   |
| epsr      | Display EPSR specific information            |
| firewall  | Display firewall specific information        |
| igmp      | Display IGMP specific information            |
| ip        | Display IP specific information              |
| ipv6      | Display IPv6 specific information            |
| mld       | Display MLD specific information             |
| openflow  | Display information related to OpenFlow      |
| ospf      | Display OSPF related information             |
| ospf6     | Display OSPF6 specific information           |
| pim       | Display PIM related information              |
| rip       | RIP related information                      |
| ripng     | Display RIPNG specific information           |
| stack     | Display stacking device information          |
| stp       | Display STP specific information             |
| system    | Display general system information           |
| tacacs+   | Display TACACS+ information                  |
| update    | Display resource update specific information |
|           | Output modifier                              |

| Parameter  | Description                                                                                                     |
|------------|-----------------------------------------------------------------------------------------------------------------|
| >          | Output redirection                                                                                              |
| >>         | Output redirection (append)                                                                                     |
| outfile    | Output file name                                                                                                |
| <filename> | Specifies a name for the output file. If no name is specified, this file will be saved as: tech-support.txt.gz. |

**Default** Captures **all** information for the device.

By default the output is saved to the file 'tech-support.txt.gz' in the current directory. If this file already exists in the current directory then a new file is generated with the time stamp appended to the file name, for example 'tech-support20161009.txt.gz', so the previous file is retained.

**Usage notes** The command generates a large amount of output, which is saved to a file in compressed format. The output file name can be specified by outfile option. If the output file already exists, a new file name is generated with the current time stamp. If the output filename does not end with ".gz", then ".gz" is appended to the filename. Since output files may be too large for Flash on the device we recommend saving files to external memory or a TFTP server whenever possible to avoid device lockup. This method is not likely to be appropriate when running the working set option of AMF across a range of physically separated devices.

**Mode** Privileged Exec

**Examples** To produce the output needed by technical support staff, use the command:

```
awplus# show tech-support
```

## speed (asyn)

**Overview** This command changes the console speed from the device. Note that a change in console speed is applied for subsequent console sessions. Exit the current session to enable the console speed change using the **clear line console** command.

**Syntax** speed <console-speed-in-bps>

| Parameter              | Description                                       |
|------------------------|---------------------------------------------------|
| <console-speed-in-bps> | Console speed Baud rate in bps (bits per second). |
|                        | 1200      1200 Baud                               |
|                        | 2400      2400 Baud                               |
|                        | 9600      9600 Baud                               |
|                        | 19200     19200 Baud                              |
|                        | 38400     38400 Baud                              |
|                        | 57600     57600 Baud                              |
|                        | 115200    115200 Baud                             |

**Default** The default console speed baud rate is 9600 bps.

**Mode** Line Configuration

**Usage notes** This command is used to change the console (asyn) port speed. Set the console speed to match the transmission rate of the device connected to the console (asyn) port on your device.

**Example** To set the terminal console (asyn0) port speed from the device to 57600 bps, then exit the session, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# speed 57600
awplus(config-line)# exit
awplus(config)# exit
awplus# exit
```

Then log in again to enable the change:

```
awplus login:
Password:
awplus>
```

**Related commands**

# terminal monitor

**Overview** Use this command to display debugging output on a terminal.

To display the cursor after a line of debugging output, press the Enter key.

Use the command **terminal no monitor** or **no terminal monitor** to stop displaying debugging output on the terminal. Alternatively, you can use the timeout option to stop displaying debugging output on the terminal after a set time.

**Syntax** terminal monitor [<1-60>]  
terminal no monitor  
no terminal monitor

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| <1-60>    | Set a timeout between 1 and 60 seconds for terminal output. |

**Default** Disabled

**Mode** User Exec and Privileged Exec

**Examples** To display debugging output on a terminal, enter the command:

```
awplus# terminal monitor
```

To display debugging on the terminal for 60 seconds, enter the command:

```
awplus# terminal monitor 60
```

To stop displaying debugging output on the terminal, use the command:

```
awplus# no terminal monitor
```

**Related commands** All debug commands

**Command changes** Version 5.4.8-0.2: **no terminal monitor** added as an alias for **terminal no monitor**

# undebbug all

**Overview** This command applies the functionality of the **no debug all** command.

# Introduction

- Overview** This chapter provides an alphabetical reference of commands used to configure and monitor Pluggables and Cabling, including:
- Optical Digital Diagnostic Monitoring (DDM) to help find fiber issues when links go down
  - Active Fiber Monitoring for detecting changes in optical power received over fiber cables.

For more information, see the **Pluggables and Cabling Feature Overview and Configuration Guide**.

# clear fiber-monitoring interface

**Overview** Use this command to clear the Active Fiber Monitoring state of a port. It clears the alarm, baseline and history and starts monitoring from the beginning. It does not change the configuration.

**Syntax** clear fiber-monitoring interface *<port>*

| Parameter           | Description                                               |
|---------------------|-----------------------------------------------------------|
| <i>&lt;port&gt;</i> | The name of the port to reset Active Fiber Monitoring on. |

**Default** n/a

**Mode** Privileged Exec

**Usage notes** Normally, you do not need to clear the Active Fiber Monitoring state of a port. If the issue resolves itself and the monitored optical power returns to the baseline, the alarm clears automatically.

However, you may need to clear the Active Fiber Monitoring state if the optical power level reduces for a known reason, causing the port to be stuck in the alarm state. In this situation, the alarm will not clear automatically, because Active Fiber Monitoring does not update the baseline when the port is in the alarm state, for security reasons.

**Example** To clear the Active Fiber Monitoring state for interface port1.0.25, use the command:

```
awplus# clear fiber-monitoring interface port1.0.25
```

**Related commands** [show system fiber-monitoring](#)

**Command changes** Version 5.4.8-0.2: command added

# clear test cable-diagnostics tdr

**Overview** Use this command to clear the results of the last cable test that was run.

**Syntax** clear test cable-diagnostics tdr

**Mode** Privileged Exec

**Examples** To clear the results of a previous cable-diagnostics test use the following commands:

```
awplus# clear test cable-diagnostics tdr
```

**Related commands** [show test cable-diagnostics tdr](#)  
[test cable-diagnostics tdr interface](#)

# debug fiber-monitoring

**Overview** Use this command to enable debugging of active fiber monitoring on the specified ports.

Use the **no** variant of this command to disable debugging on all ports or the specified ports.

**Syntax** debug fiber-monitoring interface *<port-list>*  
no debug fiber-monitoring [interface *<port-list>*]

| Parameter                | Description                                                                                                                 |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;port-list&gt;</i> | The list of fiber ports to enable or disable debugging for, as a single port, a comma separated list or a hyphenated range. |

**Default** Debugging of active fiber monitoring is disabled by default.

**Mode** User Exec/Privileged Exec

**Usage** While debugging is enabled by this command for a port, all the optical power readings for the port are sent to the console.

**Example** To enable debugging messages for active fiber monitoring of port1.0.25 to be sent to the console, use the commands:

```
awplus# debug fiber-monitoring interface port1.0.25  
awplus# terminal monitor
```

To disable debugging messages for active fiber monitoring on port1.0.25, use the command:

```
awplus# no debug fiber-monitoring interface port1.0.25
```

To disable all debugging messages for active fiber monitoring, use the command:

```
awplus# no debug fiber-monitoring
```

**Output** The following shows typical output.

**Example output from debug fiber-monitoring**

```
awplus#debug fiber-monitoring interface port1.0.25
awplus#terminal monitor
% Warning: Console logging enabled
awplus#01:42:50 awplus Pluggable[522]: Fiber-monitor port2.0.1: Channel:1
  Reading:1748 Baseline:1708 Threshold:1356
01:42:52 awplus Pluggable[522]: Fiber-monitor port2.0.1: Channel:1 Reading:1717
  Baseline:1709 Threshold:1357
01:42:54 awplus Pluggable[522]: Fiber-monitor port2.0.1: Channel:1 Reading:1780
  Baseline:1709 Threshold:1357
01:42:56 awplus Pluggable[522]: Fiber-monitor port2.0.1: Channel:1 Reading:1685
  Baseline:1710 Threshold:1358
01:42:58 awplus Pluggable[522]: Fiber-monitor port2.0.1: Channel:1 Reading:1701
  Baseline:1710 Threshold:1358
01:43:01 awplus Pluggable[522]: Fiber-monitor port2.0.1: Channel:1 Reading:1733
  Baseline:1709 Threshold:1357
```

**Related** [show system fiber-monitoring commands](#)

## fiber-monitoring action

**Overview** Use this command to specify an action to be taken if the optical power received on the port changes from the baseline by the amount specified in the **fiber-monitoring sensitivity** command.

Use the **no** variant of this command to remove the specified action or all actions from the port.

**Syntax** fiber-monitoring action [trap] [shutdown] [continuous]  
no fiber-monitoring action [trap|shutdown]

| Parameter  | Description                                                                                                                                                                                |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| trap       | Send an SNMP notification.                                                                                                                                                                 |
| shutdown   | Shutdown the port.                                                                                                                                                                         |
| continuous | Make the action or actions happen continuously (every polling interval) while the sensor is in the alarm state. Otherwise, the action only happens when the alarm is triggered or cleared. |

**Default** By default a log message is generated, but no additional action is performed.

**Mode** Interface Configuration mode for a fiber port.

**Usage** If fiber monitoring is enabled and this command is not used to set an action, a change in received power on a fiber port only generates a log message.

**Example** To set the device to send an SNMP trap when port1.0.25 or port1.0.26 receive reduced power and when that reduced-power alarm is cleared, use the commands:

```
awplus(config)# interface port1.0.25-port1.0.26
awplus(config-if)# fiber-monitoring action trap
```

To set the device to send an SNMP trap when port1.0.25 or port1.0.26 receive reduced power, and every polling interval after that until the alarm is cleared, use the commands:

```
awplus(config)# interface port1.0.25-port1.0.26
awplus(config-if)# fiber-monitoring action trap continuous
```

To set the device to send an SNMP trap and to shut down the port when port1.0.25 or port1.0.26 receive reduced power, use the commands:

```
awplus(config)# interface port1.0.25-port1.0.26
awplus(config-if)# fiber-monitoring action trap shutdown
```

To set the device to stop shutting down the port if port1.0.25 or port1.0.26 receive reduced power, use the commands:

```
awplus(config)# interface port1.0.25-port1.0.26
awplus(config-if)# no fiber-monitoring action shutdown
```

If the device is set to send an SNMP trap for those ports, it will continue to do so.

To set the device not to perform any action when it receives reduced power on port1.0.25 or port1.0.26, except sending a log message, use the commands:

```
awplus(config)# interface port1.0.25-port1.0.26
awplus(config-if)# no fiber-monitoring action
```

**Related commands** [fiber-monitoring sensitivity](#)  
[show system fiber-monitoring](#)

**Command changes** Version 5.4.8-0.2: **continuous** parameter added

## fiber-monitoring baseline

**Overview** Use this command to configure how the baseline value for comparison is calculated for active fiber monitoring on the port.

Note that alarm generation will not commence until the link has been up for a full averaging period.

Use the **no** variant of this command to set the fiber-monitoring baseline to its default value.

**Syntax** fiber-monitoring baseline average <12-150> [interval <2-86400>]  
fiber-monitoring baseline fixed <1-65535>  
no fiber-monitoring baseline

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| average<br><12-150>   | Set the baseline optical power received to be based on the moving average of the specified number of most recent (non-zero) values. Default is to use this setting and 12 values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| interval<br><2-86400> | <p>Optionally, specify the optical power polling interval for determining the baseline, in seconds. By default, the baseline polling interval is the same as the monitoring polling interval, which is 5 seconds by default.</p> <p>If specified, this baseline interval should be larger than the monitoring interval.</p> <p>Even if you specify a baseline interval, Active Fiber Monitoring will use the monitoring interval to calculate the initial baseline average. This means the first x baseline readings will be taken at the monitoring interval, where x is the number of readings specified in the <b>average</b> parameter.</p> <p>See Usage below for more information.</p> |
| fixed<br><1-65535>    | Set the baseline to a fixed level of received optical power in 0.0001mW. Not recommended—see Usage below.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Default** The default is a moving average of the last 12 values, taken at the same interval as the monitoring interval. The monitoring interval is set using the **fiber-monitoring interval** command. If the monitoring interval is set to its default of 5 seconds, the **fiber-monitoring baseline** default will be the average over the last minute.

**Mode** Interface Configuration for a fiber port

**Usage notes** There are two ways to configure the baseline. The first is to choose a number of readings to average. This is the default and recommended method. The second is to set a fixed value in units of x0.0001mW.

If a fixed value is required, the easiest way to choose a value is to enable fiber monitoring on the port and use the **show system fiber-monitoring** command to see what readings you can expect.

**CAUTION:** *We do not recommend setting a fixed value because gradual change over time caused by temperature fluctuations, etc. could lead to unnecessary alarms.*

If you use the averaging method, you can optionally specify how often Active Fiber Monitoring polls the cable to determine the baseline. This allows Active Fiber Monitoring to update the baseline less often than it polls the device for monitoring.

In order to prevent the theoretical possibility of slow clamping, you can set the baseline interval to a large value, so that the baseline average is only updated with the current reading (for example) once per day or once per hour.

As fiber attenuation can be affected by ambient temperature, take care if changing the baseline interval in environments with large daily temperature fluctuations.

**Example** To set the baseline optical power to a moving average of the last 30 monitoring readings on port1.0.25 and port1.0.26, use the command:

```
awplus(config)# interface port1.0.25-port1.0.26
awplus(config-if)# fiber-monitoring baseline average 30
```

To calculate the baseline based on 12 values taken 24 hours (86400 seconds) apart, instead of using the monitoring interval, use the command:

```
awplus(config)# interface port1.0.25-port1.0.26
awplus(config-if)# fiber-monitoring baseline average 12 interval
86400
```

To set the baseline to its default, averaging the last 12 readings, use the command:

```
awplus(config)# interface port1.0.25-port1.0.26
awplus(config-if)# no fiber-monitoring baseline
```

**Command changes** Version 5.4.8-0.2: **interval** parameter added

# fiber-monitoring enable

**Overview** Use this command to enable active fiber monitoring on a fiber port. If the port can support fiber monitoring but does not have the correct SFP or fiber type installed, the configuration will be saved, and monitoring will commence when a supported SFP is inserted. Disabling and re-enabling fiber monitoring on a port resets the baseline calculation.

Use the **no** variants of this command to disable active fiber monitoring on the interface, or to remove all the configuration and state for the ports, respectively.

**Syntax** fiber-monitoring enable  
no fiber-monitoring enable  
no fiber-monitoring

**Default** Active fiber monitoring is disabled by default

**Mode** Interface Configuration mode for a fiber port

**Examples** To enable active fiber monitoring on port1.0.25 and port1.0.26, use the commands:

```
awplus(config)# interface port1.0.25-port1.0.26  
awplus(config-if)# fiber-monitoring enable
```

To disable fiber monitoring on the ports, use the commands:

```
awplus(config)# interface port1.0.25-port1.0.26  
awplus(config-if)# no fiber-monitoring enable
```

To remove all fiber-monitoring configuration and state for the ports, use the commands:

```
awplus(config)# interface port1.0.25-port1.0.26  
awplus(config-if)# no fiber-monitoring
```

## fiber-monitoring interval

**Overview** Use this command to configure the fiber monitoring polling interval in seconds for the port. The optical power will be read every <interval> seconds and compared against the calculated threshold values to see if a log message or other action is required.

Use the **no** variant of this command to reset the polling interval to the default (5 seconds).

**Syntax** fiber-monitoring interval <2-60>  
no fiber-monitoring interval

| Parameter | Description                                |
|-----------|--------------------------------------------|
| <2-60>    | Optical power polling interval in seconds. |

**Default** The interval is set to 5 seconds by default.

**Mode** Interface configuration mode for a fiber port.

**Example** To set the fiber monitoring polling interval for port1.0.25 to 30 seconds, use the commands:

```
awplus(config)# interface port1.0.25
awplus(config-if)# fiber-monitoring interval 30
```

To reset the fiber monitoring polling interval back to the default (5s), use the commands:

```
awplus(config)# interface port1.0.25
awplus(config-if)# no fiber-monitoring interval
```

## fiber-monitoring sensitivity

**Overview** Use this command to configure the sensitivity of the alarm thresholds on the port for active fiber monitoring.

Use the **no** variant of this command to reset the sensitivity to the default.

**Syntax** fiber-monitoring sensitivity (low|medium|high|highest|fixed <25-65535>)|relative <0.01-10.0>  
no fiber-monitoring sensitivity

| Parameter            | Description                                            |
|----------------------|--------------------------------------------------------|
| low                  | Low sensitivity (+/-2 dB)                              |
| medium               | Medium sensitivity (1 dB) (default)                    |
| high                 | High sensitivity (the greater of 0.5 dB and 0.0025 mW) |
| highest              | The highest sensitivity available: 0.0025mW            |
| fixed <25-65535>     | Fixed sensitivity at the specified level in 0.0001 mW. |
| relative <0.01-10.0> | Relative sensitivity at the specified level in dB.     |

**Default** Medium sensitivity.

**Mode** User Exec/Privileged Exec

**Usage** A log message is generated and configured actions are taken if the received optical power drops below the baseline value by the sensitivity configured with this command.

The sensitivity can be configured to one of four pre-defined levels in decibels or to a fixed absolute delta in units of 0.0001mW. The alarm thresholds can be seen in the **show system fiber-monitoring** output. The maximum absolute sensitivity configurable is 0.0025 mW. Note that 0.0025 mW equates to a reduction of approximately 1dB at the maximum attenuation of an AT-SPLX10/1.

**Example** To set the fiber monitoring sensitivity for port1.0.25 to a relative sensitivity of 0.1 dB, use the commands:

```
awplus(config)# interface port1.0.25  
awplus(config-if)# fiber-monitoring sensitivity relative 0.1
```

To reset the fiber monitoring sensitivity to the default (medium), use the commands:

```
awplus(config)# interface port1.0.25  
awplus(config-if)# no fiber-monitoring sensitivity
```

**Related commands** **fiber-monitoring action**  
**fiber-monitoring baseline**  
**show system fiber-monitoring**

# show system fiber-monitoring

**Overview** Use this command to display settings and current status for Active Fiber Monitoring.

**Syntax** show system fiber-monitoring

**Mode** User Exec and Privileged Exec

**Example** To display configuration and status for active fiber monitoring on ports, use the command:

```
awplus# show system fiber-monitoring
```

**Output** The following shows typical output.

**Example output from show system fiber-monitoring**

```
awplus#show sys fiber-monitoring
Fiber Monitoring Status
  Reading units 0.0001mW

Interface port1.0.25
Status:          enabled
Supported:       Supported pluggable
Debugging:       disabled
Interval:        2 seconds
Sensitivity:     1.00dB
Baseline type:   average of last 35 values greater than 50
Status:
  Baseline value: 496
  Alarm threshold: 393
  Alarm:          no
  Last 12 Readings: 498 498 498 498 498 498 498 498 498 498 498 498
  Minimum reading: 486
  Maximum reading: 498

Interface port1.0.26
Status:          enabled
Supported:       Supported pluggable
Debugging:       disabled
Interval:        2 seconds
Sensitivity:     1.00dB
Baseline type:   average of last 30 values greater than 50
Status:
  Baseline value: 0
  Alarm threshold: 0
  Alarm:          no
  Last 12 Readings: 0 0 0 0 0 0 0 0 0 0 0 0
  Minimum reading: 0
  Maximum reading: 0
```

**Parameters in the output from show system fiber-monitoring**

| Parameter     | Description                                                                        |
|---------------|------------------------------------------------------------------------------------|
| Reading units | The units for optical power readings in the rest of the display, e.g. 0.0001mW.    |
| Status        | Whether active fiber monitoring is enabled or disabled for this port.              |
| Supported     | Whether the pluggable inserted in this port supports active fiber monitoring.      |
| Debugging     | Whether debugging of active fiber monitoring is enabled or disabled for this port. |
| Interval      | The configured interval between readings of optical power on this port.            |
| Sensitivity   | The configured sensitivity threshold for optical power changes on this port.       |

| Parameter        | Description                                                                                                                                                 |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Baseline type    | How the baseline optical power level is calculated: either the average of the specified number of previous readings or a specified fixed value in 0.0001mW. |
| Status           | Current values for the following parameters.                                                                                                                |
| Baseline value   | The baseline value, calculated according to the configured baseline method, in 0.0001mW.                                                                    |
| Alarm threshold  | The current threshold for a change in optical power, calculated according to the configured sensitivity method, that will result in action.                 |
| Alarm            | Whether the optical power at the most recent reading fallen below the threshold.                                                                            |
| Last 12 readings | The last 12 optical power values measured, in 0.0001mW, with oldest value first.                                                                            |
| Minimum reading  | The lowest optical power reading since the fiber pluggable was last inserted, or since active fiber monitoring was last enabled on the port.                |
| Maximum reading  | The highest optical power reading since the fiber pluggable was last inserted, or since active fiber monitoring was last enabled on the port.               |

## show system pluggable

**Overview** This command displays **brief** pluggable transceiver information showing the pluggable type, the pluggable serial number, and the pluggable port on the device. Different types of pluggable transceivers are supported in different models of device. See your Allied Telesis dealer for more information about the models of pluggables that your device supports.

**Syntax** show system pluggable [<port-list>]

| Parameter   | Description                                                                                                                                                                                                                                                                                                                     |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port-list> | The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>• a single port (e.g. port1.0.25)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.25-port1.0.26)</li><li>• a comma-separated list of ports and port ranges (e.g. port1.0.25,port1.0.26)</li></ul> |

**Mode** User Exec and Privileged Exec

**Example** To display brief information about all installed pluggable transceivers, use the command:

```
awplus# show system pluggable
```

**Output** The following shows typical output.

### Example output from show system pluggable

| awplus#show system pluggable |        |         |                  |          |             |
|------------------------------|--------|---------|------------------|----------|-------------|
| System Pluggable Information |        |         |                  |          |             |
| Port                         | Vendor | Device  | Serial Number    | Datecode | Type        |
| port1.0.25                   | ATI    | AT-SPSX | A03240R151300867 | 15032801 | 1000BASE-SX |
| port1.0.26                   | ATI    | AT-SPSX | A03240R111800076 | 15032801 | 1000BASE-SX |

### Parameters in the output from the show system pluggable command

| Parameter    | Description                                                        |
|--------------|--------------------------------------------------------------------|
| Stack member | The stack member number.                                           |
| Port         | Specifies the port number for the installed pluggable transceiver. |

| Parameter     | Description                                                                                                                                                                                                                                                                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Vendor        | Specifies the vendor's name for the installed pluggable transceiver.                                                                                                                                                                                                                                                                                |
| Device        | Specifies the device name for the installed pluggable transceiver.                                                                                                                                                                                                                                                                                  |
| Serial Number | Specifies the serial number for the installed pluggable transceiver.                                                                                                                                                                                                                                                                                |
| Datecode      | Specifies the manufacturing datecode for the installed pluggable transceiver. Checking the manufacturing datecode with the vendor may be useful when determining Laser Diode aging issues. For more information, see "Troubleshooting Fiber and Pluggable Issues" in the <b>"Pluggables and Cabling" Feature Overview and Configuration Guide</b> . |
| Type          | Specifies the device type for the installed pluggable transceiver.                                                                                                                                                                                                                                                                                  |

## show system pluggable detail

**Overview** This command displays detailed pluggable transceiver information showing the pluggable type, the pluggable serial number, and the pluggable port on the device. Different types of pluggable transceivers are supported in different models of device. See your Allied Telesis reseller or distributor for more information about the models of pluggables that your device supports.

For information on filtering and saving command output, see the **[“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)**.

**Syntax** show system pluggable [*<port-list>*] detail

| Parameter                | Description                                                                                                                                                                                                                                                                                                                     |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;port-list&gt;</i> | The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>• a single port (e.g. port1.0.25)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.25-port1.0.26)</li><li>• a comma-separated list of ports and port ranges (e.g. port1.0.25,port1.0.26)</li></ul> |

**Mode** User Exec and Privileged Exec

**Usage notes** In addition to the information about pluggable transceivers displayed using the **show system pluggable** command (port, manufacturer, serial number, manufacturing datecode, and type information), the **show system pluggable detail** command displays the following information:

- **SFP Laser Wavelength:** Specifies the laser wavelength of the installed pluggable transceiver.
- **Single mode Fiber:** Specifies the link length supported by the pluggable transceiver using single mode fiber.
- **OM1 (62.5µm) Fiber:** Specifies the link length, in meters (m) or kilometers (km) supported by the pluggable transceiver using 62.5 micron multi-mode fiber.
- **OM2 (50µm) Fiber:** Specifies the link length (in meters or kilometers) supported by the pluggable transceiver using 50 micron multi-mode fiber.
- **Diagnostic Calibration:** Specifies whether the pluggable transceiver supports DDM or DOM Internal or External Calibration.
  - **Internal** is displayed if the pluggable transceiver supports DDM or DOM Internal Calibration.
  - **External** is displayed if the pluggable transceiver supports DDM or DOM External Calibration.
  - a dash (-) is displayed if neither Internal Calibration or External Calibration is supported.
- **Power Monitoring:** Displays the received power measurement type, which can be either **OMA** (Optical Module Amplitude) or **Avg** (Average Power) measured in µW.

**NOTE:** For parameters that are not supported or not specified, a hyphen is displayed instead.

**Example** To display detailed information about the pluggable transceivers installed in a particular port on the device, use a command like:

```
awplus# show system pluggable port1.0.25 detail
```

To display detailed information about all the pluggable transceivers installed on the device, use the command:

```
awplus# show system pluggable detail
```

**Output** The following shows typical output.

**Example output from show system pluggable detail for a port**

```
awplus#show system pluggable port1.0.25 detail
System Pluggable Information Detail
port1.0.25
=====
Vendor Name:                ATI
Device Name:                AT-SPSX

Power Monitoring:            Average
```

### Parameters in the output from show system pluggable detail

| Parameter              | Description                                                                                                                                                                                                                                                                                                                                         |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Stack member           | The stack member number.                                                                                                                                                                                                                                                                                                                            |
| Port                   | Specifies the port the pluggable transceiver is installed in.                                                                                                                                                                                                                                                                                       |
| Vendor Name            | Specifies the vendor's name for the installed pluggable transceiver.                                                                                                                                                                                                                                                                                |
| Device Name            | Specifies the device name for the installed pluggable transceiver.                                                                                                                                                                                                                                                                                  |
| Device Revision        | Specifies the hardware revision code for the pluggable transceiver. This may be useful for troubleshooting because different devices may support different pluggable transceiver revisions.                                                                                                                                                         |
| Device Type            | Specifies the device type for the installed pluggable transceiver.                                                                                                                                                                                                                                                                                  |
| Serial Number          | Specifies the serial number for the installed pluggable transceiver.                                                                                                                                                                                                                                                                                |
| Manufacturing Datecode | Specifies the manufacturing datecode for the installed pluggable transceiver. Checking the manufacturing datecode with the vendor may be useful when determining Laser Diode aging issues. For more information, see "Troubleshooting Fiber and Pluggable Issues" in the <b>"Pluggables and Cabling" Feature Overview and Configuration Guide</b> . |
| SFP Laser Wavelength   | Specifies the laser wavelength of the installed pluggable transceiver.                                                                                                                                                                                                                                                                              |
| Single Mode Fiber      | Specifies the link length supported by the pluggable transceiver using single mode fiber.                                                                                                                                                                                                                                                           |
| OM1 (62.5um) Fiber     | Specifies the link length (in $\mu\text{m}$ - micron) supported by the pluggable transceiver using 62.5 micron multi-mode fiber.                                                                                                                                                                                                                    |
| OM2 (50um) Fiber       | Specifies the link length (in $\mu\text{m}$ - micron) supported by the pluggable transceiver using 50 micron multi-mode fiber.                                                                                                                                                                                                                      |
| Diagnostic Calibration | Specifies whether the pluggable transceiver supports DDM or DOM Internal or External Calibration:<br><br><b>Internal</b> is displayed if the pluggable transceiver supports DDM or DOM Internal Calibration.<br><br><b>External</b> is displayed if the pluggable transceiver supports DDM or DOM External Calibration.                             |

| Parameter        | Description                                                                                                                                                |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  | - is displayed if neither Internal Calibration or External Calibration is supported.                                                                       |
| Power Monitoring | Displays the received power measurement type, which can be either <b>OMA</b> (Optical Module Amplitude) or <b>Avg</b> (Average Power) measured in $\mu$ W. |

# show system pluggable diagnostics

**Overview** This command displays diagnostic information about pluggable transceivers that support Digital Diagnostic Monitoring (DDM).  
Different types of pluggable transceivers are supported in different device models. See your device's Datasheet for more information about the models of pluggables that your device supports.  
For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

**Syntax** show system pluggable [*<port-list>*] diagnostics [dbm]

| Parameter                | Description                                                                                                                                                                                                                                                                                                                     |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;port-list&gt;</i> | The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>• a single port (e.g. port1.0.25)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.25-port1.0.26)</li><li>• a comma-separated list of ports and port ranges (e.g. port1.0.25,port1.0.26)</li></ul> |
| dbm                      | This option shows TX and RX power values in dBm instead of mW for the transceivers.                                                                                                                                                                                                                                             |

**Mode** User Exec and Privileged Exec

**Usage notes** Diagnostic monitoring features allow you to monitor real-time parameters of the pluggable transceiver, such as optical output power, optical input power, temperature, laser bias current, and transceiver supply voltage. Additionally, RX LOS (Loss of Signal) is shown when the received optical level is below a preset threshold. Monitor these parameters to check on the health of all transceivers, selected transceivers or a specific transceiver installed in a device.

**Examples** To display detailed information about all pluggable transceivers installed on a standalone device, use the command:

```
awplus# show system pluggable diagnostics
```

**Output** The following shows typical output.

**Example output from the show system pluggable diagnostics command on a device**

```
awplus#show system pluggable diagnostics

**Parameters in the output from the show system pluggable diagnostics command**

| Parameter        | Description                                                                                                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Temp (Degrees C) | Shows the temperature inside the transceiver.                                                                                                                                                                                                |
| Vcc (Volts)      | Shows voltage supplied to the transceiver.                                                                                                                                                                                                   |
| Tx Bias (mA)     | Shows current to the Laser Diode in the transceiver.                                                                                                                                                                                         |
| Tx Power (mW)    | Shows the amount of light transmitted from the transceiver.                                                                                                                                                                                  |
| Rx Power (mW)    | Shows the amount of light received in the transceiver.                                                                                                                                                                                       |
| Rx LOS           | Rx Loss of Signal. This indicates whether: <ul style="list-style-type: none"><li>• light is being received (Rx Up) and therefore the link is up, or</li><li>• light is not being received (Rx Down) and therefore the link is down</li></ul> |

**Command changes** Version 5.5.4-0.1: **dbm** parameter added

# show test cable-diagnostics tdr

**Overview** Use this command to display the results of the last cable-diagnostics test that was run using the TDR (Time Domain Reflectometer) on a fixed copper cable port.

The displayed status of the cable can be either:

- OK
- Open
- Short (within-pair)
- Short (across-pair)
- Error

**Syntax** show test cable-diagnostics tdr

**Mode** Privileged Exec

**Examples** To show the results of a cable-diagnostics test use the following command:

```
awplus# show test cable-diagnostics tdr
```

**Output** The following shows typical output.

**Example output from the show test cable-diagnostics tdr command**

| Port      | Pair | Length | Status |
|-----------|------|--------|--------|
| port1.0.1 | A    | -      | OK     |
|           | B    | -      | OK     |
|           | C    | -      | OK     |
|           | D    | -      | OK     |

**Related commands** [clear test cable-diagnostics tdr](#)  
[test cable-diagnostics tdr interface](#)

# test cable-diagnostics tdr interface

**Overview** Use this command to apply the Cable Fault Locator's cable-diagnostics tests to twisted pair data cables for a selected port. The tests will detect either correct, short circuit, or open, circuit terminations. For more information on running the CFL, see the [Pluggables and Cabling Feature Overview and Configuration Guide](#).

The test can take several seconds to complete. See the related show command to display the test results.

A new test can only be started if no other test is in progress. CFL cannot run on a port that is currently supplying power via PoE.

The displayed status of the cable can be either, OK, Short (within-pair), or Open. The "Open" or "Short" status is accompanied with the distance from the source port to the incorrect termination.

**Syntax** test cable-diagnostics tdr interface *<interface>*

| Parameter                | Description                                                |
|--------------------------|------------------------------------------------------------|
| cable-diagnostics        | The cable diagnostic tests.                                |
| tdr                      | Time Domain Reflectometry.                                 |
| interface                | Selects the interface to test.                             |
| <i>&lt;interface&gt;</i> | Interface number of the port to be tested, e.g. port1.0.2. |

**Mode** Privileged Exec

**Example** To run a cable test on the cable inserted into port1.0.1 use the following command:

```
awplus# test cable-diagnostics tdr interface port1.0.1
```

You will receive the following message:

```
Link will go down while test is in progress. Continue? (y/n): y
Select y to continue.
```

```
awplus# y
```

You will then receive the following message:

```
Test started. This will take several seconds to complete. Use
"show test cable-diagnostics tdr" to print results.
```

# Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Connectivity Fault Management.

For more information, see the **Connectivity Fault Management (CFM) Feature Overview and Configuration Guide**.

## cc interval

**Overview** Use this command to set the CCM Interval.

**Syntax** `cc ma-name <ma-name> interval <interval>`

| Parameter  | Description                                                                                                                                                                                                                                                                              |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ma-name    | Specify the Maintenance Association for which the Interval is used.                                                                                                                                                                                                                      |
| <ma-name>  | Specify the Maintenance Association's CLI instance name.                                                                                                                                                                                                                                 |
| interval   | Specify the CCM Interval.                                                                                                                                                                                                                                                                |
| <interval> | Specify the CCM Interval (CCI), using one of the following:<br>1 - CCI of 3 milliseconds (currently not supported) 2 - CCI of 10 milliseconds (currently not supported) 3 - CCI of 100 milliseconds 4 - CCI of 1 second 5 - CCI of 10 seconds 6 - CCI of 1 minute 7 - CCI of 10 minutes. |

**Default** The default interval is 4 (1 second).

**Mode** Ethernet CFM Configuration

**Usage notes** Continuity Checks is another term for connectivity fault detection. This makes use of Continuity Check Messages (CCMs) that are periodically sent by an MEP (multicast or unicast) and received by other MEP(s). CCMs can be used to detect connectivity faults across a link (using Link Level MEPs) or across a segment of a VLAN using VLAN aware MEPs, both of which are used within an MD/MA. CCMs are sent periodically at a given rate (or frame interval) that is agreed upon by all the MEPs in the MA. The faster the rate, the more quickly faults can be detected.

If an MEP does not receive a CCM within 3.5 times the expected interval from a peer MEP(s), that MEP declares a connectivity fault. This is known as a "defect". Upon detecting a defect, the detecting MEP will also set the Remote Defect Indicator (RDI) bit for its outgoing CCM messages to its peer MEP(s) so as to notify the peer MEPs that a defect has been detected. If the defect persists long enough (generally 2.5 seconds), then an "alarm" is declared. If an alarm is declared, then the defect has to abate long enough (generally 10 seconds) for the alarm to clear.

**Example** To set the CCM interval of a Maintenance Association named "MA-INST2-1" to the value of "4", use the commands:

```
awplus(config)# ethernet cfm domain-name MD-INST2
awplus(config-ether-cfm)# cc ma-name MA-INST2-1 interval 4
```

**Related commands** **ethernet cfm domain-name**  
**service ma-name**

**Command changes** Version 5.4.7-1.1: command added  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

## cc multicast

**Overview** Use this command to enable a Local MEP to send CCMs using multicast, or to disable sending CCMs altogether.

**Syntax** `cc multicast state {enable|disable}`

| Parameter | Description                                             |
|-----------|---------------------------------------------------------|
| state     | Specify to either enable or disable CFM multicast CCMs. |
| enable    | Start sending periodic multicast frames.                |
| disable   | Stop sending multicast frames.                          |

**Default** Multicast is disabled by default.

**Mode** Interface Ethernet CFM MEP Configuration

**Usage notes** Continuity Checks is another term for connectivity fault detection. This makes use of Continuity Check Messages (CCMs) that are periodically sent by an MEP (multicast or unicast) and received by other MEP(s). CCMs can be used to detect connectivity faults across a link (using Link Level MEPs) or across a segment of a VLAN using VLAN aware MEPs, both of which are used within an MD/MA. CCMs are sent using multicast or unicast (but not both).

In order to enable a Local MEP to send, the Local MEP's "active" administrative state must be set to true, using the command **mep active**.

**Example** To configure a Local MEP to send CCMs using multicast, use the commands:

```
awplus(config)# interface port1.0.2
awplus(config-if)# ethernet cfm mep down mpid 12 domain-name MD-INST2 ma-name MA-INST2-1
awplus(config-if-eth-cfm-mep)# cc multicast state enable
```

**Related commands** **ethernet cfm domain-name**  
**ethernet cfm mep**  
**service ma-name**

**Command changes** Version 5.4.7-1.1: command added  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

## cc unicast

**Overview** Use this command to enable a Local MEP to send CCMs using unicast, or to disable sending CCMs altogether.

**Syntax** `cc unicast rmpid <rmep-id> state {enable|disable}`

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| rmpid     | The remote MEP that the Local MEP is to unicast to. |
| <rmep-id> | The remote MEP ID in the range 1-8191.              |

**Mode** Interface Ethernet CFM MEP Configuration

**Usage notes** Continuity Checks is another term for connectivity fault detection. This makes use of Continuity Check Messages (CCMs) that are periodically sent by an MEP (multicast or unicast) and received by other MEP(s). CCMs can be used to detect connectivity faults across a link (using Link Level MEPs) or across a segment of a VLAN using VLAN aware MEPs, both of which are used within an MD/MA. CCMs are sent using multicast or unicast (but not both).

In order to enable a Local MEP to send, the Local MEP's "active" administrative state must be set to true, using the command **mep active**.

In order to send unicast CCMs, the Remote MEP has to be configured along with its MAC address.

**Example** To configure a Local MEP to send CCMs using unicast, use the commands:

```
awplus(config)# interface port1.0.2
awplus(config-if)# ethernet cfm mep down mpid 12 domain-name MD-INST2 ma-name MA-INST2-1
awplus(config-if-eth-cfm-mep)# cc unicast rmpid 21 state enable
```

**Related commands** **ethernet cfm domain-name**  
**ethernet cfm mep**  
**mep crosscheck**  
**service ma-name**

**Command changes** Version 5.4.7-1.1: command added  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

## clear (MEP Attribute)

**Overview** Use this command to clear a Local MEP attribute.

**Syntax** `clear {ccm-ltm-priority|lowest-priority-defect|fng-alarm-time |  
reset-fng-time|active|all}`

| Parameter              | Description                                                                                                                                |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| ccm-ltm-priority       | Set the queuing and p-bit priority for CCM messages to their default value of 7.                                                           |
| lowest-priority-defect | Set the Fault Notification Generation (FNG) lowest alarm priority defect to the default value of 2.                                        |
| fng-alarm-time         | Set the Fault Notification Generation (FNG) time for a defect to be present before an alarm is raised to the default value of 2.5 seconds. |
| reset-fng-time         | Set the Fault Notification Generation (FNG) time for a defect to abate before an alarm is cleared to the default value of 10 seconds.      |
| active                 | Set the Local MEP's Active state to the default value of False, which sets the Local MEP's Administrative State to Down.                   |
| all                    | Set all of the above attributes to their default values.                                                                                   |

**Mode** Interface Ethernet CFM MEP Configuration

**Example** To set the active state of the Local MEP to False, use the commands:

```
awplus(config)# interface port1.0.2
awplus(config-if)# ethernet cfm mep down mpid 12 domain-name MD-INST2 ma-name MA-INST2-1
awplus(config-if-eth-cfm-mep)# clear active
```

**Related commands** [ethernet cfm domain-name](#)  
[ethernet cfm mep](#)  
[mep \(FNG attributes\)](#)  
[service ma-name](#)

**Command changes** Version 5.4.7-1.1: command added  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

## clear ethernet cfm errorlog

**Overview** Use this command to clear the Event List for all Maintenance Associations (MAs) associated with the specified Maintenance Domain (MD).

**Syntax** clear ethernet cfm errorlog domain *<domain-name>*

| Parameter                  | Description             |
|----------------------------|-------------------------|
| <i>&lt;domain-name&gt;</i> | Specify the domain name |

**Mode** Privileged Exec

**Usage notes** When a new error is detected for an MA that is associated with an MD, and the error is due to an error from a received or missing CCM from a Remote MEP, an event is logged to the CFM Errors Event List.

**Example** To clear the event list for all MA's associated with an MD named "MD-INST2", use the command:

```
awplus# clear ethernet cfm errorlog domain MD-INST2
```

**Related commands** [show ethernet cfm errorlog](#)

**Command changes** Version 5.4.7-1.1: command added

Version 5.4.8-0.2: added to SBx8100 series products

Version 5.4.8-1.1: added to SBx908 GEN2 series products

## clear mep counter

**Overview** Use this command to clear statistics counters for all Local MEPs within a given Maintenance Association (MA) and its associated Maintenance Domain (MD), or to optionally clear counters for one specific Local MEP.

**Syntax** `clear mep counter domain <domain-name> service <ma-name> [mep <mep-id>]`

| Parameter     | Description                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| domain        | Specify the Maintenance Domain that Local MEP(s) are to have their counters cleared for. Both domain and service must be specified.          |
| <domain-name> | Specify the Maintenance Domain's CLI instance name.                                                                                          |
| service       | Specify the Maintenance Association that the Local MEP(s) are to have their counters cleared for. Both domain and service must be specified. |
| <ma-name>     | Specify the CLI name that identifies the service (Maintenance Association (MA)) instance.                                                    |
| mep           | Specify one specific Local MEP.                                                                                                              |
| <mep-id>      | Specify the Local MEP instance by MEP-id.                                                                                                    |

**Mode** User Exec/Privileged Exec

**Example** To clear the statistic counter for an MEP with the MEP ID "12", use the command:

```
awplus# clear mep counter domain MD-INST1 service MA-INST1-1 mep 12
```

**Command changes** Version 5.4.7-1.1: command added  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

## ethernet cfm domain-name

**Overview** Use this command to create and configure a CFM Maintenance Domain, or to enter Ethernet CFM Configuration mode for an existing Maintenance Domain instance.

Use the **no** variant of this command to destroy the Maintenance Domain's instance that was previously created.

**Syntax** ethernet cfm domain-name <domain-name>  
 ethernet cfm domain-name <domain-name> md-type character-string  
     md-type-name <md-type-name> level <level> [mip-creation none]  
 ethernet cfm domain-name <domain-name> md-type dns-based md-  
     type-name <md-type-name> level <level> [mip-creation none]  
 ethernet cfm domain-name <domain-name> md-type mac md-type-name  
     <md-type-name> level <level> [mip-creation none]  
 ethernet cfm domain-name <domain-name> md-type no-name level  
     <level> [mip-creation none]  
 no ethernet cfm domain-name <domain-name>

| Parameter        | Description                                                                                                                                                                                                                                                                                               |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <domain-name>    | The name that identifies this Maintenance Domain instance. If creating this instance, specify the remaining parameters. If re-entering configuration mode for this instance, use this parameter to identify this instance, and do not enter the remaining parameters.                                     |
| md-type          | Specify the name type. The MD name part of the MAID field may or may not appear in the CCM message. There are different formats and conventions for the name depending on type.                                                                                                                           |
| character-string | Specify the md-type as Character String-based MD name format. The <md-type-name> is a character string of 1 to 43 characters. This character string plus the Short MA name that is configured for an MA make up the MAID field in a CCM message.                                                          |
| md-type-name     | The Maintenance Domain type.                                                                                                                                                                                                                                                                              |
| <md-type-name>   | The value of the MD type name, which depends on the md-type selected.                                                                                                                                                                                                                                     |
| dns-based        | Specify the md-type as DNS-based MD name format. The <md-type-name> is a Domain Name like string of 1 to 43 characters. This is a globally unique text string derived from a DNS name. This DNS based string plus the Short MA name that is configured for an MA make up the MAID field in a CCM message. |
| mac              | Specify the md-type as MAC-based MD name format. The <md-type-name> consists of a MAC address + 2-octet (unsigned) integer in the form of HHHH.HHHH.HHHH:<2-octet integer>. This MAC based string plus the Short MA name that is configured for an MA make up the MAID field in a CCM message.            |
| no-name          | Specify the md-type whereby no MD name is to appear in the CCM message.                                                                                                                                                                                                                                   |
| level            | Specify the Level the Domain operates in.                                                                                                                                                                                                                                                                 |

| Parameter    | Description                                                          |
|--------------|----------------------------------------------------------------------|
| <level>      | 0 to 7.                                                              |
| mip-creation | Optional parameter that specifies the MIP creation permission value. |
| none         | Specifies that no MIPs are to be created (default and only choice).  |

**Mode** Global Configuration

**Usage notes** A Maintenance Domain is a Connectivity Fault Management (CFM) term that represents the administrative area of a network from which an operator can manage VLANs that traverse their area. An MD can also be scoped to a simple Ethernet link. To differentiate different administrative areas, an MD is made up of a name and a level. As part of CFM, a Connectivity Check Message (CCM) is used to detect Ethernet connectivity faults amongst nodes that participate in CFM. CCM messages carry the MD name within the MAID field as well as carries the level of the MD.

This command is used to configure the MD name, which can be chosen from a variety of name format types, as well as the level.

**Example** To create a Maintenance Domain instance named "MD-INST2" with a character string-based name of "MD-12L3" and a level of 3, use the command:

```
awplus(config)# ethernet cfm domain-name MD-INST2 md-type  
character-string md-type-name MD-12L3 level 3
```

To enter Ethernet CFM Configuration mode for an existing MD instance named "MD-INST2", use the command:

```
awplus(config)# ethernet cfm domain-name MD-INST2  
awplus(config-ether-cfm)#
```

To destroy a Maintenance Domain instance named "MD-INST2", use the command:

```
awplus(config)# no ethernet cfm domain-name MD-INST2
```

## ethernet cfm mep

**Overview** Use this command to create a Local MEP instance, or to enter Interface Ethernet CFM MEP Configuration mode for an existing Local MEP's instance, so you can configure it.

Use the **no** variant of this command to destroy the Local MEP instance.

**Syntax** ethernet cfm mep down mpid *<mep-id>* domain-name *<domain-name>*  
ma-name *<ma-name>*  
no ethernet cfm mep down mpid *<mep-id>* domain-name *<domain-name>*  
ma-name *<ma-name>*

| Parameter                  | Description                                                                      |
|----------------------------|----------------------------------------------------------------------------------|
| down                       | Specify the Local MEP as a Down MEP.                                             |
| mpid                       | Specify the Local MEP ID.                                                        |
| <i>&lt;mep-id&gt;</i>      | 1-8191. This must be unique ID for all MEPs in the MA (both local and remote).   |
| domain-name                | Specify the Maintenance Domain that the Local MEP is to be associated with.      |
| <i>&lt;domain-name&gt;</i> | Specify the Maintenance Domain's CLI instance name.                              |
| ma-name                    | Specify the Maintenance Association that the Local MEP is to be associated with. |
| <i>&lt;ma-name&gt;</i>     | Specify the Maintenance Association's CLI instance name.                         |

**Mode** Interface Configuration

**Usage notes** Maintenance Points are entities that exist within an MD/MA and can perform the CFM/802.1ag functions such as Continuity Checks for fault management. The main type of MP is a Maintenance End Point (MEP). This type of maintenance point sits at the edges of a Maintenance Domain but is a member of only one MA within the Maintenance Domain. Thus an MEP is used at the end of a VLAN segment, or it is used at the end of a link. MPs live on bridge ports and station ports. On a bridge port, there are two types.

- An Up Maintenance Entity is considered an inward MP. It communicates across the inside of the bridge to the other side, and this allows it to reach the outside world. It lives on a bridge port for a given VLAN, but it does not use this port to send or receive to get to the outside world. Instead, it sends and receives through the inside of the bridge and communicates to the outside world through the other VLAN port members. An Up MP cannot be used for Link Level CFM.
- A Down Maintenance Entity is considered an outward MP. It sends and receives only through its bridge port outwardly to the outside world, and does not communicate inside the bridge. A Down MP is not subject to blocking due to Spanning Tree Protocol (STP) or any other protocol trying to prevent loops in the network. As such, it is important that Down MPs be used in an MD/MA that is not subject to topology loops. A Down MP can be VLAN aware or link-local.

An MEP can be either Up or Down for a given MD/MA, but within a bridge for the same MD/MA, there can only be one Up or Down MEP (not both). An Up MEP must be VLAN aware. A Down MEP may be VLAN aware. Otherwise, a Down MEP is allowed to be link local (VLAN unaware), and its scope is that of the entire link.

AlliedWare Plus supports Down Maintenance Entities only.

**Example** To create a local MEP instance context with a domain name of "MD-INST2" and an MA name of "MA-INST2-1", use the commands:

```
awplus(config)# interface port1.0.2
```

```
awplus(config-if)# ethernet cfm mep down mpid 12 domain-name MD-INST2 ma-name MA-INST2-1
```

To re-enter a local MEP instance context with the domain name "MD-INST2" and the MA name "MA-INST2-1", use the commands:

```
awplus(config-if)# ethernet cfm mep down mpid 12 domain-name MD-INST2 ma-name MA-INST2-1
```

```
awplus(config-if-eth-cfm-mep)#
```

To destroy a local MEP instance context with the domain name "MD-INST2" and the MA name "MA-INST2-1", use the commands:

```
awplus(config-if)# no ethernet cfm mep down mpid 12 domain-name MD-INST2 ma-name MA-INST2-1
```

## mep (FNG attributes)

**Overview** Use this command to configure the Fault Notification Generation (FNG) attributes of a Local MEP.

**Syntax** `mep {lowest-priority-defect <defect-priority>|  
fng-alarm-time <soak-time>|reset-fng-time <abate-time>}`

| Parameter                               | Description                                                                                                                                                              |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| lowest-priority-defect<defect-priority> | The lowest level defect allowed to generate alarms. An integer in the range 1 to 6. The default is 2.                                                                    |
| fng-alarm-time <soak-time>              | The time that the defects must be present before an alarm is generated. An integer in the range of 250 to 1000 in increments of 10 ms. The default is 250 (2.5 seconds). |
| reset-fng-time <abate-time>             | The time that the defect must be absent before the alarm is cleared. An integer in the range of 250 to 1000 in increments of 10 ms. The default is 1000 (10 seconds).    |

**Mode** Interface Ethernet CFM MEP Configuration

**Usage notes** Maintenance Points are entities that exist within an MD/MA and can perform the CFM/802.1ag functions such as Continuity Checks for fault management. The main type of MP is a Maintenance End Point (MEP). This type of maintenance point sits at the edges of a Maintenance Domain but is a member of only one MA within the Maintenance Domain. Thus an MEP is used at the end of a VLAN segment, or it is used at the end of a link.

A Local MEP can detect defects in connectivity of a VLAN or a local link using Continuity Check Messages (CCM) by sending and receiving CCMs with Remote MEP peers. Any defects detected locally can also be conveyed to Remote MEP peers by sending a Remote Defect Indicator (RDI) to the peers within a Continuity Check Message (CCM). If defects persist long enough, an alarm can be generated.

Use this command to configure the following attributes of a Local MEP:

- Fault Notification Generation Lowest Alarm Priority Defect – the lowest defect priority that can cause an alarm to be raised. This configuration parameter specifies the lowest defect that has to occur before an alarm can be generated. Any priority less than this will not result in an alarm notification. Note that if a local defect is detected and its priority is not high enough to generate an alarm, then the Local MEP will not send an RDI to its Remote MEP peers, which is used to notify the peers of a connectivity fault. We recommend you keep the lowest alarm priority defect set to 2.
- Fault Notification Generation Alarm timers – the timers that determine whether a defect has been present long enough to result in an alarm being generated, or whether a defect has been abated for long enough to clear an alarm.

**Example** To clear an alarm after the defect has been abated for 6 seconds, use the commands:

```
awplus(config)# interface port1.0.2
awplus(config-if)# ethernet cfm mep down mpid 12 domain-name MD-INST2 ma-name MA-INST2-1
awplus(config-if-eth-cfm-mep)# mep reset-fng-time 600
```

**Related commands** [clear \(MEP Attribute\)](#)  
[ethernet cfm domain-name](#)  
[ethernet cfm mep](#)  
[service ma-name](#)  
[show mep-alarm status](#)

**Command changes** Version 5.4.7-1.1: command added  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

## mep active

**Overview** Use this command to specify the administrative state of the Local MEP.

**Syntax** `mep active {true|false}`

| Parameter | Description                                                                                                              |
|-----------|--------------------------------------------------------------------------------------------------------------------------|
| true      | Put the Local MEP into a state of active, which enables it to perform various functions such as processing CCM messages. |
| false     | Specify the state of the Local MEP to cease functioning.                                                                 |

**Default** false

**Mode** Interface Ethernet CFM MEP Configuration

**Usage notes** Maintenance Points are entities that exist within an MD/MA and can perform the CFM/802.1ag functions such as Continuity Checks for fault management. The main type of MP is a Maintenance End Point (MEP). This type of maintenance point sits at the edges of a Maintenance Domain but is a member of only one MA within the Maintenance Domain. Thus an MEP is used at the end of a VLAN segment, or it is used at the end of a link.

A Local MEP can detect defects in connectivity of a VLAN or a local link using Continuity Check Messages (CCM) by sending and receiving CCMs with Remote MEP peers. Any defects detected locally can also be conveyed to Remote MEP peers by sending a Remote Defect Indicator (RDI) to the peers within a Continuity Check Message (CCM). If defects persist long enough, an alarm can be generated.

Setting the Local MEP's Administrative State to true enables it to perform various functions such as processing CCM messages. Setting the state to false deactivates the Local MEP.

**Example** To set the administrative state of the local MEP to "active", use the commands:

```
awplus(config)# interface port1.0.2
awplus(config-if)# ethernet cfm mep down mpid 12 domain-name MD-INST2 ma-name MA-INST2-1
awplus(config-if-eth-cfm-mep)# mep active true
```

**Related commands** **clear (MEP Attribute)**  
**ethernet cfm domain-name**  
**ethernet cfm mep**  
**service ma-name**  
**show mep-alarm status**

**Command changes** Version 5.4.7-1.1: command added  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

## mep ccm-ltm-priority

**Overview** Use this command to specify the queuing and p-bit priority for CCM messages.

**Syntax** mep ccm-ltm-priority <0-7>

| Parameter | Description                                      |
|-----------|--------------------------------------------------|
| <0-7>     | The queuing and p-bit priority for CCM messages. |

**Default** 7

**Mode** Interface Ethernet CFM MEP Configuration

**Usage notes** Maintenance Points are entities that exist within an MD/MA and can perform the CFM/802.1ag functions such as Continuity Checks for fault management. The main type of MP is a Maintenance End Point (MEP). This type of maintenance point sits at the edges of a Maintenance Domain but is a member of only one MA within the Maintenance Domain. Thus an MEP is used at the end of a VLAN segment, or it is used at the end of a link.

A Local MEP can detect defects in connectivity of a VLAN or a local link using Continuity Check Messages (CCM) by sending and receiving CCMs with Remote MEP peers. CCMs are high priority messages by default, but the priority is configurable, although we do not recommend changing it. Any defects detected locally can also be conveyed to Remote MEP peers by sending a Remote Defect Indicator (RDI) to the peers within a Continuity Check Message (CCM). If defects persist long enough, an alarm can be generated.

**Example** To set the queuing and p-bit priority for CCM messages to 6, use the commands:

```
awplus(config)# interface port1.0.2
awplus(config-if)# ethernet cfm mep down mpid 12 domain-name MD-INST2 ma-name MA-INST2-1
awplus(config-if-eth-cfm-mep)# mep ccm-ltm-priority 6
```

CCMs should be the highest priority message so we recommend leaving their priority as 7.

**Related commands** **clear (MEP Attribute)**  
**ethernet cfm domain-name**  
**ethernet cfm mep**  
**service ma-name**  
**show mep-alarm status**

Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

## mep crosscheck

**Overview** Use this command within the MD instance context to create a Remote MEP instance and configure its parameters.

Use the **no** variant of this command to destroy the Remote MEP instance.

**Syntax** `mep crosscheck mpid <rmep-id> ma-name <ma-name> [mac <HHHH.HHHH.HHHH>]`  
`no mep crosscheck mpid <rmep-id> ma-name <ma-name>`

| Parameter                           | Description                                                                                                                  |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <code>mpid</code>                   | Specify the Remote MEP id.                                                                                                   |
| <code>&lt;rmep-id&gt;</code>        | 1-8191. This must be unique ID for all MEPs in the MA (both local and remote).                                               |
| <code>ma-name</code>                | Specify the Maintenance Association that the Remote MEP is to be associated with.                                            |
| <code>&lt;ma-name&gt;</code>        | Specify the Maintenance Association's CLI instance name.                                                                     |
| <code>mac</code>                    | Optionally, when using unicast for communication between a Local MEP and a Remote MEP, specify the remote MEP's MAC address. |
| <code>&lt;HHHH.HHHH.HHHH&gt;</code> | Specify the Remote MEP's MAC address using the HHHH.HHHH.HHHH format where H is a hexadecimal value.                         |

**Mode** Ethernet CFM Configuration

**Usage notes** Maintenance Points are entities that exist within an MD/MA and can perform the CFM/802.1ag functions such as Continuity Checks for fault management. The main type of MP is a Maintenance End Point (MEP). This type of maintenance point sits at the edges of a Maintenance Domain but is a member of only one MA within the Maintenance Domain. Thus an MEP is used at the end of a VLAN segment, or it is used at the end of a link. MPs live on bridge ports and station ports. On a bridge port, there are two types.

- An Up Maintenance Entity is considered an inward MP. It communicates across the inside of the bridge to the other side, and this allows it to reach the outside world. It lives on a bridge port for a given VLAN, but it does not use this port to send or receive to get to the outside world. Instead, it sends and receives through the inside of the bridge and communicates to the outside world through the other VLAN port members. An Up MP cannot be used for Link Level CFM.
- A Down Maintenance Entity is considered an outward MP. It sends and receives only through its bridge port outwardly to the outside world, and does not communicate inside the bridge. A Down MP is not subject to blocking due to Spanning Tree Protocol (STP) or any other protocol trying to prevent loops in the network. As such, it is important that Down MPs be used in an MD/MA that is not subject to topology loops. A Down MP can be VLAN aware or link-local.

An MEP can be either Up or Down for a given MD/MA, but within a bridge for the same MD/MA, there can only be one Up or Down MEP (not both). An Up MEP must be VLAN aware. A Down MEP may be VLAN aware. Otherwise, a Down MEP is allowed to be link local (VLAN unaware), and its scope is that of the entire link.

**Example** To create a remote MEP instance named "MA-INST2-1" with an MEP ID of 21, use the command:

```
awplus(config-ether-cfm)# mep crosscheck mpid 21 ma-name MA-INST2-1
```

To destroy the remote MEP instance named "MA-INST2-1" with the MEP ID of 21, use the command:

```
awplus(config-ether-cfm)# no mep crosscheck mpid 21 ma-name MA-INST2-1
```

## service ma-name

**Overview** Use this command to create a Maintenance Association instance within the MD instance context and configure its parameters.

Use the **no** variant of this command to destroy the Maintenance Association instance.

**Syntax** service ma-name <ma-name> ma-type {icc|integer|primary-vid|  
string|vpn-id} ma-type-name <ma-type-name> [vlan <primary-vid>  
[mip-creation {none}]]  
no service <ma-name>

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ma-name>      | The CLI name that identifies this Maintenance Association (MA) instance.                                                                                                                                                                                                                                                                                                                                  |
| ma-type        | Specify the MA name type. The MA name part of the MAID field appears in the CCM message. There are different formats and conventions for the name depending on the type.                                                                                                                                                                                                                                  |
| icc            | Specify the ma-type as ICC based MA name format. The <ma-type-name> is a 13 byte character string consisting of a 1 to 6 character ITU Carrier Code (ICC) plus a 1 to 6 character Unique MEGID (UMC) code for the name. Any remaining characters are padding out with NULLs by the system to fill out the 13 bytes. This can only be used with Maintenance Domain whose name md-type is set to "No name". |
| integer        | Specify the ma-type as Integer based MA name format. The <ma-type-name> is a number up to 2 Bytes (0..65535).                                                                                                                                                                                                                                                                                             |
| primary-vid    | Specify the ma-type as Primary VLAN-id based MA name format. The <ma-type-name> is the VLAN id number that has been assigned to the MA as the primary VLAN.                                                                                                                                                                                                                                               |
| string         | Specify the ma-type as Character String based MA name format. The <ma-type-name> is a string of 1 to 45 characters.                                                                                                                                                                                                                                                                                       |
| vpn-id         | Specify the ma-type as an RFC2685 VPN ID based MA name format. The <ma-type-name> is a 7 Byte value divided into two parts. The first part makes up the VPN's OUI which is three octets and the remaining four octets make up the VPN Index. The format is HHHHHH.HHHHHHHH where H is a hexadecimal digit.                                                                                                |
| ma-type-name   | The Maintenance Association (MA) name type.                                                                                                                                                                                                                                                                                                                                                               |
| <ma-type-name> | The value of the MA type name, which depends on the ma-type selected (icc, integer, primary-vid, string, vpn-id).                                                                                                                                                                                                                                                                                         |
| vlan           | An optional parameter that specifies the VLAN.                                                                                                                                                                                                                                                                                                                                                            |
| <primary-vid>  | Specify the ID of the primary VLAN in the MA.                                                                                                                                                                                                                                                                                                                                                             |
| mip-creation   | Optional parameter that specifies the MIP creation permission value.                                                                                                                                                                                                                                                                                                                                      |

| Parameter | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| none      | Specifies that no MIPs are to be created (the default and only choice). |

**Mode** Ethernet CFM Configuration

**Usage notes** A Maintenance Association is a Connectivity Fault Management (CFM) term that represents a particular segment of a network within a Maintenance Domain. An MA can represent a segment of a VLAN that is managed for connectivity within that segment. As a VLAN is often the granularity that a Network Service Provider sells to their customer, an MA is often referred to as a "Service". An MA can also be used to represent a link and in this case the MA is VLAN unaware.

As part of CFM, a Connectivity Check Message (CCM) is used to detect Ethernet connectivity faults amongst nodes that participate in CFM. CCM messages carry the MA name within the MAID field. Within an MD instance context, this command is used to configure the MA name, which can be chosen from a variety of format types.

**Example** To create a Maintenance Association instance named "MA-INST2-1" with an MA name type of "string" and value of "MA-12V100", use the command:

```
awplus(config-ether-cfm)# service ma-name MA-INST2-1 ma-type
string ma-type-name MA-12V100
```

To destroy a Maintenance Association instance named "MA-INST2-1", use the command:

```
awplus(config-ether-cfm)# no service MA-INST2-1
```

**Command changes**    Version 5.4.7-1.1: command added  
                          Version 5.4.8-0.2: added to SBx8100 series products  
                          Version 5.4.8-1.1: added to SBx908 GEN2 series products

## show ethernet cfm details

**Overview** Use this command to show CFM configuration, status, and statistics in detail for all CFM entities that the system knows about.

**Syntax** show ethernet cfm details

**Mode** User Exec/Privileged Exec

**Example** To show CFM configuration, status, and statistics in detail for all CFM entities, use the command:

```
awplus# show ethernet cfm details
```

The output loops through the hierarchy of MDs, then MAs within each MD, then local MEPs within that MA, and finally remote MEPs within that MA.

**Output** The following shows typical output.

**Example output from show ethernet cfm details**

```
awplus#show ethernet cfm details

# show ethernet cfm domain

**Overview** Use this command to show the Ethernet CFM Domain(s) that have been configured in summary format. Options include the ability to show all domains with detailed information, or to show a specified domain with detailed information.

**Syntax** show ethernet cfm domain  
show ethernet cfm domain details  
show ethernet cfm domain <domain-name> details

| Parameter     | Description                                                    |
|---------------|----------------------------------------------------------------|
| <domain-name> | The CLI name that identifies this Maintenance Domain instance. |
| details       | Provide detailed information in the output.                    |

**Mode** Privileged Exec

**Example** To show all domain configurations in summary format, use the command:

```
awplus# show ethernet cfm domain
```

To show all domains in detail, use the command:

```
awplus# show ethernet cfm domain details
```

To show a specific domain named "MD-INST1" in detail, use the command:

```
awplus# show ethernet cfm domain MD-INST1 details
```

**Output** The following shows typical output.

**Example output from show ethernet cfm domain**

```
awplus#show ethernet cfm domain

CFM Domain Name                      Level
-----
MD-INST1                             0
MD-INST2                             3
```

**Parameters in the output from show ethernet cfm domain**

| Parameter       | Description                                         |
|-----------------|-----------------------------------------------------|
| CFM Domain Name | The Maintenance Domain name for the managed object. |
| Level           | The level for the domain.                           |

**Example output from show ethernet cfm domain details**

```
awplus#show ethernet cfm domain details

Maintenance Domain Name..... MD-INST1
Maintenance Domain Name Format... character-string
Maintenance Domain Name Value... MD-12L0
Level..... 0
Associated CFM Services..... (Link Level ): MA-INST1-1
MIP Creation..... None
-----
Maintenance Domain Name..... MD-INST2
Maintenance Domain Name Format... character-string
Maintenance Domain Name Value... MD-12L3
Level..... 3
Associated CFM Services..... (Link Level ): MA-INST2-1
MIP Creation..... None
-----
```

**Example output from show ethernet cfm domain MD-INST1 details**

```
awplus#show ethernet cfm domain MD-INST1 details

Maintenance Domain Name..... MD-INST1
Maintenance Domain Name Format... character-string
Maintenance Domain Name Value... MD-12L0
Level..... 0
Associated CFM Services..... (Link Level ): MA-INST1-1
MIP Creation..... None
-----
```

**Parameters in the output from show ethernet cfm domain details**

| Parameter   | Description                                         |
|-------------|-----------------------------------------------------|
| Domain Name | The Maintenance Domain name for the managed object. |

| Parameter                    | Description                                                                                                     |
|------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Domain Name Format and Value | The Maintenance Domain Name Format and Value. The format is one of the following: character-stringDNSMACNo name |
| Level                        | The level for the domain.                                                                                       |
| Associated CFM Services      | The Maintenance Associations (MA) instance names.                                                               |
| MIP Creation                 | The MIP creation value.                                                                                         |

Version 5.4.8-1.1: added to SBx908 GEN2 series products

## show ethernet cfm errorlog

**Overview** Use this command to list the CFM Errors that are in the CFM Errors Event List, starting from the oldest at the top to the latest at the end.

**Syntax** show ethernet cfm errorlog domain *<domain-name>*

| Parameter                  | Description                    |
|----------------------------|--------------------------------|
| <i>&lt;domain-name&gt;</i> | Specify the domain name value. |

**Mode** Privileged Exec

**Usage notes** When a new error is detected for a Maintenance Association (MA) that is associated with a Maintenance Domain (MD), and such is due to an error from a received or missing CCM from a Remote MEP, an event is logged to the CFM Errors Event List.

**Example** To show the list of errors for an MD named "MD-INST2", use the command:  
awplus# show ethernet cfm errorlog domain MD-INST2

**Output** The following shows typical output.

**Example output from show ethernet cfm errorlog domain MD-INST2**

|                                                   |       |      |       |                |                 |  |
|---------------------------------------------------|-------|------|-------|----------------|-----------------|--|
| awplus#show ethernet cfm errorlog domain MD-INST2 |       |      |       |                |                 |  |
| CFM Service Name                                  | Level | VLAN | MEPID | Remote MAC     | Error Reason    |  |
| MA-INST2-1                                        | 0     | 0    | 12    | 0000.0000.0000 | Remote MEP Down |  |

**Parameters in the output from show ethernet cfm errorlog domain MD-INST2**

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Level            | The level configured for the MD.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| VLAN             | The VLAN ID used by the MA if any, otherwise is "0".                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| MEPID            | The MEP ID of the local MEP that detected the error.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Remote MAC       | The source MAC address of the received CCM causing the error if known, 0000.0000.0000 otherwise.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Error Reason     | One of the following: "Remote MEP Down" - an RMEPCCMDefect has been declared for this remote MEP. CCMs have not been received from this remote MEP within the CCM interval. "MEP Configuration" - the CCM received from the remote MEP has the same MEP ID as the local MEP that received the CCM. For unicast remote MEPs this error can also indicate that even though the CCM received from the remote MEP has an MEP ID that matches a configured remote MEP ID in the MA, the source MAC address differs from the configured MAC address for that remote MEP. "Forwarding Loop" - the CCM received from the remote MEP has an MEP ID that matches a configured local MEP ID in the MA, and also has the same source MAC address as the local MEP's MAC address that received the CCM. "Cross Connected" - a xconCCMdefect was detected. |
| CFM Service Name | The name of the MA associated with the MD for this error(s).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

# show ethernet cfm maintenance-points local mep

**Overview** Use this command to show one or more Local MEPs, and their configuration and status in summary format. Options include the ability to show Local MEP(s) for a given interface with further option to show statistics counters. Another option is to show Local MEPs for a given Maintenance Association (MA) and Maintenance Domain (MD) either for statistics counters, or for one specific Local MEP with either detailed information or statistics counters.

**Syntax** `show ethernet cfm maintenance-points local mep interface <port> [counters]`  
`show ethernet cfm maintenance-points local mep domain <domain-name> service <ma-name> [counters]`  
`show ethernet cfm maintenance-points local mep domain <domain-name> service <ma-name> mep <mep-id> {details|counters}`

| Parameter        | Description                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------|
| interface        | Specify the interface for which Local MEP(s) are to be shown.                                                          |
| <interface-name> | Specify the interface by name.                                                                                         |
| counters         | Specify that counter statistics are to be shown.                                                                       |
| domain           | Specify the Maintenance Domain that Local MEP(s) are to be shown for. Both this and service must be specified.         |
| <domain-name>    | Specify the Maintenance Domain's CLI instance name.                                                                    |
| service          | Specify the Maintenance Association that the Local MEP(s) are to be shown for. Both this and domain must be specified. |
| <ma-name>        | Specify CLI name that identifies the service (Maintenance Association (MA)) instance of interest.                      |
| mep              | Specify one particular Local MEP of interest.                                                                          |
| <mep-id>         | Specify the Local MEP instance by MEP-id.                                                                              |
| details          | Specify that details are to be included in the output.                                                                 |

**Mode** User Exec/Privileged Exec

**Examples** To show the configuration and status of all the Local MEP(s) on an interface, use the command:

```
awplus# show ethernet cfm maintenance-points local mep interface  
port1.0.2
```

To show details of a specific Local MEP on an MA and its associated MD, use the command:

```
awplus# show ethernet cfm maintenance-points local mep domain  
MD-INST1 service MA-INST1-1 mep 12 details
```

**Output** The following shows typical output.

**Example output from show ethernet cfm maintenance-points local mep interface port1.0.2**

```
awplus#show ethernet cfm maintenance-points local mep
interface port1.0.2
```

| Service Name | MEPID | Dir | Interface | State | Defect |
|--------------|-------|-----|-----------|-------|--------|
| MA-INST1-1   | 12    | D   | port1.0.2 | En    | ..3..  |

**Parameters in the output from show ethernet cfm maintenance-points local mep interface <interface-name>**

| Parameter    | Description                                                                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service Name | The MA service name.                                                                                                                                                     |
| MEPID        | The MEP ID of the local MEP of interest within the MA.                                                                                                                   |
| Dir          | The direction of this local MEP:D - Down MEP.U - Up MEP.Note: Only Down is currently supported.                                                                          |
| Interface    | The interface on which the local MEP resides.                                                                                                                            |
| State        | Whether the local MEP's CCM processing is enabled "En" or disabled "Dis".                                                                                                |
| Defect       | Defect bit list <dbl> indicating which of 5 possible defects are currently being detected with each bit showing the detected <defect-number> or . if there is no defect. |

**Example output from show ethernet cfm maintenance-points local mep domain MD-INST1 service MA-INST1-1 mep 12 details**

```
awplus#show ethernet cfm maintenance-points local mep domain MD-
INST1 service MA-INST1-1 mep 12 details
```

**Parameters in the output from show ethernet cfm maintenance-points local mep domain <domain-name> service <ma-name> mep <mep-id> details**

| Parameter                       | Description                                                                                                                                                                                       |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Domain Name and MA Service Name | Uniquely identify the MD and MA this local MEP is associated with.                                                                                                                                |
| MA Primary VLAN                 | The VLAN used by this MEP. A link-local MEP VLAN is indicated by “-”.                                                                                                                             |
| MEP ID                          | The local MEP's ID.                                                                                                                                                                               |
| Direction                       | The direction of the local MEP, either Down or Up.                                                                                                                                                |
| Interface                       | The Interface port or Interface lag that the local MEP is configured against.                                                                                                                     |
| MEP Active State                | The MEP's configured administrative state:Up: TrueDown: False.                                                                                                                                    |
| CC State                        | The MEP's CCM configured administrative state:Up: EnableDown: Disable.                                                                                                                            |
| CC Type                         | The configured CCM sending and receiving type, either multicast or unicast. If not yet configured, it shows as None.                                                                              |
| Tx-RDI                          | Whether this local MEP is sending RDI or not. An RDI is sent when one or more of the following defects have been declared by the local MEP:someRMEPCCMdefectsoneMACstatusDefecterrorCCMdefectxco  |
| Current Defects                 | A list of defects the local MEP is currently detecting. It shows the defect(s), as both a defect priority and name.                                                                               |
| Current Highest Defect Alarm    | The highest defect priority that has been encountered while the local MEP has been in an alarm state.                                                                                             |
| Alarm Minimum Defect            | The minimum defect the local MEP has to see before declaring an alarm.                                                                                                                            |
| Alarm Trip Time                 | The amount of time the defect has to exist before an alarm is declared.                                                                                                                           |
| Configured Remote MEP IDs       | A comma separated list of configured remote MEPs (by MEP IDs) known by this local MEP. If the remote MEP also has a configured unicast MAC address, the MEP ID will also include -HHHH.HHHH.HHHH. |

| Parameter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Missing Remote MEPs         | The remote MEPs (by MEP ID) that have been configured against this local MEP but have not been heard from.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Error CCM Reason            | The reason that the local MEP is detecting the errorCCMdefect condition (if any):Wrong MEP ID Received - CCM received with correct level and MAID, but MEP ID has not been configured in this MA.My MEP ID Received - CCM received with correct level and MAID, but an MEP ID that is the same as a local MEP in this MA.My MEP ID Received (loop) - as above, but the CCM received also has the same MAC address as the local MEP in the MA.CCM Interval Mismatch - CCM received with correct level and MAID, but CCM interval does not match that configured for this MA.MAC address mismatch - for a configured unicast RMEP (via crosscheck) the MAC address did not match the provisioned value in the associated MA.N/A - indicates there is no error CCM defect being detected. |
| Last Error CCM              | If an errorCCMdefect condition is detected, portions of the CCM that caused this condition are displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Cross Connect Defect Reason | The reason that the local MEP is detecting the xconCCMdefect condition (if any):Wrong MAID - CCM received with correct level but incorrect MAID (mismatch in the domain name and/or short MA name versus configured).Wrong Level - CCM received with a level that is lower than the level configured for this local MEP's domain.N/A - indicates there is no error CCM defect being detected.                                                                                                                                                                                                                                                                                                                                                                                          |
| Last Cross Connect CCM      | If a xconCCMdefect condition is detected, portions of the CCM that caused this condition are displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

# show ethernet cfm maintenance-points remote mep

**Overview** Use this command to show one or more Ethernet CFM maintenance points, namely Remote Maintenance End Points (MEPs) within a given Maintenance Association (MA) and its associated Maintenance Domain (MD), and their configuration and status in summary format. Options include the ability to show an individual Remote MEP in detail.

**Syntax** show ethernet cfm maintenance-points remote mep domain <domain-name> service <ma-name> [{mac <rmep-mac-address>|rmep <mep-id>} details]

| Parameter          | Description                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------------------|
| domain             | Specify the Maintenance Domain that Remote MEP(s) are to be shown for.                                            |
| <domain-name>      | Specify the Maintenance Domain's CLI instance name.                                                               |
| service            | Specify the Maintenance Association that the Remote MEP(s) are to be shown for.                                   |
| <ma-name>          | Specify the service's (Maintenance Association (MA)) CLI instance name.                                           |
| mac                | Specify the remote MEP of interest by its MAC address.                                                            |
| <rmep-mac-address> | Specify the value of the remote MEP's MAC address using the format HHHH.HHHH.HHHH where H is a hexadecimal digit. |
| rmep               | Specify the remote MEP of interest by its ID.                                                                     |
| <mep-id>           | Specify the value of the remote MEP's ID in the range 1 to 8191.                                                  |

**Mode** User Exec/Privileged Exec

**Example** To show all the remote MEP(s)'s status for this MA and MD in summary form, use the command:

```
awplus# show ethernet cfm maintenance-points remote mep domain  
MD-INST1 service MA-INST1-1
```

To show a specific remote MEP by its ID in detail, use the command:

```
awplus# show ethernet cfm maintenance-points remote mep domain  
MD-INST1 service MA-INST1-1 rmep 21 details
```

To show a specific remote MEP by its MAC address in detail, use the command:

```
awplus# show ethernet cfm maintenance-points remote mep domain  
MD-INST1 service MA-INST1-1 mac 000c.2526.95bf details
```

**Output** The following shows typical output.

**Example output from show ethernet cfm maintenance-points remote mep domain MD-INST1 service MA-INST1-1**

```
awplus#show ethernet cfm maintenance-points remote mep domain MD-INST1 service MA-INST1-1

CFM Domain Name: MD-INST1
CFM Service Name: MA-INST1-1
      RX      RX      Port  Intf
MEPID  CCM      RDI  Stat  Stat
-----
21      Yes     No    Up    Up
```

**Example output from show ethernet cfm maintenance-points remote mep domain MD-INST1 service MA-INST1-1 rmep 21 details**

```
awplus#show ethernet cfm maintenance-points remote mep domain MD-INST1 service MA-INST1-1 rmep 21 details

CFM Service Name..... MA-INST1-1
CFM Domain Name..... MD-INST1
Remote MEPID..... 21
Receiving CCMS..... Yes
Rx RDI..... No
MAC Address..... 000c.2526.95bf
Port Status..... Up
Interface Status..... Up
```

**Example output from show ethernet cfm maintenance-points remote mep domain MD-INST1 service MA-INST1-1 mac 000c.2526.95bf details**

```
awplus#show ethernet cfm maintenance-points remote mep domain MD-INST1 service MA-INST1-1 mac 000c.2526.95bf details

CFM Service Name..... MA-INST1-1
CFM Domain Name..... MD-INST1
Remote MEPID..... 21
Receiving CCMS..... Yes
Rx RDI..... No

Port Status..... Up
Interface Status..... Up
```

**Parameters in the output from show ethernet cfm maintenance-points remote mep**

| Parameter                            | Description                                                                                      |
|--------------------------------------|--------------------------------------------------------------------------------------------------|
| CFM Domain Name and CFM Service Name | The instance identifiers that uniquely identify the MA and MD for the remote MEP(s) of interest. |
| Remote MEPID                         | The remote MEP ID that is configured for this MA.                                                |
| Receiving CCMS                       | The current state of the 802.1ag remote MEP state machine: Yes - RMEP_OK. CCMS are being         |

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                       |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  | received without any error.Wait - RMEP_START. Still preparing to receive remote MEP CCMs without a timeout occurring.Failed - RMEP_FAILED. While waiting to receive CCMs from a remote MEP, a timeout occurred.- - the state machine is not running.                                                                                              |
| RX RDI           | The current RDI being received from this remote MEP:True - the last CCM received from the remote MEP has the RDI set. This means the remote MEP itself is seeing one of the following defects: someRMEPCCMDefect, someMACstatusDefect, errorCCMdefect, xconCCMdefect.False - the last CCM received from the remote MEP does not have its RDI set. |
| MAC Address      | The configured or discovered MAC address of the remote MEP.                                                                                                                                                                                                                                                                                       |
| Port Status      | If the CCM was received with a port status TLV, this indicates the last value received, or "-" if none received.                                                                                                                                                                                                                                  |
| Interface Status | If the CCM was received with an interface status TLV, this indicates the last value received, or "-" if none received.                                                                                                                                                                                                                            |

## show ethernet cfm service

**Overview** Use this command to show the Ethernet CFM Services (Maintenance Associations (MA)) configuration in summary format, or show a specified MA with detailed information.

**Syntax** show ethernet cfm service [*<ma-name>* domain *<domain-name>* details]

| Parameter                  | Description                                                                                   |
|----------------------------|-----------------------------------------------------------------------------------------------|
| <i>&lt;ma-name&gt;</i>     | The CLI name that identifies the service (Maintenance Association (MA)) instance of interest. |
| domain                     | Specify the domain name by name.                                                              |
| <i>&lt;domain-name&gt;</i> | The CLI name that identifies this Maintenance Domain instance.                                |

**Mode** User Exec/Privileged Exec

**Example** To show details for all MAs in summary form, use the command:

```
awplus# show ethernet cfm service
```

To show a specified MA in detailed form, use the command:

```
awplus# show ethernet cfm service MA-INST2-1 domain MD-INST2 details
```

**Output** The following shows typical output.

**Example output from show ethernet cfm service**

```
awplus#show ethernet cfm service
```

| CFM Domain Name | CFM Service Name | VLAN | Defect |
|-----------------|------------------|------|--------|
| MD-INST1        | MA-INST1-1       | NONE | .....  |
| MD-INST2        | MA-INST2-1       | NONE | ..3..  |

**Parameters in the output from show ethernet cfm service**

| Parameter        | Description                                                                                                                                                                                                                              |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CFM Domain Name  | The Maintenance Domain name for the managed object.                                                                                                                                                                                      |
| CFM Service Name | The Maintenance Associations (MA) instance name.                                                                                                                                                                                         |
| VLAN             | The Primary VLAN.                                                                                                                                                                                                                        |
| Defect           | A list of defects detected by the MA's Local MEPs. The defects shown can be:1 - someRDIdefect is declared2 - someMACstatusDefect is declared3 - someRMEPCCMdefect is declared4 - errorCCMdefect is declared5 - xconCCMdefect is declared |

| Parameter                               | Description                                                                                                                                                                                                                                                                                   |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CFM Domain Name                         | The Maintenance Domain name for the managed object.                                                                                                                                                                                                                                           |
| CFM Domain Level                        | The level of the domain.                                                                                                                                                                                                                                                                      |
| Primary VLAN                            | The Primary VLAN that was configured (if any).                                                                                                                                                                                                                                                |
| Maintenance Assoc Name Format and Value | The name and name format of the MA. The name format is one of the following:<br>ICC - ICC string based name format<br>Integer - Integer based name format<br>Primary-vid - Primary VLAN based name format<br>String - Character string based name format<br>VPN-ID - VPN-ID based name format |
| CCM Transmission Interval               | The CCI that was configured for this MA. It can be one of the following:<br>3 - CCI of 100 milliseconds<br>4 - CCI of 1 second (default)<br>5 - CCI of 10 seconds<br>6 - CCI of 1 minute<br>7 - CCI of 10 minutes                                                                             |
| Local MEPs                              | A list of the Local MEPs configured for this MA. For each MEP, it displays the MEP direction Up or Down, its MEP-id, and the interface it was configured on.                                                                                                                                  |
| Configured Remote MEPs                  | A list of Remote MEPs by MEP-id.                                                                                                                                                                                                                                                              |
| Missing Remote MEPs                     | A list of the configured Remote MEPs that this MA has not received any CCM messages from within 3.5 times the configured CCI.                                                                                                                                                                 |
| Defect                                  | A list of defects detected by the MA's Local MEPs. The defects shown can be:<br>1 - someRDId defect is declared<br>2 - someMACstatusDefect is declared<br>3 - someRMEPCCMdefect is declared<br>4 - errorCCMdefect is declared<br>5 - xconCCMdefect is declared                                |

# show mep-alarm status

**Overview** Use this command to show any alarms that have been declared by Local MEPs, and the defect(s) that caused the alarm.

**Syntax** show mep-alarm status

**Mode** User Exec/Privileged Exec

**Usage notes** A Local MEP is used to detect connectivity faults with other remote MEPs that are in the same Maintenance Association (MA) and Maintenance Domain (MD) as the Local MEP. A Local MEP looks first for connectivity defects, and if these defects persist for a long enough period of time (typically 2.5 seconds), then an alarm is declared.

**Example** To show the alarms on local MEPs, use the command:  
awplus# show mep-alarm status

**Output** The following shows typical output.

## Example output from show mep-alarm status

|                              |                  |     |              |
|------------------------------|------------------|-----|--------------|
| awplus#show mep-alarm status |                  |     |              |
| CFM Domain Name              | CFM Service Name | MEP | Active Alarm |
| -----                        |                  |     |              |
| MD-INST1                     | MA-INST1-1       | 12  | someRMEPCCM  |

## Parameters in the output from show mep-alarm status

| Parameter        | Description                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------|
| CFM Domain Name  | The domain name.                                                                                                                |
| CFM Service Name | The MA name.                                                                                                                    |
| Active Alarms    | The highest priority defect causing the alarm, one of the following: someRDI, someMACstatus, someRMEPCCM, errorCCM, or xconCCM. |
| MEP              | The local MEP's ID.                                                                                                             |

# Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure logging. See the [Logging Feature Overview and Configuration Guide](#) for more information about the different types of log and how to filter log messages.

## clear exception log

**Overview** This command resets the contents of the exception log, but does not remove the associated core files.

**Syntax** clear exception log

**Mode** Privileged Exec

**Example** awplus# clear exception log

# clear log

**Overview** This command removes the contents of the buffered and permanent logs.

**Syntax** clear log

**Mode** Privileged Exec

**Example** To delete the contents of the buffered and permanent log use the command:

```
awplus# clear log
```

**Related commands**

- [clear log buffered](#)
- [clear log permanent](#)
- [show log](#)

# clear log buffered

**Overview** This command removes the contents of the buffered log.

**Syntax** clear log buffered

**Mode** Privileged Exec

**Example** To delete the contents of the buffered log use the following commands:

```
awplus# clear log buffered
```

**Related commands**

- [default log buffered](#)
- [log buffered](#)
- [log buffered \(filter\)](#)
- [log buffered size](#)
- [log buffered exclude](#)
- [show log](#)
- [show log config](#)

# clear log external

**Overview** Use this command to delete the external log file from the USB storage device it is stored on.

If the external log is rotating between multiple files, this command deletes all those files, not just the most recent one.

When this command is used within a stacked environment, it will delete the external logs on all stack members.

**Syntax** `clear log external`

**Mode** Privileged Exec

**Example** To delete the external log file, use the command:

```
awplus# clear log external
```

**Related commands**

- [default log external](#)
- [log external](#)
- [log external \(filter\)](#)
- [log external exclude](#)
- [log external rotate](#)
- [log external size](#)
- [show log config](#)
- [show log external](#)
- [unmount](#)

**Command changes** Version 5.4.7-1.1: command added

# clear log permanent

**Overview** This command removes the contents of the permanent log.

**Syntax** clear log permanent

**Mode** Privileged Exec

**Example** To delete the contents of the permanent log use the following commands:

```
awplus# clear log permanent
```

**Related commands**

- [default log permanent](#)
- [log permanent](#)
- [log permanent \(filter\)](#)
- [log permanent exclude](#)
- [log permanent size](#)
- [show log config](#)
- [show log permanent](#)

# copy buffered-log

**Overview** Use this command to copy the buffered log to an internal or external destination.

**Syntax** `copy buffered-log <destination-name>`

| Parameter                             | Description                                                                                        |
|---------------------------------------|----------------------------------------------------------------------------------------------------|
| <code>&lt;destination-name&gt;</code> | The filename and path for the destination file. See <a href="#">Introduction</a> for valid syntax. |

**Mode** Privileged Exec

**Example** To copy the buffered log file into a folder in Flash named “buffered-log” and name the file “buffered-log.log”, use the command:

```
awplus# copy buffered-log flash:/buffered-log/buffered-log.log
```

To copy the buffered log file onto a USB storage device and name the file “buffered-log.log”, use the command:

```
awplus# copy buffered-log usb:/buffered-log.log
```

**Related commands** [log buffered](#)  
[show file systems](#)  
[show log](#)

**Command changes** Version 5.4.7-1.1: command added

## copy permanent-log

**Overview** Use this command to copy the permanent log to an internal or external destination.

**Syntax** `copy permanent-log <destination-name>`

| Parameter                             | Description                                                                                        |
|---------------------------------------|----------------------------------------------------------------------------------------------------|
| <code>&lt;destination-name&gt;</code> | The filename and path for the destination file. See <a href="#">Introduction</a> for valid syntax. |

**Mode** Privileged Exec

**Example** To copy the permanent log file into a folder in Flash named “perm-log” and name the file “permanent-log.log”, use the command:

```
awplus# copy permanent-log flash:/perm-log/permanent-log.log
```

To copy the permanent log file onto a USB storage device and name the file “permanent-log.log”, use the command:

```
awplus# copy permanent-log usb:/permanent-log.log
```

**Related commands**

- [log permanent](#)
- [show file systems](#)
- [show log permanent](#)

**Command changes** Version 5.4.7-1.1: command added

# default log buffered

**Overview** This command restores the default settings for the buffered log stored in RAM. By default the size of the buffered log is 50 kB and it accepts messages with the severity level of “warnings” and above.

**Syntax** default log buffered

**Default** The buffered log is enabled by default.

**Mode** Global Configuration

**Example** To restore the buffered log to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log buffered
```

**Related commands**

- clear log buffered**
- log buffered**
- log buffered (filter)**
- log buffered size**
- log buffered exclude**
- show log**
- show log config**

# default log console

**Overview** This command restores the default settings for log messages sent to the terminal when a **log console** command is issued. By default all messages are sent to the console when a **log console** command is issued.

**Syntax** default log console

**Mode** Global Configuration

**Example** To restore the log console to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log console
```

**Related commands**

- log console**
- log console (filter)**
- log console exclude**
- show log config**

# default log email

**Overview** This command restores the default settings for log messages sent to an email address. By default no filters are defined for email addresses. Filters must be defined before messages will be sent. This command also restores the remote syslog server time offset value to local (no offset).

**Syntax** `default log email <email-address>`

| Parameter                          | Description                               |
|------------------------------------|-------------------------------------------|
| <code>&lt;email-address&gt;</code> | The email address to send log messages to |

**Mode** Global Configuration

**Example** To restore the default settings for log messages sent to the email address `admin@alliedtelesis.com` use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# default log email admin@alliedtelesis.com
```

**Related commands**

- [log email](#)
- [log email \(filter\)](#)
- [log email exclude](#)
- [log email time](#)
- [show log config](#)

# default log external

**Overview** Use this command to restore the default settings for the external log. By default, the size of the external log is 50 kB, it rotates through 1 additional file, and it accepts messages with a severity level of notices and above.

Note that this command does not clear the configured filename for the external log.

**Syntax** `default log external`

**Mode** Global Configuration

**Example** To restore the default settings for the external log, use the commands:

```
awplus# configure terminal
awplus(config)# default log external
```

**Related commands**

- [clear log external](#)
- [log external](#)
- [log external \(filter\)](#)
- [log external exclude](#)
- [log external rotate](#)
- [log external size](#)
- [show log config](#)
- [show log external](#)
- [unmount](#)

**Command changes** Version 5.4.7-1.1: command added

# default log host

**Overview** This command restores the default settings for log sent to a remote syslog server. By default no filters are defined for remote syslog servers. Filters must be defined before messages will be sent. This command also restores the remote syslog server time offset value to local (no offset).

**Syntax** default log host *<ip-addr>*

| Parameter              | Description                              |
|------------------------|------------------------------------------|
| <i>&lt;ip-addr&gt;</i> | The IP address of a remote syslog server |

**Mode** Global Configuration

**Example** To restore the default settings for messages sent to the remote syslog server with IP address 10.32.16.21 use the following commands:

```
awplus# configure terminal
awplus(config)# default log host 10.32.16.21
```

**Related commands**

- [log host](#)
- [log host \(filter\)](#)
- [log host exclude](#)
- [log host source](#)
- [log host time](#)
- [show log config](#)

# default log monitor

**Overview** This command restores the default settings for log messages sent to the terminal when a **terminal monitor** command is used.

**Syntax** default log monitor

**Default** All messages are sent to the terminal when a **terminal monitor** command is used.

**Mode** Global Configuration

**Example** To restore the log monitor to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log monitor
```

**Related commands**

- log monitor (filter)**
- log monitor exclude**
- show log config**
- terminal monitor**

# default log permanent

**Overview** This command restores the default settings for the permanent log stored in Flash. By default, the size of the permanent log is 50 kB and it accepts messages with the severity level of warnings and above.

**Syntax** default log permanent

**Default** The permanent log is enabled by default.

**Mode** Global Configuration

**Example** To restore the permanent log to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log permanent
```

**Related commands**

- [clear log permanent](#)
- [log permanent](#)
- [log permanent \(filter\)](#)
- [log permanent exclude](#)
- [log permanent size](#)
- [show log config](#)
- [show log permanent](#)

# log buffered

**Overview** This command configures the device to store log messages in RAM. Messages stored in RAM are not retained on the device over a restart. Once the buffered log reaches its configured maximum allowable size old messages will be deleted to make way for new ones.

**Syntax** log buffered  
no log buffered

**Default** The buffered log is configured by default.

**Mode** Global Configuration

**Examples** To configured the device to store log messages in RAM use the following commands:

```
awplus# configure terminal  
awplus(config)# log buffered
```

To configure the device to not store log messages in a RAM buffer use the following commands:

```
awplus# configure terminal  
awplus(config)# no log buffered
```

**Related commands**

- clear log buffered**
- copy buffered-log**
- default log buffered**
- log buffered (filter)**
- log buffered size**
- log buffered exclude**
- show log**
- show log config**

## log buffered (filter)

**Overview** Use this command to create a filter to select messages to be sent to the buffered log. Selection can be based on the priority/ severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

The **no** variant of this command removes the corresponding filter, so that the specified messages are no longer sent to the buffered log.

**Syntax** log buffered [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]  
no log buffered [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]

| Parameter       | Description                                                                                                                                                                                                                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level           | Filter messages to the buffered log by severity level.                                                                                                                                                                                                                                                  |
| <level>         | The minimum severity of message to send to the buffered log. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:                                                                                                   |
| 0 emergencies   | System is unusable                                                                                                                                                                                                                                                                                      |
| 1 alerts        | Action must be taken immediately                                                                                                                                                                                                                                                                        |
| 2 critical      | Critical conditions                                                                                                                                                                                                                                                                                     |
| 3 errors        | Error conditions                                                                                                                                                                                                                                                                                        |
| 4 warnings      | Warning conditions                                                                                                                                                                                                                                                                                      |
| 5 notices       | Normal, but significant, conditions                                                                                                                                                                                                                                                                     |
| 6 informational | Informational messages                                                                                                                                                                                                                                                                                  |
| 7 debugging     | Debug-level messages                                                                                                                                                                                                                                                                                    |
| program         | Filter messages to the buffered log by program. Include messages from a specified program in the buffered log.                                                                                                                                                                                          |
| <program- name> | The name of a program to log messages from. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. |
| rip             | Routing Information Protocol (RIP)                                                                                                                                                                                                                                                                      |
| ripng           | Routing Information Protocol - next generation (RIPng)                                                                                                                                                                                                                                                  |
| ospf            | Open Shortest Path First (OSPF)                                                                                                                                                                                                                                                                         |
| ospfv3          | Open Shortest Path First (OSPF) version 3 (OSPFv3)                                                                                                                                                                                                                                                      |

| rstp       | Rapid Spanning Tree Protocol (RSTP)                                                          |
| mstp       | Multiple Spanning Tree Protocol (MSTP)                                                       |
| imi        | Integrated Management Interface (IMI)                                                        |
| imish      | Integrated Management Interface Shell (IMISH)                                                |
| epsr       | Ethernet Protection Switched Rings (EPSR)                                                    |
| irdp       | ICMP Router Discovery Protocol (IRDP)                                                        |
| rmon       | Remote Monitoring                                                                            |
| loopprot   | Loop Protection                                                                              |
| poe        | Power-inline (Power over Ethernet)                                                           |
| dhcpsn     | DHCP snooping (DHCP SN)                                                                      |
| facility   | Filter messages to the buffered log by syslog facility.                                      |
| <facility> | Specify one of the following syslog facilities to include messages from in the buffered log: |
| kern       | Kernel messages                                                                              |

| Parameter      | Description                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------|
| user           | Random user-level messages                                                                                              |
| mail           | Mail system                                                                                                             |
| daemon         | System daemons                                                                                                          |
| auth           | Security/authorization messages                                                                                         |
| syslog         | Messages generated internally by syslogd                                                                                |
| lpr            | Line printer subsystem                                                                                                  |
| news           | Network news subsystem                                                                                                  |
| uucp           | UUCP subsystem                                                                                                          |
| cron           | Clock daemon                                                                                                            |
| authpriv       | Security/authorization messages (private)                                                                               |
| ftp            | FTP daemon                                                                                                              |
| msgtext        | Select messages containing a certain text string.                                                                       |
| <text- string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** By default the buffered log has a filter to select messages whose severity level is “notices (5)” or higher. This filter may be removed using the **no** variant of this command.

**Mode** Global Configuration

**Examples** To add a filter to send all messages generated by EPSR that have a severity of **notices** or higher to the buffered log, use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered level notices program epsr
```

To add a filter to send all messages containing the text “Bridging initialization” to the buffered log, use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered msgtext Bridging initialization
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to the buffered log, use the following commands:

```
awplus# configure terminal
awplus(config)# no log buffered level notices program epsr
```

To remove a filter that sends all messages containing the text “Bridging initialization” to the buffered log, use the following commands:

```
awplus# configure terminal
awplus(config)# no log buffered msgtext Bridging initialization
```

- show log config**

## log buffered exclude

**Overview** Use this command to exclude specified log messages from the buffered log. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** log buffered exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]  
no log buffered exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |               |                                    |          |                                                        |            |                                 |          |                                                    |            |                               |           |                                      |                 |                        |             |                      |

| <facility> | Specify one of the following syslog facilities to exclude messages from: |
| kern       | Kernel messages                                                          |
| user       | Random user-level messages                                               |

| Parameter      | Description                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------|
| mail           | Mail system                                                                                                             |
| daemon         | System daemons                                                                                                          |
| auth           | Security/authorization messages                                                                                         |
| syslog         | Messages generated internally by syslogd                                                                                |
| lpr            | Line printer subsystem                                                                                                  |
| news           | Network news subsystem                                                                                                  |
| uucp           | UUCP subsystem                                                                                                          |
| cron           | Clock daemon                                                                                                            |
| authpriv       | Security/authorization messages (private)                                                                               |
| ftp            | FTP daemon                                                                                                              |
| msgtext        | Exclude messages containing a certain text string.                                                                      |
| <text- string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered exclude msgtext example of
irrelevant message
```

**Related commands**

- [default log buffered](#)
- [log buffered](#)
- [log buffered \(filter\)](#)
- [log buffered size](#)
- [show log](#)
- [show log config](#)

# log buffered size

**Overview** This command configures the amount of memory that the buffered log is permitted to use. Once this memory allocation has been filled, old messages will be deleted to make room for new messages.

Use the **no** variant of this command to return to the default.

**Syntax** `log buffered size <50-250>`

| Parameter                   | Description                            |
|-----------------------------|----------------------------------------|
| <code>&lt;50-250&gt;</code> | Size of the permanent log in kilobytes |

**Default** 50 kilobytes

**Mode** Global Configuration

**Example** To allow the buffered log to use up to 100 kilobytes of RAM, use the commands:

```
awplus# configure terminal
awplus(config)# log buffered size 100
```

To return to the default value, use the commands:

```
awplus# configure terminal
awplus(config)# no log buffered size
```

**Related commands**

- `clear log buffered`
- `copy buffered-log`
- `default log buffered`
- `log buffered`
- `log buffered (filter)`
- `log buffered exclude`
- `show log`
- `show log config`

**Command changes** Version 5.5.3-2.1: Maximum and default size increased on AMFCloud and AR4000S-Cloud

# log console

**Overview** This command configures the device to send log messages to consoles. The console log is configured by default to send messages to the device's main console port.

Use the **no** variant of this command to configure the device not to send log messages to consoles.

**Syntax** log console  
no log console

**Mode** Global Configuration

**Examples** To configure the device to send log messages use the following commands:

```
awplus# configure terminal
awplus(config)# log console
```

To configure the device not to send log messages in all consoles use the following commands:

```
awplus# configure terminal
awplus(config)# no log console
```

**Related commands** [default log console](#)  
[log console \(filter\)](#)  
[log console exclude](#)  
[show log config](#)

## log console (filter)

**Overview** This command creates a filter to select messages to be sent to all consoles when the **log console** command is given. Selection can be based on the priority/severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

**Syntax** log console [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]  
no log console [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |               |                                    |          |                                                        |            |                                 |          |                                                    |            |                               |           |                                      |                 |                        |             |                      |

| Parameter      | Description                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------|
| mail           | Mail system                                                                                                             |
| daemon         | System daemons                                                                                                          |
| auth           | Security/authorization messages                                                                                         |
| syslog         | Messages generated internally by syslogd                                                                                |
| lpr            | Line printer subsystem                                                                                                  |
| news           | Network news subsystem                                                                                                  |
| uucp           | UUCP subsystem                                                                                                          |
| cron           | Clock daemon                                                                                                            |
| authpriv       | Security/authorization messages (private)                                                                               |
| ftp            | FTP daemon                                                                                                              |
| msgtext        | Select messages containing a certain text string.                                                                       |
| <text- string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** By default the console log has a filter to select messages whose severity level is **critical** or higher. This filter may be removed using the **no** variant of this command. This filter may be removed and replaced by filters that are more selective.

**Mode** Global Configuration

**Examples** To create a filter to send all messages containing the text “Bridging initialization” to console instances where the **log console** command has been entered, use the following commands:

```
awplus# configure terminal
awplus(config)# log console msgtext "Bridging initialization"
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to consoles, use the following commands:

```
awplus# configure terminal
awplus(config)# no log console level notices program epsr
```

To remove a default filter that includes sending **critical**, **alert** and **emergency** level messages to the console, use the following commands:

```
awplus# configure terminal
awplus(config)# no log console level critical
```

**Related commands**

- default log console**
- log console**
- log console exclude**
- show log config**

# log console exclude

**Overview** Use this command to prevent specified log messages from being sent to the console, when console logging is turned on. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** log console exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]  
no log console exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]

| ftp            | FTP daemon                                                                                                              |
| msgtext        | Exclude messages containing a certain text string.                                                                      |
| <text- string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
awplus(config)# log console exclude msgtext example of
irrelevant message
```

# log email

**Overview** This command configures the device to send log messages to an email address. The email address is specified in this command.

**Syntax** `log email <email-address>`

| Parameter                          | Description                               |
|------------------------------------|-------------------------------------------|
| <code>&lt;email-address&gt;</code> | The email address to send log messages to |

**Default** By default no filters are defined for email log targets. Filters must be defined before messages will be sent.

**Mode** Global Configuration

**Example** To have log messages emailed to the email address `admin@alliedtelesis.com` use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@alliedtelesis.com
```

- [log email exclude](#)
- [log email time](#)
- [show log config](#)

## log email (filter)

**Overview** This command creates a filter to select messages to be sent to an email address. Selection can be based on the priority/ severity of the message, the program that generated the message, the logging facility used, a substring within the message or a combination of some or all of these.

The **no** variant of this command configures the device to no longer send log messages to a specified email address. All configuration relating to this log target will be removed.

**Syntax** log email <email-address> [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]  
no log email <email-address> [level <level>] [program <program-name>] [facility <facility>] [msgtext <text-string>]

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |               |                                    |          |                                                        |            |                                 |          |                                                    |            |                               |           |                                     |                 |                        |             |                      |

| authpriv       | Security/authorization messages (private)                                                                               |
| ftp            | FTP daemon                                                                                                              |
| msgtext        | Select messages containing a certain text string.                                                                       |
| <text- string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

### Mode Global Configuration

**Examples** To create a filter to send all messages generated by EPSR that have a severity of **notices** or higher to the email address admin@homebase.com, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@homebase.com level notices
program epsr
```

To create a filter to send all messages containing the text "Bridging initialization", to the email address admin@homebase.com, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@homebase.com msgtext "Bridging
initialization"
```

To create a filter to send messages with a severity level of **informational** and above to the email address admin@alliedtelesis.com, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@alliedtelesis.com level
informational
```

To stop the device emailing log messages emailed to the email address admin@alliedtelesis.com, use the following commands:

```
awplus# configure terminal
awplus(config)# no log email admin@homebase.com
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to the email address admin@homebase.com, use the following commands:

```
awplus# configure terminal
awplus(config)# no log email admin@homebase.com level notices
program epsr
```

To remove a filter that sends messages with a severity level of **informational** and above to the email address admin@alliedtelesis.com, use the following commands:

```
awplus# configure terminal
awplus(config)# no log email admin@alliedtelesis.com level
informational
```

## log email exclude

**Overview** Use this command to prevent specified log messages from being emailed, when the device is configured to send log messages to an email address. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** log email exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]  
no log email exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |               |                                    |          |                                                        |            |                                 |          |                                                    |            |                               |           |                                      |                 |                        |             |                      |

| uucp           | UUCP subsystem                                                                                                          |
| cron           | Clock daemon                                                                                                            |
| authpriv       | Security/authorization messages (private)                                                                               |
| ftp            | FTP daemon                                                                                                              |
| msgtext        | Exclude messages containing a certain text string.                                                                      |
| <text- string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
awplus(config)# log email exclude msgtext example of irrelevant message
```

# log email time

**Overview** This command configures the time used in messages sent to an email address. If the syslog server is in a different time zone to your device then the time offset can be configured using either the **utc-offset** parameter option keyword or the **local-offset** parameter option keyword, where **utc-offset** is the time difference from UTC (Universal Time, Coordinated) and **local-offset** is the difference from local time.

**Syntax** `log email <email-address> time {local|local-offset|utc-offset {plus|minus}<0-24>}`

| Parameter       | Description                                                                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <email-address> | The email address to send log messages to                                                                                                                                                                      |
| time            | Specify the time difference between the email recipient and the device you are configuring.                                                                                                                    |
| local           | The device is in the same time zone as the email recipient                                                                                                                                                     |
| local-offset    | The device is in a different time zone to the email recipient. Use the <b>plus</b> or <b>minus</b> keywords and specify the difference (offset) from local time of the device to the email recipient in hours. |
| utc-offset      | The device is in a different time zone to the email recipient. Use the <b>plus</b> or <b>minus</b> keywords and specify the difference (offset) from UTC time of the device to the email recipient in hours.   |
| plus            | Negative offset (difference) from the device to the email recipient.                                                                                                                                           |
| minus           | Positive offset (difference) from the device to the email recipient.                                                                                                                                           |
| <0-24>          | World Time zone offset in hours                                                                                                                                                                                |

**Default** The default is **local** time.

**Mode** Global Configuration

**Usage notes** Use the **local** option if the email recipient is in the same time zone as this device. Messages will display the time as on the local device when the message was generated.

Use the **offset** option if the email recipient is in a different time zone to this device. Specify the time offset of the email recipient in hours. Messages will display the time they were generated on this device but converted to the time zone of the email recipient.

**Examples** To send messages to the email address `test@home.com` in the same time zone as the device's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@base.com time local 0
```

To send messages to the email address `admin@base.com` with the time information converted to the time zone of the email recipient, which is 3 hours ahead of the device's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@base.com time local-offset plus
3
```

To send messages to the email address `user@remote.com` with the time information converted to the time zone of the email recipient, which is 3 hours behind the device's UTC time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log email user@remote.com time utc-offset minus
3
```

# log external

**Overview** Use this command to enable external logging. External logging sends syslog messages to a file on a USB storage device.

If the file does not already exist on the storage device, it (and any specified subdirectory) will be automatically created. If the file already exists, messages are appended to it.

Use the **no** variant of this command to disable external logging.

**Syntax** log external <filename>  
no log external

| Parameter  | Description                                                                                                                    |
|------------|--------------------------------------------------------------------------------------------------------------------------------|
| <filename> | The file and optionally directory path to store the log messages in.<br><br>See <a href="#">Introduction</a> for valid syntax. |

**Default** External logging is disabled by default.

**Mode** Global Configuration

**Usage notes** We strongly recommend using ext3 or ext4 as the file system on the external storage device. These file systems have a lower risk of file corruption occurring if the switch or firewall loses power.

You should also unmount the storage device before removing it from the switch or firewall, to avoid corrupting the log file. To unmount the device, use the **unmount** command.

If you are using this on a VCStack, each stack member needs to have its own external storage device. Enabling or disabling external logging enables or disables it on all stack members.

**Example** To save messages to a file called "messages.log" in a directory called "log" on a USB storage device, use the command:

```
awplus# configure terminal
awplus(config)# log external usb:/log/messages.log
```

- show log external**
- unmount**

**Command changes** Version 5.4.7-1.1: command added

## log external (filter)

**Overview** Use this command to create a filter to select messages to be sent to the external log. You can include messages based on:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

The **no** variant of this command removes the corresponding filter, so that the specified messages are no longer sent to the external log.

**Syntax** log external [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]  
no log external [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]

| epsr       | Ethernet Protection Switched Rings (EPSR)                                           |
| irdp       | ICMP Router Discovery Protocol (IRDP)                                               |
| rmon       | Remote Monitoring                                                                   |
| loopprot   | Loop Protection                                                                     |
| poe        | Power-inline (Power over Ethernet)                                                  |
| dhcpsn     | DHCP snooping (DHCP SN)                                                             |
| facility   | Filter messages to the external log by syslog facility.                             |
| <facility> | Specify one of the following syslog facilities to include messages from in the log: |
| kern       | Kernel messages                                                                     |

| Parameter      | Description                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------|
| user           | Random user-level messages                                                                                              |
| mail           | Mail system                                                                                                             |
| daemon         | System daemons                                                                                                          |
| auth           | Security/authorization messages                                                                                         |
| syslog         | Messages generated internally by syslogd                                                                                |
| lpr            | Line printer subsystem                                                                                                  |
| news           | Network news subsystem                                                                                                  |
| uucp           | UUCP subsystem                                                                                                          |
| cron           | Clock daemon                                                                                                            |
| authpriv       | Security/authorization messages (private)                                                                               |
| ftp            | FTP daemon                                                                                                              |
| msgtext        | Select messages containing a certain text string.                                                                       |
| <text- string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** By default the external log has a filter to select messages whose severity level is “notices (5)” or higher. This filter may be removed using the **no** variant of this command.

**Mode** Global Configuration

**Examples** To add a filter to send all messages generated by EPSR that have a severity of **notices** or higher to the external log, use the following commands:

```
awplus# configure terminal
awplus(config)# log external level notices program epsr
```

To add a filter to send all messages containing the text “Bridging initialization” to the external log, use the following commands:

```
awplus# configure terminal
awplus(config)# log external msgtext Bridging initialization
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to the external log, use the following commands:

```
awplus# configure terminal
awplus(config)# no log external level notices program epsr
```

To remove a filter that sends all messages containing the text “Bridging initialization” to the external log, use the following commands:

```
awplus# configure terminal
awplus(config)# no log external msgtext Bridging initialization
```

**Related commands**

- clear log external**
- default log external**
- log external**
- log external exclude**
- log external rotate**
- log external size**
- show log config**
- show log external**
- unmount**

**Command changes** Version 5.4.7-1.1: command added

## log external exclude

**Overview** Use this command to exclude specified log messages from the external log. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** log external exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]  
no log external exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]

| ftp            | FTP daemon                                                                                                              |
| msgtext        | Exclude messages containing a certain text string.                                                                      |
| <text- string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global Configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
awplus(config)# log external exclude msgtext example of
irrelevant message
```

**Related commands**

- [show log external](#)
- [unmount](#)

**Command changes** Version 5.4.7-1.1: command added

# log external rotate

**Overview** Use this command to configure the number of files that the external log can rotate through.

Use the **no** variant of this command to return to the default.

**Syntax** log external rotate <0-255>  
no log external rotate

| Parameter | Description                                                                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <0-255>   | The number of additional files to rotate through. Note that the device rotates between the initial file and the number of additional files specified by this value - see the Usage section below. |

**Default** The default is 1, which rotates between the initial file and 1 additional file (for example, rotates between messages.log and messages.log.1)

**Mode** Global Configuration

**Usage notes** The device rotates between the initial file and the number of additional files specified by this command. For example, the diagram below shows how setting rotate to 2 makes the device rotate through 3 files.

Note that if you set rotate to 0, and the external log file becomes full, then the device deletes the full log file and creates a new (empty) file of the same name to save messages into. For this reason, we recommend setting rotate to at least 1.

**Example** To set the rotation value to 2, and therefore rotate between 3 files, use the commands:

```
awplus# configure terminal
awplus(config)# log external rotate 2
```

**Related commands**

- [clear log external](#)
- [default log external](#)
- [log external](#)
- [log external \(filter\)](#)
- [log external exclude](#)
- [log external size](#)
- [show log config](#)
- [show log external](#)
- [unmount](#)

**Command changes** Version 5.4.7-1.1: command added

# log external size

**Overview** Use this command to configure the total amount of size that the external log is permitted to use, in kilobytes. The maximum possible depends on the storage device's file system.

Note that if you are rotating between multiple files, this is the maximum size of all files, not of each individual file. For example, if you are rotating between 2 files (**log external rotate 1**), each file will have a maximum size of 25 kBytes by default.

Use the **no** variant of this command to return to the default size.

**Syntax** log external size [<50-4194304>]  
no log external size

| Parameter    | Description                                                                       |
|--------------|-----------------------------------------------------------------------------------|
| <50-4194304> | The total amount of size that the external log is permitted to use, in kilobytes. |

**Default** 50 kBytes

**Mode** Global Configuration

**Example** To configure a total log size of 100 kBytes, use the commands:

```
awplus# configure terminal
awplus(config)# log external size 100
```

**Related commands**

- clear log external**
- default log external**
- log external**
- log external (filter)**
- log external exclude**
- log external rotate**
- log external size**
- show log config**
- show log external**
- unmount**

**Command changes** Version 5.4.7-1.1: command added

# log facility

**Overview** Use this command to assign a facility to all log messages generated on this device. This facility overrides any facility that is automatically generated as part of the log message.

Use the **no** variant of this command to remove the configured facility.

**Syntax** `log facility {kern|user|mail|daemon|auth|syslog|lpr|news|uucp|cron|authpriv|ftp|local0|local1|local2|local3|local4|local5|local6|local7}`  
`no log facility`

**Default** None. The outgoing syslog facility depends on the log message.

**Mode** Global Configuration

**Usage notes** Specifying different facilities for log messages generated on different devices can allow messages from multiple devices sent to a common server to be distinguished from each other.

Ordinarily, the facility values generated in log messages have meanings as shown in the following table. Using this command will override these meanings, and the new meanings will depend on the use you put them to.

### Ordinary meanings of the facility parameter in log messages

| Facility    | Description                                                                                                                                                                                                                                                                                             |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| kern        | Kernel messages                                                                                                                                                                                                                                                                                         |
| user        | User-level messages                                                                                                                                                                                                                                                                                     |
| mail        | Mail system                                                                                                                                                                                                                                                                                             |
| daemon      | System daemons                                                                                                                                                                                                                                                                                          |
| auth        | Security/authorization messages                                                                                                                                                                                                                                                                         |
| syslog      | Messages generated internally by the syslog daemon                                                                                                                                                                                                                                                      |
| lpr         | Line printer subsystem                                                                                                                                                                                                                                                                                  |
| news        | Network news subsystem                                                                                                                                                                                                                                                                                  |
| uucp        | UNIX-to-UNIX Copy Program subsystem                                                                                                                                                                                                                                                                     |
| cron        | Clock daemon                                                                                                                                                                                                                                                                                            |
| authpriv    | Security/authorization (private) messages                                                                                                                                                                                                                                                               |
| ftp         | FTP daemon                                                                                                                                                                                                                                                                                              |
| local<0..7> | The facility labels above have specific meanings, while the local facility labels are intended to be put to local use. In AlliedWare Plus, some of these local facility labels are used in log messages. In particular, local5 is assigned to log messages generated by UTM Firewall security features. |

**Example** To specify a facility of local6, use the following commands:

```
awplus# configure terminal
awplus(config)# log facility local6
```

**Related commands** [show log config](#)

# log host

**Overview** This command configures the device to send log messages to a remote syslog server via UDP port 514. The IP address of the remote server must be specified. By default no filters are defined for remote syslog servers. Filters must be defined before messages will be sent.

Use the **no** variant of this command to stop sending log messages to the remote syslog server.

**Syntax** `log host <ipv4-addr> [secure]`  
`log host <ipv6-addr>`  
`no log host <ipv4-addr>|<ipv6-addr>`

| Parameter   | Description                                                                                  |
|-------------|----------------------------------------------------------------------------------------------|
| <ipv4-addr> | Specify the source IPv4 address, in dotted decimal notation (A.B.C.D).                       |
| <ipv6-addr> | Specify the source IPv6 address, in X:X::X:X notation.                                       |
| secure      | Optional value to create a secure log destination. This option is only valid for IPv4 hosts. |

**Mode** Global Configuration

**Usage notes** Use the optional **secure** parameter to configure a secure IPv4 syslog host. For secure hosts, syslog over TLS is used to encrypt the logs. The certificate received from the remote log server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

The remote server may also request that a certificate is transmitted from the local device. In this situation the first trustpoint added to the syslog application will be transmitted to the remote server.

For detailed information about securing syslog, see the [PKI Feature Overview\\_and Configuration\\_Guide](#).

**Examples** To configure the device to send log messages to a remote secure syslog server with IP address 10.32.16.99, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.99 secure
```

To stop the device from sending log messages to the remote syslog server with IP address 10.32.16.99, use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.99
```

**Related commands**

- default log host**
- log host (filter)**
- log host exclude**
- log host source**
- log host startup-delay**
- log host time**
- log trustpoint**
- show log config**

**Command changes** Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

## log host (filter)

**Overview** This command creates a filter to select messages to be sent to a remote syslog server. Selection can be based on the priority/severity of the message, the program that generated the message, the logging facility used, a substring within the message or a combination of some or all of these.

The **no** variant of this command configures the device to no longer send log messages to a remote syslog server. The IP address of the syslog server must be specified. All configuration relating to this log target will be removed.

**Syntax** `log host <ip-addr> [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]  
no log host <ip-addr> [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]`

| Parameter                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |               |                                    |          |                                                        |            |                                 |          |                                                    |            |                               |           |                                      |                 |                                                      |             |                      |

| msgtext        | Select messages containing a certain text string.                                                                       |
| <text- string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Mode** Global Configuration

**Examples** To create a filter to send all messages generated by EPSR that have a severity of **notices** or higher to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 level notices program epsr
```

To create a filter to send all messages containing the text "Bridging initialization", to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 msgtext "Bridging
initialization"
```

To create a filter to send messages with a severity level of **informational** and above to the syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 level informational
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.21 level notices program
epsr
```

To remove a filter that sends all messages containing the text "Bridging initialization", to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.21 msgtext "Bridging
initialization"
```

To remove a filter that sends messages with a severity level of **informational** and above to the syslog server with IP address 10.32.16.21, use the following commands:

```
awplusawpluls# configure terminal
awplus(config)# no log host 10.32.16.21 level informational
```

## log host exclude

**Overview** Use this command to prevent specified log messages from being sent to the remote syslog server, when **log host** is enabled. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** `log host {<hostname>|<ipv4-addr>|<ipv6-addr>} exclude  
[level <level>] [program <program-name>] [facility <facility>]  
[msgtext <text-string>]  
no log host {<hostname>|<ipv4-addr>|<ipv6-addr>} exclude  
[level <level>] [program <program-name>] [facility <facility>]  
[msgtext <text-string>]`

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |               |                                    |          |                                                        |            |                                 |          |                                                    |            |                               |           |                                      |                 |                        |             |                      |

| ftp            | FTP daemon                                                                                                              |
| msgtext        | Exclude messages containing a certain text string.                                                                      |
| <text- string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To exclude messages that contain the string 'example of irrelevant message' being sent to the remote syslog server 10.10.10.100, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.10.10.100 exclude msgtext example of
irrelevant message
```

**Command changes** Version 5.2.2-1.1: **vrf** parameter added for products that support VRF

# log host source

**Overview** Use this command to specify a source interface or IP address for the device to send syslog messages from. You can specify any one of an interface name, an IPv4 address or an IPv6 address.

This is useful if the device can reach the syslog server via multiple interfaces or addresses and you want to control which interface/address the device uses.

Note that AlliedWare Plus does not support source interface settings on secure log hosts (which are hosts configured using "log host <ip-address> secure").

Use the **no** variant of this command to stop specifying a source interface or address.

**Syntax** log host source {<interface-name>|<ipv4-addr>|<ipv6-addr>}  
no log host source

| Parameter        | Description                                                                                   |
|------------------|-----------------------------------------------------------------------------------------------|
| <interface-name> | Specify the source interface name. You can enter a VLAN, eth interface or loopback interface. |
| <ipv4-addr>      | Specify the source IPv4 address, in dotted decimal notation (A.B.C.D).                        |
| <ipv6-addr>      | Specify the source IPv6 address, in X:X::X:X notation.                                        |

**Default** None (no source is configured)

**Mode** Global Configuration

**Example** To send syslog messages from 192.168.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# log host source 192.168.1.1
```

## log host startup-delay

**Overview** Use this command to set the delay between the device booting up and it attempting to connect to remote log hosts. This is to allow time for network connectivity to the remote host to be established. During this period, the device buffers log messages and sends them once it has connected to the remote host.

The startup delay begins when the message "syslog-ng starting up" appears in the log.

If the default startup delay is not long enough for the boot and configuration process to complete and the links to come up, you may see logging failure messages on startup. In these cases, you can use the command to increase the startup delay.

Use the **no** variant of this command to return to the default delay values.

**Syntax** log host startup-delay [delay <1-600>] [messages <1-5000>]  
no log host startup-delay

| Parameter         | Description                                                                                                                            |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| delay <1-600>     | The time, in seconds, from when syslog starts before the device attempts to filter and transmit the buffered messages to remote hosts. |
| messages <1-5000> | The maximum number of messages that the device will buffer during the delay period.                                                    |

**Default** By default the system will buffer up to 2000 messages and wait 120 seconds from when syslog starts before attempting to filter and transmit the buffered messages to remote hosts.

**Mode** Global Configuration

**Example** To increase the delay to 180 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# log host startup-delay delay 180
```

**Command changes** Version 5.4.8-0.2: defaults changed

# log host time

**Overview** This command configures the time used in messages sent to a remote syslog server. If the syslog server is in a different time zone to your device then the time offset can be configured using either the **utc-offset** parameter option keyword or the **local-offset** parameter option keyword, where **utc-offset** is the time difference from UTC (Universal Time, Coordinated) and **local-offset** is the difference from local time.

**Syntax** `log host {<hostname>|<ipv4-addr>|<ipv6-addr>} time {local|local-offset|utc-offset {plus|minus} <0-24>}`

| Parameter                    | Description                                                                                                                                                                                                    |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;hostname&gt;</i>      | The host name of a remote syslog server.                                                                                                                                                                       |
| <i>&lt;ipv4-addr&gt;</i>     | The IPv4 address of a remote syslog server, in A.B.C.D format.                                                                                                                                                 |
| <i>&lt;ipv6-addr&gt;</i>     | The IPv6 address of a remote syslog server, in X:X::X:X format.                                                                                                                                                |
| <i>&lt;email-address&gt;</i> | The email address to send log messages to                                                                                                                                                                      |
| time                         | Specify the time difference between the email recipient and the device you are configuring.                                                                                                                    |
| local                        | The device is in the same time zone as the email recipient                                                                                                                                                     |
| local-offset                 | The device is in a different time zone to the email recipient. Use the <b>plus</b> or <b>minus</b> keywords and specify the difference (offset) from local time of the device to the email recipient in hours. |
| utc-offset                   | The device is in a different time zone to the email recipient. Use the <b>plus</b> or <b>minus</b> keywords and specify the difference (offset) from UTC time of the device to the email recipient in hours.   |
| plus                         | Negative offset (difference) from the device to the syslog server.                                                                                                                                             |
| minus                        | Positive offset (difference) from the device to the syslog server.                                                                                                                                             |
| <i>&lt;0-24&gt;</i>          | World Time zone offset in hours                                                                                                                                                                                |

**Default** The default is **local** time.

**Mode** Global Configuration

**Usage notes** Use the **local** option if the remote syslog server is in the same time zone as the device. Messages will display the time as on the local device when the message was generated.

Use the **offset** option if the email recipient is in a different time zone to this device. Specify the time offset of the remote syslog server in hours. Messages will display the time they were generated on this device but converted to the time zone of the remote syslog server.

**Examples** To send messages to the remote syslog server with the IP address 10.32.16.21 in the same time zone as the device's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 time local 0
```

To send messages to the remote syslog server with the IP address 10.32.16.12 with the time information converted to the time zone of the remote syslog server, which is 3 hours ahead of the device's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.12 time local-offset plus 3
```

To send messages to the remote syslog server with the IP address 10.32.16.02 with the time information converted to the time zone of the email recipient, which is 3 hours behind the device's UTC time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.02 time utc-offset minus 3
```

**Related commands**

**Command changes** Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

## log monitor (filter)

**Overview** This command creates a filter to select messages to be sent to the terminal when the **terminal monitor** command is given. Selection can be based on the priority/severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

**Syntax** log monitor [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]  
no log monitor [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |               |                                    |          |                                                        |            |                                 |          |                                                    |            |                               |           |                                      |                 |                        |             |                      |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|------------------------------------|----------|--------------------------------------------------------|------------|---------------------------------|----------|----------------------------------------------------|------------|-------------------------------|-----------|--------------------------------------|-----------------|------------------------|-------------|----------------------|
| level           | Filter messages by severity level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |               |                                    |          |                                                        |            |                                 |          |                                                    |            |                               |           |                                      |                 |                        |             |                      |
| <level>         | <p>The minimum severity of message to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:</p> <table> <tr> <td>0 emergencies</td><td>System is unusable</td></tr> <tr> <td>1 alerts</td><td>Action must be taken immediately</td></tr> <tr> <td>2 critical</td><td>Critical conditions</td></tr> <tr> <td>3 errors</td><td>Error conditions</td></tr> <tr> <td>4 warnings</td><td>Warning conditions</td></tr> <tr> <td>5 notices</td><td>Normal, but significant, conditions</td></tr> <tr> <td>6 informational</td><td>Informational messages</td></tr> <tr> <td>7 debugging</td><td>Debug-level messages</td></tr> </table>                                                        | 0 emergencies | System is unusable                 | 1 alerts | Action must be taken immediately                       | 2 critical | Critical conditions             | 3 errors | Error conditions                                   | 4 warnings | Warning conditions            | 5 notices | Normal, but significant, conditions  | 6 informational | Informational messages | 7 debugging | Debug-level messages |

| facility   | Filter messages by syslog facility.                                      |
| <facility> | Specify one of the following syslog facilities to include messages from: |
| kern       | Kernel messages                                                          |
| user       | Random user-level messages                                               |

| Parameter      | Description                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------|
| mail           | Mail system                                                                                                             |
| daemon         | System daemons                                                                                                          |
| auth           | Security/authorization messages                                                                                         |
| syslog         | Messages generated internally by syslogd                                                                                |
| lpr            | Line printer subsystem                                                                                                  |
| news           | Network news subsystem                                                                                                  |
| uucp           | UUCP subsystem                                                                                                          |
| cron           | Clock daemon                                                                                                            |
| authpriv       | Security/authorization messages (private)                                                                               |
| ftp            | FTP daemon                                                                                                              |
| msgtext        | Select messages containing a certain text string.                                                                       |
| <text- string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** By default there is a filter to select all messages. This filter may be removed and replaced by filters that are more selective.

**Mode** Global Configuration

**Examples** To create a filter to send all messages that are generated by authentication and have a severity of **info** or higher to terminal instances where the terminal monitor command has been given, use the following commands:

```
awplus# configure terminal
awplus(config)# log monitor level info program auth
```

To remove a filter that sends all messages generated by EPSR that have a severity of **notices** or higher to the terminal, use the following commands:

```
awplus# configure terminal
awplus(config)# no log monitor level notices program epsr
```

To remove a default filter that includes sending everything to the terminal, use the following commands:

```
awplus# configure terminal
awplus(config)# no log monitor level debugging
```

**Related**  
**commands**

- default log monitor**
- log monitor exclude**
- show log config**
- terminal monitor**

# log monitor exclude

**Overview** Use this command to prevent specified log messages from being displayed on a terminal, when **terminal monitor** is enabled. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** log console exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]  
no log console exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |               |                                    |          |                                                        |            |                                 |          |                                                    |            |                               |           |                                      |                 |                        |             |                      |

| ftp            | FTP daemon                                                                                                              |
| msgtext        | Exclude messages containing a certain text string.                                                                      |
| <text- string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
awplus(config)# log monitor exclude msgtext example of
irrelevant message
```

**Related commands**

- [default log monitor](#)
- [log monitor \(filter\)](#)
- [show log config](#)
- [terminal monitor](#)

# log permanent

**Overview** This command configures the device to send permanent log messages to Flash memory on the device. The content of the permanent log is retained over a reboot. Once the permanent log reaches its configured maximum allowable size old messages will be deleted to make way for new messages.

The **no** variant of this command configures the device not to send any messages to the permanent log. Log messages will not be retained over a restart.

**Syntax** log permanent  
no log permanent

**Mode** Global Configuration

**Examples** To enable permanent logging use the following commands:

```
awplus# configure terminal  
awplus(config)# log permanent
```

To disable permanent logging use the following commands:

```
awplus# configure terminal  
awplus(config)# no log permanent
```

**Related commands**

- clear log permanent**
- copy permanent-log**
- default log permanent**
- log permanent (filter)**
- log permanent exclude**
- log permanent size**
- show log config**
- show log permanent**

## log permanent (filter)

**Overview** This command creates a filter to select messages to be sent to the permanent log. Selection can be based on the priority/ severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

The **no** variant of this command removes the corresponding filter, so that the specified messages are no longer sent to the permanent log.

**Syntax** log permanent [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]  
no log permanent [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]

| Parameter       | Description                                                                                                                                                                                                                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| level           | Filter messages sent to the permanent log by severity level.                                                                                                                                                                                                                                            |
| <level>         | The minimum severity of message to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity:                                                                                                                       |
| 0 emergencies   | System is unusable                                                                                                                                                                                                                                                                                      |
| 1 alerts        | Action must be taken immediately                                                                                                                                                                                                                                                                        |
| 2 critical      | Critical conditions                                                                                                                                                                                                                                                                                     |
| 3 errors        | Error conditions                                                                                                                                                                                                                                                                                        |
| 4 warnings      | Warning conditions                                                                                                                                                                                                                                                                                      |
| 5 notices       | Normal, but significant, conditions                                                                                                                                                                                                                                                                     |
| 6 informational | Informational messages                                                                                                                                                                                                                                                                                  |
| 7 debugging     | Debug-level messages                                                                                                                                                                                                                                                                                    |
| program         | Filter messages by program. Include messages from a specified program.                                                                                                                                                                                                                                  |
| <program- name> | The name of a program to log messages from. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. |
| rip             | Routing Information Protocol (RIP)                                                                                                                                                                                                                                                                      |
| ripng           | Routing Information Protocol - next generation (RIPng)                                                                                                                                                                                                                                                  |

| news           | Network news subsystem                                                                                                  |
| uucp           | UUCP subsystem                                                                                                          |
| cron           | Clock daemon                                                                                                            |
| authpriv       | Security/authorization messages (private)                                                                               |
| ftp            | FTP daemon                                                                                                              |
| msgtext        | Select messages containing a certain text string.                                                                       |
| <text- string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** By default the buffered log has a filter to select messages whose severity level is notices (5) or higher. This filter may be removed using the **no** variant of this command.

**Mode** Global Configuration

**Examples** To create a filter to send all messages generated by EPSR that have a severity of notices or higher to the permanent log use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent level notices program epsr
```

To create a filter to send all messages containing the text "Bridging initialization", to the permanent log use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent msgtext Bridging initialization
```

**Related commands**

- clear log permanent**
- default log permanent**
- log permanent**
- log permanent exclude**
- log permanent size**
- show log config**
- show log permanent**

## log permanent exclude

**Overview** Use this command to prevent specified log messages from being sent to the permanent log. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax** `log permanent exclude [level <level>] [program <program-name>]  
[facility <facility>] [msgtext <text-string>]  
no log permanent exclude [level <level>] [program <program-  
name>] [facility <facility>] [msgtext <text-string>]`

| <facility> | Specify one of the following syslog facilities to exclude messages from: |
| kern       | Kernel messages                                                          |
| user       | Random user-level messages                                               |

| Parameter      | Description                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------|
| mail           | Mail system                                                                                                             |
| daemon         | System daemons                                                                                                          |
| auth           | Security/authorization messages                                                                                         |
| syslog         | Messages generated internally by syslogd                                                                                |
| lpr            | Line printer subsystem                                                                                                  |
| news           | Network news subsystem                                                                                                  |
| uucp           | UUCP subsystem                                                                                                          |
| cron           | Clock daemon                                                                                                            |
| authpriv       | Security/authorization messages (private)                                                                               |
| ftp            | FTP daemon                                                                                                              |
| msgtext        | Exclude messages containing a certain text string.                                                                      |
| <text- string> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent exclude msgtext example of
irrelevant message
```

**Related commands**

- [clear log permanent](#)
- [default log permanent](#)
- [log permanent](#)
- [log permanent \(filter\)](#)
- [log permanent size](#)
- [show log config](#)
- [show log permanent](#)

# log permanent size

**Overview** This command configures the amount of memory that the permanent log is permitted to use. Once this memory allocation has been filled, old messages will be deleted to make room for new messages.

Use the **no** variant of this command to return to the default.

**Syntax** log permanent size <50-250>

no log permanent size

| Parameter | Description                            |
|-----------|----------------------------------------|
| <50-250>  | Size of the permanent log in kilobytes |

**Default** 50 kilobytes

**Mode** Global Configuration

**Example** To allow the permanent log to use up to 100 kilobytes of flash, use the commands:

```
awplus# configure terminal
awplus(config)# log permanent size 100
```

To return to the default value, use the commands:

```
awplus# configure terminal
awplus(config)# no log permanent size
```

**Related commands**

- [show log permanent](#)

**Command changes** Version 5.5.3-2.1: Maximum and default size increased on AMFCloud and AR4000S-Cloud

## log-rate-limit nsm

**Overview** This command limits the number of log messages generated by the device for a specified time interval.

Use the **no** variant of this command to revert to the default number of log messages, which is up to 200 log messages per second.

**Syntax** `log-rate-limit nsm messages <message-limit> interval <time-interval>`  
`no log-rate-limit nsm`

| Parameter                          | Description                                                                                                                                                                 |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;message-limit&gt;</code> | <code>&lt;1-65535&gt;</code><br>The number of log messages generated by the device.                                                                                         |
| <code>&lt;time-interval&gt;</code> | <code>&lt;0-65535&gt;</code><br>The time period for log message generation in 1/100 seconds. If an interval of 0 is specified then no log message rate limiting is applied. |

**Default** By default, the device will allow 200 log messages to be generated per second.

**Mode** Global Configuration

**Usage notes** This command limits the rate that log messages are generated. Limiting log messages protects the device from running out of memory in extreme conditions, such as during a broadcast storm.

Once the specified number of log messages per interval is exceeded, any excess log messages are dropped. When this occurs a summary log message is generated at the end of the interval. This summary message includes the number of log messages dropped.

If you expect a lot of dropped log messages, we recommend setting the time interval to no less than 100. This limits the number of summary messages to one per second, which prevents the log from filling up with these summary messages.

**Examples** To allow the device to generate a maximum of 300 log messages per second, use the following commands:

```
awplus# configure terminal
awplus(config)# log-rate-limit nsm messages 300 interval 100
```

To return the device to the default setting, use the following commands:

```
awplus# configure terminal
awplus(config)# no log-rate-limit nsm
```

# log trustpoint

**Overview** This command adds one or more trustpoints to be used with the syslog application. Multiple trustpoints may be specified, or the command may be executed multiple times, to add multiple trustpoints to the application.

The **no** version of this command removes one or more trustpoints from the list of trustpoints associated with the application.

**Syntax** log trustpoint [*<trustpoint-list>*]  
no log trustpoint [*<trustpoint-list>*]

| Parameter                      | Description                                             |
|--------------------------------|---------------------------------------------------------|
| <i>&lt;trustpoint-list&gt;</i> | Specify one or more trustpoints to be added or deleted. |

**Default** No trustpoints are created by default.

**Mode** Global Configuration

**Usage notes** The device certificate associated with first trustpoint added to the application will be transmitted to remote servers. The certificate received from the remote server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

If no trustpoints are specified in the command, the trustpoint list will be unchanged.

If **no log trustpoint** is issued without specifying any trustpoints, then all trustpoints will be disassociated from the application.

**Example** You can add multiple trustpoints by executing the command multiple times:

```
awplus# configure terminal
awplus(config)# log trustpoint trustpoint_1
awplus(config)# log trustpoint trustpoint_2
```

Alternatively, add multiple trustpoints with a single command:

```
awplus(config)# log trustpoint trustpoint_2 trustpoint_3
```

Disassociate all trustpoints from the syslog application using the command:

```
awplus(config)# log trustpoint trustpoint_2 trustpoint_3
```

**Related** **log host**  
**commands** **show log config**

# show counter log

**Overview** This command displays log counter information.

**Syntax** show counter log

**Mode** User Exec and Privileged Exec

**Example** To display the log counter information, use the command:

```
awplus# show counter log
```

**Output** The following shows typical output.

**Example output from the show counter log command**

|                   |       |      |
|-------------------|-------|------|
| Log counters      |       |      |
| Total Received    | ..... | 2328 |
| Total Received P0 | ..... | 0    |
| Total Received P1 | ..... | 0    |
| Total Received P2 | ..... | 1    |
| Total Received P3 | ..... | 9    |
| Total Received P4 | ..... | 32   |
| Total Received P5 | ..... | 312  |
| Total Received P6 | ..... | 1602 |
| Total Received P7 | ..... | 372  |

**Parameters in output of the show counter log command**

| Parameter         | Description                                              |
|-------------------|----------------------------------------------------------|
| Total Received    | Total number of messages received by the log             |
| Total Received P0 | Total number of Priority 0 (Emergency) messages received |
| Total Received P1 | Total number of Priority 1 (Alert) messages received     |
| Total Received P2 | Total number of Priority 2 (Critical) messages received  |
| Total Received P3 | Total number of Priority 3 (Error) messages received     |
| Total Received P4 | Total number of Priority 4 (Warning) messages received   |
| Total Received P5 | Total number of Priority 5 (Notice) messages received    |
| Total Received P6 | Total number of Priority 6 (Info) messages received      |
| Total Received P7 | Total number of Priority 7 (Debug) messages received     |

**Related commands** [show log config](#)

## show exception log

**Overview** This command displays the contents of the exception log. If the device has unexpectedly restarted and has produced a core dump file, the output of this command shows the name and location of the file.

**Syntax** show exception log

**Mode** User Exec and Privileged Exec

**Example** To display the exception log, use the command:

```
awplus# show exception log
```

**Output** The following shows typical output.

**Example output from the show exception log command on a device that has never had an exception occur**

```
awplus#show exception log
<date> <time> <facility>.<severity> <program[<pid>]>: <message>
-----
None
-----
awplus#
```

# show log

**Overview** This command displays the contents of the buffered log.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

**Syntax** show log [tail [<10-250>]]

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| tail      | Display only the latest log entries.          |
| <10-250>  | Specify the number of log entries to display. |

**Default** By default the entire contents of the buffered log is displayed.

**Mode** User Exec, Privileged Exec and Global Configuration

**Usage notes** If the optional **tail** parameter is specified, only the latest 10 messages in the buffered log are displayed. A numerical value can be specified after the **tail** parameter to select how many of the latest messages should be displayed.

The **show log** command is only available to users at privilege level 7 and above. To set a user’s privilege level, use the command:

```
awplus(config)# username <name> privilege <1-15>
```

**Examples** To display the contents of the buffered log use the command:

```
awplus# show log
```

To display the 10 latest entries in the buffered log use the command:

```
awplus# show log tail 10
```

**Output** The following shows typical output.

**Example output from show log**

```
awplus#show log
<date> <time> <facility>.<severity> <program[<pid>]>: <message>
-----
2023 May 29 07:55:22 kern.warning awplus kernel: No pci config register base in

## show log config

**Overview** This command displays information about the logging system. This includes the configuration of the various log destinations, such as buffered, permanent, syslog servers (hosts) and email addresses. This also displays the latest status information for each log destination.

**Syntax** show log config

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the logging configuration use the command:

```
awplus# show log config
```

**Output** The following shows typical output.

**Example output from show log config**

```
Facility: default
PKI trustpoints: example_trustpoint

Buffered log:
Status ..... enabled
Maximum size ... 100kb
Filters:
*1 Level ..... notices
  Program ..... any
  Facility ..... any
  Message text . any
  2 Level ..... informational
    Program ..... auth
    Facility ..... daemon
    Message text . any
  Statistics ..... 1327 messages received, 821 accepted by filter (2016 Oct 11
10:36:16)

Permanent log:
Status ..... enabled
Maximum size ... 60kb
Filters:
  1 Level ..... error
    Program ..... any
    Facility ..... any
    Message text . any
  *2 Level ..... warnings
    Program ..... dhcp
    Facility ..... any
    Message text . "pool exhausted"
  Statistics ..... 1327 messages received, 12 accepted by filter (2016 Oct 11
10:36:16)

Host 10.32.16.21:
Time offset .... +2:00
Offset type .... UTC
Source ..... -
Secured ..... enabled
Filters:
  1 Level ..... critical
    Program ..... any
    Facility ..... any
    Message text . any
  Statistics ..... 1327 messages received, 1 accepted by filter (2016 Oct 11
10:36:16)

Email admin@alliedtelesis.com:
Time offset .... +0:00
Offset type .... Local
Filters:
  1 Level ..... emergencies
    Program ..... any
    Facility ..... any
    Message text . any
  Statistics ..... 1327 messages received, 0 accepted by filter (2016 Oct 11
10:36:16)
...
```

In the above example the '\*' next to filter 1 in the buffered log configuration indicates that this is the default filter. The permanent log has had its default filter removed, so none of the filters are marked with '\*'.

**NOTE:** *Terminal log and console log cannot be set at the same time. If console logging is enabled then the terminal logging is turned off.*

**Related commands**

- show counter log**
- show log**
- show log permanent**

# show log external

**Overview** Use this command to display the contents of the external log, which is stored on a USB storage device.

**Syntax** `show log external [tail [<10-250>]]`

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| tail      | Display only the latest log entries.          |
| <10-250>  | Specify the number of log entries to display. |

**Mode** Global Configuration  
Privileged Exec  
User Exec

**Usage notes** If the optional **tail** parameter is specified, only the latest 10 messages in the permanent log are displayed. A numerical value can be specified after the **tail** parameter to change how many of the latest messages should be displayed.

**Example** To display the last 5 entries in the external log, use the command:  
`awplus# show log external tail 5`

**Related commands** [clear log external](#)  
[default log external](#)  
[log external](#)  
[log external \(filter\)](#)

**Command changes** Version 5.4.7-1.1: command added

# show log permanent

**Overview** This command displays the contents of the permanent log.

**Syntax** show log permanent [<stack-ID>] [tail [<10-250>]]

| Parameter  | Description                                   |
|------------|-----------------------------------------------|
| <stack-ID> | Stack member number, from 1 to 8.             |
| tail       | Display only the latest log entries.          |
| <10-250>   | Specify the number of log entries to display. |

**Usage notes** If the optional **tail** parameter is specified, only the latest 10 messages in the permanent log are displayed. A numerical value can be specified after the **tail** parameter to change how many of the latest messages should be displayed.

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the permanent log, use the command:

```
awplus# show log permanent
```

To display the permanent log of stack member 2, use the command:

```
awplus# show log permanent 2
```

**Output** The following shows typical output.

## Example output from show log permanent

```
awplus#show log permanent
<date> <time> <facility>.<severity> <program[<pid>]>: <message>
-----

# show running-config log

**Overview** This command displays the current running configuration of the Log utility.

**Syntax** show running-config log

**Mode** Privileged Exec and Global Configuration

**Example** To display the current configuration of the log utility, use the command:

```
awplus# show running-config log
```

**Related commands** [show log](#)  
[show log config](#)

# unmount

**Overview** Use this command to unmount an external storage device. We recommend you unmount storage devices before removing them, to avoid file corruption. This is especially important if files may be automatically written to the storage device, such as external log files or AMF backup files.

**Syntax** unmount usb  
unmount usb member [<stack-ID>]

| Parameter         | Description                       |
|-------------------|-----------------------------------|
| usb               | Unmount the USB storage device.   |
| member <stack-ID> | Stack member number, from 1 to 8. |

**Mode** Privileged Exec

**Example** To unmount a USB storage device and safely remove it from the device, use the command:

```
awplus# unmount usb
```

## Scripting Commands

- Contents**
- **Introduction** on page 482
  - **activate** on page 483
  - **echo** on page 485
  - **wait** on page 486

# Introduction

**Overview** This chapter provides commands used for command scripts.

## Command List

# activate

**Overview** This command activates a script file.

**Syntax** activate [background] <script>

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                   |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| background | Activate a script to run in the background. A process that is running in the background will operate as a separate task, and will not interrupt foreground processing. Generally, we recommend running short, interactive scripts in the foreground and longer scripts in the background. The default is to run the script in the foreground. |
| <script>   | The file name of the script to activate. The script is a command script consisting of commands documented in this software reference.<br><br>Note that you must use either a <b>.scp</b> or a <b>.sh</b> filename extension for a valid script text file, as described below in the usage section for this command.                           |

**Mode** Privileged Exec

**Usage notes** In a stacked environment you can use the CLI on a stack master to access file systems that are located on a stack backup member. In this case the command specifies a file on the backup member. The stack member's file system will be denoted by: <hostname>- <member-id> For example, **awplus-1** for member 1, **awplus-2** for member 2.

When a script is activated, the privilege level is set to 1 enabling User Exec commands to run in the script. If you need to run Privileged Exec commands in your script you need to add an **enable (Privileged Exec mode)** command to the start of your script. If you need to run Global Configuration commands in your script you need to add a **configure terminal** command after the **enable** command at the start of your script.

The **activate** command executes the script in a new shell. A **terminal length** shell command, such as **terminal length 0** may also be required to disable a delay that would pause the display.

A script must be a text file with a filename extension of either **.sh** or **.scp** only for the AlliedWare Plus CLI to activate the script file. The **.sh** filename extension indicates the file is an ASH script, and the **.scp** filename extension indicates the file is an AlliedWare Plus script. You can't use ASH scripts when the device is in Secure Mode.

**Examples** To activate a command script to run as a background process, use the command:

```
awplus#activate background test.scp
```

To activate a script named “/flash:/test.scp” on stack member 2, use the command:

```
awplus-2#activate awplus-2/flash:/test.scp
```

**Related commands**

- configure terminal**
- echo**
- enable (Privileged Exec mode)**
- wait**

# echo

**Overview** This command echoes a string to the terminal, followed by a blank line.

**Syntax** `echo <line>`

| Parameter | Description        |
|-----------|--------------------|
| <line>    | The string to echo |

**Mode** User Exec and Privileged Exec

**Usage** This command may be useful in CLI scripts, to make the script print user-visible comments.

**Example** To echo the string Hello World to the console, use the command:

```
awplus# echo Hello World
```

**Output**

```
Hello World
```

**Related commands** [activate](#)  
[wait](#)

# wait

**Overview** This command pauses execution of the active script for the specified period of time.

**Syntax** wait <delay>

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| <delay>   | <1 - 65535> Specify the time delay in seconds |

**Default** No wait delay is specified by default.

**Mode** Privileged Exec (when executed from a script not directly from the command line)

**Usage notes** Use this command to pause script execution in an **.scp** (AlliedWare Plus™ script) or an **.sh** (ASH script) file executed by the **activate** command. The script must contain an **enable** command, because the **wait** command is only executed in the Privileged Exec mode.

**Example** See an **.scp** script file extract below that will show port counters for interface port1.0.2 over a 10 second interval:

```
enable
show interface port1.0.2
wait 10
show interface port1.0.2
```

**Related commands** **activate**  
**echo**  
**enable (Privileged Exec mode)**

# Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure and display interfaces.

# description (interface)

**Overview** Use this command to add a description to a specific port or interface.

**Syntax** `description <description>`

| Parameter                        | Description                                                                                                     |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <code>&lt;description&gt;</code> | Text describing the specific interface. Descriptions can contain any printable ASCII characters (ASCII 32-126). |

**Mode** Interface Configuration

**Example** The following example uses this command to describe the device that an interface is connected to.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# description Boardroom PC
```

**Command changes** Version 5.4.7-1.1: valid character set changed to printable ASCII characters

# interface (to configure)

**Overview** Use this command to select one or more interfaces to configure.

**Syntax** `interface <interface-list>`

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;interface-list&gt;</code> | <p>The interfaces to configure. An interface-list can be:</p> <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• the loopback interface (lo)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. vlan10-20)</li><li>• a comma-separated list (e.g. vlan1,vlan10-20). Do not mix interface types in a list.</li></ul> <p>The specified interfaces must exist.</p> |

**Usage notes** A local loopback interface is one that is always available for higher layer protocols to use and advertise to the network. Although a local loopback interface is assigned an IP address, it does not have the usual requirement of connecting to a lower layer physical entity. This lack of physical attachment creates the perception of a local loopback interface always being accessible via the network.

Local loopback interfaces can be utilized by a number of protocols for various purposes. They can be used to improve access to the device and also increase its reliability, security, scalability and protection. In addition, local loopback interfaces can add flexibility and simplify management, information gathering and filtering.

**Mode** Global Configuration

**Examples** The following example shows how to enter Interface mode to configure VLAN interface vlan1. Note how the prompt changes.

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)#
```

The following example shows how to enter Interface mode to configure the local loopback interface.

```
awplus# configure terminal
awplus(config)# interface lo
awplus(config-if)#
```

**Related commands** **ip address (IP Addressing and Protocol)**  
**show interface**  
**show interface brief**

## mtu

**Overview** Use this command to set the Maximum Transmission Unit (MTU) size for interfaces, where MTU is the maximum packet size that interfaces can transmit. The MTU size setting is applied to both IPv4 and IPv6 packet transmission.

Use the **no** variant of this command to remove a previously specified Maximum Transmission Unit (MTU) size, and restore the default MTU size. For example, the VLAN interface default is 1500 bytes.

**Syntax** `mtu <68-1582>`  
`no mtu`

| Parameter                    | Description                             |
|------------------------------|-----------------------------------------|
| <code>&lt;68-1582&gt;</code> | The Maximum Transmission size in bytes. |

**Default** The default MTU size, for example 1500 bytes for VLAN interfaces.

**Mode** Interface Configuration

**Usage notes** If a device receives an IPv4 packet for Layer 3 switching to another interface with an MTU size smaller than the packet size, and if the packet has the **'don't fragment'** bit set, then the device will send an ICMP **'destination unreachable'** (3) packet type and a **'fragmentation needed and DF set'** (4) code back to the source. For IPv6 packets bigger than the MTU size of the transmitting interface, an ICMP **'packet too big'** (ICMP type 2 code 0) message is sent to the source.

Note that **show interface** output will only show MTU size for VLAN interfaces.

**Examples** To configure an MTU size of 1555 bytes on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# mtu 1555
```

To restore the MTU size to the default MTU size of 1500 bytes on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no mtu
```

**Related commands** **show interface**

**Command changes** Version 5.4.7-1.1: Behavior change when MTU set to less than 1500 on FS980M and GS980M.

Version 5.5.1-0.1: Layer 3 jumbo frames supported on SBx908 GEN2 and x950.

Version 5.5.1-1.2: Layer 3 jumbo frames supported on x530 and GS980MX.

Version 5.5.3-1.x Layer 3 jumbo frames supported on x240, SE240, x250, SE250, x540L, SE540L.

Version 5.5.5-0.1 Layer 3 jumbo frames supported on XS900MX, x550, x930, SBx81CFC960.

# platform jumboframe

**Overview** This command enables the device to forward jumbo frames. See the [Switching Feature Overview and Configuration Guide](#) for more information.

When jumbo frame support is enabled, the maximum size of packets that the device can forward is 9216 bytes of payload.

Use the **no** variant of this command to remove jumbo frame support. This stops the ports from forwarding packets larger than VLAN tagged frames (1522 bytes).

**NOTE:** The number above specifies the payload only. For an IEEE 802.1q frame, provision is made (internally) for the following additional components:

- Source and Destination addresses
- EtherType field
- Priority and VLAN tag fields
- FCS

These additional components increase the frame size (to 1522 bytes in the default case).

**Syntax** platform jumboframe  
no platform jumboframe

**Default** By default, jumbo frames is off.

**Mode** Global Configuration

**Usage notes** You must save the configuration and restart the device after entering this command for it to take effect. You can use the [reboot](#) command to restart the device.

**Example** To enable the device to forward jumbo frames, use the following commands:

```
awplus# configure terminal
awplus(config)# platform jumboframe
```

**Related commands** [show platform](#)  
[show running-config](#)

# service statistics interfaces counter

**Overview** Use this command to enable the interface statistics counter.  
Use the **no** variant of this command to disable the interface statistics counter.

**Syntax** service statistics interfaces counter  
no service statistics interfaces counter

**Default** The interface statistics counter is enabled by default.

**Mode** Global Configuration

**Example** To enable the interface statistics counter, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# service statistics interfaces counter
```

To disable the interface statistics counter, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# no service statistics interfaces counter
```

**Command changes** Version 5.4.7-2.1: command added

# show interface

**Overview** Use this command to display interface configuration and status.

For information on filtering and saving command output, see the **[“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)**.

**Syntax** show interface [*<interface-list>*]

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;interface-list&gt;</i> | <p>The interfaces or ports to display. An interface-list can be:</p> <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• the loopback interface (lo)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. vlan10-20)</li><li>• a comma-separated list (e.g. vlan1,vlan10-20). Do not mix interface types in a list.</li></ul> <p>The specified interfaces must exist.</p> |

**Mode** User Exec and Privileged Exec

**Usage notes** Note that the output displayed with this command will show MTU (Maximum Transmission Unit) size for VLAN interfaces, and MRU (Maximum Received Unit) size for switch ports.

**Example** To display configuration and status information for all interfaces, use the command:

```
awplus# show interface
```

To display configuration and status information for the loopback interface lo, use the command:

```
awplus# show interface lo
```

To display configuration and status information for interface vlan1, use the command:

```
awplus# show interface vlan1
```

**Output** The following shows typical output.

**Example output from the show interface command:**

```
awplus#show interface
Interface port1.0.1
  Scope: both
  Link is UP, administrative state is UP
  Thrash-limiting
    Status Not Detected, Action learn-disable, Timeout 1(s)
  Hardware is Ethernet, address is 00c0.ffee.0401
  index 5001 metric 1 mru 1500
  current duplex full, current speed 1000, current polarity mdix
  configured duplex auto, configured speed auto, configured polarity auto
  <UP,BROADCAST,RUNNING,MULTICAST>
  SNMP link-status traps: Disabled
    input packets 2901115, bytes 212107158, dropped 0, multicast packets 1250912
    output packets 317532, bytes 29171173, multicast packets 3, broadcast packets 3
    input average rate : 30 seconds 5.09 Kbps, 5 minutes 3.72 Kbps
    output average rate: 30 seconds 1.36 Kbps, 5 minutes 477 bps
    input peak rate 152.06 Kbps at 2018/04/10 15:56:53
    output peak rate 6.78 Mbps at 2018/04/10 15:56:53
  Time since last state change: 7 days 03:06:10
  ...
```

**Example output from the show interface lo command:**

```
awplus#show interface lo
Interface lo
  Scope: both
  Link is UP, administrative state is UP
  Hardware is Loopback
  index 1 metric 1
  <UP,LOOPBACK,RUNNING>
  SNMP link-status traps: Disabled
  Router Advertisement is disabled
  Router Advertisement default routes are accepted
  Router Advertisement prefix info is accepted
  Time since last state change: 8 days 00:01:09
```

**Example output from the show interface vlan1 command:**

```
awplus#show interface vlan1
Interface vlan1
  Link is UP, administrative state is UP
  Hardware is VLAN, address is 0000.cd38.026c
  IPv4 address 192.168.1.1/24 broadcast 192.168.1.255
  index 301 metric 1 mtu 1500
  arp ageing timeout 300
  <UP,BROADCAST,RUNNING,MULTICAST>
  VRF Binding: Not bound
  SNMP link-status traps: Disabled
  Router Advertisement is disabled
  Router Advertisement default routes are accepted
  Router Advertisement prefix info is accepted
    input packets 0, bytes 0, dropped 0, multicast packets 0
    output packets 9, bytes 612, multicast packets 0, broadcast packets 0
    input average rate : 30 seconds 0 bps, 5 minutes 0 bps
    output average rate: 30 seconds 0 bps, 5 minutes 0 bps
    output peak rate 140 bps at 2018/04/10 16:40:56
  Time since last state change: 8 days 19:09:19
```

**Related commands** [mtu](#)  
[show interface brief](#)  
[show interface status](#)

**Command changes** Version 5.4.7-2.1: average rate and peak rate added to output

# show interface brief

**Overview** Use this command to display brief interface, configuration, and status information, including provisioning information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show interface brief

**Mode** User Exec and Privileged Exec

**Example** To display summarized information about all interfaces on the device, use the command:

```
awplus# show interface brief
```

**Output** The following shows typical output.

## Example output from show interface brief

|                             |          |          |
|-----------------------------|----------|----------|
| awplus#show interface brief |          |          |
| Interface                   | Status   | Protocol |
| port1.0.1                   | admin up | down     |
| port1.0.2                   | admin up | down     |
| port1.0.3                   | admin up | down     |
| port1.0.4                   | admin up | down     |
| port1.0.5                   | admin up | down     |
| port1.0.6                   | admin up | running  |
| lo                          | admin up | running  |
| vlan1                       | admin up | down     |
| vlan2                       | admin up | down     |

## Parameters in the output of show interface brief

| Parameter | Description                                                                               |
|-----------|-------------------------------------------------------------------------------------------|
| Interface | The name or type of interface.                                                            |
| Status    | The administrative state. This can be either <b>admin up</b> or <b>admin down</b> .       |
| Protocol  | The link state. This can be either <b>down</b> , <b>running</b> , or <b>provisioned</b> . |

**Related commands** [show interface](#)  
[show interface status](#)  
[show interface memory](#)

# show interface memory

**Overview** This command displays the shared memory used by either all interfaces, or the specified interface or interfaces. The output is useful for diagnostic purposes by Allied Telesis authorized service personnel.

For information on filtering and saving command output, see the **[“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)**.

**Syntax** show interface memory  
show interface *<port-list>* memory

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;port-list&gt;</i> | Display information about only the specified port or ports. The port list can be: <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)</li><li>• a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list.</li></ul> |

**Mode** User Exec and Privileged Exec

**Example** To display the shared memory used by all interfaces, use the command:

```
awplus# show interface memory
```

To display the shared memory used by port1.0.1 and port1.0.3 to port1.0.4, use the command:

```
awplus# show interface port1.0.1,port1.0.3-port1.0.4 memory
```

**Output** The following shows typical output.

**Example output from the show interface memory command**

```
awplus#show interface memory
Vlan blocking state shared memory usage
-----
```

| Interface | shmid   | Bytes Used | nattch | Status |
|-----------|---------|------------|--------|--------|
| port1.0.1 | 491535  | 512        | 1      |        |
| port1.0.2 | 393228  | 512        | 1      |        |
| port1.0.3 | 557073  | 512        | 1      |        |
| ...       |         |            |        |        |
| lo        | 425997  | 512        | 1      |        |
| po1       | 1179684 | 512        | 1      |        |
| po2       | 1212453 | 512        | 1      |        |
| sa3       | 1245222 | 512        | 1      |        |

**Example output from show interface <port-list> memory for a list of interfaces**

```
awplus#show interface port1.0.1,port1.0.3-port1.0.4 memory
Vlan blocking state shared memory usage
-----
```

| Interface | shmid  | Bytes Used | nattch | Status |
|-----------|--------|------------|--------|--------|
| port1.0.1 | 589842 | 512        | 1      |        |
| port1.0.3 | 688149 | 512        | 1      |        |
| port1.0.4 | 327690 | 512        | 1      |        |

**Related commands**

- [show interface brief](#)
- [show interface status](#)
- [show interface switchport](#)

# show interface status

**Overview** Use this command to display the status of the specified interface or interfaces. Note that when no interface or interfaces are specified then the status of all interfaces on the device are shown.

**Syntax** `show interface [<port-list>] status`

| Parameter                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;port-list&gt;</code> | The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)</li><li>• a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list.</li></ul> |

**Mode** User Exec and Privileged Exec

**Examples** To display the status of port1.0.1 to port1.0.3, use the command:

```
awplus# show interface port1.0.1-port1.0.3 status
```

To display the status of all ports, use the command:

```
awplus# show interface status
```

**Output** The following shows typical output.

**Example output from the show interface <port-list> status command**

```
awplus#show interface port1.0.1-port1.0.3 status
Port      Name      Status      Vlan Duplex  Speed Type
port1.0.1      notconnect      1 auto    auto 1000BASE-T
port1.0.2      notconnect      1 auto    auto 1000BASE-T
port1.0.3      notconnect      1 auto    auto 1000BASE-T
```

**Example output from the show interface status command**

```
awplus#show interface status
Port      Name      Status      Vlan Duplex  Speed Type
port1.0.1 Trunk_Net  connected    trunk a-full  a-1000 1000BaseTX
port1.0.2 Access_Net1 connected    1 full   1000 1000BaseTX
port1.0.3 Access_Net1 disabled     1 auto   auto 1000BaseTX
...
```

**Parameters in the output from the show interface status command**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port      | Name/Type of the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Name      | Description of the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Status    | The administrative and operational status of the interface; one of: <ul style="list-style-type: none"> <li>disabled: the interface is administratively down.</li> <li>connect: the interface is operationally up.</li> <li>notconnect: the interface is operationally down.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Vlan      | VLAN type or VLAN IDs associated with the port: <ul style="list-style-type: none"> <li>When the VLAN mode is trunk, it displays <b>trunk</b> (it does not display the VLAN IDs).</li> <li>When the VLAN mode is access, it displays the VLAN ID.</li> <li>When the VLAN mode is private promiscuous, it displays the primary VLAN ID if it has one, and <b>promiscuous</b> if it does not have a VLAN ID.</li> <li>When the VLAN mode is private host, it displays the primary and secondary VLAN IDs.</li> <li>When the VLAN is dynamically assigned, it displays the current dynamically assigned VLAN ID (not the access VLAN ID), or <b>dynamic</b> if it has multiple VLANs dynamically assigned.</li> </ul> |
| Duplex    | The actual duplex mode of the interface, preceded by <b>a-</b> if it has autonegotiated this duplex mode. If the port is disabled or not connected, it displays the configured duplex setting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Parameter | Description                                                                                                                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Speed     | The actual link speed of the interface, preceded by <b>a-</b> if it has autonegotiated this speed. If the port is disabled or not connected, it displays the configured speed setting.              |
| Type      | The type of interface, e.g. 1000BaseTX. For SFP bays, it displays <b>Unknown</b> if it does not recognize the type of SFP installed, or <b>Not present</b> if an SFP is not installed or is faulty. |

# shutdown

**Overview** This command shuts down the selected interface. This administratively disables the link and takes the link down at the physical (electrical) layer.

Use the **no** variant of this command to disable this function and bring the link back up again.

**Syntax** shutdown  
no shutdown

**Mode** Interface Configuration

**Usage notes** If you shutdown an aggregator, the device shows the admin status of the aggregator and its component ports as "admin down". While the aggregator is down, the device accepts **shutdown** and **no shutdown** commands on component ports, but these have no effect on port status. Ports will not come up again while the aggregator is down.

**Example** To shut down port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# shutdown
```

To bring up port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no shutdown
```

To shut down vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# shutdown
```

To bring up vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no shutdown
```

# Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Port Mirroring and Remote Mirroring (also known as RSPAN). For more information, see the [Mirroring Feature Overview and Configuration Guide](#).

## mirror interface

**Overview** Use this command to mirror traffic. Mirroring involves sending a copy of traffic from one port out another port, so it can be analyzed by a device attached to that port. Using this command allows you to specify:

- one or more mirror ports - these are the ports you specify when you enter interface configuration mode before entering this **mirror interface** command
- the ports to mirror - these are the ports you specify in this command
- the direction of traffic to mirror - received, transmitted, or both.

Mirror ports are removed from all VLANs, and no longer participate in other switching.

Use the **no** variant of this command to disable port mirroring by the destination port on the specified source port.

**Syntax** mirror interface <source-port-list> direction {both|receive|transmit}  
mirror interface none  
no mirror interface <source-port-list>  
no mirror interface none

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <source-port-list> | The source switch ports to mirror. A port-list can be: <ul style="list-style-type: none"><li>• a port (e.g. port1.0.2)</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.0.1-port1.0.3</li><li>• a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.2-port1.0.4</li></ul> The source port list cannot include dynamic or static channel groups (link aggregators).                             |
| direction          | Specifies whether to mirror traffic that the source port receives, transmits, or both.                                                                                                                                                                                                                                                                                                                                                    |
| both               | Mirroring traffic both received and transmitted by the source port.                                                                                                                                                                                                                                                                                                                                                                       |
| receive            | Mirroring traffic received by the source port.                                                                                                                                                                                                                                                                                                                                                                                            |
| transmit           | Mirroring traffic transmitted by the source port.                                                                                                                                                                                                                                                                                                                                                                                         |
| none               | Specify this parameter for use with the <b>copy-to-mirror</b> parameter of: <ul style="list-style-type: none"><li>- the ACL (Access Control List) <b>access-list</b> and <b>ipv6 access-list</b> commands or</li><li>- the QoS (Quality of Service) <b>default action</b> command.</li></ul> The <b>none</b> parameter lets you specify the destination port (the analyzer port) for the traffic without specifying a source mirror port. |

**Mode** Interface Configuration

**Usage notes** A mirror port cannot be associated with a VLAN. If a switch port is configured to be a mirror port, it is automatically removed from any VLAN it was associated with.

You can use access control lists to mirror a subset of traffic from the mirrored port by using the copy-to-mirror parameter in hardware ACL commands.

For more information about mirroring, see the [Mirroring Feature Overview and Configuration Guide](#).

**Example** To mirror traffic received and transmitted on port1.0.1 to destination port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# mirror interface port1.0.1 direction both
```

To enable use with the **access-list (numbered hardware ACL for IP packets)** ACL and **default-action** QoS commands to destination port1.0.1 without specifying a source port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# mirror interface none
```

To mirror all received or transmitted TCP traffic to analyzer port1.0.1, use the sample configuration snippet below:

```
awplus#show running-config

mls qos enable
access-list 3000 copy-to-mirror tcp any any
access-group 3000
!
interface port1.0.1
 mirror interface none
```

**Related commands** **access-list (numbered hardware ACL for IP packets)**  
**access-list (numbered hardware ACL for MAC addresses)**  
**default-action**  
**ipv6 access-list (named IPv6 hardware ACL)**

**Command changes** Version 5.5.4-2.3: ability to create multiple mirror ports added, except on x220, x320, GS980M and GS980EM Series

## remote-mirror interface

**Overview** Use this command on the source device to specify the source port whose traffic is to be remote-mirrored (monitored), and the remote mirroring VLAN ID these mirrored frames will be tagged with when they egress from the source device. The port for which Interface Configuration mode is entered is the port via which the mirrored traffic egresses the source device towards the remote destination device.

Use the **no** variant of this command to disable remote mirroring of the specified mirrored port by the egress (destination) port on the source device.

**Syntax** `remote-mirror interface <port-list> direction {both|receive|transmit} vlan <2-4090> [priority <0-7>]`  
`remote-mirror interface none vlan <2-4090> [priority <0-7>]`  
`no remote-mirror interface <port-list> [direction {receive|transmit}]`  
`no remote-mirror interface none`

| Parameter                      | Description                                                                                                                                                                                                                                                                                                               |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;port-list&gt;</code> | The ports from which to mirror traffic. A port-list can be: <ul style="list-style-type: none"><li>• a port (e.g. port1.0.1)</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.0.1-port1.0.4</li><li>• a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.3-port1.0.4</li></ul> |
| <code>direction</code>         | Specifies whether to mirror traffic that the source port receives, transmits, or both.                                                                                                                                                                                                                                    |
| <code>both</code>              | Mirroring traffic both received and transmitted by the source port.                                                                                                                                                                                                                                                       |
| <code>receive</code>           | Mirroring traffic received by the source port.                                                                                                                                                                                                                                                                            |
| <code>transmit</code>          | Mirroring traffic transmitted by the source port.                                                                                                                                                                                                                                                                         |
| <code>2-4090</code>            | The VLAN ID of the remote mirroring VLAN that this mirrored traffic is to be tagged with at the egress port on the source device.                                                                                                                                                                                         |
| <code>priority</code>          | The 802.1p priority tag to apply to mirrored packets.                                                                                                                                                                                                                                                                     |

**Default** No ports are set to be remote mirrored by default.

**Mode** Interface Configuration

**Usage notes** To prevent unwanted processing of mirrored traffic, we recommend configuring remote monitoring on the receiving device before configuring it on the source device.

This command can only be used to configure a single egress port on the source device, not a range of egress ports. Do not use the **interface** command with multiple interfaces before using this **remote-mirror interface** command. One egress (destination) port on the source device can transmit mirrored frames from up to four remote mirrored (source) ports.

The egress port on the source device can be associated with other VLANs in addition to the remote mirror VLAN, so it can function as an uplink for traffic from multiple VLANs. This command does not change the VLAN associations of the mirrored ports.

Only one port on the device can be configured as either a mirror port for port mirroring (**mirror interface** command) or as an egress port on the source device for remote mirroring (**remote-mirror interface** command).

All mirrored ports on a single device must use the same remote mirror VLAN and priority.

Access control lists can be used to mirror a subset of traffic from the mirrored port by using the copy-to-mirror parameter in hardware ACL commands.

**Example** To configure the source device to send all the traffic that it receives on remote-mirrored port port1.0.2 out egress port port1.0.1 tagged with remote mirroring VLAN ID 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# remote-mirror interface port1.0.2 direction
receive vlan 2
```

To stop port1.0.1 remote-mirroring traffic received on mirrored port port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no remote-mirror interface port1.0.2
direction receive
```

# show mirror

**Overview** Use this command to display the status of all mirrored ports.

**Syntax** show mirror

**Mode** User Exec and Privileged Exec

**Example** To display the status of all mirrored ports, use the following command:

```
awplus# show mirror
```

**Output** The following shows typical output.

## Example output from the show mirror command

```
Mirror Test Port Name: port1.0.1  
Mirror option: Enabled  
Mirror direction: both  
Monitored Port Name: port1.0.2
```

# show mirror interface

**Overview** Use this command to display port mirroring configuration for a mirrored (monitored) switch port.

**Syntax** show mirror interface *<port>*

| Parameter           | Description                                             |
|---------------------|---------------------------------------------------------|
| <i>&lt;port&gt;</i> | The monitored switch port to display information about. |

**Mode** User Exec, Privileged Exec and Interface Configuration

**Example** To display port mirroring configuration for port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# show mirror interface port1.0.2
```

**Output** The following shows typical output.

## Example output from the show mirror interface command

```
Mirror Test Port Name: port1.0.1
Mirror option: Enabled
Mirror direction: both
Monitored Port Name: port1.0.2
```

# show remote-mirror

**Overview** Use this command to display information for remote-mirroring.

**Syntax** show remote-mirror

**Mode** User Exec

**Example** To display information about remote mirroring, use the command:

```
awplus# show remote-mirror
```

**Output** The following shows typical output.

**Example output from show remote-mirror**

```
awplus#show remote-mirror
Remote mirror information:
Remote mirror destination:
  Port: port1.0.3
  VLAN: 259
  User priority: 0

Monitored ports:
  port1.0.1
  direction: both

Remote mirror egress ports:

Remote mirror VLANs:
  VLAN 259
```

**Parameters in the output from show remote-mirror**

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote mirror destination  | On the source device, this displays information about: <ul style="list-style-type: none"><li>the egress port for the mirrored traffic on the source device</li><li>the remote mirroring VLAN ID this traffic is tagged with on egress</li><li>the user priority this traffic is tagged with on egress</li></ul>                                                              |
| Monitored ports            | On the source device, this displays: <ul style="list-style-type: none"><li>the ports being mirrored (monitored)</li><li>the direction—whether both received traffic, transmitted traffic or both are mirrored</li><li>'none (via ACL)' if it is configured with the command <b>remote-mirror interface none</b> to allow ACLs to select the traffic to be mirrored</li></ul> |
| Remote mirror egress ports | On the destination device, this displays : <ul style="list-style-type: none"><li>the remote mirror egress ports</li><li>the remote mirror VLANs they are associated with</li></ul>                                                                                                                                                                                           |
| Remote mirror VLANs        | On source, destination and intermediate devices, this displays a list of any VLANs configured in remote mirror VLAN mode. To see a list of the ports associated with these VLANs, use the command <b>show vlan brief</b> .                                                                                                                                                   |

**Related commands** [remote-mirror interface](#)  
[switchport remote-mirror-egress](#)  
[vlan mode remote-mirror-vlan](#)

# switchport remote-mirror-egress

**Overview** Use this command on the device receiving remote mirrored traffic to set the remote mirroring egress port for the specified remote mirroring VLAN. This port removes the remote mirror VLAN tagging before transmitting the mirrored traffic. Ingress traffic on this port is disabled.

Use the **no** variant of this command to reset the port to no longer function as a remote mirror egress port.

**Syntax** switchport remote-mirror-egress vlan <vlan-id>  
no switchport remote-mirror-egress

| Parameter | Description                                                                           |
|-----------|---------------------------------------------------------------------------------------|
| <vlan-id> | The port will transmit the mirrored traffic it receives from this remote mirror VLAN. |

**Default** There is no remote mirror egress port by default.

**Mode** Interface Configuration for a switch port

**Usage notes** To prevent unwanted processing of mirrored traffic, we recommend configuring remote monitoring on the receiving device before configuring it on the source device.

This command would typically be used for the port that transmits the remote-mirrored traffic to a device that will analyze it. The port effectively functions as an access port in the remote mirror VLAN, with the added feature of not allowing ingress traffic on the port.

**Example** To set port1.0.2 on the destination device as the remote mirror egress port for mirrored traffic that is tagged with VLAN ID 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport remote-mirror-egress vlan 2
```

To unset port1.0.2 as a remote mirror egress port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport remote-mirror-egress
```

**Related commands** [remote-mirror interface](#)  
[show remote-mirror](#)  
[vlan mode remote-mirror-vlan](#)

## vlan mode remote-mirror-vlan

**Overview** Use this command to create a single VLAN or a range of VLANs in remote mirror mode to be used for remote mirroring.

Use the **no** variant of this command to remove the remote mirror VLAN from the VLAN database and its configurations.

**Syntax** `vlan [<vid>|<vid-range>] mode remote-mirror-vlan`  
`no vlan [<vid>|<vid-range>]`

| Parameter                      | Description                                                         |
|--------------------------------|---------------------------------------------------------------------|
| <code>&lt;vid&gt;</code>       | The VLAN ID of the remote mirroring VLAN to be created.             |
| <code>&lt;vid-range&gt;</code> | The range of VLAN IDs for the remote mirroring VLANs to be created. |

**Default** There is no remote mirror VLAN by default.

**Mode** VLAN Configuration

**Usage notes** This remote mirror VLAN needs to be configured on the remote mirroring source device, the destination (receiving) device, and any devices in between that are to forward the mirrored traffic. We recommend configuring this on the receiving device and intermediate devices before configuring the source device.

The remote mirror VLAN operates in a special mode— all traffic on the remote mirror VLAN is flooded, and no learning or CPU processing is done for packets in the VLAN. BPDU packets (link-local packets used to control features like spanning tree or AMF) are dropped on remote mirror VLANs.

Disabling the remote-mirroring VLAN on the source switch does not prevent the mirrored packets from being sent with the remote-mirror VLAN tag. To stop the mirroring, the command **no remote-mirror interface** must be used.

**Example** To create a VLAN with VLAN ID 3 in remote mirror VLAN mode, use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 3 mode remote-mirror-vlan
```

To remove the remote mirror VLAN with ID 3, use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no vlan 3
```

**Related commands** [remote-mirror interface](#)

# Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure switching.

For more information, see the [Switching Feature Overview and Configuration Guide](#).

# clear loop-protection action

**Overview** Use this command to clear the loop protection actions on the specified interfaces.

**Syntax** clear loop-protection [interface *<port-list>*] action

| Parameters               | Description                                    |
|--------------------------|------------------------------------------------|
| interface                | The interface whose actions are to be cleared. |
| <i>&lt;port-list&gt;</i> | A port, a port range, or an aggregated link.   |

**Mode** Privileged Exec

**Example** To clear the loop protection actions on interface port1.0.2, use the command:

```
awplus# clear loop-protection interface port1.0.2 action
```

To clear the loop protection actions of all interfaces on a device, use the command:

```
awplus# clear loop-protection action
```

**Related commands** [loop-protection loop-detect](#)  
[loop-protection action](#)  
[show loop-protection](#)

# clear loop-protection counters

**Overview** Use this command to clear the loop protection counters.

**Syntax** `clear loop-protection [interface <port-list>] counters`

| Parameters  | Description                                     |
|-------------|-------------------------------------------------|
| interface   | The interface whose counters are to be cleared. |
| <port-list> | A port, a port range, or an aggregated link.    |

**Mode** Privileged Exec

**Examples** To clear the counter information for all interfaces:

```
awplus# clear loop-protection counters
```

To clear the counter information for a single port:

```
awplus# clear loop-protection interface port1.0.1 counters
```

**Related commands** [show loop-protection](#)

## clear mac address-table dynamic

**Overview** Use this command to clear the filtering database of all entries learned for a selected MAC address, an MSTP instance, a switch port interface, or a VLAN interface.

**Syntax** `clear mac address-table dynamic  
[address <mac-address>|interface <port> [instance <inst>]]  
vlan <vid>]`

| Parameter             | Description                                                                                                                                                                                                                                                       |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| address <mac-address> | Specify a MAC (Media Access Control) address to be cleared from the filtering database, in the format HHHH.HHHH.HHHH.                                                                                                                                             |
| interface <port>      | Specify a switch port to be cleared from the filtering database. The port can be: <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li></ul> |
| instance <inst>       | Specify an MSTP (Multiple Spanning Tree) instance in the range 1 to 63 to be cleared from the filtering database.                                                                                                                                                 |
| vlan <vid>            | Specify a VID (VLAN ID) in the range 1 to 4094 to be cleared from the filtering database.                                                                                                                                                                         |

**Mode** Privileged Exec

**Usage notes** Use this command with options to clear the filtering database of all entries learned for a given MAC address, interface or VLAN. Use this command without options to clear any learned entries.

Use the optional **instance** parameter to clear the filtering database entries associated with a specified MSTP instance. Note that you must first specify a switch port interface before you can specify an MSTP instance.

Compare this usage and operation with the [clear mac address-table static](#). Note that an MSTP instance cannot be specified with the command `clear mac address-table static`.

**Examples** This example shows how to clear all dynamically learned filtering database entries.

```
awplus# clear mac address-table dynamic
```

This example shows how to clear all dynamically learned filtering database entries when learned through device operation for the MAC address 0000.5E00.5302.

```
awplus# clear mac address-table dynamic address 0000.5E00.5302
```

This example shows how to clear all dynamically learned filtering database entries when learned through device operation for a given MSTP instance 1 on switch port interface port1.0.3.

```
awplus# clear mac address-table dynamic interface port1.0.3  
instance 1
```

**Related commands** [clear mac address-table static](#)  
[show mac address-table](#)

# clear mac address-table static

**Overview** Use this command to clear the filtering database of all statically configured entries for a selected MAC address, interface, or VLAN.

**Syntax** `clear mac address-table static [address <mac-address>|  
interface <port>|vlan <vid>]`

| Parameter             | Description                                                                                                                                                                                                                                                                  |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| address <mac-address> | Specify a MAC (Media Access Control) address to be cleared from the filtering database, in the format HHHH.HHHH.HHHH.                                                                                                                                                        |
| interface <port>      | Specify the port from which statically configured entries are to be cleared. The port can be <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li></ul> |
| vlan <vid>            | Specify a VID (VLAN ID) in the range 1 to 4094 to be cleared from the filtering database.                                                                                                                                                                                    |

**Mode** Privileged Exec

**Usage notes** Use this command with options to clear the filtering database of all entries made from the CLI for a given MAC address, interface or VLAN. Use this command without options to clear any entries made from the CLI.

Compare this usage with [clear mac address-table dynamic](#).

**Examples** This example shows how to clear all filtering database entries configured through the CLI.

```
awplus# clear mac address-table static
```

This example shows how to clear all filtering database entries for a specific interface configured through the CLI.

```
awplus# clear mac address-table static interface port1.0.3
```

This example shows how to clear filtering database entries configured through the CLI for the MAC address 0000.5E00.5302.

```
awplus# clear mac address-table static address 0000.5E00.5302
```

**Related commands** [clear mac address-table dynamic](#)  
[mac address-table static](#)  
[show mac address-table](#)

# clear port counter

**Overview** Use this command to clear the packet counters of the port.

**Syntax** clear port counter [*<port>*]

| Parameter           | Description              |
|---------------------|--------------------------|
| <i>&lt;port&gt;</i> | The port number or range |

**Mode** Privileged Exec

**Example** To clear the packet counter for port1.0.1, use the command:

```
awplus# clear port counter port1.0.1
```

**Related commands** [show platform port](#)

## clear port-security intrusion

**Overview** Use this command to clear the history of the port-security intrusion list on all ports and LAGs, or an individual port or LAG. If you do not specify a port or LAG, this command clears the intrusion lists of all ports and LAGs.

This command does not clear any MAC addresses the switch has already learned. If you want to clear already-learned MAC addresses from the filtering database, use the **clear mac address-table dynamic** command or the **clear mac address-table static** command.

**Syntax** clear port-security intrusion [interface *<port>*]

| Parameter           | Description                                                                                                                                                                                                                             |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;port&gt;</i> | Specify the switch port or LAG from which the history of violated address entries will be cleared. This can be a single switch port, (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2). |

**Mode** Privileged Exec

**Examples** To see the intrusion list on port1.0.2, use the following command:

```
awplus# show port-security intrusion interface port1.0.2
```

**Example output from show port-security intrusion**

```
awplus#show port-security intrusion interface port1.0.2
Port Security Intrusion List
-----
Interface: port1.0.2      - 1 intrusion(s) detected
801f.0200.19da
```

To clear the history of port-security intrusion list on port1.0.2, use the following command:

```
awplus# clear port-security intrusion interface port1.0.2
```

To see the port-security status on port1.0.2, use the following command:

```
awplus# show port-security interface port1.0.2
```

**Example output from show port-security interface**

```
awplus#show port-security interface port1.0.2
Port Security configuration
-----
Security Enabled : YES
Port Status : ENABLED
Violation Mode : TRAP
Aging : OFF
Maximum MAC Addresses : 1
Total MAC Addresses : 1
Lock Status : LOCKED
Security Violation Count : 0
Last Violation Source Address : None
```

**NOTE:** Note that the port status is still locked while the history of port violation is cleared from the database.

To re-check the intrusion list on port1.0.2, use the following command:

```
awplus# show port-security intrusion interface port1.0.2
```

**Example output from show port-security intrusion**

```
awplus#show port-security intrusion interface port1.0.2
Port Security Intrusion List
-----
Interface: port1.0.2      - no intrusions detected
```

**Related commands** **show port-security interface**  
**show port-security intrusion**  
**switchport port-security**  
**switchport port-security aging**  
**switchport port-security maximum**  
**switchport port-security violation**

**Command changes** Version 5.5.1-0.1: port-security on LAGs added for SBx81CFC960, SBx908 GEN2, x950, x930, x550, x530, x530L, x320, x230, x230L and x220 Series switches

# debug loopprot

**Overview** This command enables Loop Protection debugging.  
The **no** variant of this command disables Loop Protection debugging.

**Syntax** debug loopprot {info|msg|pkt|state|nsm|all}  
no debug loopprot {info|msg|pkt|state|nsm|all}

| Parameter | Description                                                                    |
|-----------|--------------------------------------------------------------------------------|
| info      | General Loop Protection information.                                           |
| msg       | Received and transmitted Loop Detection Frames (LDFs).                         |
| pkt       | Echo raw ASCII display of received and transmitted LDF packets to the console. |
| state     | Loop Protection states transitions.                                            |
| nsm       | Network Service Module information.                                            |
| all       | All debugging information.                                                     |

**Mode** Privileged Exec and Global Configuration

**Example** To enable debug for all state transitions, use the command:

```
awplus# debug loopprot state
```

**Related commands** [show debugging loopprot](#)  
[undebug loopprot](#)

## debug platform packet

**Overview** This command enables platform to CPU level packet debug functionality on the device.

Use the **no** variant of this command to disable platform to CPU level packet debug. If the result means both send and receive packet debug are disabled, then any active timeout will be canceled.

**Syntax** debug platform packet [recv] [send] [sflow] [timeout <timeout>]  
[vlan <vid>|all]  
no debug platform packet [recv] [send]

| Parameter         | Description                                                                 |
|-------------------|-----------------------------------------------------------------------------|
| recv              | Debug packets received.                                                     |
| send              | Debug packets sent.                                                         |
| sflow             | Debug sFlow packets.                                                        |
| timeout <timeout> | Stop debug after a specified time. Specify the time in seconds.             |
| vlan <vid>        | Specify a VID (VLAN ID) in the range 1 to 4094 to limit debug to that VLAN. |
| all               | Debug all VLANs (default setting).                                          |

**Default** A 5 minute timeout is configured by default if no other timeout duration is specified.

**Mode** Privileged Exec and Global Configuration

**Usage notes** This command can be used to trace packets sent and received by the CPU. If a timeout is not specified, then a default 5 minute timeout will be applied.

If a timeout of 0 is specified, packet debug will be generated until the **no** variant of this command is used or another timeout value is specified. The timeout value applies to both send and receive debug and is updated whenever the **debug platform packet** command is used.

**Examples** To enable both receive and send packet debug for the default timeout of 5 minutes, enter:

```
awplus# debug platform packet
```

To enable receive packet debug for 10 seconds, enter:

```
awplus# debug platform packet recv timeout 10
```

To enable packet debug for sFlow packets only for the default timeout of 5 minutes, enter:

```
awplus# debug platform packet sflow
```

To enable send packet debug with no timeout, enter:

```
awplus# debug platform packet send timeout 0
```

To enable VLAN packet debug for VLAN 1 with a timeout duration of 3 minutes, enter:

```
awplus# debug platform packet vlan 1 timeout 180
```

To disable receive packet debug, enter:

```
awplus# no debug platform packet recv
```

**Related commands** [show debugging platform packet](#)  
[undebug platform packet](#)

# duplex

**Overview** This command changes the duplex mode for the specified port.

To see the currently-negotiated duplex mode for ports whose links are up, use the command **show interface**. To see the configured duplex mode (when different from the default), use the command **show running-config**.

**Syntax** duplex {auto|full|half}

| Parameter | Description                       |
|-----------|-----------------------------------|
| auto      | Auto-negotiate duplex mode.       |
| full      | Operate in full duplex mode only. |
| half      | Operate in half duplex mode only. |

**Default** By default, ports auto-negotiate duplex mode (except for 100Base-FX ports which do not support auto-negotiation, so default to full duplex mode).

**Mode** Interface Configuration

**Usage notes** Switch ports in a static or dynamic (LACP) channel group must have the same port speed and be in full duplex mode. Once switch ports have been aggregated into a channel group, you can set the duplex mode of all the switch ports in the channel group by applying this command to the channel group.

**Examples** To specify full duplex for port1.0.4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# duplex full
```

To specify half duplex for port1.0.4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# duplex half
```

To auto-negotiate duplex mode for port1.0.4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# duplex auto
```

**Related** **polarity**  
**commands** **speed**  
**show interface**

## linkflap action

**Overview** Use this command to detect flapping on all ports. If more than 15 flaps occur in less than 15 seconds the flapping port will shut down.

Use the **no** variant of this command to disable flapping detection at this rate.

**Syntax** linkflap action [shutdown]  
no linkflap action

| Parameter | Description                       |
|-----------|-----------------------------------|
| linkflap  | Global setting for link flapping. |
| action    | Specify the action for port.      |
| shutdown  | Shutdown the port.                |

**Default** Linkflap action is disabled by default.

**Mode** Global Configuration

**Example** To enable the linkflap action command on the device, use the following commands:

```
awplus# configure terminal
awplus(config)# linkflap action shutdown
```

# linkflap enable-stable-time

**Overview** Use this command to enable linkflap detection delay, which causes the switch to wait for 500 milliseconds for a stable connection when a cable is plugged in.

Use the **no** variant of this command to remove linkflap detection delay.

**Syntax** linkflap enable-stable-time  
no linkflap enable-stable-time

| Parameter          | Description                     |
|--------------------|---------------------------------|
| linkflap           | Global setting for linkflapping |
| enable-stable-time | Enable stable-time delay        |

**Default** Enabled.

**Mode** Global Configuration

**Example** To configure linkflap detection delay, use the commands:

```
awplus# configure terminal
awplus(config)# linkflap enable-stable-time
```

**Command changes** Version 5.5.4-2.1: command added

## loop-protection loop-detect

**Overview** Use this command to enable the loop-protection loop-detect feature and configure its parameters.

Use the **no** variant of this command to disable the loop-protection loop-detect feature.

**Syntax** `loop-protection loop-detect [ldf-interval <period>] [ldf-rx-window <frames>] [fast-block]`  
`no loop-protection loop-detect`

| Parameter                   | Description                                                                                                              |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <code>ldf-interval</code>   | The time (in seconds) between successive loop-detect frames being sent.                                                  |
| <code>&lt;period&gt;</code> | Specify a period between 1 and 600 seconds. The default is 10 seconds.                                                   |
| <code>ldf-rx-window</code>  | The number of transmitted loop detect frames whose details are held for comparing with frames arriving at the same port. |
| <code>&lt;frames&gt;</code> | Specify a value for the window size between 1 and 5 frames. The default is 3 frames.                                     |
| <code>fast-block</code>     | The fast-block blocks transmitting port to keep partial connectivity.                                                    |

**Default** The loop-protection loop-detect feature is disabled by default. The default interval is 10 seconds, and the default window size is 3 frames.

**Mode** Global Configuration

**Usage notes** If transmitting of loop-detection frames takes too long, then it can time out and the switch may not send all loop-detection frames, and therefore may not detect a loop. This can happen in some networks with large numbers of loop-protection instances with short loop-detection intervals. In this case, the switch generates a log message:

“Sending loop-detection frames taking longer than expected - too many instances?”

To prevent this log message, you can either:

- change the loop-detection frame interval to a higher value to reduce the number of packets that are sent in each block. To do this, use the command **loop-protection loop-detect ldf-interval <period>**, or
- reduce the number of instances by reducing the number of VLANs per port or by removing loop protection from some ports.

The **show loop-protection** command shows the total number of loop-protection instances (one instance per VLAN per port) and the number of packets that need to be transmitted by the device each second (the Total Instances entry). It also shows the number of packets that timed out for each port (the Timeout entry). The **show loop-protection counter** command shows the number of timeouts per VLAN for each port.

See the “Loop Protection” section in the **Switching Feature Overview and Configuration Guide** for more relevant conceptual, configuration, and overview information before applying this command.

**Example** To enable the loop-detect mechanism on the switch, and generate loop-detect frames once every 5 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# loop-protection loop-detect ldf-interval 5
```

**Related commands** **loop-protection action**  
**loop-protection timeout**  
**show loop-protection**

## loop-protection action

**Overview** Use this command to specify the protective action to apply when a network loop is detected on an interface.

Use the **no** variant of this command to reset the loop protection actions to the default action, vlan-disable, on an interface.

**Syntax** loop-protection action {link-down|log-only|port-disable|vlan-disable|none}  
no loop-protection action

| Parameter    | Description                                                                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| link-down    | Block all traffic on a port (or aggregated link) that detected the loop, and take <b>down</b> the link.                                                                 |
| log-only     | Details of loop conditions are logged. No action is applied to the port (or aggregated link).                                                                           |
| port-disable | Block all traffic on interface for which the loop occurred, but keep the link in the <b>up</b> state.                                                                   |
| vlan-disable | Block all traffic for the VLAN on which the loop traffic was detected. Note that setting this parameter will also enable ingress filtering. This is the default action. |
| none         | Applies no protective action.                                                                                                                                           |

**Default** loop-protection action vlan-disable

**Mode** Interface Configuration

**Usage notes** See the “Loop Protection” section in the [Switching Feature Overview and Configuration Guide](#) for relevant conceptual, configuration, and overview information prior to applying this command.

**Example** To disable the interface port1.0.2 and bring the link down when a network loop is detected, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# loop-protection action link-down
```

**Related commands** **loop-protection loop-detect**  
**loop-protection timeout**  
**show loop-protection**

# loop-protection action-delay-time

**Overview** Use this command to sets the loop protection action delay time for an interface to specified values in seconds. The action delay time specifies the waiting period for the action.

Use the **no** variant of this command to reset the loop protection action delay time for an interface to default.

**Syntax** loop-protection action-delay-time <0-86400>  
no loop-protection action

| Parameter | Description                                              |
|-----------|----------------------------------------------------------|
| <0-86400> | Time in seconds; 0 means action delay timer is disabled. |

**Default** Action delay timer is disabled by default.

**Mode** Interface Configuration

**Example** To configure a loop protection action delay time of 10 seconds on port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# loop-protection action-delay-time 10
```

**Related commands** [loop-protection loop-detect](#)  
[loop-protection timeout](#)  
[show loop-protection](#)

# loop-protection timeout

**Overview** Use this command to specify the Loop Protection recovery action duration on an interface.

Use the **no** variant of this command to set the loop protection timeout to the default.

**Syntax** loop-protection timeout *<duration>*  
no loop-protection timeout

| Parameter               | Description                                                                                                                                                                                                      |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;duration&gt;</i> | The time (in seconds) for which the configured action will apply before being disabled. This duration can be set between 0 and 86400 seconds (24 hours). The set of 0 means infinity so timeout does not expire. |

**Default** The default is 7 seconds.

**Mode** Interface Configuration

**Usage notes** See the “Loop Protection” section in the [Switching\\_Feature Overview\\_and Configuration\\_Guide](#) for relevant conceptual, configuration, and overview information prior to applying this command.

**Example** To configure a loop protection action timeout of 10 seconds for port1.0.4, use the command:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# loop-protection timeout 10
```

**Related commands** [loop-protection loop-detect](#)  
[loop-protection action](#)  
[show loop-protection](#)

## mac address-table acquire

**Overview** Use this command to enable MAC address learning on the device.  
Use the **no** variant of this command to disable learning.

**Syntax** `mac address-table acquire`  
`no mac address-table acquire`

**Default** Learning is enabled by default for all instances.

**Mode** Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# mac address-table acquire`

## mac address-table ageing-time

**Overview** Use this command to specify an ageing-out time for a learned MAC address. The learned MAC address will persist for at least the specified time.

The **no** variant of this command will reset the ageing-out time back to the default of 300 seconds (5 minutes).

**Syntax** `mac address-table ageing-time <ageing-timer> none`  
`no mac address-table ageing-time`

| Parameter                         | Description                                                           |
|-----------------------------------|-----------------------------------------------------------------------|
| <code>&lt;ageing-timer&gt;</code> | <code>&lt;10-1000000&gt;</code> The number of seconds of persistence. |
| <code>none</code>                 | Disable learned MAC address timeout.                                  |

**Default** The default ageing time is 300 seconds.

**Mode** Global Configuration

**Examples** The following commands specify various ageing timeouts on the device:

```
awplus# configure terminal
awplus(config)# mac address-table ageing-time 1000
awplus# configure terminal
awplus(config)# mac address-table ageing-time none
awplus# configure terminal
awplus(config)# no mac address-table ageing-time
```

## mac address-table logging

**Overview** Use this command to create log entries when the content of the FDB (forwarding database) changes. Log messages are produced when a MAC address is added to or removed from the FDB.

**CAUTION:** MAC address table logging may impact the performance of the switch. Only enable it when necessary as a debug tool.

Use the **no** variant of this command to stop creating log entries when the content of the FDB changes.

**Syntax** mac address-table logging  
no mac address-table logging

**Default** MAC address table logging is disabled by default.

**Mode** User Exec/Privileged Exec

**Usage** When MAC address table logging is enabled, the switch produces the following messages:

| Change       | Message format                  | Example                                    |
|--------------|---------------------------------|--------------------------------------------|
| MAC added    | MAC add <mac> <port> <vlan>     | MAC add eccd.6db5.68a7 port1.0.1 vlan2     |
| MAC deleted  | MAC delete <mac> <port> <vlan>  | MAC delete eccd.6db5.68a7 port1.0.1 vlan2  |
| MAC aged out | MAC age-out <mac> <port> <vlan> | MAC age-out eccd.6db5.68a7 port1.0.1 vlan2 |

To see whether MAC address table logging is enabled, use the command **show running-config**.

**Example** To create log messages when the content of the FDB changes, use the command:

```
awplus# mac address-table logging
```

**Related commands** **show running-config**

# mac address-table static

**Overview** Use this command to statically configure the MAC address-table to do one of the following:

- forward frames with a matching destination MAC address
- discard frames with a matching destination MAC address

**Syntax** `mac address-table static <mac-addr> {forward|discard} interface <port> [vlan <vid>]`  
`no mac address-table static <mac-addr> {forward|discard} interface <port> [vlan <vid>]`

| Parameter        | Description                                                                                                                                                                                                      |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <mac-addr>       | The destination MAC address in HHHH.HHHH.HHHH format.                                                                                                                                                            |
| forward          | Forward frames when the destination MAC address matches.                                                                                                                                                         |
| discard          | Drop frames when the destination MAC address matches.                                                                                                                                                            |
| interface <port> | Specify a port. The port can be: <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li></ul> |
| vlan <vid>       | The ID of a VLAN to apply the command to, in the range 1 to 4094. If you do not specify a VLAN, the command applies to VLAN1.                                                                                    |

**Mode** Global Configuration

**Usage notes** The **mac address-table static** command is only applicable to Layer 2 switched traffic within a single VLAN. Do not apply the **mac address-table static** command to Layer 3 switched traffic passing from one VLAN to another VLAN. Frames will not be discarded across VLANs because packets are routed across VLANs. This command only works on Layer 2 traffic.

**Example** To forward traffic that belongs to VLAN 3 and has a destination MAC address of 2222.2222.2222, on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table static 2222.2222.2222 forward
interface port1.0.1 vlan 3
```

**Related commands** [clear mac address-table static](#)  
[show mac address-table](#)

# mac address-table thrash-limit

**Overview** Use this command to set the thrash limit on the device.

Thrashing occurs when a MAC address table rapidly “flips” its mapping of a single MAC address between two switchports on the same VLAN. This is usually because of a network loop.

Use the **no** variant of this command to return the thrash limit to its default setting.

**Syntax** `mac address-table thrash-limit <rate>`  
`no mac address-table thrash-limit`

| Parameter                 | Description                                                                                                                                                                                                    |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;rate&gt;</code> | The maximum thrash rate at which limiting is applied. This rate can be set to between 5 and 255 MAC thrashing flips per second. Once the thrash limit rate is reached, the port is considered to be thrashing. |

**Default** 10 MAC thrashing flips per second

**Mode** Global Configuration

**Usage notes** Use this command to limit thrashing on the selected port range.

**Example** To apply a thrash limit of 20 MAC address flips per second:

```
awplus# configure terminal
awplus(config)# mac address-table thrash-limit 20
```

**Related commands** [show interface](#)  
[show mac address-table thrash-limit](#)  
[thrash-limiting](#)

# platform control-plane-prioritization rate

**Overview** The feature ensures that different traffic types can share the CPU effectively.

Use this command to set the maximum traffic rate on the CPU port to limit the data rate to the CPU. This is to prevent the CPU becoming overloaded with unnecessary data packets, which in turn could result in poor performance in situations such as a CLI console lock up, or control packet loss following a broadcast storm.

Use the **no** variant of this command to restore the rate limiting on the CPU port to the default.

Note that only integer values are accepted for rate limits.

Set the rate to 0 using **platform control-plane prioritization rate** to disable CPU protection.

**Syntax** platform control-plane-prioritization rate *<rate-limit>*  
no platform control-plane-prioritization rate

| Parameter                 | Description                                                          |
|---------------------------|----------------------------------------------------------------------|
| <i>&lt;rate-limit&gt;</i> | <i>&lt;1000-30000&gt;</i> 1000Kbps to 30000Kbps (1 Mbps to 30 Mbps). |

**Default** 30 Mbps

**Mode** Global Configuration

**Usage notes** **Confirming default settings:**

Use **show platform** to confirm the default rate limit settings displayed with platform information:

```
awplus# show platform
```

**Disabling CPU protection:**

To disable the CPU protection feature you can set the control plane prioritization rate to 0:

```
awplus# platform control-plane-prioritization 0
```

Then you can confirm the CPU protection feature has been disabled using **show platform**:

```
awplus# show platform
```

|                              |                         |
|------------------------------|-------------------------|
| Load Balancing               | srt-dst-mac, src-dst-ip |
| Control-plane-prioritization | Max 0 Mbps              |
| Jumboframe support           | off                     |
| Enhanced mode                | qos counters            |
| Vlan-stacking TPID           | 0x8100                  |

**Examples** To set the maximum traffic rate on the CPU port to 20 Mbps enter the following command:

```
awplus# configure terminal
```

```
awplus(config)# platform control-plane-prioritization 20000
```

Confirm the maximum traffic rate has been configured using the following **show** command:

|                              |                         |
|------------------------------|-------------------------|
| awplus#show platform         |                         |
| Load Balancing               | srt-dst-mac, src-dst-ip |
| Control-plane-prioritization | Max 20 Mbps             |
| Jumboframe support           | off                     |
| Enhanced mode                | qos counters            |
| Vlan-stacking TPID           | 0x8100                  |

To reset the maximum traffic rate on the CPU port to the default enter the following command:

```
awplus# configure terminal
```

```
awplus(config)# no platform control-plane-prioritization
```

**Related commands** **show platform**  
**show running-config**

# platform jumboframe

**Overview** This command enables the device to forward jumbo frames. See the [Switching Feature Overview and Configuration Guide](#) for more information.

When jumbo frame support is enabled, the maximum size of packets that the device can forward is 9216 bytes of payload.

Use the **no** variant of this command to remove jumbo frame support. This stops the ports from forwarding packets larger than VLAN tagged frames (1522 bytes).

**NOTE:** *The number above specifies the payload only. For an IEEE 802.1q frame, provision is made (internally) for the following additional components:*

- *Source and Destination addresses*
- *EtherType field*
- *Priority and VLAN tag fields*
- *FCS*

*These additional components increase the frame size (to 1522 bytes in the default case).*

**Syntax** platform jumboframe  
no platform jumboframe

**Default** By default, jumbo frames is off.

**Mode** Global Configuration

**Usage notes** You must save the configuration and restart the device after entering this command for it to take effect. You can use the [reboot](#) command to restart the device.

**Example** To enable the device to forward jumbo frames, use the following commands:

```
awplus# configure terminal
awplus(config)# platform jumboframe
```

**Related commands** [show platform](#)  
[show running-config](#)

## platform l2mc-overlap

**Overview** Use this command to enable checking for overlapping (shared) multicast entries, so that shared entries are not deleted if they are still in use.

An overlap exists if the resulting MAC address is the same for two different multicast groups. For example, 224.1.1.1 and 239.1.1.1 will result in a multicast overlap—packets destined for 239.1.1.1 will also be sent to 224.1.1.1.

Use the **no** version of this command to disable checking for overlapping entries before deletion.

**Syntax** platform l2mc-overlap  
no platform l2mc-overlap

**Mode** Global Configuration

**Default** Enabled

**Usage notes** When overlap handling is on, group entries will not be deleted if a multicast overlap exists. However, this may have the unexpected behavior of flooding multicast packets to ports which have not joined the group. If this is an issue, either turn off the command or redesign the network to ensure no multicast groups overlap.

**Example** To prevent the deletion of overlapping (shared) Layer 2 multicast entries, use the command:

```
awplus# configure terminal
awplus(config)# platform l2mc-overlap
```

**Related commands** [show platform](#)

**Command changes** Version 5.5.1-0.1: Default changed to enabled

Version 5.5.1-1.2: Command added to SBx908 GEN2 and x950 Series. Note that it is disabled by default on these switches.

## platform l2mc-table mode

**Overview** Use this command to control the way in which hardware Layer 2 multicast forwarding entries are allocated to multicast groups. You can choose either to share entries between groups when possible, or to allocate one entry per multicast group. Sharing entries minimizes how many hardware entries are used for Layer 2 multicast forwarding.

Use the **no** variant of this command to return to the default, which is **compact**.

**Syntax** platform l2mc-table mode {compact|entry-per-group}  
no platform l2mc-table mode

| Parameter       | Description                                  |
|-----------------|----------------------------------------------|
| compact         | Share hardware entries across similar groups |
| entry-per-group | Allocate a distinct entry to each group      |

**Default** Compact

**Mode** Global Configuration

**Usage notes** This command controls the way in which hardware Layer 2 multicast forwarding entries are allocated to multicast groups. These hardware entries represent a set of ports in a VLAN, to which a multicast group is being sent. More than one multicast group may be sent to the same set of egress ports in a given VLAN at the same time. If this is the case, then the default behavior is to create just the one hardware forwarding entry representing that set of egress ports on that VLAN, and have multiple multicast groups share that one entry.

The entry-per-group option changes this behavior, so that each multicast group has its own hardware entry representing the egress ports to which it is being forwarded on a given VLAN. With this option, if multiple groups are being forwarded to the same set of ports on a particular VLAN, each group will have its own hardware entry, each comprising that same set of ports.

The default mode (compact) is usually well suited to a core switch, which is forwarding many groups to a relatively few ports, and not often changing which groups are sent to which ports. Because the usage of hardware entries is minimized, this maximizes the number of multicast groups that the switch can forward. However, sometimes the entry-per-group mode is preferable, especially in the following situations:

- If multicast data is being forwarded out through an aggregated link.

The hardware forwarding entries do not allocate data to aggregated links as such; they just work with sets of individual ports, and cannot include aggregations in their set of egress ports. If groups are being forwarded to an aggregated link, a given forwarding entry will include just one port of that aggregation. If multiple multicast groups share the same forwarding entry, they will all be sent down the same single link in the aggregation. The multicast data will not be shared across the aggregated links, and therefore the bandwidth of the aggregation will not be fully utilized.

If you change the mode to entry-per-group, then each group will have its own forwarding entry, and a statistical process will put different members of the aggregation into different forwarding entries. Therefore, the multicast data will be statistically distributed across the links in the aggregation.

- If the switch is forwarding a large number of groups to a large number of ports in a dynamic environment, where end hosts are frequently joining and leaving groups.

In compact mode, every time a group membership changes, the switch needs to check to see if the mapping of groups to forwarding entries is still optimized. If not, then it needs to rearrange the mapping, to return to an optimized state. In a highly dynamic environment, this activity adds significant processing overhead, and can lead to some disruption of multicast forwarding if hardware entries are being frequently updated. In this case, changing to entry-per-group mode removes the need to perform frequent re-optimizations, thereby reducing processing overhead, and avoiding such frequent updating of hardware entries.

**Example** To change to entry-per-group mode, use the commands:

```
awplus# configure terminal
awplus(config)# platform l2mc-table mode entry-per-group
```

# platform load-balancing

**Overview** This command determines which address fields are used as inputs into the load balancing algorithm for aggregated links. The output from this algorithm is used to select which individual path a given packet will traverse within an aggregated link.

The **no** variant of this command removes the specified packet type from the calculation.

**Syntax** `platform load-balancing [src-dst-mac] [src-dst-ip] [src-dst-port]`  
`no platform load-balancing [src-dst-mac] [src-dst-ip] [src-dst-port]`

| Parameter    | Description                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------|
| src-dst-mac  | The source and destination MAC addresses (Layer 2)                                                                                     |
| src-dst-ip   | The source and destination IP addresses (Layer 3)                                                                                      |
| src-dst-port | The source and destination TCP/UDP port data (Layer 4). If you include this option, make sure that <b>src-dst-ip</b> is also selected. |

**Default** Includes the **src-dst-mac** and **src-dst-ip** addresses as inputs into the platform load balancing algorithm.

**Mode** Global configuration

**Usage notes** Useful combinations of inputs are:

- MAC address and IP address (the default)
- MAC address only
- MAC address, IP address and Layer 4 port number
- IP address and Layer 4 port number
- IP address only

The following examples show how to configure each of these combinations.

Note the following restrictions:

- you can only stop using MAC addresses (**src-dst-mac**) if you still have IP addresses (**src-dst-ip**) selected
- if you specify Layer 4 ports (**src-dst-port**), you should also specify IP addresses (**src-dst-ip**)

Use the **show platform** command to verify this command's setting.

**Examples** To use MAC addresses and IP addresses, you do not have to enter any commands, because this is the default. Note that this setting is not displayed in the **show running-config** output. Use the **show platform** command to verify this setting.

To use MAC addresses only, remove IP addresses by using the commands:

```
awplus# configure terminal
awplus(config)# no platform load-balancing src-dst-ip
```

To use MAC addresses, IP addresses and Layer 4 port numbers, add Layer 4 port numbers by using the commands:

```
awplus# configure terminal
awplus(config)# platform load-balancing src-dst-port
```

To use IP addresses and Layer 4 port numbers, remove MAC addresses and add Layer 4 port numbers by using the commands:

```
awplus# configure terminal
awplus(config)# no platform load-balancing src-dst-mac
awplus(config)# platform load-balancing src-dst-port
```

To use IP addresses only, remove MAC addresses by using the commands:

```
awplus# configure terminal
awplus(config)# no platform load-balancing src-dst-mac
```

**Related commands** **show platform**

# platform multicast-address-mismatch-action

**Overview** Use this command to change the action taken by the switch when it receives IP multicast packets that have mismatched destination MAC address and destination IP address. Such packets are used by services like Microsoft Network Load Balancing (MS-NLB), in which case they need to be flooded across the switch.

Use the **no** variant of this command to return to the default action.

**Syntax** platform multicast-address-mismatch-action {bridge|drop}  
no platform multicast-address-mismatch-action

| Parameter | Description                                                                 |
|-----------|-----------------------------------------------------------------------------|
| drop      | Drop IP multicast packets with mismatched destination addresses on ingress. |
| bridge    | Flood IP multicast packets with mismatched destination addresses.           |

**Default** The default behavior depends on whether **arp-mac-disparity multicast** or **arp-mac-disparity multicast-igmp** has been configured on an interface:

- If one of these has been configured, then the default action is to flood the packets.
- If neither of these has been configured, then the default action is to drop the packets.

**Mode** Global Configuration

**Example** To ensure that the switch floods packets it receives that have IP multicast packets with mismatched L2/L3 destination addresses, use the commands:

```
awplus# configure terminal
awplus(config)# platform multicast-address-mismatch-action
bridge
```

To return to the default, where the behavior depends on the **arp-mac-disparity** command setting, use the commands:

```
awplus# configure terminal
awplus(config)# no platform multicast-address-mismatch-action
```

**Related** [arp](#)  
**commands** [arp-mac-disparity](#)

**Command** Version 5.4.8-2.1: command added  
**changes**

## platform multicast-ratelimit

**Overview** Use this command to set the maximum number of multicast packets to be forwarded to the CPU (in packets per second). Setting the value to zero disables rate limiting.

This command should be used with care. Increasing or removing the limit could make the device less responsive under heavy multicast load.

Use the **no** variant of this command to return the limit to its default.

**Syntax** platform multicast-ratelimit <0-1000>  
no platform multicast-ratelimit

**Default** 10 packets per second (pps)

**Mode** Global Configuration

**Usage notes** If you find that the CPU load on your device from multicast traffic is higher than desired, reducing this rate may reduce the CPU load.

If you need the device to process a large amount of multicast traffic, increasing this rate may improve performance.

**Example** To set the rate to 30pps, use the commands:  
awplus# configure terminal  
awplus(config)# platform multicast-ratelimit 30

**Command changes** Version 5.4.8-1.1: default changed to 100pps on SBx908 GEN2, SBx8100, and x930 Series switches.

## platform stop-unreg-mc-flooding

**Overview** If a multicast stream is arriving at a network device, and that network device has received no IGMP reports that request the receipt of the stream, then that stream is referred to as "unregistered". IGMP snooping actively prevents the flooding of unregistered streams to all ports in the VLAN on which the stream is received. However, there are brief moments at which this prevention is not in operation, and an unregistered stream may be briefly flooded. This command stops this flooding during even those brief periods when IGMP snooping is not explicitly preventing the flooding.

Use the **no** variant of this command to revert to default behavior and disable this feature.

**NOTE:** *This command should not be used within any IPv6 networks. IPv6 neighbor discovery operation is inhibited by this feature.*

This command does not affect the flooding of Local Network Control Block IPv4 multicast packets in the address range 224.0.0.1 to 224.0.0.255 (224.0.0/24). Such packets will continue to be uninterruptedly flooded, as they need to be.

**Syntax** platform stop-unreg-mc-flooding  
no platform stop-unreg-mc-flooding

**Default** This feature is disabled by default.

**Mode** Global Configuration

**Usage notes** This command stops the periodic flooding of unknown or unregistered multicast packets when the Group Membership interval timer expires and there are no subscribers to a multicast group. If there is multicast traffic in a VLAN without subscribers, multicast traffic temporarily floods out of the VLAN when the Group Membership interval timer expires, which happens when the switch does not get replies from Group Membership queries.

This command also stops the initial flood of multicast packets that happens when a new multicast source starts to send traffic. This flooding lasts until snooping realises that this the multicast group is arriving at the switch, and puts an entry into hardware to prevent it from being flooded.

This command is useful in networks where low-performance devices are attached. The operation of such devices can be impaired by them receiving unnecessary streams of traffic. For example, in sites where IP cameras are in use, the flooding of video streams to a whole VLAN can send enough traffic to the cameras to cause interruption of their video streaming.

Do not use this command in IPv6 networks. The following console message is displayed after entering this command to warn you of this:

```
% WARNING: IPv6 will not work with this setting enabled
% Please consult the documentation for more information
```

**Examples** To enable this feature and stop multicast packet flooding, use the following commands:

```
awplus# configure terminal
awplus(config)# platform stop-unreg-mc-flooding
```

To disable this feature and allow multicast packet flooding, use the following commands:

```
awplus# configure terminal
awplus(config)# no platform stop-unreg-mc-flooding
```

**Related commands** [show platform](#)  
[show running-config](#)

# platform vlan-stacking-tpid

**Overview** This command specifies the Tag Protocol Identifier (TPID) value that applies to all frames that are carrying double tagged VLANs. All such VLANs must use the same TPID value. (This feature can be referred to as nested VLANs, VLAN stacking, Q-in-Q, or VLAN double-tagging.)

Use the **no** variant of this command to revert to the default TPID value (0x8100).

**NOTE:** *platform jumboframe*

**Syntax** platform vlan-stacking-tpid <tpid>  
no platform vlan-stacking-tpid

| Parameter | Description                                                               |
|-----------|---------------------------------------------------------------------------|
| <tpid>    | The Ethernet type of the tagged packet, as a two byte hexadecimal number. |

**Default** The default TPID value is 0x8100.

**Mode** Global Configuration

**Examples** To set the VLAN stacking TPID value to 0x9100, use the following commands:

```
awplus# configure terminal
awplus(config)# platform vlan-stacking-tpid 9100
```

To reset the VLAN stacking TPID value to the default (0x8100), use the following commands:

```
awplus# configure terminal
awplus(config)# no platform vlan-stacking-tpid
```

**Related commands** *switchport vlan-stacking (double-tagging)*  
*show platform*  
*show running-config*

# polarity

**Overview** This command sets the MDI/MDIX polarity on a copper-based switch port.

**Syntax** `polarity {auto|mdi|mdix}`

| Parameter | Description                                                                  |
|-----------|------------------------------------------------------------------------------|
| mdi       | Sets the polarity to MDI (medium dependent interface).                       |
| mdix      | Sets the polarity to MDI-X (medium dependent interface crossover).           |
| auto      | The switch port sets the polarity automatically. This is the default option. |

**Default** By default, switch ports set the polarity automatically (**auto**).

**Mode** Interface Configuration

**Usage notes** We recommend the default **auto** setting for MDI/MDIX polarity. Polarity applies to copper 10BASE-T, 100BASE-T, and 1000BASE-T switch ports; it does not apply to fiber ports. See the “MDI/MDIX Connection Modes” section in the [Switching Feature Overview and Configuration Guide](#) for more information.

**Example** To set the polarity for port1.0.4 to fixed MDI mode, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# polarity mdi
```

# show debugging loopprot

**Overview** This command shows Loop Protection debugging information.

**Syntax** show debugging loopprot

**Mode** User Exec and Privileged Exec

**Example** To display the enabled Loop Protection debugging modes, use the command:

```
awplus# show debugging loopprot
```

**Related commands** [debug loopprot](#)

# show debugging platform packet

**Overview** This command shows platform to CPU level packet debugging information.

**Syntax** show debugging platform packet

**Mode** User Exec and Privileged Exec

**Example** To display the platform packet debugging information, use the command:

```
awplus# show debugging platform packet
```

**Related commands** [debug platform packet](#)  
[undebug platform packet](#)

# show flowcontrol interface

**Overview** Use this command to display flow control information.

**Syntax** show flowcontrol interface <port>

| Parameter | Description                                     |
|-----------|-------------------------------------------------|
| <port>    | Specifies the name of the port to be displayed. |

**Mode** User Exec and Privileged Exec

**Example** To display the flow control for port1.0.3, use the command:

```
awplus# show flowcontrol interface port1.0.3
```

**Output** The following shows typical output.

**Example output from the show flowcontrol interface command for a specific interface**

| Port      | Send<br>admin | FlowControl<br>oper | Receive<br>admin | FlowControl<br>oper | RxPause | TxPause |
|-----------|---------------|---------------------|------------------|---------------------|---------|---------|
| -----     | -----         | -----               | -----            | -----               | -----   | -----   |
| port1.0.3 | on            | on                  | on               | on                  | 0       | 0       |

## show interface err-disabled

**Overview** Use this command to show ports that have been dynamically shut down by protocols running on the device and the protocols responsible for the shutdown.

**Syntax** show interface [*<interface-range>*] err-disabled

| Parameter                      | Description     |
|--------------------------------|-----------------|
| <i>&lt;interface-range&gt;</i> | Interface range |

**Mode** User Exec and Privileged Exec

**Example** To show which protocols have shut down ports, use the commands:

```
awplus# show interface err-disabled
```

**Output** The following shows typical output.

**Example output from show interface err-disabled**

```
awplus#show interface err-disabled
Interface      Reason
port1.0.1      loop protection
port1.0.2      loop protection
```

**Parameters in the output from show interface err-disabled**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface | The name of the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Reason    | <p>The reason the interface was disabled or the feature or protocol that disabled it. One of:</p> <ul style="list-style-type: none"><li>• A threat has been detected on the port (linkdown action from AMF Application proxy)</li><li>• No installed/enabled SIM (5G has no SIM installed)</li><li>• thrash limiting</li><li>• loop protection</li><li>• UDLD</li><li>• port security</li><li>• VCS disabled master</li><li>• hardware health monitoring</li><li>• ATMF safe mode</li><li>• DHCP snooping</li><li>• QoS Storm Protection</li><li>• DoS Protection</li><li>• Continuous Reboot Prevention</li><li>• MSTP bpdu-guard</li><li>• Fiber monitoring</li></ul> |

# show interface switchport

**Overview** Use this command to show VLAN information about each switch port.

**Syntax** show interface switchport

**Mode** User Exec and Privileged Exec

**Example** To display VLAN information about each switch port, enter the command:

```
awplus# show interface switchport
```

**Output** The following shows typical output.

## Example output from the show interface switchport command

```
Interface name      : port1.0.1
Switchport mode    : access
Ingress filter      : enable
Acceptable frame types : all
Default Vlan       : 1
Configured Vlans    : 2
Translated Vlans    :
Translated Default  : accept
Dynamic Vlans      :

Interface name      : port1.0.2
Switchport mode    : trunk
Ingress filter      : enable
Acceptable frame types : all
Default Vlan       : 1
Configured Vlans    : 1 4 5 6 7 8
Translated Vlans    :
Translated Default  : accept
Dynamic Vlans      :
...
```

**Related commands** [show interface memory](#)  
[show vlan](#)

# show loop-protection

**Overview** Use this command to display the current configuration and operation of loop protection on the device.

**Syntax** `show loop-protection [interface <port-list>] [counters]`

| Parameter   | Description                                       |
|-------------|---------------------------------------------------|
| interface   | The interface selected for display.               |
| <port-list> | A port, a port range, or an aggregated link.      |
| counters    | Displays counter information for loop protection. |

**Mode** User Exec and Privileged Exec

**Usage notes** If transmitting of loop-detection frames takes too long, then it can time out and the switch may not send all loop-detection frames, and therefore may not detect a loop. This can happen in some networks with large numbers of loop-protection instances with short loop-detection intervals. In this case, the switch generates a log message:

"Sending loop-detection frames taking longer than expected - too many instances?"

To prevent this log message, you can either:

- change the loop-detection frame interval to a higher value to reduce the number of packets that are sent in each block. To do this, use the command **loop-protection loop-detect ldf-interval <period>**, or
- reduce the number of instances by reducing the number of VLANs per port or by removing loop protection from some ports.

The **show loop-protection** command shows the total number of loop-protection instances (one instance per VLAN per port) and the number of packets that need to be transmitted by the device each second (the Total Instances entry). It also shows the number of packets that timed out for each port (the Timeout entry). The **show loop-protection counter** command shows the number of timeouts per VLAN for each port.

**Example** To display the current configuration status, use the command:

```
awplus# show loop-protection
```

**Output** The following shows typical output.

**Example output from the show loop-protection command:**

```
awplus#show loop-protection

LDF Interval:      10
Fast Block:   Disabled
Total Instances: 29174 (2917 packets/s)

  Int           Enabled Action      Status   Timeout   Timeout   Rx port
  -----
port1.0.1      Yes     vlan-dis Normal    7         -         -
port1.0.2      Yes     vlan-dis Normal    0         -         -
port1.0.3      Yes     vlan-dis Normal    0         -         -
...
```

**Example** To display the counter information, use the command:

```
awplus# show loop-protection counters
```

**Output** The following shows typical output.

**Example output from the show loop-protection counters command:**

```
awplus#show loop-protection counters

Switch Loop Detection Counter

  Interface      Tx           Rx           Tx Timeout  Rx Invalid   Last LDF Rx
  -----
port1.0.1
  vlan1         60           0            7            0            -
port1.0.2
  vlan1          0           0            0            0            -
port1.0.3
  vlan1          0           0            0            0            -
...
```

**Related commands** [clear loop-protection counters](#)  
[loop-protection action](#)  
[loop-protection loop-detect](#)

## show mac address-table

**Overview** Use this command to display the MAC address-table for all configured VLANs.

**Syntax** show mac address-table

**Mode** User Exec and Privileged Exec

**Usage notes** The **show mac address-table** command is only applicable to view a MAC address-table for Layer 2 switched traffic within VLANs.

**Example** To display the MAC address-table, use the following command:

```
awplus# show mac address-table
```

**Output** See the following sample output captured when there was no traffic being switched:

```
awplus#show mac address-table

VLAN port      mac                type      static
1     unknown    0000.cd28.0752    forward   static
ARP   -          0000.cd00.0000    forward   static
```

See the sample output captured when packets were switched and MAC addresses were learned:

```
awplus#show mac address-table

VLAN port      mac                type      static
1     unknown    0000.cd28.0752    forward   static
1     port1.0.2    0030.846e.9bf4    forward   dynamic
1     port1.0.3    0030.846e.bac7    forward   dynamic
ARP   -          0000.cd00.0000    forward   static
```

Note the new MAC addresses learned for port1.0.2 and port1.0.3 added as dynamic entries.

Note the first column of the output below shows VLAN IDs if multiple VLANs are configured:

```
awplus#show mac address-table

VLAN port      mac                type      static
1     unknown    0000.cd28.0752    forward   static
1     port1.0.2    0030.846e.bac7    forward   dynamic
2     unknown    0000.cd28.0752    forward   static
2     port1.0.3    0030.846e.9bf4    forward   dynamic
ARP   -          0000.cd00.0000    forward   static
```

Also note if manually configured static MAC addresses exist, this is shown to the right of the type column:

```
awplus(config)#mac address-table static 0000.1111.2222 for int
port1.0.3 vlan 1
awplus(config)#end
awplus#
awplus#show mac address-table

VLAN port      mac                type      static
1     unknown    0000.cd28.0752    forward   static
1     port1.0.2    0030.846e.bac7    forward   dynamic
1     port1.0.3    0000.1111.2222    forward   static
...
```

**Related commands** [clear mac address-table dynamic](#)  
[clear mac address-table static](#)  
[mac address-table static](#)

# show mac address-table thrash-limit

**Overview** Use this command to display the current thrash limit set for all interfaces on the device.

**Syntax** show mac address-table thrash-limit

**Mode** User Exec and Privileged Exec

**Example** To display the current, use the following command:  
awplus# show mac address-table thrash-limit

**Output** The following shows typical output.

**Example output from the show mac address-table thrash-limit command**

```
% Thrash-limit 7 movements per second
```

**Related commands** [mac address-table thrash-limit](#)

# show platform

**Overview** This command displays the settings configured by using the **platform** commands.

**Syntax** show platform

**Mode** Privileged Exec

**Usage notes** This command displays the settings in the running config. For changes in some of these settings to take effect, the device must be rebooted with the new settings in the startup config.

**Example** To check the settings configured with **platform** commands on the device, use the following command:

```
awplus# show platform
```

**Output** The following shows typical output.

**Example output from the show platform command:**

```
awplus# show platform
Load Balancing          src-dst-mac,src-dst-ip
Control-plane-prioritization Max 1000 Mbps
L2MC overlapped group check on
Vlan Ingress Filter Hard Drop off
stop-unreg-mc-flooding off
MC address mismatch action Drop
Inter-chip header       4-word (default)
Jumboframe support      off
Vlan-stacking TPID      0x8100
```

**Parameters in the output of the show platform command.**

| Parameter                    | Description                                                                                                                                                                                                                               |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Routing Ratio                | Whether all memory is allocated to IPv4 address table entries only, or whether it is allocated evenly to both IPv4 and IPv6 addresses (set with the <b>platform routingratio</b> command).                                                |
| Route Weighting              | The split between multicast and unicast route entries (set with the <b>platform routingratio</b> command).                                                                                                                                |
| MAC vlan hashing algorithm   | The MAC VLAN hash-key-generating algorithm (set with the <b>platform mac-vlan-hashing-algorithm</b> command). The default algorithm is crc32l. The algorithm may need to be changed in rare circumstances in which hash collisions occur. |
| L3 hashing algorithm         | The L3 VLAN hash-key-generating algorithm (set with the <b>platform l3-vlan-hashing-algorithm</b> command). The default algorithm is crc32l. The algorithm may need to be changed in rare circumstances in which hash collisions occur.   |
| Load Balancing               | Which packet fields are used in the channel load balancing algorithm (set with the <b>platform load-balancing</b> command).                                                                                                               |
| Control-plane-prioritization | Maximum traffic rate on the CPU port (set with the <b>platform control-plane-prioritization rate</b> command).                                                                                                                            |
| Fdb-chain-length             | The length of the FDB hash chain (set with the <b>platform fdb-chain-length</b> command). FDB entries are hashed and indexed using a hash. In rare circumstances it may be useful to reduce the chain length.                             |
| L2MC overlapped group check  | Whether Layer 2 multicast entries are checked before deletion (set with the <b>platform l2mc-overlap</b> command).                                                                                                                        |
| silicon-profile              | The silicon profile setting (set with the <b>platform silicon-profile</b> command) for the switch hardware; one of: <ul style="list-style-type: none"> <li>• profile 1</li> <li>• profile 2</li> <li>• profile 3</li> </ul>               |

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                               | <ul style="list-style-type: none"> <li>None (default)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                |
| fdb-l3-hosts mode             | Whether Host Mode is turned on or not. Host Mode increases the number of host entries and is available for systems containing SBx81CFC960 controller cards and SBx81XLEM line cards. See <b>platform silicon-profile</b> and <b>platform fdb-l3-hosts</b> for details.                                                                                                                                                                          |
| Jumboframe support            | Whether the jumbo frames setting is enabled or disabled (set with the <b>platform jumboframe</b> command).                                                                                                                                                                                                                                                                                                                                      |
| Traffic Manager               | A test setting that is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                     |
| stop-unreg-mc-flooding        | Whether the stop-unreg-mc-flooding feature is on or off (set with the <b>platform stop-unreg-mc-flooding</b> command). This feature prevents flooding of unregistered multicast packets in the occasional situations in which IGMP snooping does not prevent it.                                                                                                                                                                                |
| Port Mode                     | Whether each QSFP+/QSFP28 port is configured as one 40Gbps port, one 100Gbps port, or four 10Gbps ports (set with the <b>platform portmode interface</b> command).                                                                                                                                                                                                                                                                              |
| Multicast operations mode     | Whether multicast processing happens asynchronously or synchronously among stack members (set with the <b>platform sync-mc-ops</b> command).                                                                                                                                                                                                                                                                                                    |
| Vlan-stacking TPID            | The value of the TPID set in the Ethernet type field when a frame has a double VLAN tag (set with the <b>platform vlan-stacking-tpid</b> command).                                                                                                                                                                                                                                                                                              |
| PBR enabled                   | Whether policy-based routing is globally enabled or not (set with the <b>platform pbr-enable</b> command).                                                                                                                                                                                                                                                                                                                                      |
| Hardware Filter Size          | Whether hardware ACLs can filter on IPv6 addresses (ipv4-full-ipv6) or not (ipv4-limited-ipv6). This is set with the <b>platform hwfilter-size</b> command.                                                                                                                                                                                                                                                                                     |
| Vlan Ingress Filter Hard Drop | <p>The Bridge Vlan Ingress Filtering drops traffic if the VID assigned to the packet does not match with the port's VLAN membership.</p> <p>There are two ways the traffic is dropped by the Ingress Filtering mechanism:</p> <ul style="list-style-type: none"> <li>HARD DROP - Traffic is dropped by the Bridge Engine and not forwarded or trapped.</li> <li>SOFT DROP - Traffic may be mirrored or trapped by the Bridge Engine.</li> </ul> |

Note that the parameters displayed depend on your device, and that not all displayed parameters can be modified on all devices.

# show platform classifier statistics utilization brief

**Overview** This command displays the number of used entries available for various platform functions, and the percentage that number of entries represents of the total available.

**Syntax** show platform classifier statistics utilization brief

**Mode** Privileged Exec

**Example** To display the platform classifier utilization statistics, use the following command:

```
awplus# show platform classifier statistics utilization brief
```

**Output** The following shows typical output.

```

awplus#show platform classifier statistics utilization brief
[Instance 0]
[port1.0.1-port1.0.10]
Usage:
                Used / Total

**Output  
parameters**

Depending on your switch, you will see some of the following parameters in the output from **show platform classifier statistics utilization brief**

| Parameter      | Description                                                                                                                                                                                                                                                                                                                   |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPv6 Multicast | Reserved hardware space for use by IPv6 multicast.                                                                                                                                                                                                                                                                            |
| System         | Fixed system entries. For example, resiliency links make use of system ACLs.                                                                                                                                                                                                                                                  |
| MLD Snooping   | Entries to send various packets that MLD Snooping is interested in to the CPU.                                                                                                                                                                                                                                                |
| DHCP Snooping  | Entries used to send DHCP and ARP packets to the CPU. User-added DHCP Snooping filters under ACLs are counted under the ACL or QoS categories.                                                                                                                                                                                |
| Loop Detection | Entries uses to send the special loop detection frame to the CPU.                                                                                                                                                                                                                                                             |
| EPSR           | Entries used to send EPSR control traffic to the CPU.                                                                                                                                                                                                                                                                         |
| CFM            | Entries used by Connectivity Fault Management.                                                                                                                                                                                                                                                                                |
| G8032          | Entries used to send G.8032 control traffic to the CPU.                                                                                                                                                                                                                                                                       |
| Global ACLs    | Entries for ACLs appear here if the ACLs are applied globally instead of per switchport.                                                                                                                                                                                                                                      |
| ACL            | Entries for ACL filters that have been applied directly to ports using the <b>access-group</b> command.                                                                                                                                                                                                                       |
| VACL           | Entries for VLAN-based ACLs (ACLs that are applied to VLANs instead of ports).                                                                                                                                                                                                                                                |
| DOS            | Entries used for Denial of Service protection.                                                                                                                                                                                                                                                                                |
| UFO            | Entries used by Upward Forwarding Only (UFO).                                                                                                                                                                                                                                                                                 |
| QoS            | Entries for ACL filters and other class-map configurations, such as policers, applied through policy maps using the <b>service input</b> command.                                                                                                                                                                             |
| RA Guard       | Entries used to block IPv6 router advertisements, configured with the <b>ipv6 nd raguard</b> command.                                                                                                                                                                                                                         |
| AMFAPPS        | Entries used by AMF Application Proxy. These entries enable the SES Controller to block infected ports.                                                                                                                                                                                                                       |
| Pre-Ingress    | Entries used for VLAN ID Translation (and also for subnet-based and MAC-based VLAN entries on SBx81XLEM cards).                                                                                                                                                                                                               |
| Egress         | Entries used for VLAN ID Translation.                                                                                                                                                                                                                                                                                         |
| UDB            | User Defined Bytes (UDB), which are a limited resource of bytes that can be used to implement additional arbitrary matching on packet bytes on some switches. The software manages the use and allocation of these bytes automatically. The output of this table is intended for use by Allied Telesis Customer Support only. |

# show platform port

**Overview** This command displays the various port registers or platform counters for specified switchports.

**Syntax** show platform port [*<port-list>*] [counters]

| Parameter                | Description                                                                                                                                                                                                                                                                                       |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;port-list&gt;</i> | The ports to display information about. A port-list can be: <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)</li><li>• a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4).</li></ul> |
| counters                 | Show the platform counters.                                                                                                                                                                                                                                                                       |

**Mode** Privileged Exec

**Examples** To display port registers for port1.0.1 to port1.0.4, use the command:

```
awplus# show platform port port1.0.1-port1.0.4
```

To display platform counters for port1.0.1 to port1.0.4, use the command:

```
awplus# show platform port port1.0.1-port1.0.4 counters
```

**Output** The following shows typical output.

**Example output from the show platform port command**

```
awplus#show platform port

# show port-security interface

**Overview** Use this command to show the current port-security configuration and status.

**Syntax** show port-security interface *<port>*

| Parameter           | Description                                                                                                                                                                                       |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;port&gt;</i> | Specify the switch port or LAG to display information about. This can be a single switch port, (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2). |

**Mode** Privileged Exec

**Example** To see the port-security status on port1.0.2, use the following command:  
awplus# show port-security interface port1.0.2

**Output** The following shows typical output.

## Example output from the show port-security interface command

```
Port Security configuration
Security Enabled       : YES
Port Status           : ENABLED
Violation Mode        : TRAP
Aging                 : OFF
Maximum MAC Addresses : 3
Total MAC ddresses    : 1
Lock Status           : UNLOCKED
Security Violation Count : 0
Last Violation Source Address : None
```

# show port-security intrusion

**Overview** Use this command to show the intrusion list. If the port is not specified, the entire intrusion table is shown.

**Syntax** show port-security intrusion [interface <port>]

| Parameter | Description                                                                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface | Specify a port                                                                                                                                                                                    |
| <port>    | Specify the switch port or LAG to display information about. This can be a single switch port, (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2). |

**Mode** Privileged Exec

**Example** To see the intrusion list on port1.0.2, use the following command:  
awplus# show port-security intrusion interface port1.0.2

**Output** The following shows typical output.

**Example output from the show port-security intrusion command for port1.0.2**

```
Port Security Intrusion List
Interface: port1.0.2 -3 intrusion(s) detected
11-22-33-44-55-04 11-22-33-44-55-06 11-22-33-44-55-08
```

# show storm-control

**Overview** Use this command to display storm-control information for all interfaces or a particular interface.

**Syntax** `show storm-control [<port>]`

| Parameter | Description                                                                                                                                                                                                                             |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port>    | The port to display information about. The port may be: <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li></ul> |

**Mode** User Exec and Privileged Exec

**Example** To display storm-control information for port1.0.2, use the following command:

```
awplus# show storm-control port1.0.2
```

**Output** The following shows typical output.

**Example output from the show storm-control command for port1.0.2**

|           |            |            |          |
|-----------|------------|------------|----------|
| Port      | BcastLevel | McastLevel | DlfLevel |
| port1.0.2 | 40. 0%     | 100. 0%    | 100. 0%  |

**Related commands** [storm-control level](#)

## speed

**Overview** This command changes the speed of the specified port. You can optionally specify the speed or speeds that get autonegotiated, so autonegotiation is only attempted at the specified speeds.

To see the currently-negotiated speed for ports whose links are up, use the **show interface** command. To see the configured speed (when different from the default), use the **show running-config** command.

Depending on your switch model and the SFP or SFP+ modules you use, a subset of the following speed options will be available.

**Syntax** speed {10|100|1000|2500|5000|10000|40000|100000}  
 speed auto [10] [100] [1000] [2500] [5000] [10000] [40000]  
 [100000]

The following table shows the speed options for each type of port, depending on the model.

| Port type                            | Speed Options (units are Mbps)                               |
|--------------------------------------|--------------------------------------------------------------|
| RJ.5 copper ports                    | auto (default)<br>10<br>100<br>1000                          |

**Mode** Interface Configuration

**Default** By default, ports autonegotiate speed (except for 100Base-FX ports which do not support auto-negotiation, so default to 100 Mbps).

**Usage notes** We recommend having autonegotiation enabled for link speeds of 1000 Mbps and above. For example, to apply a fixed speed of 1000 Mbps use the command **speed auto 1000**.

If multiple speeds are specified after the auto option to autonegotiate speeds, then the device only attempts autonegotiation at those specified speeds.

Switch ports in a static or dynamic (LACP) channel group must have the same port speed and be in full duplex mode. Once switch ports have been aggregated into a channel group, you can set the speed of all the switch ports in the channel group by applying this command to the channel group.

**Examples** awplus# configure terminal  
awplus(config)# interface port1.0.1  
awplus(config-if)# speed auto 1000

To return the port to auto-negotiating its speed, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# speed auto
```

## storm-control level

**Overview** Use this command to specify the speed limiting level for broadcast, multicast, or dlf (destination lookup failure) traffic for the port. Storm-control limits the selected traffic type to the specified percentage of the maximum port speed.

Use the **no** variant of this command to disable storm-control for broadcast, multicast or dlf traffic.

**Syntax** `storm-control {broadcast|multicast|dlf} level <level>`  
`no storm-control {broadcast|multicast|dlf} level`

| Parameter | Description                                                                                                                        |
|-----------|------------------------------------------------------------------------------------------------------------------------------------|
| <level>   | <0-100> Specifies the percentage of the maximum port speed allowed for broadcast, multicast or destination lookup failure traffic. |
| broadcast | Applies the storm-control to broadcast frames.                                                                                     |
| multicast | Applies the storm-control to multicast frames.                                                                                     |
| dlf       | Applies the storm-control to destination lookup failure traffic.                                                                   |

**Default** Disabled

**Mode** Interface Configuration

**Usage notes** Flooding techniques are used to block the forwarding of unnecessary flooded traffic. A packet storm occurs when a large number of broadcast packets are received on a port. Forwarding these packets can cause the network to slow down or time out.

More than one limit type can be set at a time. For example, you can configure both broadcast and multicast levels on the same port, at the same time.

**Example** To limit broadcast traffic on port1.0.2 to 30% of the maximum port speed, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# storm-control broadcast level 30
```

**Related commands** [show storm-control](#)

**Command changes**    Version 5.4.9-1.3: Multiple limit types available on x530 series  
Version 5.5.0-2.1: Multiple limit types available on x220 and GS980M series

# switchport block unicast-flooding

**Overview** Use this command to enable Unknown Unicast Flood Prevention (UUFPP). The UUFPP feature prevents unknown unicast traffic from being flooded to all Layer 2 ports in a VLAN. When enabled, UUFPP only permits egress traffic for MAC addresses that are known to exist on the port.

Use the **no** variant of this command to disable UUFPP.

**Syntax** switchport block unicast-flooding  
no switchport block unicast-flooding

**Default** UUFPP is off.

**Mode** Interface Configuration for a switchport.

**Example** To enable the UUFPP feature on port1.0.3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# switchport block unicast-flooding
```

To disable the UUFPP feature on port1.0.3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# no switchport block unicast-flooding
```

To check if UUFPP is enabled on port1.0.3, use the command:

```
awplus# show interface port1.0.3
```

```
awplus#show interface port1.0.3
Interface port1.0.3
Scope: both
Link is UP, administrative state is UP
Thrash-limiting
Status Not Detected, Action learn-disable, Timeout 1(s)
Hardware is Ethernet, address is 0000.cd28.088a

**Command changes** Version 5.5.1-2.1: command added

# switchport port-security

**Overview** Use this command to enable the port-security feature. This feature is also known as the port-based learn limit. It allows you to set the maximum number of MAC addresses that each port or link aggregation group (LAG) can learn (using the **switchport port-security maximum** command).

Use the **no** variant of this command to disable the port-security feature.

**Syntax** `switchport port-security`  
`no switchport port-security`

**Mode** Interface Configuration for a switchport or LAG.

**Usage notes** After using this command to turn on port-security, use the following commands to configure it:

- **switchport port-security maximum** to set the number of MAC addresses that can be learned
- **switchport port-security aging** (optional) to choose whether to limit it to specific devices, or to allow any devices up to the limit
- **switchport port-security violation** (optional) to change the action the switch takes if the limit is violated.

LAGs use the link local MAC address. This address counts against the limit. If you apply port-security to a LAG, this means you need to allow port-security to learn the link local address as well as the MAC address of the devices you want to connect to the LAG. To do this, simply increase the limit by 1 (using the **switchport port-security maximum** command). For example, for a limit of 2 devices, set the limit to 3.

If the switch sees a new MAC address on a port or LAG that has port-security enabled, and the MAC address is statically configured for another port or LAG, this triggers a violation. The switch will ignore the maximum learn limit and will treat that MAC address as an intruder.

**Examples** To enable the port-security feature on port1.0.2 and set it to learn 1 MAC address, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport port-security
awplus(config-if)# switchport port-security maximum 1
```

To disable the port-security feature on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport port-security
```

To enable the port-security feature on the link aggregation group sa2 and set it to learn 1 MAC address, use the following commands. Note that the maximum is set to 2 so that the link local address can be learned as well as the desired MAC address:

```
awplus# configure terminal
awplus(config)# interface sa2
awplus(config-if)# switchport port-security
awplus(config-if)# switchport port-security maximum 2
```

To disable the port-security feature on sa2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface sa2
awplus(config-if)# no switchport port-security
```

**Related commands**

**Command changes** Version 5.5.1-0.1: port-security on LAGs added for SBx81CFC960, SBx908 GEN2, x950, x930, x550, x530, x530L, x320, x230, x230L and x220 Series switches

# switchport port-security aging

**Overview** Use this command to set MAC addresses that have been learned by port security to age out.

Use the **no** variant of this command to set the MAC addresses to not age out.

**Syntax** switchport port-security aging  
no switchport port-security aging

**Default** Disabled (MAC addresses do not age out)

**Mode** Interface Configuration for a switchport or LAG.

**Usage notes** Use this command to change from static to dynamic operation.

## Static operation

Any MAC address learned will be statically installed into the MAC Address table and will not age out. The addresses are also added to the device's running configuration. Each entry then counts towards the maximum allowed addresses, regardless of whether the device is still connected.

Use this if you want to allow only specific devices to access the port. For example, this can prevent a person from plugging an unauthorized laptop into your corporate LAN.

This is the default mode.

## Dynamic operation

Any MAC addresses learned will be dynamically installed into the MAC Address table. Unlike the static operation, no MAC addresses are added to the device's running configuration. If a device is disconnected, the Maximum MAC addresses allowed decreases by 1 (once the dynamic entry times out in the MAC Address table).

Use this if you want to allow only a limited number of devices to access the port, but you are not concerned about which specific devices have access. For example, this can prevent a person from plugging a switch into a port and creating an unauthorized internet cafe.

**Examples** To choose dynamic mode by setting port1.0.2 so that the MAC addresses that have been learned by port security age out, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport port-security aging
```

To return to static mode by stopping the MAC addresses that have been learned by port security from aging out on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport port-security aging
```

**Related commands**

- clear port-security intrusion**
- show port-security interface**
- show port-security intrusion**
- switchport port-security**
- switchport port-security maximum**
- switchport port-security violation**

**Command changes** Version 5.5.1-0.1: port-security on LAGs added for SBx81CFC960, SBx908 GEN2, x950, x930, x550, x530, x530L, x320, x230, x230L and x220 Series switches

# switchport port-security maximum

**Overview** Use this command to set the maximum number of MAC addresses that each port or link aggregation group (LAG) can learn, when port-security is enabled on that port or LAG.

Use the **no** variant of this command to unset the maximum number of MAC addresses that can be learned. This is same as setting the maximum number to 0. This command also resets the intrusion list table.

**Syntax** switchport port-security maximum <0-256>  
no switchport port-security maximum

| Parameter       | Description                                       |
|-----------------|---------------------------------------------------|
| maximum <0-256> | Specify the maximum number of addresses to learn. |

**Mode** Interface Configuration for a switchport or LAG.

**Usage notes** Before using this command, turn on port-security with the **switchport port-security** command.

After using this command to specify the limit, you can use the following commands for further configuration:

- **switchport port-security aging** (optional) to choose whether to limit it to specific devices, or to allow any devices up to the limit
- **switchport port-security violation** (optional) to change the action the switch takes if the limit is violated.

LAGs use the link local MAC address. This address counts against the limit. If you apply port-security to a LAG, this means you need to allow port-security to learn the link local address as well as the MAC address of the devices you want to connect to the LAG. To do this, simply increase the limit by 1 (using the **switchport port-security maximum** command). For example, for a limit of 2 devices, set the limit to 3.

If the switch sees a new MAC address on a port or LAG that has port-security enabled, and the MAC address is statically configured for another port or LAG, this triggers a violation. The switch will ignore the maximum learn limit and will treat that MAC address as an intruder.

**Examples** To learn 3 MAC addresses on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport port-security
awplus(config-if)# switchport port-security maximum 3
```

To remove the MAC learning limit on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport port-security maximum
```

**Related commands**

- clear port-security intrusion**
- show port-security interface**
- show port-security intrusion**

- switchport port-security aging**
- switchport port-security violation**

**Command changes** Version 5.5.1-0.1: port-security on LAGs added for SBx81CFC960, SBx908 GEN2, x950, x930, x550, x530, x530L, x320, x230, x230L and x220 Series switches

## switchport port-security violation

**Overview** Use this command to set the action taken on a switch port or LAG when it exceeds the port-security learning limits.

The action can be **shutdown**, **restrict** or **protect**:

- **shutdown**: the physical link will be disabled and 'shutdown' will be shown in the configuration file.
- **restrict**: the packet from the unauthorized MAC will be discarded and an SNMP trap will be generated to alert management.
- **protect**: the packet will simply be discarded silently.

Use the **no** variant of this command to set the violation action to the default action of **protect**.

**Syntax** switchport port-security violation {shutdown|restrict|protect}  
no switchport port-security violation

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| shutdown  | Disable the port.                            |
| restrict  | Discard and alert the network administrator. |
| protect   | Discard the packet.                          |

**Mode** Interface Configuration for a switchport or LAG.

**Default** Protect

**Usage notes** When modes restrict or shutdown are used, the administrator can also be alerted via an SNMP trap. To configure this, add the following command to the SNMP configuration:

```
awplus(config)# snmp-server enable trap nsm
```

**Examples** To set the action to be shutdown on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport port-security violation shutdown
```

To set the port-security action to the default (protect) on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport port-security violation
```

**Related commands**

**Command changes** Version 5.5.1-0.1: port-security on LAGs added for SBx81CFC960, SBx908 GEN2, x950, x930, x550, x530, x530L, x320, x230, x230L and x220 Series switches

# thrash-limiting

**Overview** Use this command to configure the thrash limit action that will be applied to a port on the device when a thrashing condition is detected. The thrash-limiting timeout specifies the time, in seconds, for which the action is employed.

Use the **no** variant of this command to return the action or timeout to its default setting.

**Syntax** thrash-limiting {[action {learn-disable|link-down|port-disable|vlan-disable|none}] [timeout <0-86400>]]  
no thrash-limiting {action|timeout}

| Parameter     | Description                                                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| action        | The action taken when MAC thrashing is detected.                                                                                                                     |
| learn-disable | Disable MAC address learning                                                                                                                                         |
| link-down     | Block all traffic on an interface - link down                                                                                                                        |
| port-disable  | Block all traffic on an interface - link remains up                                                                                                                  |
| vlan-disable  | Block all traffic on a VLAN if the switch detects thrashing for that VLAN on the selected port. Note that setting this parameter will also enable ingress filtering. |
| none          | No thrash action                                                                                                                                                     |
| timeout       | Set the duration for the thrash action                                                                                                                               |
| <0-86400>     | The duration of the applied thrash action in seconds. The default is 1 seconds.                                                                                      |

**Default** The default action is learn-disable and the default timeout is 1 second.

**Mode** Interface Configuration

**Usage** Thrash-limiting actions are initiated when MAC addresses are added and removed from a port's MAC table faster than a given rate. The rate is 10 MAC address changes per second by default. You can change it with the **mac address-table thrash-limit** command.

See the "Thrash Limiting" section in the **Switching Feature Overview and Configuration Guide** for more information.

**Examples** To set the action to learn disable for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# thrash-limiting action learn-disable
```

To block all traffic on a VLAN on port1.0.1 if the switch detects thrashing for that VLAN on that port, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# thrash-limiting action vlan-disable
```

To set the thrash limiting action to its default on port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no thrash-limiting action
```

To set the thrash limiting timeout to 5 seconds on port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# thrash-limiting timeout 5
```

To set the thrash limiting timeout value to its default on port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no thrash-limiting timeout
```

# Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure VLANs. For more information see the [VLAN Feature Overview and Configuration Guide](#).

# debug private-vlan ufo

**Overview** Use this command to enable private-vlan Upward Forwarding Only (UFO) debugging.

Use the **no** variant of this command to disable private-vlan UFO debugging.

**Syntax** debug private-vlan ufo  
no debug private-vlan ufo

**Mode** Privileged Exec

**Usage notes** Use this command to enable or disable private-vlan ufo debugging.

**Example** To enable private-vlan UFO debugging, use the commands:

```
awplus# configure terminal
awplus(config)# debug private-vlan ufo
```

**Related commands** [show debugging private-vlan](#)  
[private-vlan ufo trap](#)  
[switchport mode private-vlan ufo](#)

**Command changes** Version 5.5.3-1.1: added to x220, x230, x320, x550, x950, SBx908 GEN2 Series  
Version 5.4.9-0.1: added to x530 Series  
Version 5.4.8-2.1: added to SBx8100 Series  
Version 5.4.7-2.1: command added

# platform vlan-stacking-tpid

**Overview** This command specifies the Tag Protocol Identifier (TPID) value that applies to all frames that are carrying double tagged VLANs. All such VLANs must use the same TPID value. (This feature can be referred to as nested VLANs, VLAN stacking, Q-in-Q, or VLAN double-tagging.)

Use the **no** variant of this command to revert to the default TPID value (0x8100).

**NOTE:** *platform jumboframe*

**Syntax** platform vlan-stacking-tpid <tpid>  
no platform vlan-stacking-tpid

| Parameter | Description                                                               |
|-----------|---------------------------------------------------------------------------|
| <tpid>    | The Ethernet type of the tagged packet, as a two byte hexadecimal number. |

**Default** The default TPID value is 0x8100.

**Mode** Global Configuration

**Examples** To set the VLAN stacking TPID value to 0x9100, use the following commands:

```
awplus# configure terminal
awplus(config)# platform vlan-stacking-tpid 9100
```

To reset the VLAN stacking TPID value to the default (0x8100), use the following commands:

```
awplus# configure terminal
awplus(config)# no platform vlan-stacking-tpid
```

**Related commands** *switchport vlan-stacking (double-tagging)*  
*show platform*  
*show running-config*

## port-vlan-forwarding-priority

**Overview** Use this command to specify which protocol has the highest priority for controlling transitions from blocking to forwarding traffic, when more than one of EPSR, Loop Protection, and MAC thrashing protection are used on the switch.

These protocols use the same mechanism to block or forward traffic. This command specifies either EPSR or Loop Protection as the highest priority protocol. Setting the priority stops contention between protocols.

For more information, see the Usage section below.

**CAUTION:** The *and* parameter options must not be set on an EPSR master node. Use the *parameter* option on an EPSR master node instead. Setting this command incorrectly on an EPSR master node could cause unexpected broadcast storms.

Use the **no** variant of this command to restore the default highest priority protocol back to the default of EPSR.

For more information about EPSR, see the [EPSR Feature Overview and Configuration\\_Guide](#).

**Syntax** port-vlan-forwarding-priority {epsr|loop-protection|none}  
no port-vlan-forwarding-priority

| Parameter       | Description                                                                                                                                                                                                                                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| epsr            | Sets EPSR as the highest priority protocol. Use this parameter on an EPSR master node to avoid unexpected broadcast storms.                                                                                                                                                                                  |
| loop-protection | Sets Loop Protection as the highest priority protocol.<br><br>Note that this option must not be set on an EPSR master node. Use the <b>epsr</b> parameter option on an EPSR master node to avoid unexpected broadcast storms.                                                                                |
| none            | Sets the protocols to have equal priority. This allows protocols to override each other to set a port to forwarding for a VLAN.<br><br>Note that this option must not be set on a EPSR master node.<br><br>Use the <b>epsr</b> parameter option on an EPSR master node to avoid unexpected broadcast storms. |

**Default** By default, the highest priority protocol is EPSR

**Mode** Global Configuration

**Usage notes** Usually, you only need to configure one of EPSR, Loop Protection and MAC Thrashing protection on a switch, because they perform similar functions –each prevents network loops by blocking a selected port for each (loop-containing) VLAN.

However, if more than one of these three features is configured on a switch, you can use this command to prioritize either EPSR or Loop Protection when their effects on a port would conflict and override each other. Without this command, each protocol could set a port to forwarding for a VLAN, sometimes overriding the previous setting by another protocol to block the port. This could sometimes lead to unexpected broadcast storms.

This command means that, when a protocol is set to have the highest priority over a data VLAN on a port, it will not allow other protocols to put that port-vlan into a forwarding state if the highest priority protocol blocked it.

The priority mechanism is only used for blocking-to-forwarding transitions; protocols remain independent on the forwarding-to-blocking transitions.

For example, consider an EPSR master node in a two-node ESPR ring with the following settings:

- The EPSR master node primary port is configured to switchport interface port1.0.1
- The EPSR master node secondary port is configured to switchport interface port1.0.2
- The EPSR master node control VLAN is configured to VLAN interface vlan10
- The EPSR master node has a first data VLAN configured to VLAN interface vlan20
- The EPSR master node has a second data VLAN configured to VLAN interface vlan30.

Initially, the EPSR ring is complete, with port1.0.2 blocking data VLANs vlan20 and vlan30 and some broadcast traffic flowing through. If the user removes vlan30 from EPSR, a storm is created on vlan30. MAC thrashing protection detects it and blocks vlan30.

Then after the storm has stopped, MAC thrashing protection sets it to forwarding again and it keeps oscillating between forwarding and blocking. In the meantime, the user adds back vlan30 to EPSR as a data VLAN and EPSR blocks it on port1.0.2.

If the priority is set to none (**port-vlan-forwarding-priority none**), MAC thrashing protection notices that the storm has stopped again and decides to put vlan30 on port1.0.2 into forwarding state. This overrides what EPSR requires for this port-VLAN and creates a storm.

If the priority is set to EPSR or default (**port-vlan-forwarding-priority epsr**), MAC thrashing protection notices that the storm has stopped again and attempts to put vlan30 on port1.0.2 into forwarding

state. The higher priority protocol (EPSR) is blocking the VLAN on this port, so it stays blocking and no storm occurs.

**Example** To prioritize EPSR over Loop Protection or MAC Thrashing protection settings, so that Loop Protection or MAC Thrashing protection cannot set a port to the forwarding state for a VLAN if EPSR has set it to the blocking state, use the commands:

```
awplus# configure terminal
awplus(config)# port-vlan-forwarding-priority epsr
```

To prioritize Loop Protection over EPSR or MAC Thrashing protection settings, so that EPSR or MAC Thrashing protection cannot set a port to the forwarding state for a VLAN if Loop Protection has set it to the blocking state, use the commands:

```
awplus# configure terminal
awplus(config)# port-vlan-forwarding-priority loop-protection
```

To set EPSR, Loop Protection, and MAC Thrashing protection protocols to have equal priority for port forwarding and blocking, which allows the protocols to override each other to set a port to the forwarding or blocking states, use the commands:

```
awplus# configure terminal
awplus(config)# port-vlan-forwarding-priority none
```

To restore the default highest priority protocol back to the default of EPSR, use the commands:

```
awplus# configure terminal
awplus(config)# no port-vlan-forwarding-priority
```

**Related commands** [show port-vlan-forwarding-priority](#)

## private-vlan

**Overview** Use this command to create a private VLAN. Private VLANs can be either primary or secondary. Secondary VLANs can be either community or isolated.

Alternatively, private VLANs can be UFO (Upstream Forwarding Only). Private VLAN port members are either 'downstream' or 'upstream'. Once a private VLAN is configured as UFO, its port members by default are downstream.

Use the **no** variant of this command to remove the specified private VLAN.

For more information, see the [VLAN Feature Overview and Configuration Guide](#).

**Syntax** `private-vlan <vlan-id> {community|isolated|primary}`  
`no private-vlan <vlan-id> {community|isolated|primary}`

| Parameter | Description                                                                    |
|-----------|--------------------------------------------------------------------------------|
| <vlan-id> | VLAN ID in the range <2-4094> for the VLAN which is to be made a private VLAN. |
| community | Community VLAN.                                                                |
| isolated  | Isolated VLAN.                                                                 |
| primary   | Primary VLAN.                                                                  |
| ufo       | Upstream Forwarding Only (UFO) VLAN.                                           |

**Mode** VLAN Configuration

**Examples** To configure a set of private VLANs, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 2 name vlan2 state enable
awplus(config-vlan)# vlan 3 name vlan3 state enable
awplus(config-vlan)# vlan 4 name vlan4 state enable
awplus(config-vlan)# private-vlan 2 primary
awplus(config-vlan)# private-vlan 3 isolated
awplus(config-vlan)# private-vlan 4 community
```

To remove a set of private VLANs, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no private-vlan 2 primary
awplus(config-vlan)# no private-vlan 3 isolated
awplus(config-vlan)# no private-vlan 4 community
```

To configure a private VLAN for Upward Forwarding Only (UFO), use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 512 name vlan512 state enable
awplus(config-vlan)# private-vlan 512 ufo
```

**Related  
commands**

**show vlan private-vlan**

**Command  
changes**

Version 5.5.3-1.1: **ufo** parameter added to x220, x230, x320, x550, x950, SBx908 GEN2 Series

Version 5.4.9-0.1: **ufo** parameter added to x530 Series

Version 5.4.8-2.1: **ufo** parameter added to SBx8100 Series

Version 5.4.7-2.1: **ufo** parameter added

# private-vlan association

**Overview** Use this command to associate a secondary VLAN to a primary VLAN. Only one isolated VLAN can be associated to a primary VLAN. Multiple community VLANs can be associated to a primary VLAN.

Use the **no** variant of this command to remove association of all the secondary VLANs to a primary VLAN.

For more information, see the [VLAN\\_Feature Overview and Configuration Guide](#).

**Syntax** `private-vlan <primary-vlan-id> association {add <secondary-vlan-id>|remove <secondary-vlan-id>}`  
`no private-vlan <primary-vlan-id> association`

| Parameter                              | Description                                                   |
|----------------------------------------|---------------------------------------------------------------|
| <code>&lt;primary-vlan-id&gt;</code>   | VLAN ID of the primary VLAN.                                  |
| <code>&lt;secondary-vlan-id&gt;</code> | VLAN ID of the secondary VLAN (either isolated or community). |

**Mode** VLAN Configuration

**Examples** The following commands associate primary VLAN 2 with secondary VLAN 3:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# private-vlan 2 association add 3
```

The following commands remove the association of primary VLAN 2 with secondary VLAN 3:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# private-vlan 2 association remove 3
```

The following commands remove all secondary VLAN associations of primary VLAN 2:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no private-vlan 2 association
```

# private-vlan ufo trap

**Overview** Use this command to enable the sending of SNMP traps for private VLAN UFO.

Use the **no** variant of this command to disable the sending of SNMP traps for private VLAN UFO.

**Syntax** private-vlan ufo trap  
no private-vlan ufo trap

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| ufo       | Specifies private-vlan for those VLANs in UFO mode.         |
| trap      | Enables or disables SNMP trap sending for private-vlan UFO. |

**Default** Enabled.

**Mode** Global Configuration

**Usage notes** This command activates SNMP traps for the private-vlan UFO. When enabled, traps will be sent when any UFO VLAN becomes 'isolated'. This happens when traffic cannot be forwarded at Layer 2 due to the absence of an upstream port for the UFO VLAN, and Layer 3 forwarding has not been configured for that VLAN.

**Example** To configure a private-vlan UFO trap use the commands:

```
awplus# configure terminal
awplus(config)# private-vlan ufo trap
```

**Related commands** [private-vlan](#)  
[snmp-server enable trap](#)

**Command changes** Version 5.5.3-1.1: added to x220, x230, x320, x550, x950, SBx908 GEN2 Series

Version 5.4.9-0.1: added to x530 Series

Version 5.4.8-2.1: added to SBx8100 Series

Version 5.4.7-2.1: command added

# show debugging private-vlan

**Overview** Use this command to show whether debugging for a private-vlan, namely UFO, is enabled.

**Syntax** show debugging private-vlan

**Mode** Privileged Exec

**Example** To show if debugging is enabled for private-vlan UFO, use the command:  
awplus# show debugging private-vlan

**Output** The following shows typical output.

## Example output from show debugging private-vlan

```
awplus#show debugging private-vlan  
  
Private-VLAN debugging status:  
UFO debugging is off
```

**Related commands** [debug private-vlan ufo](#)

**Command changes** Version 5.5.3-1.1: added to x220, x230, x320, x550, x950, SBx908 GEN2 Series

Version 5.4.9-0.1: added to x530 Series

Version 5.4.8-2.1: added to SBx8100 Series

Version 5.4.7-2.1: command added

# show interface switchport vlan translation

**Overview** Use this command to display VLAN translation information for some or all interfaces.

**Syntax** show interface switchport vlan translation [interface <int>]

| Parameter       | Description                                                                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface <int> | The interface to display information about. An interface can be a switch port (e.g. port1.0.4), a static channel group (e.g. sa2) or a dynamic (LACP) channel group (e.g. po2). |

**Mode** User Exec and Privileged Exec

**Example** To display VLAN translation information for port1.0.1, use the command:

```
awplus# show interface switchport vlan translation
interface port1.0.1
```

**Output** The following shows typical output.

## Example output from show interface switchport vlan translation interface port1.0.1

```
awplus#show interface switchport vlan translation
interface port1.0.1

Interface: port1.0.1
VLAN on Wire      VLAN
-----
1649              100
default           drop
```

**Output** The following shows typical output.

**Example output from show interface switchport vlan translation**

```
awplus#show interface switchport vlan translation

Interface: port1.0.1
VLAN on Wire    VLAN
-----
1649            100
default         drop

Interface: port1.0.2
VLAN on Wire    VLAN
-----
69              1
default         accept
```

**Parameters in the output from show interface switchport vlan translation**

| Parameter    | Description                                                                                                                  |
|--------------|------------------------------------------------------------------------------------------------------------------------------|
| Interface    | The interface on which VLAN-IDs will be translated.                                                                          |
| VLAN on Wire | VLAN-ID of the packet as it will be seen on the wire.                                                                        |
| VLAN         | VLAN-ID of the VLAN as it was assigned when the VLAN was created.                                                            |
| default      | The action taken on inbound tagged packets that do not match a VLAN translation entry; either <b>drop</b> or <b>accept</b> . |

**Related commands** [switchport vlan translation](#)  
[switchport vlan translation default drop](#)

**Command changes** Version 5.4.8-0.2: added to SBx908 GEN2, x930 Series products  
Version 5.4.8-1.1: added to SBx8100 Series products  
Version 5.4.9-0.1: added to x530 Series products

# show port-vlan-forwarding-priority

**Overview** Use this command to display the highest priority protocol that controls port-vlan forwarding or blocking traffic. This command displays whether EPSR or Loop Protection is set as the highest priority for determining whether a port forwards a VLAN, as set by the **port-vlan-forwarding-priority** command.

For more information about EPSR, see the **EPSR Feature Overview and Configuration Guide**.

**Syntax** show port-vlan-forwarding-priority

**Mode** Privileged Exec

**Example** To display the highest priority protocol, use the command:

```
awplus# show port-vlan-forwarding-priority
```

**Output** The following shows typical output.

**Example output from the show port-vlan-forwarding-priority command**

```
Port-vlan Forwarding Priority: EPSR
```

**Related commands** **port-vlan-forwarding-priority**

## show vlan

**Overview** Use this command to display information about a particular VLAN by specifying its VLAN ID. Selecting **all** will display information for all the VLANs configured.

**Syntax** `show vlan {all|brief|dynamic|static|auto|static-ports|<1-4094>}`

| Parameter    | Description                                                  |
|--------------|--------------------------------------------------------------|
| <1-4094>     | Display information about the VLAN specified by the VLAN ID. |
| all          | Display information about all VLANs on the device.           |
| brief        | Display information about all VLANs on the device.           |
| dynamic      | Display information about all VLANs learned dynamically.     |
| static       | Display information about all statically configured VLANs.   |
| auto         | Display information about all auto-configured VLANs.         |
| static-ports | Display static egress/forbidden ports.                       |

**Mode** User Exec and Privileged Exec

**Example** To display information about VLAN 2, use the command:

```
awplus# show vlan 2
```

**Output** The following shows typical output.

### Example output from the show vlan command

| VLAN ID | Name     | Type   | State  | Member ports<br>(u)-Untagged, (t)-Tagged               |
|---------|----------|--------|--------|--------------------------------------------------------|
| 2       | VLAN0002 | STATIC | ACTIVE | port1.0.3(u) port1.0.4(u) port1.0.5(u)<br>port1.0.6(u) |
| ...     |          |        |        |                                                        |

### Related commands

**Command changes** Version 5.5.3-1.1: Support for up to 1024 VLANs added to AR1050V

Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V

## show vlan access-map

**Overview** Use this command to display information about the configured VLAN access-maps. VLAN access-maps contain a series of ACLs and enable you to filter traffic ingress specified VLANs.

**Syntax** show vlan access-map [<name>]

| Parameter | Description                            |
|-----------|----------------------------------------|
| <name>    | The name of the access-map to display. |

**Mode** User Exec/Privileged Exec

**Example** To display the ACLs in all access-maps, use the command:

```
awplus# show vlan access-map
```

**Output** The following shows typical output.

### Example output from show vlan access-map

```
awplus#show vlan access-map

Vlan access map : deny_all
Hardware MAC access list 4000
  10 deny any any

Vlan access map : ip_range
Hardware IP access list 3000
  10 deny ip 192.168.1.1/24 any
```

**Related commands** [vlan access-map](#)

**Command changes** Version 5.4.6-2.1: command added

# show vlan filter

**Overview** Use this command to display information about the configured VLAN filters. VLAN filters apply access-maps (and therefore ACLs) to VLANs. This enables you to filter traffic ingressing specified VLANs.

**Syntax** show vlan filter [<access-map-name>]

| Parameter         | Description                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------|
| <access-map-name> | The name of an access-map. The command output displays only the filters that use that access-map. |

**Mode** User Exec/Privileged Exec

**Example** To display information about the filter that uses the access-map named "deny\_all", use the command:

```
awplus# show vlan filter deny_all
```

**Output** The following shows typical output.

## Example output from show vlan filter

```
awplus#show vlan filter deny_all
Vlan filter : deny_all
  direction : ingress
  vlan list : 48-49
  access map : deny_all
Hardware MAC access list 4000
  10 deny any any
```

**Related commands** [vlan access-map](#)  
[vlan filter](#)

**Command changes** Version 5.4.6-2.1: command added

# show vlan private-vlan

**Overview** Use this command to display the private VLAN configuration and associations.

**Syntax** show vlan private-vlan

**Mode** User Exec and Privileged Exec

**Example** To display the private VLAN configuration and associations, enter the command:

```
awplus# show vlan private-vlan
```

**Output** The following shows typical output.

**Example output from the show vlan private-vlan command**

|                               |           |           |            |
|-------------------------------|-----------|-----------|------------|
| awplus#show vlan private-vlan |           |           |            |
| PRIMARY                       | SECONDARY | TYPE      | INTERFACES |
| -----                         | -----     | -----     | -----      |
| 2                             | 3         | isolated  |            |
| 2                             | 4         | community |            |
|                               | 8         | isolated  |            |

## show vlan private-vlan ufo

**Overview** Use this command to show the configuration status of a private VLAN UFO-based VLAN(s) and member interfaces.

**Syntax** show vlan private-vlan ufo {all|<vlan-id>}

| Parameter | Description                                                                       |
|-----------|-----------------------------------------------------------------------------------|
| <vlan-id> | A specific VLAN. This must have been configured previously as a private-vlan UFO. |
| all       | All VLANs that have been configured previously as private-vlan UFO.               |

**Mode** User Exec/Privileged Exec.

**Usage notes** Private VLANs can be UFO (Upstream Forwarding Only). Private VLAN port members are either "downstream" or "upstream" which are controlled by a protocol or by static configuration.

**Example** To show all the private-vlan UFO interfaces, use the command:

```
awplus# show vlan private-vlan ufo all
```

**Output** The following shows typical output.

### Example output from show vlan private-vlan ufo all

| awplus#show vlan private-vlan ufo all |            |                    |                  |          |                |
|---------------------------------------|------------|--------------------|------------------|----------|----------------|
| VLAN                                  | INTERFACES | CONFIGURED         | TYPE             | PROTOCOL | MISC           |
| 100                                   | port1.0.1  | primary-upstream   | upstream         | UFO      | -              |
| 100                                   | port1.0.2  | secondary-upstream | downstream       | UFO      | -              |
| 100                                   | port1.0.3  | -                  | downstream       | Static   | -              |
| 200                                   | port1.0.4  | epsr               | downstream       | EPSR     | -              |
| 200                                   | sa1        | epsr               | upstream         | EPSR     | 0030.846e.bac7 |
| 200                                   | port1.0.5  | -                  | downstream       | Static   | -              |
| 300                                   | port1.0.6  | -                  | downstream-fault | Static   | -              |
| 300                                   | port1.0.7  | -                  | downstream-fault | Static   | -              |
| 300                                   | port1.0.8  | -                  | downstream-fault | Static   | -              |
| 400                                   | Port1.0.9  | stp                | upstream         | STP      | 0030.846e.9bf4 |
| 400                                   | Port1.0.10 | stp                | downstream       | STP      | -              |
| 400                                   | Port1.0.11 | -                  | downstream       | Static   | -              |

**Command changes** Version 5.5.3-1.1: added to x220, x230, x320, x550, x950, SBx908 GEN2 Series  
Version 5.4.9-0.1: added to x530 Series  
Version 5.4.8-2.1: added to SBx8100 Series  
Version 5.4.7-2.1: command added

## switchport access vlan

**Overview** Use this command to change the port-based VLAN of the current port.  
Use the **no** variant of this command to change the port-based VLAN of this port to the default VLAN, which is VLAN 1.

**Syntax** switchport access vlan <vlan-id>  
no switchport access vlan

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| <vlan-id> | <1-4094> The port-based VLAN ID for the port. |

**Default** VLAN 1

**Mode** Interface Configuration

**Usage notes** Any untagged frame received on this port will be associated with the specified VLAN.

**Examples** To change the port-based VLAN to VLAN 3 for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport access vlan 3
```

To reset the port-based VLAN to the default VLAN 1 for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport access vlan
```

**Related commands** [show interface switchport](#)  
[show vlan](#)

**Command changes** Version 5.5.3-1.1: Support for up to 1024 VLANs added to AR1050V  
Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V

## switchport mode access

**Overview** Use this command to set the switching characteristics of the port to access mode. Received frames are classified based on the VLAN characteristics, then accepted or discarded based on the specified filtering criteria.

**Syntax** `switchport mode access [ingress-filter {enable|disable}]`

| Parameter      | Description                                                                               |
|----------------|-------------------------------------------------------------------------------------------|
| ingress-filter | Set the ingress filtering for the received frames.                                        |
| enable         | Turn on ingress filtering for received frames. This is the default.                       |
| disable        | Turn off ingress filtering to accept frames that do not meet the classification criteria. |

**Default** By default, ports are in access mode with ingress filtering on.

**Usage notes** Use access mode to send untagged frames only.

**Mode** Interface Configuration

**Example**

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access ingress-filter enable
```

**Related Commands** [show interface switchport](#)

**Command changes**

Version 5.5.3-1.1: Support for up to 1024 VLANs added to AR1050V

Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V

## switchport mode private-vlan

**Overview** Use this command to make a Layer 2 port a private VLAN host port or a promiscuous port.

Use the **no** variant of this command to remove the configuration.

**Syntax** switchport mode private-vlan {host|promiscuous}  
no switchport mode private-vlan {host|promiscuous}

| Parameter   | Description                                                                                                                                                                                                                                                                    |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| host        | This port type can communicate with all other host ports assigned to the same community VLAN, but it cannot communicate with the ports in the same isolated VLAN. All communications outside of this VLAN must pass through a promiscuous port in the associated primary VLAN. |
| promiscuous | A promiscuous port can communicate with all interfaces, including the community and isolated ports within a private VLAN.                                                                                                                                                      |

**Mode** Interface Configuration

**Examples** To configure host mode, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode private-vlan host
```

To configure promiscuous mode, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# switchport mode private-vlan promiscuous
```

To remove promiscuous mode, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# no switchport mode private-vlan promiscuous
```

**Related commands** [switchport private-vlan mapping](#)

# switchport mode private-vlan trunk promiscuous

**Overview** Use this command to enable a port in trunk mode to be a promiscuous port for isolated VLANs.

Use the **no** variant of this command to remove a port in trunk mode as a promiscuous port for isolated VLANs. You must first remove the secondary port, or ports, in trunk mode associated with the promiscuous port with the **no switchport mode private-vlan trunk secondary** command.

**Syntax** switchport mode private-vlan trunk promiscuous group *<group-id>*  
no switchport mode private-vlan trunk promiscuous

| Parameter               | Description                                                                                                               |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;group-id&gt;</i> | The group ID is a numeric value in the range 1 to 32 that is used to associate the promiscuous port with secondary ports. |

**Default** By default, a port in trunk mode is disabled as a promiscuous port.

**Mode** Interface Configuration

**Usage notes** A port must be put in trunk mode with **switchport mode trunk** command before it can be enabled as a promiscuous port.

To add VLANs to be trunked over the promiscuous port, use the **switchport trunk allowed vlan** command. These VLANs can be isolated VLANs, or non-private VLANs.

To configure the native VLAN for the promiscuous port, use the **switchport trunk native vlan** command. The native VLAN can be an isolated VLAN, or a non-private VLAN.

When you enable a promiscuous port, all of the secondary port VLANs associated with the promiscuous port via the group ID number must be added to the promiscuous port. In other words, the set of VLANs on the promiscuous port must be a superset of all the VLANs on the secondary ports within the group.

**Examples** To create the isolated VLANs 2, 3 and 4 and then enable port1.0.2 in trunk mode as a promiscuous port for these VLANs with the group ID of 3, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 2-4
awplus(config-vlan)# private-vlan 2 isolated
awplus(config-vlan)# private-vlan 3 isolated
awplus(config-vlan)# private-vlan 4 isolated
awplus(config-vlan)# exit
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode trunk
awplus(config-if)# switchport trunk allowed vlan add 2-4
awplus(config-if)# switchport mode private-vlan trunk
promiscuous group 3
```

To remove port1.0.2 in trunk mode as a promiscuous port for a private VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport mode private-vlan trunk
promiscuous
```

Note that you must remove the secondary port or ports enabled as trunk ports that are associated with the promiscuous port before removing the promiscuous port.

# switchport mode private-vlan trunk secondary

**Overview** Use this command to enable a port in trunk mode to be a secondary port for isolated VLANs.

Use the **no** variant of this command to remove a port in trunk mode as a secondary port for isolated VLANs.

**Syntax** switchport mode private-vlan trunk secondary group *<group-id>*  
no switchport mode private-vlan trunk secondary

| Parameter               | Description                                                                                                                |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;group-id&gt;</i> | The group ID is a numeric value in the range 1 to 32 that is used to associate a secondary port with its promiscuous port. |

**Default** By default, a port in trunk mode is disabled as a secondary port.

When a port in trunk mode is enabled to be a secondary port for isolated VLANs, by default it will have a native VLAN of **none** (no native VLAN specified).

**Mode** Interface Configuration

**Usage notes** A port must be put in trunk mode with **switchport mode trunk** command before the port is enabled as a secondary port in trunk mode.

To add VLANs to be trunked over the secondary port use the **switchport trunk allowed vlan** command. These must be isolated VLANs and must exist on the associated promiscuous port.

To configure the native VLAN for the secondary port, use the **switchport trunk native vlan** command. The native VLAN must be an isolated VLAN and must exist on the associated promiscuous port.

**Examples** To create isolated private VLAN 2 and then enable port1.0.3 in trunk mode as a secondary port for this VLAN with the group ID of 3, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 2
awplus(config-vlan)# private-vlan 2 isolated
awplus(config-vlan)# exit
awplus(config)# interface port1.0.3
awplus(config-if)# switchport mode trunk
awplus(config-if)# switchport trunk allowed vlan add 2
awplus(config-if)# switchport mode private-vlan trunk secondary
group 3
```

To remove port1.0.3 in trunk mode as a secondary port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# no switchport mode private-vlan trunk
secondary
```

**Related commands**

- switchport mode private-vlan trunk promiscuous**
- switchport mode trunk**
- switchport trunk allowed vlan**
- switchport trunk native vlan**
- show vlan private-vlan**

## switchport mode private-vlan ufo

**Overview** Use this command to allow private VLAN UFO 802.1q member ports to be configured as upstream or downstream.

Use the **no** variant of this command to change the role of the private VLAN UFO 802.1q member port to downstream.

**Syntax** switchport mode private-vlan ufo <vid-list> {primary-upstream|secondary-upstream|stp|epsr}  
no switchport mode private-vlan ufo <vid-list>

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <vid-list>         | A hyphen-separated range or a comma-separated list of VLAN IDs, all of which must have previously been configured with the private-vlan setting of "ufo".                                                                                                                                                                                                                                                              |
| primary-upstream   | The primary interface port/LAG that this UFO VLAN will attempt to use as the Upstream interface. More than one primary-upstream interface can be configured.                                                                                                                                                                                                                                                           |
| secondary-upstream | The interface that this UFO VLAN will revert to use as the Upstream port if all the primary-upstream ports are unavailable due to being either operationally down (i.e. Link Down) or blocked from forwarding (e.g. STP). More than one secondary-upstream interface can be configured.                                                                                                                                |
| stp                | Let STP determine whether this interface is upstream or downstream. STP will determine if this interface plays the role of an STP Root Port for the CIST, or for the MSTI that this UFO VLAN belongs to. If it is, then UFO will designate this interface as an Upstream interface member for this UFO VLAN. Otherwise it is Downstream.                                                                               |
| epsr               | Let EPSR determine whether this interface is upstream or downstream. If this UFO VLAN is a protected data VLAN in an EPSR instance, and this interface is one of the transit node's interfaces, then this interface will determine if an EPSR Master is reachable from this interface. If it is, then UFO will designate this interface as an Upstream interface member for this UFO VLAN. Otherwise it is Downstream. |

**Default** Downstream.

Note: The default setting for a private VLAN UFO member interface is downstream, but it is not explicitly configured. Use the **no** variant of this command to make the member interface downstream.

**Mode** Interface Configuration

**Example** To configure a private VLAN UFO trunk port as primary-upstream, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode trunk
awplus(config-if)# switchport trunk allowed vlan add 100
awplus(config-if)# switchport mode private-vlan ufo 100 primary-upstream
```

To change the role of the private VLAN UFO 802.1q member port back to the default of downstream, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport mode private-vlan ufo 100
```

**Related commands** [private-vlan](#)

**Command changes** Version 5.5.3-1.1: added to x220, x230, x320, x550, x950, SBx908 GEN2 Series

Version 5.4.9-0.1: added to x530 Series

Version 5.4.8-2.1: added to SBx8100 Series

Version 5.4.7-2.1: command added

# switchport mode trunk

**Overview** Use this command to set the switching characteristics of the port to trunk. Received frames are classified based on the VLAN characteristics, then accepted or discarded based on the specified filtering criteria.

**Syntax** `switchport mode trunk [ingress-filter {enable|disable}]`

| Parameter      | Description                                                                               |
|----------------|-------------------------------------------------------------------------------------------|
| ingress-filter | Set the ingress filtering for the frames received.                                        |
| enable         | Turn on ingress filtering for received frames. This is the default.                       |
| disable        | Turn off ingress filtering to accept frames that do not meet the classification criteria. |

**Default** By default, ports are in access mode, are untagged members of the default VLAN (VLAN 1), and have ingress filtering on.

**Mode** Interface Configuration

**Usage notes** A port in trunk mode can be a tagged member of multiple VLANs, and an untagged member of one native VLAN.

To configure which VLANs this port will trunk for, use the [switchport trunk allowed vlan](#) command.

**Example**

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# switchport mode trunk ingress-filter enable
```

**Related Commands** [show interface switchport](#)

**Command changes** Version 5.5.3-1.1: Support for up to 1024 VLANs added to AR1050V  
Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V

# switchport private-vlan host-association

**Overview** Use this command to associate a primary VLAN and a secondary VLAN to a host port. Only one primary and secondary VLAN can be associated to a host port.

Use the **no** variant of this command to remove the association.

**Syntax** `switchport private-vlan host-association <primary-vlan-id> add <secondary-vlan-id>`  
`no switchport private-vlan host-association`

| Parameter                              | Description                                                   |
|----------------------------------------|---------------------------------------------------------------|
| <code>&lt;primary-vlan-id&gt;</code>   | VLAN ID of the primary VLAN.                                  |
| <code>&lt;secondary-vlan-id&gt;</code> | VLAN ID of the secondary VLAN (either isolated or community). |

**Mode** Interface Configuration

**Examples** `awplus# configure terminal`  
`awplus(config)# interface port1.0.2`  
`awplus(config-if)# switchport private-vlan host-association 2`  
`add 3`  
`awplus# configure terminal`  
`awplus(config)# interface port1.0.2`  
`awplus(config-if)# no switchport private-vlan host-association`

# switchport private-vlan mapping

**Overview** Use this command to associate a primary VLAN and a set of secondary VLANs to a promiscuous port.

Use the **no** variant of this to remove all the association of secondary VLANs to primary VLANs for a promiscuous port.

**Syntax** `switchport private-vlan mapping <primary-vlan-id> add  
<secondary-vid-list>`  
`switchport private-vlan mapping <primary-vlan-id> remove  
<secondary-vid-list>`  
`no switchport private-vlan mapping`

| Parameter                               | Description                                                                                                                       |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;primary-vlan-id&gt;</code>    | VLAN ID of the primary VLAN.                                                                                                      |
| <code>&lt;secondary-vid-list&gt;</code> | VLAN ID of the secondary VLAN (either isolated or community), or a range of VLANs, or a comma-separated list of VLANs and ranges. |

**Mode** Interface Configuration

**Usage notes** This command can be applied to a switch port or a static channel group, but not a dynamic (LACP) channel group. LACP channel groups (dynamic/LACP aggregators) cannot be promiscuous ports in private VLANs.

**Examples** `awplus# configure terminal`  
`awplus(config)# interface port1.0.2`  
`awplus(config-if)# switchport private-vlan mapping 2 add 3-4`  
`awplus(config-if)# switchport private-vlan mapping 2 remove 3-4`  
`awplus(config-if)# no switchport private-vlan mapping`

**Related commands** [switchport mode private-vlan](#)

## switchport trunk allowed vlan

**Overview** Use this command to add VLANs to be trunked over this switch port. Traffic for these VLANs can be sent and received on the port.

Use the **no** variant of this command to reset switching characteristics of a specified interface to negate a trunked configuration specified with **switchport trunk allowed vlan** command.

**Syntax**

```
switchport trunk allowed vlan all
switchport trunk allowed vlan none
switchport trunk allowed vlan add <vid-list>
switchport trunk allowed vlan remove <vid-list>
switchport trunk allowed vlan except <vid-list>
no switchport trunk
```

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| all        | Allow all VLANs to transmit and receive through the port.                                                                                                                                                                                                                                                                                                                                                                                                   |
| none       | Allow no VLANs to transmit and receive through the port.                                                                                                                                                                                                                                                                                                                                                                                                    |
| add        | Add a VLAN to the list of VLANs that are allowed to transmit and receive through the port. Only use this parameter if a list of VLANs is already configured on a port.                                                                                                                                                                                                                                                                                      |
| remove     | Remove a VLAN from the list of VLANs that are allowed to transmit and receive through the port. Only use this parameter if a list of VLANs is already configured on a port.<br><br>If you are removing VLAN port membership for a large number of switchports and VLANs, note that this command may take a number of minutes to run.                                                                                                                        |
| except     | All VLANs, except the VLAN for which the VID is specified, are part of its port member set. Only use this parameter to remove VLANs after either this parameter or the <b>all</b> parameter have added VLANs to a port.                                                                                                                                                                                                                                     |
| <vid-list> | <2-4094> The ID of the VLAN or VLANs that will be added to, or removed from, the port. A single VLAN, VLAN range, or comma-separated VLAN list can be set.<br><br>For a VLAN range, specify two VLAN numbers: lowest, then highest number in the range, separated by a hyphen.<br><br>For a VLAN list, specify the VLAN numbers separated by commas.<br><br>Do not enter spaces between hyphens or commas when setting parameters for VLAN ranges or lists. |

**Default** By default, ports are untagged members of the default VLAN (VLAN 1).

**Mode** Interface Configuration

**Usage notes** The **all** parameter sets the port to be a tagged member of all the VLANs configured on the device. The **none** parameter removes all VLANs from the port's tagged member set. The **add** and **remove** parameters will add and remove VLANs to and from the port's member set. The **except** parameter creates an exception to the list.

If you use the **all** parameter, and then you want to remove VLANs from the port's member list, you must use the **except** parameter to remove the unwanted VLANs. Similarly, if you use the **except** parameter to remove a list of VLANs, and you want to change that list, you must use the **except** parameter to make that change (not the **add** and **remove** parameters).

For example, if you want to remove VLAN3-5 from a port and the port's configuration is currently **switchport trunk allowed vlan all**, then you should remove VLAN3-5 by entering the **except** parameter, instead of using the **remove** parameter. This means using the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.6
awplus(config-if)# switchport trunk allowed vlan except 3-5
```

If you do this, then the configuration changes to:

```
awplus#show running-config
interface port1.0.6
switchport
switchport mode trunk
switchport trunk allowed vlan except 3-5
```

For example, if you want to add VLAN4 back in again, and the port configuration is currently **switchport trunk allowed vlan except 3-5**, then you should add VLAN4 by re-entering the **except** parameter with the list of VLANs to remove, instead of using the **add** parameter. This means using the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.6
awplus(config-if)# switchport trunk allowed vlan except 3,5
```

If you do this, then the configuration changes to:

```
awplus#show running-config
interface port1.0.6
switchport
switchport mode trunk
switchport trunk allowed vlan except 3,5
```

**Examples** The following shows adding a single VLAN to a port's member set.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk allowed vlan add 2
```

The following shows adding a range of VLANs to a port's member set.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk allowed vlan add 2-4
```

The following shows adding a list of VLANs to a port's member set.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk allowed vlan add 2,3,4
```

**Command changes** Version 5.5.3-1.1: Support for up to 1024 VLANs added to AR1050V  
Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V

## switchport trunk native vlan

**Overview** Use this command to configure the native VLAN for this port. The native VLAN is used for classifying the incoming untagged packets. Use the **none** parameter with this command to remove the native VLAN from the port and set the acceptable frame types to VLAN-tagged only.

Use the **no** variant of this command to reset the native VLAN to the default VLAN ID 1 and remove tagged VLANs from the port.

**Syntax** switchport trunk native vlan {<vid>|none}  
no switchport trunk native vlan

| Parameter | Description                                                                                                                                                                                                                                                                                               |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <vid>     | The ID of the VLAN that will be used to classify the incoming untagged packets, in the range 2-2094. The VLAN ID must be a part of the VLAN member set of the port.                                                                                                                                       |
| none      | No native VLAN specified. This option removes the native VLAN from the port and sets the acceptable frame types to vlan-tagged only.<br><br>Note: Use the <b>no</b> variant of this command to revert to the default VLAN 1 as the native VLAN for the specified interface switchport - not <b>none</b> . |

**Default** VLAN 1 (the default VLAN), which is reverted to using the **no** form of this command.

**Mode** Interface Configuration

**Examples** To set the native VLAN on interface port1.0.2 to VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk native vlan 2
```

To remove the native VLAN from interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk native vlan none
```

To reset the native VLAN on interface port1.0.2 to the default VLAN 1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport trunk native vlan
```

**Command changes** Version 5.5.3-1.1: Support for up to 1024 VLANs added to AR1050V  
Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V

## switchport vlan translation

**Overview** Use this command to create a VLAN translation entry on an interface. The translation entry translates a packet's VLAN ID as seen on the wire.

Use the **no** variant of this command to remove all translation entries or a specific entry.

**Syntax** switchport vlan translation vlan <wire-vid> vlan <vid>  
no switchport vlan translation [all|vlan <wire-vid>]

| Parameter       | Description                                                       |
|-----------------|-------------------------------------------------------------------|
| vlan <wire-vid> | VLAN-ID of the packet as it is seen on the wire.                  |
| vlan <vid>      | VLAN-ID of the VLAN as it was assigned when the VLAN was created. |
| all             | Delete all translation entries.                                   |

**Default** None (By default, no translation entries exist.)

**Mode** Interface Configuration for a switch port, a static channel group, or a dynamic (LACP) channel group. Switch ports must be trunked.

**Usage notes** This command configures trunked ports only. For information on double-tagging on access ports, and for more information about VLAN ID translation on trunk ports, see the [VLAN Feature Overview and Configuration Guide](#).

**Example** To translate between internal VLAN100 and wire-VID 200 on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport vlan translation vlan 200 vlan 100
```

To remove a translation entry from port1.0.1 for wire-VID 200, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no switchport vlan translation vlan 200
```

To remove all translation entries from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no switchport vlan translation all
```

**Related commands** **show interface switchport vlan translation**  
**switchport mode trunk**  
**switchport vlan translation default drop**

**Command changes** Version 5.4.8-0.2: added to SBx908 GEN2, x930 Series products  
Version 5.4.8-1.1: added to SBx8100 Series products  
Version 5.4.9-0.1: added to x530 Series products  
Version 5.4.9-1.1: added **outer-vlan** parameter for SBx908 GEN2, x950, x930, x510, x510L, IE510-28GSX and IE300 Series switches.  
Version 5.5.0-2.1: added **outer-vlan** parameter for x530 Series switches.

# switchport vlan translation default drop

**Overview** Use this command to drop inbound tagged packets if their VLAN-ID does not match any entries in the VLAN translation table for an interface.

Use the **no** variant of this command to stop dropping non-matching inbound packets and let them be accepted as is for further processing.

**Syntax** switchport vlan translation default drop  
no switchport vlan translation default drop

**Default** Do not drop packets

**Mode** Interface Configuration for a switch port or a static channel group, or a dynamic (LACP) channel group. The interface must be in a mode that supports tagged packets.

**Example** To drop inbound tagged packets arriving at port1.0.1 unless they match a VLAN translation entry, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport vlan translation default drop
```

To accept inbound tagged packets arriving at port1.0.1 regardless of whether they match a VLAN translation entry, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no switchport vlan translation default drop
```

**Related commands** [show interface switchport vlan translation](#)  
[switchport vlan translation](#)

**Command changes** Version 5.4.8-0.2: added to SBx908 GEN2, x930 Series products  
Version 5.4.8-1.1: added to SBx8100 Series products  
Version 5.4.9-0.1: added to x530 Series products

# switchport vlan-stacking (double-tagging)

**Overview** Use this command to enable VLAN stacking on a port and set it to be a customer-edge-port or provider-port. This is sometimes referred to as VLAN double-tagging, nested VLANs, or Q in Q.

Use **no** parameter with this command to disable VLAN stacking on an interface.

The port must be in access mode.

**Syntax** switchport vlan-stacking {customer-edge-port|provider-port}  
no switchport vlan-stacking

| Parameter          | Description                                                                        |
|--------------------|------------------------------------------------------------------------------------|
| customer-edge-port | Set the port to be a customer edge port. This port must already be in access mode. |
| provider-port      | Set the port to be a provider port. This port must already be in trunk mode.       |

**Default** By default, ports are not VLAN stacking ports.

**Mode** Interface Configuration

**Usage** Use VLAN stacking to separate traffic from different customers to that they can be managed over a provider network.

For more information about how to configure this feature, see the [VLAN Feature Overview and Configuration Guide](#).

Note that you must also enable jumbo frame support on the customer edge port, by using the [platform jumboframe](#) command.

Traffic with an extra VLAN header added by VLAN stacking cannot be routed.

**Example** To apply vlan-stacking to the selected port, configure it to be a customer edge port, and turn on jumbo frames, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport vlan-stacking customer-edge-port
awplus(config-if)# platform jumboframe
```

**Related** [platform jumboframe](#)  
**commands**

## switchport voice dscp

**Overview** Use this command for a specific port to configure the Layer 3 DSCP value advertised when the transmission of LLDP-MED Network Policy TLVs for voice devices is enabled. When LLDP-MED capable IP phones receive this network policy information, they transmit voice data with the specified DSCP value.

Use the **no** variant of this command to reset the DSCP value to the default, 0.

**Syntax** switchport voice dscp <0-63>  
no switchport voice dscp

| Parameter | Description                          |
|-----------|--------------------------------------|
| dscp      | Specify a DSCP value for voice data. |
| <0-63>    | DSCP value.                          |

**Default** A DSCP value of 0 will be advertised.

**Mode** Interface Configuration

**Usage notes** LLDP-MED advertisements including Network Policy TLVs are transmitted via a port if:

- LLDP is enabled (**lldp run**)
- Voice VLAN is configured for the port (**switchport voice vlan**)
- The port is configured to transmit LLDP advertisements—enabled by default (**lldp transmit receive**)
- The port is configured to transmit Network Policy TLVs—enabled by default (**lldp med-tlv-select**)
- There is an LLDP-MED device connected to the port

**Example** To tell IP phones connected to port1.0.2 to send voice data with DSCP value 27, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport voice dscp 27
```

**Related commands** **lldp med-tlv-select**  
**show lldp**  
**switchport voice vlan**

## switchport voice vlan

**Overview** Use this command to configure the Voice VLAN tagging advertised when the transmission of LLDP-MED Network Policy TLVs for voice endpoint devices is enabled. When LLDP-MED capable IP phones receive this network policy information, they transmit voice data with the specified tagging. This command also sets the ports to be spanning tree edge ports, that is, it enables spanning tree portfast on the ports.

Use the **no** variant of this command to remove LLDP-MED network policy configuration for voice devices connected to these ports. This does not change the spanning tree edge port status.

**Syntax** switchport voice vlan [<vid>|dot1p|dynamic|untagged]  
no switchport voice vlan

| Parameter | Description                                                                                                                                                                                                                                   |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dot1p     | The IP phone should send User Priority tagged packets, that is, packets in which the tag contains a User Priority value, and a VID of 0. (The User Priority tag is also known as the 802.1p priority tag, or the Class of Service (CoS) tag.) |
| dynamic   | The VLAN ID with which the IP phone should send tagged packets will be assigned by RADIUS authentication.                                                                                                                                     |
| untagged  | The IP phone should send untagged packets.                                                                                                                                                                                                    |

**Default** By default, no Voice VLAN is configured, and therefore no network policy is advertised for voice devices.

**Mode** Interface Configuration

**Usage notes** LLDP-MED advertisements including Network Policy TLVs are transmitted via a port if:

- LLDP is enabled (**lldp run**)
- Voice VLAN is configured for the port using this command (**switchport voice vlan**)
- The port is configured to transmit LLDP advertisements—enabled by default (**lldp transmit receive**)
- The port is configured to transmit Network Policy TLVs—enabled by default (**lldp med-tlv-select**)
- There is an LLDP-MED device connected to the port.

To set the priority value to be advertised for tagged frames, use the **switchport voice vlan priority**.

If the Voice VLAN details are to be assigned by RADIUS, then the RADIUS server must be configured to send the attribute “Egress-VLANID (56)” or “Egress-VLAN-Name (58)” in the RADIUS Accept message when authenticating a phone attached to this port.

To set these attributes on the local RADIUS server, use the **egress-vlan-id (radsrv-grp)** or the **egress-vlan-name (radsrv-grp)**.

**Examples** To tell IP phones connected to port1.0.4 to send voice data tagged for VLAN 10, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# switchport voice vlan 10
```

To tell IP phones connected to port1.0.2-port1.0.8 to send priority tagged packets (802.1p priority tagged with VID 0, so that they will be assigned to the port VLAN) use the following commands. The priority value is 5 by default, but can be configured with the **switchport voice vlan priority** command.

```
awplus# configure terminal
awplus(config)# interface port1.0.2-port1.0.8
awplus(config-if)# switchport voice vlan dot1p
```

To dynamically configure the VLAN ID advertised to IP phones connected to port1.0.1 based on the VLAN assigned by RADIUS authentication (with RADIUS attribute "Egress- VLANID" or "Egress-VLAN-Name" in the RADIUS accept packet), use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport voice vlan dynamic
```

To remove the Voice VLAN, and therefore disable the transmission of LLDP-MED network policy information for voice devices on port1.0.8, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.8
awplus(config-if)# no switchport voice vlan
```

**Related commands** **switchport voice dscp**  
**switchport voice vlan priority**

## switchport voice vlan priority

**Overview** Use this command to configure the Layer 2 user priority advertised when the transmission of LLDP-MED Network Policy TLVs for voice devices is enabled. This is the priority in the User Priority field of the IEEE 802.1Q VLAN tag, also known as the Class of Service (CoS), or 802.1p priority. When LLDP-MED capable IP phones receive this network policy information, they transmit voice data with the specified priority.

**Syntax** `switchport voice vlan priority <0-7>`  
`no switchport voice vlan priority`

| Parameter                | Description                                   |
|--------------------------|-----------------------------------------------|
| <code>priority</code>    | Specify a user priority value for voice data. |
| <code>&lt;0-7&gt;</code> | Priority value.                               |

To remove the Voice VLAN, and therefore disable the transmission of LLDP-MED network policy information for voice devices on port1.0.6, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.6
awplus(config-if)# no switchport voice vlan
```

## vlan

**Overview** This command creates VLANs, assigns names to them, and enables or disables them. Disabling the VLAN causes all forwarding over the specified VLAN ID to cease. Enabling the VLAN allows forwarding of frames on the specified VLAN.

You can create a management-only VLAN that contains only one member port and may be used as a remote management port. Management-only VLANs process packets in the CPU rather than in hardware. See the parameter table below for more detail.

If you need to control ingress and egress traffic to and from management interfaces, you can use software-based ACLs to filter traffic to and from a management-only VLAN.

The **no** variant of this command destroys the specified VLANs or returns their MTU to the default.

**Syntax** `vlan <vid> [name <vlan-name>] [state {enable|disable|management-only}]`  
`vlan <vid-range> [state {enable|disable|management-only}]`  
`vlan {<vid>|<vlan-name>} [mtu <mtu-value>]`  
`no vlan {<vid>|<vid-range>} [mtu]`

| Parameter       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <vid>           | The VID of the VLAN to enable or disable, in the range 1-4094.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <vlan-name>     | The ASCII name of the VLAN. Maximum length: 32 characters.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <vid-range>     | Specifies a range of VLAN identifiers.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <mtu-value>     | Specifies the Maximum Transmission Unit (MTU) size in bytes, in the range 68 to 1500 bytes, for the VLAN.                                                                                                                                                                                                                                                                                                                                                                         |
| enable          | Puts the VLAN into an enabled state.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| disable         | Puts the VLAN into a disabled state.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| management-only | Management-only VLANs are VLANs which: <ul style="list-style-type: none"><li>• have one and only one access port (no aggregators, trunk port etc.)</li><li>• do not route to/from other interfaces.</li><li>• process packets in the CPU, rather than in hardware.</li><li>• cannot be converted to a normal VLAN, nor can a normal VLAN be converted to a management-only VLAN. Delete and re-create the VLAN to convert a normal VLAN to/from a management-only VLAN.</li></ul> |

**Default** By default, VLANs are enabled when they are created.

**Mode** VLAN Configuration

**Examples** To enable VLAN 45, use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 45 name accounts state enable
```

To destroy VLAN 45, use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no vlan 45
```

To create a management-only VLAN with VID 100, use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 100 state management-only
```

**Related commands** **mtu**  
**vlan database**  
**show vlan**

**Command changes** Version 5.5.3-1.1: Support for up to 1024 VLANs added to AR1050V  
Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V  
Version 5.4.9-2.1: Parameter **management-only** added

## vlan access-map

**Overview** Use this command to create a VLAN access-map and enter into VLAN access-map mode, so you can add ACLs to the map. You can use any IPv4 or IPv6 hardware ACLs. VLAN access-maps are used to attach ACLs to VLANs, and therefore to filter traffic as it ingresses VLANs.

See the [ACL Feature Overview and Configuration Guide](#) for more information, including information about the number of rules consumed by per-VLAN ACLs, and ACL processing order.

Use the **no** variant of this command to delete a VLAN access-map.

**Syntax** `vlan access-map <name>`  
`no vlan access-map <name>`

| Parameter | Description                |
|-----------|----------------------------|
| <name>    | A name for the access-map. |

**Default** By default, no VLAN access-maps exist.

**Mode** Global Configuration

**Example** To apply ACL 3001 to VLAN 48, where the ACL drops IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 3001 deny ip any any
awplus(config)# vlan access-map deny_all
awplus(config-vlan-access-map)# match access-group 3001
awplus(config-vlan-access-map)# exit
awplus(config)# vlan filter deny_all vlan-list 48 input
```

**Related commands** [match access-group](#)  
[show vlan access-map](#)  
[vlan filter](#)

**Command changes** Version 5.4.6-2.1: command added

# vlan database

**Overview** Use this command to enter the VLAN Configuration mode. You can then add or delete a VLAN, or modify its values.

**Syntax** `vlan database`

**Mode** Global Configuration

**Example** In the following example, note the change to VLAN Configuration mode from Global Configuration mode:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)#
```

**Related commands** [vlan](#)

**Command changes** Version 5.5.3-1.1: Support for up to 1024 VLANs added to AR1050V  
Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V

## vlan filter

**Overview** Use this command to apply a VLAN access-map to a list of VLANs. The switch uses the ACLs in the access-map to filter traffic ingressing those VLANs.

See the [ACL Feature Overview and Configuration Guide](#) for more information, including information about the number of rules consumed by per-VLAN ACLs, and ACL processing order.

Use the **no** variant of this command to remove the access-map filter from the listed VLANs.

**Syntax** `vlan filter <access-map-name> vlan-list <vid> input`  
`no vlan filter <access-map-name> vlan-list <vid> input`

| Parameter                            | Description                                                                                                                                                                                     |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;access-map-name&gt;</code> | The name of the VLAN access-map to apply to the specified list of VLANs                                                                                                                         |
| <code>vlan-list &lt;vid&gt;</code>   | The list of VLANs to filter. You can specify a single VLAN (e.g. 49), a comma-separated list of VLANs (e.g. 49, 51), a hyphenated range of VLANs (e.g. 49-51), or a combination (e.g. 49,51-53) |
| <code>input</code>                   | Apply the filter to ingress traffic                                                                                                                                                             |

**Default** By default, no VLAN filters exist.

**Mode** Global Configuration

**Example** To apply ACL 3001 to VLAN 48, where the ACL drops IP traffic from any source to any destination, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 3001 deny ip any any
awplus(config)# vlan access-map deny_all
awplus(config-vlan-access-map)# match access-group 3001
awplus(config-vlan-access-map)# exit
awplus(config)# vlan filter deny_all vlan-list 48 input
```

**Related commands** [match access-group](#)  
[show vlan filter](#)  
[vlan access-map](#)

**Command changes** Version 5.4.6-2.1: command added

## vlan mode stack-local-vlan

**Overview** This command enables you to create stack-local-VLANs and use ICMP to monitor and diagnose issues within specific members of the stack. When a VLAN is added using this method, all its traffic will be trapped to and processed by the CPU of the specific local stack member, rather than the CPU of the stack master.

The **no** variant of this command destroys the specified VLAN.

**Syntax** `vlan <vid> mode stack-local-vlan <member-id>`  
`no vlan <vid>`

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <vid>                 | The VID of the VLAN to be created in the range 2-4094. We recommend that the first stack-local-vlan be assigned the number 4001 for the first stack member, then incremented by one for each stack member. For example, a stack of four members would be assigned the following VID numbers: <ul style="list-style-type: none"><li>• stack member one: VID 4001</li><li>• stack member two: VID 4002</li><li>• stack member three: VID 4003</li><li>• stack member four: VID 4004</li></ul> |
| mode stack-local-vlan | Specifies that the new VLAN will function as a stack-local- VLAN.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <member-id>           | Specifies the stack member ID. Enter a decimal number in the range 1-8.                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Default** By default, VLANs are automatically enabled as they are added.

**Mode** VLAN Configuration

**Usage notes** If IGMP snooping is operating on a stack-local-VLAN, the device will try to process some multicast traffic via that VLAN, if it is connected to a Microsoft Windows PC.

To avoid this, we recommend disabling IGMP snooping on stack-local-VLANs, by using the command **no ip igmp snooping**.

**Examples** To add a stack-local-VLAN with the VID of 4002 and assign it to stack member 2, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 4002 mode stack-local-vlan 2
awplus(config-vlan)# exit
awplus(config)# interface vlan4002
awplus(config-if)# no ip igmp snooping
```

To remove VLAN 4002, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no vlan 4002
```

## vlan mode transmit-local-vlan

**Overview** Use this command to create a VLAN that allows individual stack members to communicate with each other. This means container instances can communicate across the stack links.

**Syntax** `vlan <vid> mode transmit-local-vlan`

| Parameter               | Description                                                         |
|-------------------------|---------------------------------------------------------------------|
| <vid>                   | The VID of the VLAN to be created in the range 2-4094.              |
| modetransmit-local-vlan | Specifies that the new VLAN will function as a transmit-local VLAN. |

**Default** By default, VLANs do not use this mode.

**Mode** VLAN Configuration

**Usage notes** Use this mode when configuring fail-over for SESC mini. Only one transmit-local VLAN is required for each stack.

The use of this command is only supported with Container Services. The configuration of IP addresses, routes, etc is not supported on a VLAN of this type. It is not recommended to configure this VLAN on any ports.

**Example** To configure a transmit-local VLAN with the VID of 4002, use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 4002 mode transmit-local-vlan
```

**Command changes** Version 5.5.1-2.1: command added

# Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure RSTP, STP or MSTP. For information about spanning trees, including configuration procedures, see the [STP Feature Overview and Configuration Guide](#).

# clear spanning-tree statistics

**Overview** Use this command to clear all the STP BPDU (Bridge Protocol Data Unit) statistics.

**Syntax** clear spanning-tree statistics  
clear spanning-tree statistics [instance <mstp-instance>]  
clear spanning-tree statistics [interface <port> [instance <mstp-instance>]]

| Parameter       | Description                                                                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port>          | The port to clear STP BPDU statistics for. The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2). |
| <mstp-instance> | The MSTP instance (MSTI - Multiple Spanning Tree Instance) to clear MSTP BPDU statistics.                                                                                   |

**Mode** User Exec and Privileged Exec

**Usage notes** Use this command with the **instance** parameter in MSTP mode. Specifying this command with the **interface** parameter only not the instance parameter will work in STP and RSTP mode.

**Examples** awplus# clear spanning-tree statistics  
awplus# clear spanning-tree statistics instance 1  
awplus# clear spanning-tree statistics interface port1.0.2  
awplus# clear spanning-tree statistics interface port1.0.2  
instance 1

# clear spanning-tree detected protocols (RSTP and MSTP)

**Overview** Use this command to clear the detected protocols for a specific port, or all ports.

Use this command in RSTP or MSTP mode only.

**Syntax** `clear spanning-tree detected protocols [interface <port>]`

| Parameter | Description                                                                                                                                                                |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port>    | The port to clear detected protocols for. The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2). |

**Mode** Privileged Exec

**Example** `awplus# clear spanning-tree detected protocols`

## debug mstp (RSTP and STP)

**Overview** Use this command to enable debugging for the configured spanning tree mode, and echo data to the console, at various levels. Note that although this command uses the keyword **mstp** it displays debugging output for RSTP and STP protocols as well the MSTP protocol.

Use the **no** variant of this command to disable spanning tree debugging.

**Syntax**

```
debug mstp {all|cli|protocol [detail]|timer [detail]}
debug mstp {packet {rx|tx} [decode] [interface <interface>]}
debug mstp {topology-change [interface <interface>]}
no debug mstp {all|cli|protocol [detail]|timer [detail]}
no debug mstp {packet {rx|tx} [decode] [interface <interface>]}
no debug mstp {topology-change [interface <interface>]}
```

| Parameter       | Description                                                             |
|-----------------|-------------------------------------------------------------------------|
| all             | Echoes all spanning tree debugging levels to the console.               |
| cli             | Echoes spanning tree commands to the console.                           |
| packet          | Echoes spanning tree packets to the console.                            |
| rx              | Received packets.                                                       |
| tx              | Transmitted packets.                                                    |
| protocol        | Echoes protocol changes to the console.                                 |
| timer           | Echoes timer information to the console.                                |
| detail          | Detailed output.                                                        |
| decode          | Interprets packet contents                                              |
| topology-change | Interprets topology change messages                                     |
| interface       | Keyword before <interface> placeholder to specify an interface to debug |
| <interface>     | Placeholder used to specify the name of the interface to debug.         |

**Mode** Privileged Exec and Global Configuration mode

**Usage 1** Use the **debug mstp topology-change interface** command to generate debugging messages when the device receives an indication of a topology change in a BPDU from another device. The debugging can be activated on a per-port basis. Although this command uses the keyword **mstp**, it displays debugging output for RSTP and STP protocols as well as the MSTP protocol.

Due to the likely volume of output, these debug messages are best viewed using the **terminal monitor** before issuing the relevant **debug mstp** command. The default terminal monitor filter will select and display these messages. Alternatively, the messages can be directed to any of the other log outputs by adding a filter for the MSTP application using **log buffered (filter)**:

```
awplus# configure terminal
awplus(config)# log buffered program mstp
```

### Output 1

```
awplus#terminal monitor
awplus#debug mstp topology-change interface port1.0.4
10:09:09 awplus MSTP[1409]: Topology change rcvd on port1.0.4 (internal)
10:09:09 awplus MSTP[1409]: Topology change rcvd on MSTI 1 port1.0.4
awplus#debug mstp topology-change interface port1.0.6
10:09:29 awplus MSTP[1409]: Topology change rcvd on port1.0.6 (external)
10:09:29 awplus MSTP[1409]: Topology change rcvd on MSTI 1 port1.0.6
```

**Usage 2** Use the **debug mstp packet rx|tx decode interface** command to generate debugging messages containing the entire contents of a BPDU displayed in readable text for transmitted and received xSTP BPDUs. The debugging can be activated on a per-port basis and transmit and receive debugging is controlled independently. Although this command uses the keyword **mstp**, it displays debugging output for RSTP and STP protocols as well as the MSTP protocol.

Due to the likely volume of output, these debug messages are best viewed using the **terminal monitor** before issuing the relevant **debug mstp** command. The default terminal monitor filter will select and display these messages. Alternatively, the messages can be directed to any of the other log outputs by adding a filter for the MSTP application using the **log buffered (filter)**:

```
awplus(config)# log buffered program mstp
```

**Output 2** In MSTP mode - an MSTP BPDU with 1 MSTI:

```
awplus#terminal monitor
awplus#debug mstp packet rx decode interface port1.0.4
17:23:42 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - start
17:23:42 awplus MSTP[1417]: Protocol version: MSTP, BPDU type: RST
17:23:42 awplus MSTP[1417]: CIST Flags: Agree Forward Learn role=Desig
17:23:42 awplus MSTP[1417]: CIST root id      : 0000:0000cd1000fe
17:23:42 awplus MSTP[1417]: CIST ext pathcost : 0
17:23:42 awplus MSTP[1417]: CIST reg root id   : 0000:0000cd1000fe
17:23:42 awplus MSTP[1417]: CIST port id      : 8001 (128:1)
17:23:42 awplus MSTP[1417]: msg age: 0 max age: 20 hellotime: 2 fwd delay: 15
17:23:42 awplus MSTP[1417]: Version 3 length : 80
17:23:42 awplus MSTP[1417]: Format id         : 0
17:23:42 awplus MSTP[1417]: Config name      : test
17:23:42 awplus MSTP[1417]: Revision level   : 0
17:23:42 awplus MSTP[1417]: Config digest    : 3ab68794d602fdf43b21c0b37ac3bca8
17:23:42 awplus MSTP[1417]: CIST int pathcost : 0
17:23:42 awplus MSTP[1417]: CIST bridge id    : 0000:0000cd1000fe
17:23:42 awplus MSTP[1417]: CIST hops remaining : 20
17:23:42 awplus MSTP[1417]: MSTI flags       : Agree Forward Learn role=Desig
17:23:42 awplus MSTP[1417]: MSTI reg root id  : 8001:0000cd1000fe
17:23:42 awplus MSTP[1417]: MSTI pathcost    : 0
17:23:42 awplus MSTP[1417]: MSTI bridge priority : 32768 port priority : 128
17:23:42 awplus MSTP[1417]: MSTI hops remaining : 20
17:23:42 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - finish
```

In STP mode transmitting a TCN BPDU:

```
awplus#terminal monitor
awplus#debug mstp packet tx decode interface port1.0.4
17:28:09 awplus MSTP[1417]: port1.0.4 xSTP BPDU tx - start
17:28:09 awplus MSTP[1417]: Protocol version: STP, BPDU type: TCN
17:28:09 awplus MSTP[1417]: port1.0.4 xSTP BPDU tx - finish
```

In STP mode receiving an STP BPDU:

```
awplus#terminal monitor
awplus#debug mstp packet rx decode interface port1.0.4
17:31:36 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - start
17:31:36 awplus MSTP[1417]: Protocol version: STP, BPDU type: Config
17:31:36 awplus MSTP[1417]: Flags: role=none
17:31:36 awplus MSTP[1417]: Root id         : 8000:0000cd1000fe
17:31:36 awplus MSTP[1417]: Root pathcost   : 0
17:31:36 awplus MSTP[1417]: Bridge id      : 8000:0000cd1000fe
17:31:36 awplus MSTP[1417]: Port id       : 8001 (128:1)
17:31:36 awplus MSTP[1417]: msg age: 0 max age: 20 hellotime: 2 fwd delay: 15
17:31:36 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - finish
```

In RSTP mode receiving an RSTP BPDU:

```
awplus#terminal monitor
awplus#debug mstp packet rx decode interface port1.0.4
awplus#17:30:17 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - start
17:30:17 awplus MSTP[1417]: Protocol version: RSTP, BPDU type: RST
17:30:17 awplus MSTP[1417]: CIST Flags: Forward Learn role=Desig
17:30:17 awplus MSTP[1417]: CIST root id      : 8000:0000cd1000fe
17:30:17 awplus MSTP[1417]: CIST ext pathcost : 0
17:30:17 awplus MSTP[1417]: CIST reg root id   : 8000:0000cd1000fe
17:30:17 awplus MSTP[1417]: CIST port id      : 8001 (128:1)
17:30:17 awplus MSTP[1417]: msg age: 0 max age: 20 hellotime: 2 fwd delay: 15
17:30:17 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - finish
```

**Examples** awplus# debug mstp all  
awplus# debug mstp cli  
awplus# debug mstp packet rx  
awplus# debug mstp protocol detail  
awplus# debug mstp timer  
awplus# debug mstp packet rx decode interface port1.0.2  
awplus# debug mstp packet tx decode interface port1.0.6

[terminal monitor](#)  
[undebug mstp](#)

## instance priority (MSTP)

**Overview** Use this command to set the priority for this device to become the root bridge for the specified MSTI (Multiple Spanning Tree Instance).

Use this command for MSTP only.

Use the **no** variant of this command to restore the root bridge priority of the device for the instance to the default.

**Syntax** `instance <instance-id> priority <priority>`  
`no instance <instance-id> priority`

| Parameter                        | Description                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;instance-id&gt;</code> | Specify an MSTP instance in the range 1-15.                                                                                                                                                                                                                                                                                                                                |
| <code>&lt;priority&gt;</code>    | Specify the root bridge priority for the device for the MSTI in the range <0 - 61440>. Note that a lower priority number indicates a greater likelihood of the device becoming the root bridge. The priority values can be set only in increments of 4096. If you specify a number that is not a multiple of 4096, it will be rounded down. The default priority is 32768. |

**Default** The default priority value for all instances is 32768.

**Mode** MST Configuration

**Usage notes** MSTP lets you distribute traffic more efficiently across a network by blocking different links for different VLANs. You do this by making different devices into the root bridge for each MSTP instance, so that each instance blocks a different link.

If all devices have the same root bridge priority for the instance, MSTP selects the device with the lowest MAC address to be the root bridge. Give the device a higher priority for becoming the root bridge for a particular instance by assigning it a lower priority number, or vice versa.

**Examples** To set the root bridge priority for MSTP instance 2 to be the highest (0), so that it will be the root bridge for this instance when available, use the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# instance 2 priority 0
```

To reset the root bridge priority for instance 2 to the default (32768), use the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# no instance 2 priority
```

**Related commands**

- revision (MSTP)**
- show spanning-tree mst config**
- spanning-tree mst instance**
- spanning-tree mst instance priority**

## instance vlan (MSTP)

**Overview** Use this command to create an MST Instance (MSTI), and associate the specified VLANs with it. An MSTI is a spanning tree instance that exists within an MST region (MSTR).

When a VLAN is associated with an MSTI the member ports of the VLAN are automatically configured to send and receive spanning-tree information for the associated MSTI. You can disable this automatic configuration of member ports of the VLAN to the associated MSTI by using a **no spanning-tree mst instance** command to remove the member port from the MSTI.

Use the **instance vlan** command for MSTP only.

Use the **no** variant of this command to remove the specified VLANs from the MSTI.

**Syntax** `instance <instance-id> vlan <vid-list>`  
`no instance <instance-id> vlan <vid-list>`

| Parameter                        | Description                                                                                                                                                                                           |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;instance-id&gt;</code> | Specify an MSTP instance in the range 1-15.                                                                                                                                                           |
| <code>&lt;vid-list&gt;</code>    | Specify one or more VLAN identifiers (VID) to be associated with the MSTI specified. This can be a single VID in the range 1-4094, or a hyphen-separated range or a comma-separated list of VLAN IDs. |

**Mode** MST Configuration

**Usage notes** The VLANs must be created before being associated with an MST instance (MSTI). If the VLAN range is not specified, the MSTI will not be created.

This command removes the specified VLANs from the CIST and adds them to the specified MSTI. If you use the **no** variant of this command to remove the VLAN from the MSTI, it returns it to the CIST. To move a VLAN from one MSTI to another, you must first use the **no** variant of this command to return it to the CIST.

Ports in these VLANs will remain in the control of the CIST until you associate the ports with the MSTI using the **spanning-tree mst instance** command.

**Example** To associate VLAN 30 with MSTI 2, use the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mode mstp
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# instance 2 vlan 30
```

**Related commands**

- region (MSTP)**
- revision (MSTP)**
- show spanning-tree mst config**
- spanning-tree mst instance**

## region (MSTP)

**Overview** Use this command to assign a name to the device's MST Region. MST Instances (MSTI) of a region form different spanning trees for different VLANs.

Use this command for MSTP only.

Use the **no** variant of this command to remove this region name and reset it to the default.

**Syntax** `region <region-name>`  
`no region`

| Parameter                        | Description                                                                                                           |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <code>&lt;region-name&gt;</code> | Specify the name of the region, up to 32 characters. Valid characters are upper-case, lower-case, digits, underscore. |

**Default** By default, the region name is My Name.

**Mode** MST Configuration

**Usage** The region name, the revision number, and the digest of the VLAN to MSTI configuration table must be the same on all devices that are intended to be in the same MST region.

**Example**

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# region ATL
```

**Related commands** [revision \(MSTP\)](#)  
[show spanning-tree mst config](#)

## revision (MSTP)

**Overview** Use this command to specify the MST revision number to be used in the configuration identifier.

Use this command for MSTP only.

**Syntax** `revision <revision-number>`

| Parameter                            | Description                                   |
|--------------------------------------|-----------------------------------------------|
| <code>&lt;revision-number&gt;</code> | <code>&lt;0-65535&gt;</code> Revision number. |

**Default** The default of revision number is 0.

**Mode** MST Configuration

**Usage** The region name, the revision number, and the digest of the VLAN to MSTI configuration table must be the same on all devices that are intended to be in the same MST region.

**Example**

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# revision 25
```

**Related commands**

- [region \(MSTP\)](#)
- [show spanning-tree mst config](#)

# show debugging mstp

**Overview** Use this command to see what debugging is turned on for MSTP.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show debugging mstp

**Mode** User Exec and Privileged Exec

**Example** To display the MSTP debugging options set, enter the command:  
`awplus# show debugging mstp`

**Output** The following shows typical output.

## Example output from show debugging mstp

```
MSTP debugging status:
MSTP receiving packet debugging is on
```

**Related commands** [debug mstp \(RSTP and STP\)](#)

## show spanning-tree

**Overview** Use this command to display detailed spanning tree information on the specified port or on all ports. Use this command for RSTP, MSTP or STP.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show spanning-tree [interface *<port-list>*]

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| interface                | Display information about the following port only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <i>&lt;port-list&gt;</i> | The ports to display information about. A port-list can be: <ul style="list-style-type: none"><li>• a switch port (e.g. port1.0.6) a static channel group (e.g. sa2) or a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.0.1-1.0.4, or sa1-2, or po1-2</li><li>• a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.4-1.0.6. Do not mix switch ports, static channel groups, and dynamic (LACP) channel groups in the same list</li></ul> |

**Mode** User Exec and Privileged Exec

**Usage notes** Note that any list of interfaces specified must not span any interfaces that are not installed.

A topology change counter has been included for RSTP and MSTP. You can see the topology change counter for RSTP by using the **show spanning-tree** command. You can see the topology change counter for MSTP by using the **show spanning-tree mst instance** command.

**Example** To display spanning tree information about port1.0.3, use the command:  
awplus# show spanning-tree interface port1.0.3

**Output** The following shows typical output.

**Example output from show spanning-tree in RSTP mode**

```
awplus#show spanning-tree

# show spanning-tree brief

**Overview** Use this command to display a summary of spanning tree status information on all ports. Use this command for RSTP, MSTP or STP.

**Syntax** show spanning-tree brief

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| brief     | A brief summary of spanning tree information. |

**Mode** User Exec and Privileged Exec

**Usage notes** Note that any list of interfaces specified must not span any interfaces that are not installed.

A topology change counter has been included for RSTP and MSTP. You can see the topology change counter for RSTP by using the **show spanning-tree** command. You can see the topology change counter for MSTP by using the **show spanning-tree mst instance** command.

**Example** To display a summary of spanning tree status information, use the command:

```
awplus# show spanning-tree brief
```

**Output** The following shows typical output.

## Example output from show spanning-tree brief

```
Default: Bridge up - Spanning Tree Enabled
Default: Root Path Cost 40000 - Root Port 4501 - Bridge Priority 32768
Default: Root Id 8000:0000cd250001
Default: Bridge Id 8000:0000cd296eb1

Port          Designated Bridge  Port Id  Role          State

# show spanning-tree mst detail interface

**Overview** This command displays detailed information about the specified switch port, and the MST instances associated with it.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show spanning-tree mst detail interface *<port>*

| Parameter           | Description                                                                                                                                                             |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;port&gt;</i> | The port to display information about. The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2). |

**Mode** User Exec, Privileged Exec and Interface Configuration

**Example** To display detailed information about port1.0.3 and the instances associated with it, enter the command:

```
awplus# show spanning-tree mst detail interface port1.0.3
```

**Output** The following shows typical output.

**Example output from show spanning-tree mst detail interface**

# show spanning-tree mst instance

**Overview** This command displays detailed information for the specified instance, and all switch ports associated with that instance.

A topology change counter has been included for RSTP and MSTP. You can see the topology change counter for RSTP by using the **show spanning-tree** command. You can see the topology change counter for MSTP by using the **show spanning-tree mst instance** command.

For information on filtering and saving command output, see the **“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide**.

**Syntax** show spanning-tree mst instance <instance-id>

| Parameter     | Description                                 |
|---------------|---------------------------------------------|
| <instance-id> | Specify an MSTP instance in the range 1-15. |

**Mode** User Exec, Privileged Exec, and Interface Configuration

**Example** To display detailed information for **instance 2**, and all switch ports associated with that instance, use the command:

```
awplus# show spanning-tree mst instance 2
```

**Output** The following shows typical output.

## Example output from show spanning-tree mst instance

```
% 1: MSTI Root Path Cost 0 - MSTI Root Port 0 - MSTI Bridge Priority 32768
% 1: MSTI Root Id 80020000cd24ff2d
% 1: MSTI Bridge Id 80020000cd24ff2d
% port1.0.2: Port 5002 - Id 838a - Role Disabled - State Discarding
% port1.0.2: Designated Internal Path Cost 0 - Designated Port Id 838a
% port1.0.2: Configured Internal Path Cost 20000000

% port1.0.2: Hello Time 2 - Forward Delay 15
% port1.0.2: Forward Timer 0 - Msg Age Timer 0 - Hello Timer 0
%
```

# show spanning-tree mst instance interface

**Overview** This command displays detailed information for the specified MST (Multiple Spanning Tree) instance, and the specified switch port associated with that MST instance.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show spanning-tree mst instance *<instance-id>* interface *<port>*

| Parameter                  | Description                                                                                                                                                             |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;instance-id&gt;</i> | Specify an MSTP instance in the range 1-15.                                                                                                                             |
| <i>&lt;port&gt;</i>        | The port to display information about. The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2). |

**Mode** User Exec, Privileged Exec, and Interface Configuration

**Example** To display detailed information for instance 2, interface port1.0.2, use the command:

```
awplus# show spanning-tree mst instance 2 interface port1.0.2
```

**Output** The following shows typical output.

## Example output from show spanning-tree mst instance

```
% 1: MSTI Root Path Cost 0 - MSTI Root Port 0 - MSTI Bridge Priority 32768
% 1: MSTI Root Id 80020000cd24ff2d
% 1: MSTI Bridge Id 80020000cd24ff2d

# show spanning-tree mst interface

**Overview** This command displays the number of instances created, and VLANs associated with it for the specified switch port.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show spanning-tree mst interface <port>

| Parameter | Description                                                                                                                                                             |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <port>    | The port to display information about. The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2). |

**Mode** User Exec, Privileged Exec, and Interface Configuration

**Example** To display detailed information about each instance, and all interfaces associated with them, for port1.0.4, use the command:

```
awplus# show spanning-tree mst interface port1.0.4
```

**Output** The following shows typical output.

## Example output from show spanning-tree mst interface

```
% 1: Bridge up - Spanning Tree Enabled
% 1: CIST Root Path Cost 0 - CIST Root Port 0 - CIST Bridge Priority 32768
% 1: Forward Delay 15 - Hello Time 2 - Max Age 20 - Max-hops 20
% 1: CIST Root Id 80000008c73a2b22
% 1: CIST Reg Root Id 80000008c73a2b22
% 1: CST Bridge Id 80000008c73a2b22
% 1: portfast bpdu-filter disabled
% 1: portfast bpdu-guard disabled
% 1: portfast errdisable timeout disabled
% 1: portfast errdisable timeout interval 1 sec
%
% Instance      VLAN
% 0:            1
% 1:            2-3
% 2:            4-5
```

# show spanning-tree statistics

**Overview** This command displays BPDU (Bridge Protocol Data Unit) statistics for all spanning-tree instances, and all switch ports associated with all spanning-tree instances.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show spanning-tree statistics

**Mode** Privileged Exec

**Usage notes** To display BPDU statistics for all spanning-tree instances, and all switch ports associated with all spanning-tree instances, use the command:

```
awplus# show spanning-tree statistics
```

**Output** The following shows typical output.

**Example output from show spanning-tree statistics**

```
Port number = 915 Interface = port1.0.6

**Related** [show spanning-tree statistics](#)  
**commands**

# show spanning-tree vlan range-index

**Overview** Use this command to display information about MST (Multiple Spanning Tree) instances and the VLANs associated with them including the VLAN range-index value for the device.

**Syntax** show spanning-tree vlan range-index

**Mode** Privileged Exec

**Example** To display information about MST instances and the VLANs associated with them for the device, including the VLAN range-index value, use the following command:

```
awplus# show spanning-tree vlan range-index
```

**Output** The following shows typical output.

## Example output from show spanning-tree vlan range-index

```
awplus#show spanning-tree vlan range-index
% MST Instance  VLAN      RangeIdx
%      1         1         1%
```

**Related commands** [show spanning-tree statistics](#)

# spanning-tree autoedge (RSTP and MSTP)

**Overview** Use this command to enable the autoedge feature on the port.

The autoedge feature allows the port to automatically detect that it is an edge port. If it does not receive any BPDUs in the first three seconds after linkup, enabling, or entering RSTP or MSTP mode, it sets itself to be an edgeport and enters the forwarding state.

Use this command for RSTP or MSTP.

Use the **no** variant of this command to disable this feature.

**Syntax** spanning-tree autoedge  
no spanning-tree autoedge

**Default** Disabled

**Mode** Interface Configuration

**Example** awplus# configure terminal  
awplus(config)# interface port1.0.3  
awplus(config-if)# spanning-tree autoedge

**Related commands** [spanning-tree edgeport \(RSTP and MSTP\)](#)

## spanning-tree bpdudata-bbox="142 171 890 220"> **Overview** Use this command to configure BPDU (Bridge Protocol Data Unit) discarding or forwarding, when STP is disabled on the switch. This may be needed for correct STP operation in complex networks.

There is no **no** variant for this command. Instead, apply the **discard** parameter to reset it back to the default then re-enable STP with the command **spanning-tree enable**.

**Syntax** spanning-tree bpdudata-bbox="241 328 871 623">

| Parameter                               | Description                                                                                                    |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------|
| bpdudata-bbox="378 438 791 454">discard | Discards all ingress STP BPDU frames.                                                                          |
| forward                                 | Forwards any ingress STP BPDU packets to all ports, regardless of any VLAN membership.                         |
| forward-untagged-vlan                   | Forwards any ingress STP BPDU frames to all ports that are untagged members of the ingress port's native VLAN. |
| forward-vlan                            | Forwards any ingress STP BPDU frames to all ports that are tagged members of the ingress port's native VLAN.   |

**Default** The discard parameter is enabled by default.

**Mode** Global Configuration

**Usage notes** This command enables the switch to forward unsupported BPDUs with an unsupported Spanning Tree Protocol, such as proprietary STP protocols with unsupported BPDUs, by forwarding BPDU (Bridge Protocol Data Unit) frames unchanged through the switch.

You must disable RSTP with the **no spanning-tree rstp enable** command before you can use this command.

When you want to revert to default behavior on the switch, issue a **spanning-tree bpdudata-bbox="100 939 223 953">C613-50741-01 Rev A**

**Examples** To enable STP BPDU discard in Global Configuration mode with STP disabled, which discards all ingress STP BPDU frames, enter the commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree rstp enable
awplus(config)# spanning-tree bpdu discard
```

To enable STP BPDU forward in Global Configuration mode with STP disabled, which forwards any ingress STP BPDU frames to all ports regardless of any VLAN membership, enter the commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree rstp enable
awplus(config)# spanning-tree bpdu forward
```

To enable STP BPDU forwarding for untagged frames in Global Configuration mode with STP disabled, which forwards any ingress STP BPDU frames to all ports that are untagged members of the ingress port's native VLAN, enter the commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree rstp enable
awplus(config)# spanning-tree bpdu forward-untagged-vlan
```

To enable STP BPDU forwarding for tagged frames in Global Configuration mode with STP disabled, which forwards any ingress STP BPDU frames to all ports that are tagged members of the ingress port's native VLAN, enter the commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree rstp enable
awplus(config)# spanning-tree bpdu forward-vlan
```

To reset STP BPDU back to the default discard parameter and re-enable RSTP on the switch, enter the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree bpdu discard
awplus(config)# spanning-tree rstp enable
```

**Related commands** [show spanning-tree](#)  
[spanning-tree enable](#)

# spanning-tree cisco-interoperability (MSTP)

**Overview** Use this command to enable/disable Cisco-interoperability for MSTP.  
Use this command for MSTP only.

**Syntax** spanning-tree cisco-interoperability {enable|disable}

| Parameter | Description                              |
|-----------|------------------------------------------|
| enable    | Enable Cisco interoperability for MSTP.  |
| disable   | Disable Cisco interoperability for MSTP. |

**Default** If this command is not used, Cisco interoperability is disabled.

**Mode** Global Configuration

**Usage** For compatibility with certain Cisco devices, all devices in the switched LAN running the AlliedWare Plus™ Operating System must have Cisco-interoperability enabled. When the AlliedWare Plus Operating System is interoperating with Cisco, the only criteria used to classify a region are the region name and revision level. VLAN to instance mapping is not used to classify regions when interoperating with Cisco.

**Examples** To enable Cisco interoperability on a Layer 2 device:

```
awplus# configure terminal
awplus(config)# spanning-tree cisco-interoperability enable
```

To disable Cisco interoperability on a Layer 2 device:

```
awplus# configure terminal
awplus(config)# spanning-tree cisco-interoperability disable
```

# spanning-tree edgeport (RSTP and MSTP)

**Overview** Use this command to set a port as an edge-port.

Use this command for RSTP or MSTP.

This command has the same effect as the **spanning-tree portfast (STP)** command, but the configuration displays differently in the output of some show commands.

Use the **no** variant of this command to set a port to its default state (not an edge-port).

**Syntax** spanning-tree edgeport  
no spanning-tree edgeport

**Default** Not an edge port.

**Mode** Interface Configuration

**Usage notes** Use this command on a switch port connected to a LAN that has no other bridges attached. If a BPDU is received on the port that indicates that another bridge is connected to the LAN, then the port is no longer treated as an edge port.

**Example** awplus# configure terminal  
awplus(config)# interface port1.0.2  
awplus(config-if)# spanning-tree edgeport

**Related commands** **spanning-tree autoedge (RSTP and MSTP)**

## spanning-tree enable

**Overview** Use this command in Global Configuration mode to enable the specified spanning tree protocol for all switch ports. Note that this must be the spanning tree protocol that is configured on the device by the **spanning-tree mode** command.

Use the **no** variant of this command to disable the configured spanning tree protocol. This places all switch ports in the forwarding state.

**Syntax** `spanning-tree {mstp|rstp|stp} enable`  
`no spanning-tree {mstp|rstp|stp} enable`

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| mstp      | Enables or disables MSTP (Multiple Spanning Tree Protocol). |
| rstp      | Enables or disables RSTP (Rapid Spanning Tree Protocol).    |
| stp       | Enables or disables STP (Spanning Tree Protocol).           |

**Default** RSTP is enabled by default for all switch ports.

**Mode** Global Configuration

**Usage** With no configuration, spanning tree is enabled, and the spanning tree mode is set to RSTP. To change the mode, see **spanning-tree mode**.

**Examples** To enable STP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree stp enable
```

To disable STP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree stp enable
```

To enable MSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mstp enable
```

To disable MSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree mstp enable
```

To enable RSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree rstp enable
```

To disable RSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree rstp enable
```

**Related commands** [spanning-tree bpdu](#)  
[spanning-tree mode](#)

# spanning-tree errdisable-timeout enable

**Overview** Use this command to enable the errdisable-timeout facility, which sets a timeout for ports that are disabled due to the BPDU guard feature.

Use this command for RSTP or MSTP.

Use the **no** variant of this command to disable the errdisable-timeout facility.

**Syntax** spanning-tree errdisable-timeout enable  
no spanning-tree errdisable-timeout enable

**Default** By default, the errdisable-timeout is disabled.

**Mode** Global Configuration

**Usage** The BPDU guard feature shuts down the port on receiving a BPDU on a BPDU-guard enabled port. This command associates a timer with the feature such that the port is re-enabled without manual intervention after a set interval. This interval can be configured by the user using the **spanning-tree errdisable-timeout interval** command.

**Example** awplus# configure terminal  
awplus(config)# spanning-tree errdisable-timeout enable

**Related commands** **show spanning-tree**  
**spanning-tree errdisable-timeout interval**  
**spanning-tree portfast bpdu-guard**

# spanning-tree errdisable-timeout interval

**Overview** Use this command to specify the time interval after which a port is brought back up when it has been disabled by the BPDU guard feature.

Use this command for RSTP or MSTP.

**Syntax** spanning-tree errdisable-timeout interval <10-1000000>  
no spanning-tree errdisable-timeout interval

| Parameter    | Description                                         |
|--------------|-----------------------------------------------------|
| <10-1000000> | Specify the errdisable-timeout interval in seconds. |

**Default** By default, the port is re-enabled after 300 seconds.

**Mode** Global Configuration

**Example** awplus# configure terminal  
awplus(config)# spanning-tree errdisable-timeout interval 34

**Related commands** [show spanning-tree](#)  
[spanning-tree errdisable-timeout enable](#)  
[spanning-tree portfast bpdu-guard](#)

# spanning-tree force-version

**Overview** Use this command in Interface Configuration mode for a switch port interface only to force the protocol version for the switch port. Use this command for RSTP or MSTP only.

**Syntax** spanning-tree force-version <version>  
no spanning-tree force-version

| Parameter | Description                                                                                                                                                                            |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <version> | <0-3> Version identifier.                                                                                                                                                              |
| 0         | Forces the port to operate in STP mode.                                                                                                                                                |
| 1         | Not supported.                                                                                                                                                                         |
| 2         | Forces the port to operate in RSTP mode. If it receives STP BPDUs, it can automatically revert to STP mode.                                                                            |
| 3         | Forces the port to operate in MSTP mode (this option is only available if MSTP mode is configured). If it receives RSTP or STP BPDUs, it can automatically revert to RSTP or STP mode. |

**Default** By default, no version is forced for the port. The port is in the spanning tree mode configured for the device, or a lower version if it automatically detects one.

**Mode** Interface Configuration mode for a switch port interface only.

**Examples** Set the value to enforce the spanning tree protocol (STP):

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree force-version 0
```

Set the default protocol version:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree force-version
```

**Related commands** [show spanning-tree](#)

## spanning-tree forward-time

**Overview** Use this command to set the forward delay value. Use the **no** variant of this command to reset the forward delay value to the default setting of 15 seconds.

The **forward delay** sets the time (in seconds) to control how fast a port changes its spanning tree state when moving towards the forwarding state. If the mode is set to STP, the value determines how long the port stays in each of the listening and learning states which precede the forwarding state. If the mode is set to RSTP or MSTP, this value determines the maximum time taken to transition from discarding to learning and from learning to forwarding.

This value is used only when the device is acting as the root bridge. Devices not acting as the Root Bridge use a dynamic value for the **forward delay** set by the root bridge. The **forward delay**, **max-age**, and **hello time** parameters are interrelated.

**Syntax** spanning-tree forward-time <forward-delay>  
no spanning-tree forward-time

| Parameter       | Description                                  |
|-----------------|----------------------------------------------|
| <forward-delay> | <4-30> The forwarding time delay in seconds. |

**Default** The default is 15 seconds.

**Mode** Global Configuration

**Usage notes** The allowable range for forward-time is 4-30 seconds.

The **forward delay**, **max-age**, and **hello time** parameters should be set according to the following formula, as specified in IEEE Standard 802.1d:

$2 \times (\text{forward delay} - 1.0 \text{ seconds}) \geq \text{max-age}$

$\text{max-age} \geq 2 \times (\text{hello time} + 1.0 \text{ seconds})$

**Example** awplus# configure terminal  
awplus(config)# spanning-tree forward-time 6

**Related commands** **show spanning-tree**  
**spanning-tree forward-time**  
**spanning-tree hello-time**  
**spanning-tree mode**

## spanning-tree guard root

**Overview** Use this command in Interface Configuration mode for a switch port only to enable the Root Guard feature for the switch port. The root guard feature disables reception of superior BPDUs. You can use this command for RSTP, STP or MSTP.

Use the **no** variant of this command to disable the root guard feature for the port.

**Syntax** spanning-tree guard root  
no spanning-tree guard root

**Mode** Interface Configuration mode for a switch port interface only.

**Usage notes** The Root Guard feature makes sure that the port on which it is enabled is a designated port. If the Root Guard enabled port receives a superior BPDU, it goes to a Listening state (for STP) or discarding state (for RSTP and MSTP).

**Example** awplus# configure terminal  
awplus(config)# interface port1.0.2  
awplus(config-if)# spanning-tree guard root

# spanning-tree hello-time

**Overview** Use this command to set the hello-time. This sets the time in seconds between the transmission of device spanning tree configuration information when the device is the Root Bridge of the spanning tree or is trying to become the Root Bridge.

Use this command for RSTP, STP or MSTP.

Use the **no** variant of this command to restore the default of the hello time.

**Syntax** spanning-tree hello-time *<hello-time>*  
no spanning-tree hello-time

| Parameter                 | Description                                |
|---------------------------|--------------------------------------------|
| <i>&lt;hello-time&gt;</i> | <1-10> The hello BPDU interval in seconds. |

**Default** Default is 2 seconds.

**Mode** Global Configuration and Interface Configuration for switch ports.

**Usage notes** The allowable range of values is 1-10 seconds.  
The forward delay, max-age, and hello time parameters should be set according to the following formula, as specified in IEEE Standard 802.1d:

$2 \times (\text{forward delay} - 1.0 \text{ seconds}) \geq \text{max-age}$

$\text{max-age} \geq 2 \times (\text{hello time} + 1.0 \text{ seconds})$

**Example** awplus# configure terminal  
awplus(config)# spanning-tree hello-time 3

**Related commands** [spanning-tree forward-time](#)  
[spanning-tree max-age](#)  
[show spanning-tree](#)

## spanning-tree link-type

**Overview** Use this command in Interface Configuration mode for a switch port interface only to enable or disable point-to-point or shared link types on the switch port.

Use this command for RSTP or MSTP only.

Use the **no** variant of this command to return the port to the default link type.

**Syntax** spanning-tree link-type {point-to-point|shared}  
no spanning-tree link-type

| Parameter      | Description               |
|----------------|---------------------------|
| shared         | Disable rapid transition. |
| point-to-point | Enable rapid transition.  |

**Default** The default link type is point-to-point.

**Mode** Interface Configuration mode for a switch port interface only.

**Usage notes** You may want to set link type to shared if the port is connected to a hub with multiple devices connected to it.

**Examples** awplus# configure terminal  
awplus(config)# interface port1.0.2  
awplus(config-if)# spanning-tree link-type point-to-point

# spanning-tree max-age

**Overview** Use this command to set the max-age. This sets the maximum age, in seconds, that dynamic spanning tree configuration information is stored in the device before it is discarded.

Use this command for RSTP, STP or MSTP.

Use the **no** variant of this command to restore the default of max-age.

**Syntax** spanning-tree max-age <max-age>  
no spanning-tree max-age

| Parameter | Description                          |
|-----------|--------------------------------------|
| <max-age> | <6-40> The maximum time, in seconds. |

**Default** The default of spanning-tree max-age is 20 seconds.

**Mode** Global Configuration

**Usage** Max-age is the maximum time in seconds for which a message is considered valid.

Configure this value sufficiently high, so that a frame generated by the root bridge can be propagated to the leaf nodes without exceeding the max-age.

The **forward delay**, **max-age**, and **hello time** parameters should be set according to the following formula, as specified in IEEE Standard 802.1d:

$2 \times (\text{forward delay} - 1.0 \text{ seconds}) \geq \text{max-age}$

$\text{max-age} \geq 2 \times (\text{hello time} + 1.0 \text{ seconds})$

**Example** awplus# configure terminal  
awplus(config)# spanning-tree max-age 12

**Related commands** [show spanning-tree](#)  
[spanning-tree forward-time](#)  
[spanning-tree hello-time](#)

## spanning-tree max-hops (MSTP)

**Overview** Use this command to specify the maximum allowed hops for a BPDU in an MST region. This parameter is used by all the instances of the MST region.

Use the **no** variant of this command to restore the default.

Use this command for MSTP only.

**Syntax** spanning-tree max-hops *<hop-count>*  
no spanning-tree max-hops *<hop-count>*

| Parameter                | Description                                                              |
|--------------------------|--------------------------------------------------------------------------|
| <i>&lt;hop-count&gt;</i> | Specify the maximum hops the BPDU will be valid for in the range <1-40>. |

**Default** The default max-hops in a MST region is 20.

**Mode** Global Configuration

**Usage** Specifying the max hops for a BPDU prevents the messages from looping indefinitely in the network. The hop count is decremented by each receiving port. When a device receives an MST BPDU that has a hop count of zero, it discards the BPDU.

**Examples** awplus# configure terminal  
awplus(config)# spanning-tree max-hops 25  
awplus# configure terminal  
awplus(config)# no spanning-tree max-hops

## spanning-tree mode

**Overview** Use this command to change the spanning tree protocol mode on the device. The spanning tree protocol mode on the device can be configured to either STP, RSTP or MSTP.

**Syntax** spanning-tree mode {stp|rstp|mstp}

**Default** The default spanning tree protocol mode on the device is RSTP.

**Mode** Global Configuration

**Usage** With no configuration, the device will have spanning tree enabled, and the spanning tree mode will be set to RSTP. Use this command to change the spanning tree protocol mode on the device. MSTP is VLAN aware, but RSTP and STP are not VLAN aware. To enable or disable spanning tree operation, see the [spanning-tree enable](#).

**Examples** To change the spanning tree mode from the default of RSTP to MSTP, use the following commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mode mstp
```

**Related commands** [spanning-tree enable](#)

# spanning-tree mst configuration

**Overview** Use this command to enter the MST Configuration mode to configure the Multiple Spanning-Tree Protocol.

**Syntax** spanning-tree mst configuration

**Mode** Global Configuration

**Examples** The following example uses this command to enter MST Configuration mode. Note the change in the command prompt.

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)#
```

## spanning-tree mst instance

**Overview** Use this command to assign a Multiple Spanning Tree instance (MSTI) to a switch port or channel group.

Note that ports are automatically configured to send and receive spanning-tree information for the associated MSTI when VLANs are assigned to MSTIs using the **instance vlan (MSTP)** command.

Use the **no** variant of this command in Interface Configuration mode to remove the MSTI from the specified switch port or channel group.

**Syntax** `spanning-tree mst instance <instance-id>`  
`no spanning-tree mst instance <instance-id>`

| Parameter                        | Description                                                                                                                                |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;instance-id&gt;</code> | Specify an MSTP instance in the range 1-15. The MST instance must have already been created using the <b>instance vlan (MSTP)</b> command. |

**Default** A port automatically becomes a member of an MSTI when it is assigned to a VLAN.

**Mode** Interface Configuration mode for a switch port or channel group.

**Usage notes** You can disable automatic configuration of member ports of a VLAN to an associated MSTI by using a **no spanning-tree mst instance** command to remove the member port from the MSTI. Use the **spanning-tree mst instance** command to add a VLAN member port back to the MSTI.

**Examples** To assign instance 3 to a switch port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3
```

To remove instance 3 from a switch port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3
```

**Related commands** **instance vlan (MSTP)**  
**spanning-tree mst instance path-cost**  
**spanning-tree mst instance priority**  
**spanning-tree mst instance restricted-role**  
**spanning-tree mst instance restricted-tcn**

# spanning-tree mst instance path-cost

**Overview** Use this command to set the cost of a path associated with a switch port, for the specified MSTI.

This specifies the switch port's contribution to the cost of a path to the MSTI regional root via that port. This applies when the port is the root port for the MSTI.

Use the **no** variant of this command to restore the default cost value of the path.

**Syntax** `spanning-tree mst instance <instance-id> path-cost <path-cost>`  
`no spanning-tree mst instance <instance-id> path-cost`

| Parameter                        | Description                                                                                                                                                |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;instance-id&gt;</code> | Specify an MSTP instance in the range 1-15.                                                                                                                |
| <code>&lt;path-cost&gt;</code>   | Specify the cost of path in the range of <1-2000000000>, where a lower path-cost indicates a greater likelihood of the specific interface becoming a root. |

**Default** The default path cost values and the range of recommended path cost values depend on the port speed, as shown in the following table from the IEEE 802.1q-2003 standard.

| Port speed         | Default path cost | Recommended path cost range |
|--------------------|-------------------|-----------------------------|
| Less than 100 Kb/s | 200,000,000       | 20,000,000-200,000,000      |
| 1Mbps              | 20,000,000        | 2,000,000-20,000,000        |
| 10Mbps             | 2,000,000         | 200,000-2,000,000           |
| 100 Mbps           | 200,000           | 20,000-200,000              |
| 1 Gbps             | 20,000            | 2,000-20,000                |
| 10 Gbps            | 2,000             | 200-2,000                   |
| 100 Gbps           | 200               | 20-200                      |
| 1Tbps              | 20                | 2-200                       |
| 10 Tbps            | 2                 | 2-20                        |

**Mode** Interface Configuration mode for a switch port interface only.

**Usage notes** Before you can use this command to set a path-cost in a VLAN configuration, you must explicitly add an MST instance to a port using the **spanning-tree mst instance** command.

**Examples** To set a path cost of 1000 on instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3 path-cost 1000
```

To return the path cost to its default value on instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3 path-cost
```

**Related commands**

# spanning-tree mst instance priority

**Overview** Use this command in Interface Configuration mode for a switch port interface only to set the port priority for an MST instance (MSTI).  
Use the **no** variant of this command to restore the default priority value (128).

**Syntax** spanning-tree mst instance *<instance-id>* priority *<priority>*  
no spanning-tree mst instance *<instance-id>* [priority]

| Parameter                  | Description                                                                                                                                     |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;instance-id&gt;</i> | Specify an MSTP instance in the range 1-15.                                                                                                     |
| <i>&lt;priority&gt;</i>    | This must be a multiple of 16 and within the range <0 - 240>. A lower priority indicates greater likelihood of the port becoming the root port. |

**Default** The default is 128.

**Mode** Interface Configuration mode for a switch port interface.

**Usage notes** This command sets the value of the priority field contained in the port identifier. The MST algorithm uses the port priority when determining the root port for the switch in the MSTI. The port with the lowest value has the highest priority, so it will be chosen as root port over a port that is equivalent in all other aspects but with a higher priority value.

**Examples** To set the priority to 112 on instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3 priority 112
```

To return the priority to its default value of 128 on instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3 priority
```

**Related commands** **instance vlan (MSTP)**  
**spanning-tree priority (port priority)**  
**spanning-tree mst instance**  
**spanning-tree mst instance path-cost**  
**spanning-tree mst instance restricted-role**  
**spanning-tree mst instance restricted-tcn**

# spanning-tree mst instance restricted-role

**Overview** Use this command in Interface Configuration mode for a switch port interface only to enable the restricted role for an MSTI (Multiple Spanning Tree Instance) on a switch port. Configuring the restricted role for an MSTI on a switch port prevents the switch port from becoming the root port in a spanning tree topology.

Use the **no** variant of this command to disable the restricted role for an MSTI on a switch port. Removing the restricted role for an MSTI on a switch port allows the switch port to become the root port in a spanning tree topology.

**Syntax** spanning-tree mst instance *<instance-id>* restricted-role  
no spanning-tree mst instance *<instance-id>* restricted-role

| Parameter                  | Description                                                                                                                                |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;instance-id&gt;</i> | Specify an MSTP instance in the range 1-15. The MST instance must have already been created using the <b>instance vlan (MSTP)</b> command. |

**Default** The restricted role for an MSTI instance on a switch port is disabled by default.

**Mode** Interface Configuration mode for a switch port interface only.

**Usage notes** The root port is the port providing the best path from the bridge to the root bridge. Use this command to disable a port from becoming a root port. Use the **no** variant of this command to enable a port to become a root port. See the **STP Feature Overview and Configuration Guide** for root port information.

**Examples** To prevent a switch port from becoming the root port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3 restricted-role
```

To stop preventing the switch port from becoming the root port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3 restricted-role
```

**Related commands** **instance vlan (MSTP)**  
**spanning-tree priority (port priority)**  
**spanning-tree mst instance**  
**spanning-tree mst instance path-cost**  
**spanning-tree mst instance restricted-tcn**

# spanning-tree mst instance restricted-tcn

**Overview** Use this command to prevent a switch port from propagating received topology change notifications and topology changes to other switch ports. This is named restricted TCN (Topology Change Notification). A TCN is a simple Bridge Protocol Data Unit (BPDU) that a bridge sends out to its root port to signal a topology change.

Use the **no** variant of this command to stop preventing the switch port from propagating received topology change notifications and topology changes to other switch ports for the specified MSTI (Multiple Spanning Tree Instance).

The restricted TCN setting applies only to the specified MSTI (Multiple Spanning Tree Instance).

**Syntax** spanning-tree mst instance *<instance-id>* restricted-tcn  
no spanning-tree mst instance *<instance-id>* restricted-tcn

| Parameter                  | Description                                                                                                                                |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;instance-id&gt;</i> | Specify an MSTP instance in the range 1-15. The MST instance must have already been created using the <b>instance vlan (MSTP)</b> command. |

**Default** Disabled. By default, switch ports propagate TCNs.

**Mode** Interface Configuration mode for a switch port interface only.

**Examples** To prevent a switch port from propagating received topology change notifications and topology changes to other switch ports, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3 restricted-tcn
```

To stop preventing a switch port from propagating received topology change notifications and topology changes to other switch ports, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3 restricted-tcn
```

**Related commands**

- instance vlan (MSTP)**

- spanning-tree mst instance**
- spanning-tree mst instance path-cost**
- spanning-tree mst instance restricted-role**

## spanning-tree path-cost

**Overview** Use this command in Interface Configuration mode for a switch port interface only to set the cost of a path for the specified port. This value then combines with others along the path to the root bridge in order to determine the total cost path value from the particular port, to the root bridge. The lower the numeric value, the higher the priority of the path. This applies when the port is the root port.

Use this command for RSTP, STP or MSTP. When MSTP mode is configured, this will apply to the port's path cost for the CIST.

**Syntax** spanning-tree path-cost *<pathcost>*  
no spanning-tree path-cost

| Parameter               | Description                                        |
|-------------------------|----------------------------------------------------|
| <i>&lt;pathcost&gt;</i> | <1-200000000> The cost to be assigned to the port. |

**Default** The default path cost values and the range of recommended path cost values depend on the port speed, as shown in the following table from the IEEE 802.1q-2003 and IEEE 802.1d-2004 standards.

| Port speed         | Default path cost | Recommended path cost range |
|--------------------|-------------------|-----------------------------|
| Less than 100 Kb/s | 200,000,000       | 20,000,000-200,000,000      |
| 1Mbps              | 20,000,000        | 2,000,000-20,000,000        |
| 10Mbps             | 2,000,000         | 200,000-2,000,000           |
| 100 Mbps           | 200,000           | 20,000-200,000              |
| 1 Gbps             | 20,000            | 2,000-20,000                |
| 10 Gbps            | 2,000             | 200-2, 000                  |
| 100 Gbps           | 200               | 20-200                      |
| 1Tbps              | 20                | 2-200                       |
| 10 Tbps            | 2                 | 2-20                        |

**Mode** Interface Configuration mode for switch port interface only.

**Example** awplus# configure terminal  
awplus(config)# interface port1.0.2  
awplus(config-if)# spanning-tree path-cost 123

## spanning-tree portfast (STP)

**Overview** Use this command in Interface Configuration mode for a switch port interface only to set a port as an edge-port. The portfast feature enables a port to rapidly move to the forwarding state, without having first to pass through the intermediate spanning tree states. This command has the same effect as the **spanning-tree edgeport (RSTP and MSTP)** command, but the configuration displays differently in the output of some show commands.

**NOTE:** You can run either of two additional parameters with this command. To simplify the syntax these are documented as separate commands. See the following additional portfast commands:

- **spanning-tree portfast bpdu-filter**
- **spanning-tree portfast bpdu-guard.**

You can obtain the same effect by running the **spanning-tree edgeport (RSTP and MSTP)** command. However, the configuration output may display differently in some show commands.

Use the **no** variant of this command to set a port to its default state (not an edge-port).

**Syntax** spanning-tree portfast  
no spanning-tree portfast

**Default** Not an edge port.

**Mode** Interface Configuration mode for a switch port interface only.

**Usage notes** Portfast makes a port move from a blocking state to a forwarding state, bypassing both listening and learning states. The portfast feature is meant to be used for ports connected to end-user devices. Enabling portfast on ports that are connected to a workstation or server allows devices to connect to the network without waiting for spanning-tree to converge.

For example, you may need hosts to receive a DHCP address quickly and waiting for STP to converge would cause the DHCP request to time out. Ensure you do not use portfast on any ports connected to another device to avoid creating a spanning-tree loop on the network.

Use this command on a switch port that connects to a LAN with no other bridges attached. An edge port should never receive BPDUs. Therefore if an edge port receives a BPDU, the portfast feature takes one of three actions.

- Cease to act as an edge port and pass BPDUs as a member of a spanning tree network (**spanning-tree portfast (STP)** command disabled).
- Filter out the BPDUs and pass only the data and continue to act as a edge port (**spanning-tree portfast bpdu-filter** command enabled).
- Block the port to all BPDUs and data (**spanning-tree portfast bpdu-guard** command enabled).

**Example**

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree portfast
```

**Related commands** **spanning-tree edgeport (RSTP and MSTP)**  
**show spanning-tree**  
**spanning-tree portfast bpdu-filter**  
**spanning-tree portfast bpdu-guard**

## spanning-tree portfast bpdu-filter

**Overview** This command sets the bpdu-filter feature and applies a filter to any BPDUs (Bridge Protocol Data Units) received. Enabling this feature ensures that configured ports will not transmit any BPDUs and will ignore (filter out) any BPDUs received. BPDU Filter is not enabled on a port by default.

Using the **no** variant of this command to turn off the bpdu-filter, but retain the port's status as an enabled port. If the port then receives a BPDU it will change its role from an **edge-port** to a **non edge-port**.

**Syntax (Global Configuration)** spanning-tree portfast bpdu-filter  
no spanning-tree portfast bpdu-filter

**Syntax (Interface Configuration)** spanning-tree portfast bpdu-filter {default|disable|enable}  
no spanning-tree portfast bpdu-filter

| Parameter   | Description                                                                                                                                                                               |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bpdu-filter | A port that has bpdu-filter enabled will not transmit any BPDUs and will ignore any BPDUs received. This port type has one of the following parameters (in Interface Configuration mode): |
| default     | Takes the setting that has been configured for the whole device, i.e. the setting made from the Global configuration mode.                                                                |
| disable     | Turns off BPDU filter.                                                                                                                                                                    |
| enable      | Turns on BPDU filter.                                                                                                                                                                     |

**Default** BPDU Filter is not enabled on any ports by default.

**Mode** Global Configuration and Interface Configuration

**Usage notes** This command filters the BPDUs and passes only data to continue to act as an edge port. Using this command in Global Configuration mode applies the portfast bpdu-filter feature to all ports on the device. Using it in Interface mode applies the feature to a specific port, or range of ports. The command will operate in both RSTP and MSTP networks.

Use the **show spanning-tree** command to display status of the bpdu-filter parameter for the switch ports.

**Example** To enable STP BPDU filtering in Global Configuration mode, enter the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree portfast bpdu-filter
```

To enable STP BPDU filtering in Interface Configuration mode, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree portfast bpdu-filter enable
```

**Related commands**

- spanning-tree edgeport (RSTP and MSTP)**
- show spanning-tree**
- spanning-tree portfast (STP)**
- spanning-tree portfast bpdu-guard**

## spanning-tree portfast bpdu-guard

**Overview** This command applies a BPDU (Bridge Protocol Data Unit) guard to the port. A port with the bpdu-guard feature enabled will block all traffic (BPDUs and user data), if it starts receiving BPDUs.

Use this command in Global Configuration mode to apply BPDU guard to all ports on the device. Use this command in Interface mode for an individual interface or a range of interfaces specified. BPDU Guard is not enabled on a port by default.

Use the **no** variant of this command to disable the BPDU Guard feature on a device in Global Configuration mode or to disable the BPDU Guard feature on a port in Interface mode.

**Syntax (Global Configuration)** spanning-tree portfast bpdu-guard  
no spanning-tree portfast bpdu-guard

**Syntax (Interface Configuration)** spanning-tree portfast bpdu-guard {default|disable|enable}  
no spanning-tree portfast bpdu-guard

| Parameter  | Description                                                                                                                                                                         |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bpdu-guard | A port that has bpdu-guard turned on will enter the STP blocking state if it receives a BPDU. This port type has one of the following parameters (in Interface Configuration mode): |
| default    | Takes the setting that has been configured for the whole device, i.e. the setting made from the Global configuration mode.                                                          |
| disable    | Turns off BPDU guard.                                                                                                                                                               |
| enable     | Turns on BPDU guard and will also set the port as an edge port.                                                                                                                     |

**Default** BPDU Guard is not enabled on any ports by default.

**Mode** Global Configuration or Interface Configuration

**Usage notes** This command blocks the port(s) to all devices and data when enabled. BPDU Guard is a port-security feature that changes how a portfast-enabled port behaves if it receives a BPDU. When **bpdu-guard** is set, then the port shuts down if it receives a BPDU. It does not process the BPDU as it is considered suspicious. When **bpdu-guard** is not set, then the port will negotiate spanning-tree with the device sending the BPDUs. By default, **bpdu-guard** is not enabled on a port.

You can configure a port disabled by the **bpdu-guard** to re-enable itself after a specific time interval. This interval is set with the **spanning-tree errdisable-timeout interval**. If you do not use the **errdisable-timeout** feature, then you will need to manually re-enable the port by using the **no shutdown** command.

Use the **show spanning-tree** to display the device and port configurations for the BPDU Guard feature. It shows both the administratively configured and currently running values of **bpdu-guard**.

**Example** To enable STP BPDU guard in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree portfast bpdu-guard
```

To enable STP BPDU guard in Interface Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree portfast bpdu-guard enable
```

**Related commands** **spanning-tree edgeport (RSTP and MSTP)**  
**show spanning-tree**  
**spanning-tree portfast (STP)**  
**spanning-tree portfast bpdu-filter**

# spanning-tree priority (bridge priority)

**Overview** Use this command to set the bridge priority for the device. A lower priority value indicates a greater likelihood of the device becoming the root bridge.

Use this command for RSTP, STP or MSTP. When MSTP mode is configured, this will apply to the CIST.

Use the **no** variant of this command to reset it to the default.

**Syntax** spanning-tree priority <priority>  
no spanning-tree priority

| Parameter  | Description                                                                 |
|------------|-----------------------------------------------------------------------------|
| <priority> | <0-61440> The bridge priority, which will be rounded to a multiple of 4096. |

**Default** The default priority is 32678.

**Mode** Global Configuration

**Usage** To force a particular device to become the root bridge use a lower value than other devices in the spanning tree.

**Example** awplus# configure terminal  
awplus(config)# spanning-tree priority 4096

**Related commands** [spanning-tree mst instance priority](#)  
[show spanning-tree](#)

# spanning-tree priority (port priority)

**Overview** Use this command in Interface Configuration mode for a switch port interface only to set the port priority for port. A lower priority value indicates a greater likelihood of the port becoming part of the active topology.

Use this command for RSTP, STP, or MSTP. When the device is in MSTP mode, this will apply to the CIST.

Use the **no** variant of this command to reset it to the default.

**Syntax** spanning-tree priority <priority>  
no spanning-tree priority

| Parameter  | Description                                                                                      |
|------------|--------------------------------------------------------------------------------------------------|
| <priority> | <0-240>, in increments of 16. The port priority, which will be rounded down to a multiple of 16. |

**Default** The default priority is 128.

**Mode** Interface Configuration mode for a switch port interface only.

**Usage notes** To force a port to be part of the active topology (for instance, become the root port or a designated port) use a lower value than other ports on the device. (This behavior is subject to network topology, and more significant factors, such as bridge ID.)

**Example** awplus# configure terminal  
awplus(config)# interface port1.0.2  
awplus(config-if)# spanning-tree priority 16

**Related commands** [spanning-tree mst instance priority](#)  
[spanning-tree priority \(bridge priority\)](#)  
[show spanning-tree](#)

## spanning-tree restricted-role

**Overview** Use this command in Interface Configuration mode for a switch port interface only to restrict the port from becoming a root port.

Use the **no** variant of this command to disable the restricted role functionality.

**Syntax** spanning-tree restricted-role  
no spanning-tree restricted-role

**Default** The restricted role is disabled.

**Mode** Interface Configuration mode for a switch port interface only.

**Example** awplus# configure terminal  
awplus(config)# interface port1.0.2  
awplus(config-if)# spanning-tree restricted-role

## spanning-tree restricted-tcn

**Overview** Use this command in Interface Configuration mode for a switch port interface only to prevent TCN (Topology Change Notification) BPDUs (Bridge Protocol Data Units) from being sent on a port. If this command is enabled, after a topology change a bridge is prevented from sending a TCN to its designated bridge.

Use the **no** variant of this command to disable the restricted TCN functionality.

**Syntax** spanning-tree restricted-tcn  
no spanning-tree restricted-tcn

**Default** The restricted TCN is disabled.

**Mode** Interface Configuration mode for a switch port interface only.

**Example** awplus# configure terminal  
awplus(config)# interface port1.0.2  
awplus(config-if)# spanning-tree restricted-tcn

# spanning-tree transmit-holdcount

**Overview** Use this command to set the maximum number of BPDU transmissions that are held back.  
Use the **no** variant of this command to restore the default transmit hold-count value.

**Syntax** spanning-tree transmit-holdcount  
no spanning-tree transmit-holdcount

**Default** Transmit hold-count default is 3.

**Mode** Global Configuration

**Example** awplus# configure terminal  
awplus(config)# spanning-tree transmit-holdcount

# undebbug mstp

**Overview** This command applies the functionality of the no **debug mstp (RSTP and STP)** command.

# 16

# Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure a static channel group (static aggregator) and dynamic channel group (LACP channel group, etherchannel or LACP aggregator). Link aggregation is also sometimes referred to as channeling.

**NOTE:** *AlliedWare Plus™ supports IEEE 802.3ad and IEEE 802.1AX link aggregation and uses the Link Aggregation Control Protocol (LACP). LACP does not interoperate with devices that use Port Aggregation Protocol (PAgP).*

*Link aggregation does not necessarily achieve exact load balancing across the links. The load sharing algorithm is designed to ensure that any given data flow always goes down the same link. It also aims to spread data flows across the links as evenly as possible.*

*For example, for a 2 Gbps LAG that is a combination of two 1 Gbps ports, any one flow of traffic can only ever reach a maximum throughput of 1 Gbps. However, the hashing algorithm should spread the flows across the links so that when many flows are operating, the full 2 Gbps can be utilized.*

*For information about load balancing see the [platform load-balancing](#) command.*

For a description of static and dynamic link aggregation (LACP), and configuration examples, see the [Link Aggregation and Ethernet Bonding Feature Overview and Configuration Guide](#).

# channel-group

## Overview

Use this command to create a dynamic channel group, or to add a port to an existing dynamic channel group.

You can create up to 124 channel groups, in any combination of static and dynamic (LACP) groups. This means you can create up to 124 dynamic channel groups, if you have no static channel groups.

Use the **no** variant of this command to turn off link aggregation on the device port. You will be returned to Global Configuration mode from Interface Configuration mode.

**Syntax** `channel-group <dynamic-channel-group-number> mode {active|passive}`  
`no channel-group`

| Parameter                                         | Description                                                                                                                                                                                |
|---------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;dynamic-channel-group-number&gt;</code> | <1-248> Dynamic channel group number for an LACP link. You can create up to 124 dynamic channel groups, numbered in the range 1-248.                                                       |
| <code>active</code>                               | Enables initiation of LACP negotiation on a port. The port will transmit LACP dialogue messages whether or not it receives them from the partner device.                                   |
| <code>passive</code>                              | Disables initiation of LACP negotiation on a port. The port will only transmit LACP dialogue messages if the partner device is transmitting them, i.e., the partner is in the active mode. |

**Mode** Interface Configuration

**Usage notes** All the device ports in a channel-group must belong to the same VLANs, have the same tagging status, and can only be operated on as a group. All device ports within a channel group must have the same port speed and be in full duplex mode.

Once the LACP channel group has been created, it is treated as a device port. You can specify it in other commands. If you are specifying it in:

- an LACP command, then use the channel-group number on its own. For example, use the command **show etherchannel 2** to show details about channel group 2.
- a non-LACP command, then use **po** followed by the channel-group number. For example, use the command **show interface po2** to show details about channel group 2's interface.

For more information about LACP, see the [Link Aggregation Feature Overview and Configuration Guide](#) which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Examples** To add device port1.0.2 to a newly created LACP channel group 2, in active mode, use the commands below:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# channel-group 2 mode active
```

To remove device port1.0.2 from any created LACP channel groups, use the command below:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no channel-group
```

To reference channel group 2 as an interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface po2
awplus(config-if)#
```

**Related commands** [show etherchannel](#)  
[show etherchannel detail](#)  
[show etherchannel summary](#)  
[show port etherchannel](#)

**Command changes** Version 5.4.9-0.1: Ability added to create up to 124 groups as any combination of static and dynamic channel groups. Also, numbering changed to 1-248.

## clear lacp counters

**Overview** Use this command to clear all counters of all present LACP aggregators (channel groups) or a given LACP aggregator.

**Syntax** `clear lacp [<1-248>] counters`

| Parameter | Description           |
|-----------|-----------------------|
| <1-248>   | Channel-group number. |

**Mode** Privileged Exec

**Example** `awplus# clear lacp 2 counters`

## debug lacp

**Overview** Use this command to enable all LACP troubleshooting functions.  
Use the **no** variant of this command to disable this function.

**Syntax** `debug lacp {all|cli|event|ha|packet|sync|timer[detail]}`  
`no debug lacp {all|cli|event|ha|packet|sync|timer[detail]}`

| Parameter | Description                                                                                               |
|-----------|-----------------------------------------------------------------------------------------------------------|
| all       | Turn on all debugging for LACP.                                                                           |
| cli       | Specifies debugging for CLI messages.<br>Echoes commands to the console.                                  |
| event     | Specifies debugging for LACP events.<br>Echoes events to the console.                                     |
| ha        | Specifies debugging for HA (High Availability) events.<br>Echoes High Availability events to the console. |
| packet    | Specifies debugging for LACP packets.<br>Echoes packet contents to the console.                           |
| sync      | Specified debugging for LACP synchronization.<br>Echoes synchronization to the console.                   |
| timer     | Specifies debugging for LACP timer.<br>Echoes timer expiry to the console.                                |
| detail    | Optional parameter for LACP timer-detail.<br>Echoes timer start/stop details to the console.              |

**Mode** Privileged Exec and Global Configuration

**Examples** `awplus# debug lacp timer detail`  
`awplus# debug lacp all`

**Related commands** [show debugging lacp](#)  
[undebug lacp](#)

# lacp global-passive-mode enable

**Overview** Use this command to enable LACP channel-groups to dynamically self-configure when they are connected to another device that has LACP channel-groups configured with Active Mode.

**Syntax** lacp global-passive-mode enable  
no lacp global-passive-mode enable

**Default** Enabled

**Mode** Global Configuration

**Usage notes** Do not mix LACP configurations (manual and dynamic). When LACP global passive mode is turned on (by using the **lacp global-passive-mode enable** command), we do not recommend using a mixed configuration in a LACP channel-group; i.e. some links are manually configured (by the **channel-group** command) and others are dynamically learned in the same channel-group.

**Example** To enable global passive mode for LACP channel groups, use the command:

```
awplus(config)# lacp global-passive-mode enable
```

To disable global passive mode for LACP channel groups, use the command:

```
awplus(config)# no lacp global-passive-mode enable
```

**Related commands** [show etherchannel](#)  
[show etherchannel detail](#)

## lacp port-priority

**Overview** Use this command to set the priority of a device port. Ports are selected for aggregation based on their priority, with the higher priority (numerically lower) ports selected first.

Use the **no** variant of this command to reset the priority of port to the default.

**Syntax** lacp port-priority <1-65535>  
no lacp port-priority

| Parameter | Description                     |
|-----------|---------------------------------|
| <1-65535> | Specify the LACP port priority. |

**Default** The default is 32768.

**Mode** Interface Configuration

**Example** awplus# configure terminal  
awplus(config)# interface port1.0.2  
awplus(config-if)# lacp port-priority 34

## lacp system-priority

**Overview** Use this command to set the system priority of a local system. This is used in determining the system responsible for resolving conflicts in the choice of aggregation groups.

Use the **no** variant of this command to reset the system priority of the local system to the default.

**Syntax** lacp system-priority <1-65535>  
no lacp system-priority

| Parameter | Description                                                          |
|-----------|----------------------------------------------------------------------|
| <1-65535> | LACP system priority. Lower numerical values have higher priorities. |

**Default** The default is 32768.

**Mode** Global Configuration

**Example** awplus# configure terminal  
awplus(config)# lacp system-priority 6700

## lacp timeout

**Overview** Use this command to set the short or long timeout on a port. Ports will time out of the aggregation if three consecutive updates are lost.

**Syntax** lacp timeout {short|long}

| Parameter | Description                                                            |
|-----------|------------------------------------------------------------------------|
| timeout   | Number of seconds before invalidating a received LACP data unit (DU).  |
| short     | LACP short timeout. The <b>short</b> timeout value is <b>1</b> second. |
| long      | LACP long timeout. The <b>long</b> timeout value is <b>30</b> seconds. |

**Default** The default is **long** timeout (30 seconds).

**Mode** Interface Configuration

**Usage notes** This command enables the device to indicate the rate at which it expects to receive LACPDUs from its neighbor.

If the timeout is set to **long**, then the device expects to receive an update every **30** seconds, and this will time a port out of the aggregation if no updates are seen for 90 seconds (i.e. 3 consecutive updates are lost).

If the timeout is set to **short**, then the device expects to receive an update every second, and this will time a port a port out of the aggregation if no updates are seen for 3 seconds (i.e. 3 consecutive updates are lost).

The device indicates its preference by means of the Timeout field in the Actor section of its LACPDUs. If the Timeout field is set to 1, then the device has set the **short** timeout. If the Timeout field is set to 0, then the device has set the **long** timeout.

Setting the **short** timeout enables the device to be more responsive to communication failure on a link, and does not add too much processing overhead to the device (1 packet per second).

**NOTE:** *It is not possible to configure the rate that the device sends LACPDUs; the device must send at the rate which the neighbor indicates it expects to receive LACPDUs.*

**Examples** The following commands set the LACP long timeout period for 30 seconds on port1.0.2.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# lacp timeout long
```

The following commands set the LACP short timeout for 1 second on port1.0.2.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# lacp timeout short
```

# platform load-balancing

**Overview** This command determines which address fields are used as inputs into the load balancing algorithm for aggregated links. The output from this algorithm is used to select which individual path a given packet will traverse within an aggregated link.

The **no** variant of this command removes the specified packet type from the calculation.

**Syntax** `platform load-balancing [src-dst-mac] [src-dst-ip] [src-dst-port]`  
`no platform load-balancing [src-dst-mac] [src-dst-ip] [src-dst-port]`

| Parameter    | Description                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------|
| src-dst-mac  | The source and destination MAC addresses (Layer 2)                                                                                     |
| src-dst-ip   | The source and destination IP addresses (Layer 3)                                                                                      |
| src-dst-port | The source and destination TCP/UDP port data (Layer 4). If you include this option, make sure that <b>src-dst-ip</b> is also selected. |

**Default** Includes the **src-dst-mac** and **src-dst-ip** addresses as inputs into the platform load balancing algorithm.

**Mode** Global configuration

**Usage notes** Useful combinations of inputs are:

- MAC address and IP address (the default)
- MAC address only
- MAC address, IP address and Layer 4 port number
- IP address and Layer 4 port number
- IP address only

The following examples show how to configure each of these combinations.

Note the following restrictions:

- you can only stop using MAC addresses (**src-dst-mac**) if you still have IP addresses (**src-dst-ip**) selected
- if you specify Layer 4 ports (**src-dst-port**), you should also specify IP addresses (**src-dst-ip**)

Use the **show platform** command to verify this command's setting.

**Examples** To use MAC addresses and IP addresses, you do not have to enter any commands, because this is the default. Note that this setting is not displayed in the **show running-config** output. Use the **show platform** command to verify this setting.

To use MAC addresses only, remove IP addresses by using the commands:

```
awplus# configure terminal
awplus(config)# no platform load-balancing src-dst-ip
```

To use MAC addresses, IP addresses and Layer 4 port numbers, add Layer 4 port numbers by using the commands:

```
awplus# configure terminal
awplus(config)# platform load-balancing src-dst-port
```

To use IP addresses and Layer 4 port numbers, remove MAC addresses and add Layer 4 port numbers by using the commands:

```
awplus# configure terminal
awplus(config)# no platform load-balancing src-dst-mac
awplus(config)# platform load-balancing src-dst-port
```

To use IP addresses only, remove MAC addresses by using the commands:

```
awplus# configure terminal
awplus(config)# no platform load-balancing src-dst-mac
```

**Related commands** **show platform**

# show debugging lacp

**Overview** Use this command to see what debugging is turned on for LACP management.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show debugging lacp

**Mode** User Exec and Privileged Exec

**Example** awplus# show debugging lacp

**Output** The following shows typical output.

## Example output from the show debugging lacp command

```
LACP debugging status:
LACP timer debugging is on
LACP timer-detail debugging is on
LACP cli debugging is on
LACP packet debugging is on
LACP event debugging is on
LACP sync debugging is on
```

**Related commands** [debug lacp](#)

# show diagnostic channel-group

**Overview** This command displays dynamic and static channel group interface status information. The output of this command is useful for Allied Telesis authorized service personnel for diagnostic purposes.

For information on filtering and saving command output, see the **[“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)**.

**Syntax** show diagnostic channel-group

**Mode** User Exec and Privileged Exec

**Example** awplus# show diagnostic channel-group

**Output** The following shows typical output.

**Example output from the show diagnostic channel-group command**

```
awplus#show diagnostic channel-group

Channel Group Info based on NSM:
Note: Pos - position in hardware table
-----
Dev  Interface  IfIndex  Member port  IfIndex  Active  Pos
-----
    sa3        4503      port1.0.15   5015        No
    sa3        4503      port1.0.18   5018        No
    po1        4601      port1.0.7    5007        No
    po1        4601      port1.0.8    5008        No
    po1        4601      port1.0.9    5009        No

Channel Group Info based on HSL:
Note: Pos - position in hardware table
-----
Dev  Interface  IfIndex  Member port  IfIndex  Active  Pos
-----
    sa3        4503                        N/a
    po1        4601                        N/a

Channel Group Info based on IPIFWD:
Note: Pos - position in hardware table
-----

No error found
```

**Related commands** [show tech-support](#)

# show etherchannel

**Overview** Use this command to display information about an LACP channel specified by the channel group number.

The command output also shows the thrash limiting status. If thrash limiting is detected and the **action** parameter of the **thrash-limiting** command is set to **vlan-disable**, the output will also show the VLANs on which thrashing is detected.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**, which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** show etherchannel [<1-248>]

| Parameter | Description           |
|-----------|-----------------------|
| <1-248>   | Channel-group number. |

**Mode** User Exec and Privileged Exec

**Example** awplus# show etherchannel

**Output** The following shows typical output.

## Example output from show etherchannel

```
awplus#show etherchannel
LAG Maximum      : 124
LAG Static Count : 0
LAG Dynamic Count : 1
LAG Total Count  : 1
Lacp Aggregator: po1
Member:
  port1.0.1
  port1.0.2
```

**Example** awplus# show etherchannel 1

**Output** The following shows typical output.

**Example output from show etherchannel for a particular channel**

```
awplus#show etherchannel 1
Aggregator po1 (4601)
  Mac address: 00:00:00:00:00:00
  Admin Key: 0001 - Oper Key 0000
  Receive link count: 0 - Transmit link count: 0
  Individual: 0 - Ready: 0
  Partner LAG: 0x0000,00-00-00-00-00-00
  Link: port1.0.1 (5001) disabled
  Link: port1.0.2 (5002) disabled
```

# show etherchannel detail

**Overview** Use this command to display detailed information about all LACP channels.

For information on filtering and saving command output, see the **[“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)**, which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** show etherchannel detail

**Mode** User Exec and Privileged Exec

**Example** awplus# show etherchannel detail

**Output** The following shows typical output.

## Example output from show etherchannel detail

```
awplus#show etherchannel detail
Aggregator po1 (IfIndex: 4601)
  Mac address: 00:00:cd:37:05:17
  Admin Key: 0001 - Oper Key 0001
  Receive link count: 2 - Transmit link count: 2
  Individual: 0 - Ready: 1
  Partner LAG: 0x8000,00-00-cd-37-02-9a,0x0001
    Link: port1.0.1 (IfIndex: 8002) synchronized
    Link: port1.0.2 (IfIndex: 20002) synchronized
Aggregator po2 (IfIndex: 4602)
  Mac address: 00:00:cd:37:05:17
  Admin Key: 0002 - Oper Key 0002
  Receive link count: 2 - Transmit link count: 2
  Individual: 0 - Ready: 1
  Partner LAG: 0x8000,ec-cd-6d-aa-c8-56,0x0002
    Link: port1.0.3 (IfIndex: 8001) synchronized
    Link: port1.0.4 (IfIndex: 20001) synchronized
```

# show etherchannel summary

**Overview** Use this command to display a summary of all LACP channels.

For information on filtering and saving command output, see the **[“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)**, which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** show etherchannel summary

**Mode** User Exec and Privileged Exec

**Example** awplus# show etherchannel summary

**Output** The following shows typical output.

## Example output from show etherchannel summary

```
awplus#show etherchannel summary
Aggregator po10 (IfIndex: 4610)
Admin Key: 0010 - Oper Key 0010
Link: port1.0.1 (IfIndex: 7007) synchronized
Link: port1.0.2 (IfIndex: 8007) synchronized
Link: port1.0.3 (IfIndex: 11007) synchronized
```

## show lacp sys-id

**Overview** Use this command to display the LACP system ID and priority.  
For information on filtering and saving command output, see the **[“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)**, which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** show lacp sys-id

**Mode** User Exec and Privileged Exec

**Example** awplus# show lacp sys-id

**Output** The following shows typical output.

### Example output from show lacp sys-id

```
System Priority: 0x8000 (32768)
MAC Address: 0200.0034.5684
```

## show lacp-counter

**Overview** Use this command to display the packet traffic on all ports of all present LACP aggregators, or a given LACP aggregator.

For information on filtering and saving command output, see the **[“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)**, which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** show lacp-counter [<1-248>]

| Parameter | Description           |
|-----------|-----------------------|
| <1-248>   | Channel-group number. |

**Mode** User Exec and Privileged Exec

**Example** awplus# show lacp-counter 2

**Output** The following shows typical output.

### Example output from show lacp-counter

|                                  |         |      |        |      |          |      |
|----------------------------------|---------|------|--------|------|----------|------|
| % Traffic statistics             |         |      |        |      |          |      |
| Port                             | LACPDUs |      | Marker |      | Pckt err |      |
|                                  | Sent    | Recv | Sent   | Recv | Sent     | Recv |
| % Aggregator po2 (IfIndex: 4604) |         |      |        |      |          |      |
| port1.0.2                        | 0       | 0    | 0      | 0    | 0        | 0    |

# show port etherchannel

**Overview** Use this command to show LACP details of the device port specified.

For information on filtering and saving command output, see the **[“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)**, which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** show port etherchannel <port>

| Parameter | Description                                                |
|-----------|------------------------------------------------------------|
| <port>    | Name of the device port to display LACP information about. |

**Mode** User Exec and Privileged Exec

**Example** awplus# show port etherchannel port1.0.2

**Output** The following shows typical output.

## Example output from show port etherchannel

```
awplus#show port etherchannel port1.0.2
LACP link info: port1.0.2 - 7007
Link: port1.0.2 (IfIndex: 7007)
Aggregator: po10 (IfIndex: 4610)
Receive machine state: Current
Periodic Transmission machine state: Slow periodic
Mux machine state: Collecting/Distributing
Actor Information:
Selected ..... Selected
Physical Admin Key ..... 2

Collecting ..... Yes
Distributing ..... Yes
Defaulted ..... No
Expired ..... No
```

# show static-channel-group

**Overview** Use this command to display all configured static channel groups and their corresponding member ports. Note that a static channel group is the same as a static aggregator.

The command output also shows the thrash limiting status. If thrash limiting is detected and the **action** parameter of the **thrash-limiting** command is set to **vlan-disable**, the output will also show the VLANs on which thrashing is detected.

For information on filtering and saving command output, see the **[“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)**, which is available on our website at [alliedtelesis.com](http://alliedtelesis.com).

**Syntax** show static-channel-group

**Mode** User Exec and Privileged Exec

**Example** awplus# show static-channel-group

**Output** The following shows typical output.

## Example output from show static-channel-group

```
% LAG Maximum      : 124
% LAG Static Count  : 2
% LAG Dynamic Count : 0
% LAG Total Count   : 2
% Static Aggregator: sa2
% Member:
  port1.0.1
  port1.0.2
% Static Aggregator: sa3
% Member:
  port1.0.3
  port1.0.4
```

**Related commands** **[static-channel-group](#)**

## static-channel-group

**Overview** Use this command to create a static channel group, or to add a port to an existing static channel group. Static channel groups are also known as static aggregators.

You can create up to 124 channel groups, in any combination of static and dynamic (LACP) groups. This means you can create up to 124 static channel groups, if you have no dynamic channel groups.

Use the **no** variant of this command to remove the device port from the static channel group.

**Syntax** `static-channel-group <static-channel-group-number> [member-filters]`  
`no static-channel-group`

| Parameter                                        | Description                                                                                                                                                                                                       |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;static-channel-group-number&gt;</code> | Static channel group number from the range 1 to 248.<br>You can create up to 124 static channel groups.                                                                                                           |
| <code>member-filters</code>                      | Allow QoS and ACL settings to be configured on the aggregator's individual member ports, instead of the aggregator itself. This configuration is required when using QoS Storm Protection on a static aggregator. |

**Mode** Interface Configuration

**Usage notes** This command adds the device port to the static channel group with the specified channel group number. If the channel group does not exist, it is created, and the port is added to it. The **no** prefix detaches the port from the static channel group. If the port is the last member to be removed, the static channel group is deleted.

All the ports in a channel group must have the same VLAN configuration: they must belong to the same VLANs and have the same tagging status, and can only be operated on as a group.

Once the static channel group has been created, it is treated as a device port. You can specify it in other commands by using **sa** followed by the channel-group number. For example, use the command **show interface sa2** to show details about channel group 2's interface:

**Examples** To define static channel group 2 on port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# static-channel-group 2
```

To reference static channel group 2 as an interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface sa2
awplus(config-if)#
```

To make it possible to use QoS Storm Protection on static channel group 2 on port1.0.2, with an ACL named "test-acl", use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# static-channel-group 2 member-filters
awplus(config-if)# access-group test-acl
```

**Related commands** [show static-channel-group](#)

**Command changes** Version 5.4.9-0.1: Ability added to create up to 124 groups as any combination of static and dynamic channel groups. Also, numbering changed to 1-248.

# undebbug lacp

**Overview** This command applies the functionality of the no **debug lacp** .

# Introduction

**Overview** This chapter contains an alphabetical list of commands used to configure Power over Ethernet (PoE). Each command contains a functional description and shows examples of configuration and output screens for show commands. These commands are only supported on PoE capable ports. An error message will display on the console if you enter a PoE command on a port that does not support PoE. The following documents offer further information for configuring PoE on AlliedWare Plus switches.

- the **PoE Feature Overview and Configuration\_Guide**.
- the **Support for Allied Telesis Enterprise\_MIBs\_in AlliedWare Plus**, for information about which PoE MIB objects are supported.
- the **SNMP Feature Overview and Configuration\_Guide**, for information about SNMP traps.

Power over Ethernet (PoE) is a technology allowing devices such as security cameras to receive power over LAN cabling.

The Powered Device (PD) referred to throughout this chapter is a PoE or PoE+ powered device, such as an IP phone or a Wireless Access Point (AP).

# clear power-inline counters interface

**Overview** This command will clear the counters from a specified port, a range of ports, or all ports on the switch. If no ports are entered then PoE counters for all ports are cleared. It will also clear all Power over Ethernet (PoE) counters supported by the Power Ethernet MIB (RFC 3621).

**Syntax** clear power-inline counters interface [*<port-list>*]

| Parameter                | Description                                                 |
|--------------------------|-------------------------------------------------------------|
| <i>&lt;port-list&gt;</i> | Selects the port or ports whose counters are to be cleared. |

**Mode** Privileged Exec

**Usage notes** The PoE counters are displayed with the **show power-inline counters** command.

**Examples** To clear the PoE counters for port1.0.2 only, use the following command:

```
awplus# clear power-inline counters interface port1.0.2
```

To clear the PoE counters for port1.0.5 through port1.0.8, use the following command:

```
awplus# clear power-inline counters interface port1.0.5-  
port1.0.8
```

To clear the PoE counters for all ports, use the following command:

```
awplus# clear power-inline counters interface
```

**Related commands** **show power-inline counters**

**Command changes** Version 5.4.8-0.2: added to x550 series products

## debug power-inline

**Overview** This command enables debugging display for messages that are specific to Power over Ethernet (PoE).

Use the **no** variant of this command to disable the specified PoE debugging messages.

**Syntax** debug power-inline [all|event|info|power]  
no debug power-inline [all|event|info|power]

| Parameter | Description                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------|
| all       | Displays all (event, info, nsm, power) debug messages.                                                                           |
| event     | Displays event debug information, showing any error conditions that may occur during PoE operation.                              |
| info      | Displays informational level debug information, showing high-level essential debugging, such as information about message types. |
| power     | Displays power management debug information.                                                                                     |

**Default** No debug messages are enabled by default.

**Mode** Privileged Exec

**Usage notes** Use the **terminal monitor** command to display PoE debug messages on the console.

Use the **show debugging power-inline** command to show the PoE debug configuration.

**Examples** To enable PoE debugging and start the display of PoE event and info debug messages on the console, use the following commands:

```
awplus# terminal monitor
awplus# debug power-inline event info
```

To enable PoE debugging and start the display of all PoE debugging messages on the console, use the following commands:

```
awplus# terminal monitor
awplus# debug power-inline all
```

To stop the display of PoE info debug messages on the console, use the following command:

```
awplus# no debug power-inline info
```

To disable all PoE debugging and stop the display of any PoE debugging messages on the console, use the following command:

```
awplus# no debug power-inline all
```

**Related commands** [show debugging power-inline](#)  
[terminal monitor](#)

**Command changes** Version 5.4.8-0.2: added to x550 series products

## power-inline allow-legacy

**Overview** This command enables detection of pre-IEEE 802.3af Power Ethernet standard legacy powered devices (PDs).  
The **no** variant of this command disables detection of pre-IEEE 802.3af Power Ethernet standard legacy powered devices.

**Syntax** power-inline allow-legacy  
no power-inline allow-legacy

**Default** Detection of legacy PDs is disabled on all ports

**Mode** Global Configuration

**Examples** To enable detection of legacy PDs, use the following commands:

```
awplus# configure terminal
awplus(config)# power-inline allow-legacy
```

To disable detection of legacy PDs, use the following commands:

```
awplus# configure terminal
awplus(config)# no power-inline allow-legacy
```

**Validation** **show power-inline**  
**Commands** **show running-config** power-inline

**Command changes** Version 5.4.8-0.2: added to x550 series products  
Version 5.4.9-0.1: default changed to “disabled”

## power-inline autoclass

**Overview** Use this command to enable autoclass for physical layer power classification of the port the next time a PD is powered up on the port.

Use the **no** variant of this command to disable autoclass. This will have no effect until the next time a PD is powered up on the port.

**Syntax** power-inline autoclass  
no power-inline autoclass

**Default** Disabled.

**Mode** Interface Configuration

**Usage notes** When a powered device (PD) is connected to an autoclass-enabled port, the power sourcing equipment (PSE) will check the PD for autoclass support. If the PD supports this, the switch sets the power limit on the port to the maximum power consumption drawn by the PD during the autoclass procedure. The switch adds the power difference back to the available budget to use for the other ports.

If the PD does not support autoclass, the port uses the default class-based setting unless:

- you configure a power limit on the port or
- a maximum power limit is set via LLDP.

If a PD is already powered on the port when you configure autoclass, the switch will not use autoclass until the next time a PD is powered up on the port. The port's power limit stays at its current setting.

**Example** To enable autoclass on port1.0.1, so that it will try to perform autoclass on the next PD power-up event, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# power-inline autoclass
```

To disable autoclass on port1.0.1, so that it will not try to perform autoclass on the next PD power-up event, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no power-inline autoclass
```

Note that it will continue to use its current setting until the next time a PD is powered up.

**Related commands** [power-inline enable](#)  
[service power-inline](#)  
[show power-inline](#)  
[show power-inline interface detail](#)

**Command changes** Version 5.4.9-2.1: command added

## power-inline description

**Overview** This command adds a description for a Powered Device (PD) connected to a PoE port.

The **no** variant of this command clears a previously entered description for a connected PD, resetting the PD description to the default (null).

**Syntax** power-inline description <pd-description>  
no power-inline description

| Parameter        | Description                                                                                                             |
|------------------|-------------------------------------------------------------------------------------------------------------------------|
| <pd-description> | Description of the PD connected to the PoE capable port (with a maximum 256 character string limit per PD description). |

**Default** No description for a connected PD is set by default.

**Mode** Interface Configuration

**Usage notes** Select a PoE port, a list of PoE ports, or a range of PoE ports with the preceding **interface (to configure)** command. If you specify a range or list of ports they must all be PoE capable ports.

In a VCSStack of switches this command is supported on all PoE capable ports.

To configure the same description on a port on more than one stack member you specify the interface range and apply the description. Note the command will only be successfully applied to PoE capable ports.

To give ports different descriptions, select the ports separately, then configure the desired description on each.

**Examples** To add the description "Desk Phone" for a connected PD on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# power-inline description Desk Phone
```

To clear the description for the connected PD on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no power-inline description
```

**Related commands** **show power-inline interface**  
**show running-config** *<power-inline>*

**Command changes** Version 5.4.8-0.2: added to x550 series products

## power-inline enable

**Overview** This command enables Power over Ethernet (PoE) to detect a connected Powered Device (PD) and supply power.

The **no** variant of this command disables PoE functionality on the selected PoE port(s). No power is supplied to a connected PD after PoE is disabled on the selected PoE port(s).

Ports still provide Ethernet connectivity after PoE is disabled.

**Syntax** power-inline enable  
no power-inline enable

**Default** PoE is enabled by default on all ports

**Mode** Interface Configuration for one or more PoE switchports.

**Usage notes** No PoE log messages are generated for ports on which PoE is disabled.

**Examples** To disable PoE on port1.0.1 to port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# no power-inline enable
```

To enable PoE on port1.0.1 to port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# power-inline enable
```

**Related commands** [show power-inline](#)  
[show power-inline interface](#)  
[show power-inline interface detail](#)  
[show running-config power-inline](#)

**Command changes** Version 5.4.8-0.2: added to x550 series products

## power-inline hanp

**Overview** Use this command to enable High Availability Network Power (HANP), also known as Continuous PoE. Continuous PoE enables the switches to perform actions such as software upgrades without forcing the Powered Devices to power cycle. This means, for example, if you are rebooting a switch connected to a PD such as a camera, Continuous PoE allows the camera to buffer while the switch is rebooted. You can configure it on a global or per port level. Enabling it globally enables it on all PoE ports.

Use the **no** variant of this command to disable Continuous PoE globally or on the specified ports.

**Syntax** power-inline hanp  
no power-inline hanp

**Default** Continuous PoE is disabled globally by default. If you enable it globally, that enables it on all ports.

**Mode** User Exec/Privileged Exec or Interface Configuration for a PoE port

**Example** To enable Continuous PoE on all ports, use the commands:

```
awplus# configure terminal
awplus(config)# power-inline hanp
```

To enable Continuous PoE on all ports except port 1.0.5, use the commands:

```
awplus# configure terminal
awplus(config)# power-inline hanp
awplus(config)# interface port1.0.5
awplus(config-if)# no power-inline hanp
```

**Related commands** [show power-inline](#)  
[show power-inline interface](#)  
[show power-inline interface detail](#)

**Command changes** Version 5.4.6-2.1: command added  
Version 5.4.7-0.1: added to x930 series products  
Version 5.4.8-0.2: added to x550 series products  
Version 5.4.8-2.1: added to x220 series products

## power-inline max

**Overview** This command sets the maximum power allocated to a Power over an Ethernet (PoE and PoE+) port. The amount of power actually supplied to the port depends on the power requirements of the connected PD. It is also a function of the total PoE power loading on the switch and the PoE priority set for the port by the **power-inline priority** command. However this command (power-inline max) does apply a maximum value to the power that the port is able to supply.

This switch allocates power dynamically, so you do not need to use this command to set it statically. If you do use this command, the values specified in this command will override the dynamic allocation and will control the power output for each port.

Note that the value set by this command will be the figure the switch will use when apportioning the power budget for its ports. For example, if 15.4 W is assigned to a port whose PD only consumes 5 W, the switch will reserve the full 15.4 W for this port when determining its total power PoE power requirement.

The **no** variant of this command sets the maximum power supplied to a PoE port to the default, which is set to the maximum power limit for the class of the connected Powered Device (PD).

**Syntax** power-inline max <4000-30000>  
no power-inline max

| Parameter    | Description                                                  |
|--------------|--------------------------------------------------------------|
| <4000-30000> | The maximum power supplied to a PoE port in milliwatts (mW). |

**Default** By default, the switch dynamically determines the power used by the PD connected to the port.

**Mode** Interface Configuration for one or more ports. If you specify a range or list of ports, they must all be PoE capable ports.

**Usage notes** If you select a range of PoE ports in Interface Configuration mode before issuing this command, then each port in the range selected will have the same maximum power value configured.

If a PoE port attempts to draw more than the maximum power, this is logged and all power is removed.

Note that the value entered is rounded up to the next value supported by the hardware. The actual value used is displayed after you enter the command, such as in the following sample console output:

```
awplus#configure terminal
awplus(config)#interface port1.0.1
awplus(config-if)#power-line max 5300
% The maximum power has been rounded to 5450mW in hardware.
```

See the [LLDP Feature Overview and Configuration Guide](#) for information about power monitoring at the PD.

Note the difference in power supplied from the PSE to the power available at the PD due to line loss.

See the [PoE Feature Overview and Configuration Guide](#) for further information about the difference between the power supplied from the PSE and the power available at the PD.

**Examples** To set the maximum power supplied to ports in the range port1.0.1 to port1.0.4 to 6450mW per port, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2-port1.0.4
awplus(config-if)# power-inline max 6450
```

To clear the user-configured maximum power supplied to port1.0.1, and revert to using the default maximum power, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no power-inline max
```

**Related commands** [show power-inline interface](#)  
[show running-config power-inline](#)

**Command changes** Version 5.4.8-0.2: added to x550 series products

## power-inline pair max

**Overview** Use this command to set the maximum power that can be supplied to a specific cable pair. If the pair attempts to draw more than this, the switch will create a log entry and stop supplying power over that pair.

Use the **no** variant of this command to remove the maximum power setting.

**Syntax** power-inline pair {data|spare} max <4000-100000>  
no power-inline pair {data|spare} max

| Parameter         | Description                                   |
|-------------------|-----------------------------------------------|
| data              | Set the maximum power for pins 1, 2, 3 and 6. |
| spare             | Set the maximum power for pins 4, 5, 7 and 8. |
| max <4000-100000> | The maximum power, in milliwatts.             |

**Default** By default, the switch supplies the maximum power limit for the power class of the PD connected to the port.

**Mode**  
**Usage notes** This command enables you to set the maximum power on individual cable pairs on PoE++ ports, which may be helpful with dual-signature PDs. You can also use the **power-inline max** command to set the maximum power on PoE ports. On the PoE++ ports, the **power-inline max** command gives each pair the specified maximum power level.

The switch's total PoE budget is divided between all the PoE ports.

**Example**

## power-inline priority

**Overview** This command sets the Power over Ethernet (PoE) priority level of a PoE port to one of three available priority levels:

- low
- high
- critical

The **no** variant of this command restores the PoE port priority to the default (low).

**Syntax** power-inline priority {low|high|critical}  
no power-inline priority

| Parameter | Description                                                                                                                                                                                                                                                              |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| low       | The lowest priority for a PoE enabled port (default). PoE ports set to <b>low</b> only receive power if all the PoE ports assigned to the other two levels are already receiving power.                                                                                  |
| high      | The second highest priority for a PoE enabled port. PoE ports set to <b>high</b> receive power only if all the ports set to <b>critical</b> are already receiving power.                                                                                                 |
| critical  | The highest priority for a PoE enabled port. PoE ports set to <b>critical</b> are guaranteed power before any ports assigned to the other two priority levels. Ports assigned to the other priority levels receive power only if all critical ports are receiving power. |

**Default** The default priority is **low** for all PoE ports

**Mode** Interface Configuration

**Usage notes** Select a PoE port, a list of PoE ports, or a range of PoE ports with the preceding **interface (to configure)** command. If you specify a range or list of ports they must all be PoE capable ports.

PoE ports with higher priorities are given power before PoE ports with lower priorities. If the priorities for two PoE ports are the same then the lower numbered PoE port is given power before the higher numbered PoE port.

See the **PoE Feature Overview and Configuration Guide** for further information about PoE priority.

**Examples** To set the priority level to high on port1.0.1 to port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# power-inline priority high
```

To reset the priority level to the default of low on port1.0.1 to port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# no power-inline priority
```

**Related commands** **power-inline usage-threshold**

**show power-inline interface**  
**show running-config** power-inline

**Command changes** Version 5.4.8-0.2: added to x550 series products

# power-inline usage-threshold

**Overview** This command sets the level at which the switch will issue a message that the power supplied to all Powered Devices (PDs) has reached a critical level of the nominal power rating for the switch. The level is set as a percentage of total available power.

The **no** variant of this command resets the notification usage-threshold to the default (80% of the nominal power rating).

**Syntax** power-inline usage-threshold <1-99>  
no power-inline usage-threshold

| Parameter | Description                                                  |
|-----------|--------------------------------------------------------------|
| <1-99>    | The usage-threshold percentage configured with this command. |

**Default** The default power usage threshold is 80% of the nominal power rating

**Mode** Global Configuration

**Usage notes** Use the [snmp-server enable trap](#) to configure SNMP notification. An SNMP notification is sent when the usage-threshold, as configured in the example, is exceeded.

**Examples** To generate SNMP notifications when power supplied exceeds 70% of the nominal power rating, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap power-inline
awplus(config)# power-inline usage-threshold 70
```

To reset the notification threshold to the default (80% of the nominal power rating), use the following commands:

```
awplus# configure terminal
awplus(config)# no power-inline usage-threshold
```

**Related commands** [snmp-server enable trap](#)  
[show power-inline interface](#)  
[show running-config](#) power-inline

**Command changes** Version 5.4.8-0.2: added to x550 series products

## service power-inline

**Overview** This command enables Power over Ethernet (PoE) globally on the switch, for all PoE ports.

**Syntax** service power-inline  
no service power-inline

**Default** PoE functionality is enabled by default

**Mode** Global Configuration

**Examples** To disable PoE, use the following commands:

```
awplus# configure terminal
awplus(config)# no service power-inline
```

To re-enable PoE, if PoE has been disabled, use the following commands:

```
awplus# configure terminal
awplus(config)# service power-inline
```

**Related commands** **show power-inline**  
**show running-config** power-inline

**Command changes** Version 5.4.8-0.2: added to x550 series products

# show debugging power-inline

**Overview** This command displays Power over Ethernet (PoE) debug settings.

**Syntax** show debugging power-inline

**Mode** User Exec and Privileged Exec

**Example** To display PoE debug settings, use the following command:

```
awplus# show debugging power-inline
```

**Output** The following shows typical output.

## Example output from the show debugging power-inline command

```
awplus#show debugging power-inline
PoE Debugging status:
PoE Informational debugging is disabled
PoE Event debugging is disabled
PoE Power Management debugging is disabled

PoE NSM debugging is enabled
```

**Related commands** [debug power-inline](#)  
[terminal monitor](#)

**Command changes** Version 5.4.8-0.2: added to x550 series products

# show power-inline

**Overview** This command displays the Power over Ethernet (PoE) status for all ports. For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show power-inline

**Mode** User Exec and Privileged Exec

**Example** To display the PoE status for all ports, use the following command:  
awplus# show power-inline

**Output** Example output from show power-inline

```
awplus#show power-inline
PoE StatusPoE Status:

Stack member 1

### Parameters in the show power -inline command output

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Nominal Power                   | The nominal power available on the switch in watts (W).                                                                                                                                                                                                                                                                                                                           |
| Power Allocated                 | The current power allocated in watts (W) that is available to be drawn by any connected Powered Devices (PDs). This is updated every 5 seconds.                                                                                                                                                                                                                                   |
| Actual Power Consumption        | The current power consumption in watts (W) drawn by all connected Powered Devices (PDs). This is updated every 5 seconds.                                                                                                                                                                                                                                                         |
| Operational Status              | The operational status of the PSU hardware when this command was issued: <ul style="list-style-type: none"> <li>• <b>On</b> if the PSU is installed and switched on.</li> <li>• <b>Off</b> when the PSU is switched off (an RPS may be connected to the switch to power PoE instead of the PSU).</li> <li>• <b>Fault</b> when there is an issue with the PSU hardware.</li> </ul> |
| Power Usage Threshold (%)       | The configured SNMP trap / log threshold, as configured from a <b>power-inline usage-threshold</b> command.                                                                                                                                                                                                                                                                       |
| Power Source                    | PD (Class x) if the device is currently powered by a PD port, or otherwise PSU.                                                                                                                                                                                                                                                                                                   |
| Power management mode: Dynamic  | Indicates that PoE power is allocated dynamically, based on the current usage of each PD attached to the switch's ports. When you connect a new PD to the switch, the switch determines whether it can power that device by measuring the power the existing PDs are currently using. If there is sufficient power available, the switch will allocate it to the new device.      |
| High Availability Network Power | Whether High Availability Network Power is enabled or disabled globally. HANP is also known as Continuous PoE. Continuous PoE enables the switch to perform actions such as software upgrades without forcing the Powered Devices to power cycle. This allows, for example, IP cameras to buffer data instead of losing it.                                                       |
| Interface                       | The PoE port(s) in the format port1.0.z, where z is the port number. After the port number, "/D" indicates the data pair and "/S" indicates the spare pair (for ports that support PoE++).                                                                                                                                                                                        |

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Admin     | The administrative state of PoE on a PoE port, either <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Pri       | <p>The current PoE priorities for PoE ports, as configured using the <b>power-inline priority</b> command:</p> <ul style="list-style-type: none"> <li>• <b>Low</b> is the lowest priority (this is the default).</li> <li>• <b>High</b> is the second highest priority.</li> <li>• <b>Crit</b> (critical) is the highest priority.</li> </ul> <p>If the switch cannot supply all ports, it will supply critical ports, then high-priority ports, then low-priority ports.</p>                                                                                                                                                                                                                                                                                                                                                                     |
| Oper      | <p>The current PoE port state when this command was issued:</p> <ul style="list-style-type: none"> <li>• <b>Powered</b> displays if there is a PD connected and power is being supplied.</li> <li>• <b>Denied</b> displays if supplying power would make the switch go over the power budget.</li> <li>• <b>Off</b> displays if the port is not supplying power but has not been denied power by the switch. This is the default state for ports that are not connected to a PD.</li> <li>• <b>Disabled</b> displays if the PoE port is administratively disabled.</li> <li>• <b>Syncing</b> displays if PoE is still initializing the port when you issue the command.</li> <li>• <b>Fault</b> displays if there is a problem with PoE on the port.</li> <li>• <b>Unknown</b> displays if PoE cannot determine the state of the port.</li> </ul> |
| Power     | The power consumption in milliwatts (mW) for the PoE port when this command was entered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Device    | The description of the connected PD device if a description has been added with the <b>power-inline description</b> command. No description is shown for PDs not configured with the <b>power-inline description</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Class     | The class of the connected PD, if power is being supplied to the PD.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Max (mW)  | <p>The power in milliwatts (mW) allocated for the PoE port. Additionally, note the following as displayed per PoE port:</p> <ul style="list-style-type: none"> <li>• <b>[U]</b> if the power limit for a port was user configured (with the <b>power-inline max</b> command).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           | <ul style="list-style-type: none"><li>• <b>[L]</b> if the power limit for a port was supplied by LLDP.</li><li>• <b>[C]</b> if the power limit for a port was supplied by the PD class.</li></ul>                                                                                                                                                                                                                         |
| HANP      | Whether High Availability Network Power is enabled (on) or not (off) on the port. HANP is also known as Continuous PoE. Continuous PoE enables the switch to perform actions such as software upgrades without forcing the Powered Devices to power cycle. This allows, for example, IP cameras to buffer data instead of losing it. This column only displays if Continuous PoE has been enabled globally on the switch. |

**Related commands** [show power-inline counters](#)  
[show power-inline interface](#)

**Command changes** Version 5.4.8-0.2: added to x550 series products

# show power-inline counters

**Overview** This command displays Power over Ethernet (PoE) event counters for ports on the Power Sourcing Equipment (PSE). The PoE event counters displayed can also be accessed by objects in the PoE MIB (RFC 3621). See [the MIB Objects Feature Overview and Configuration Guide](#) for information about which PoE MIB objects are supported.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show power-inline counters [*<port-list>*]

| Parameter                | Description                                                   |
|--------------------------|---------------------------------------------------------------|
| <i>&lt;port-list&gt;</i> | Enter the PoE port(s) to display PoE event counters for them. |

**Mode** User Exec and Privileged Exec

**Examples** To display all PoE event counters for all PoE ports, use the command:

```
awplus# show power-inline counters
```

To display the PoE event counters for port1.0.1, use the command:

```
awplus# show power-inline counters port1.0.1
```

**Output** The following shows typical output.

**Example output from the show power-inline counters command**

```
awplus#show power-inline counters

PoE Counters:
Interface/      MPSAbsent  Overload  Short   Invalid   Denied
  Pair
port1.0.1/D    0           0         0       0         0
port1.0.1/S    0           0         0       0         0
port1.0.2/D    0           0         0       0         0
port1.0.2/S    0           0         0       0         0
port1.0.3/D    0           0         0       0         0
...
```

**Parameters in the show power-inline counters command output**

| Parameter | Description                                                                                                                                                                                                              |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface | The PoE port(s) in the format port1.0.z, where z is the port number. After the port number, "/D" indicates the data pair and "/S" indicates the spare pair (for ports that support PoE++).                               |
| MPSAbsent | The number of instances when the PoE MPS (Maintain Power Signature) signal has been lost. The PoE MPS signal is lost when a PD is disconnected from the PSE. Also increments pethPsePortMPSAbsentCounter in the PoE MIB. |
| Over load | The number of instances when a PD exceeds its configured power limit (as configured by the <b>power-inline max</b> command). Also increments pethPsePortOverLoadCounter in the PoE MIB.                                  |
| Short     | The number of short circuits that have happened with a PD. Also increments pethPsePortShortCounter in the PoE MIB.                                                                                                       |
| Invalid   | The number of times a PD with an Invalid Signature (where the PD has an open or short circuit, or is a legacy PD) is detected. Also increments pethPseInvalidSignatureCounter in the PoE MIB.                            |
| Denied    | The number of times a PD has been refused power due to power budget limitations for the PSE. Also increments pethPsePortPowerDeniedCounter in the PoE MIB.                                                               |

[show power-inline](#)  
[show power-inline interface](#)

**Command changes** Version 5.4.8-0.2: added to x550 series products

# show power-inline interface

**Overview** This command displays a summary of Power over Ethernet (PoE) information for specified ports. If no ports are specified then PoE information is displayed for all ports.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show power-inline interface [*<port-list>*]

| Parameter                | Description                                                                   |
|--------------------------|-------------------------------------------------------------------------------|
| <i>&lt;port-list&gt;</i> | Enter the PoE port(s) to display PoE specific information in the show output. |

**Mode** User Exec and Privileged Exec

**Example** To display the PoE port-specific information for all PoE ports on the switch, use the following command:

```
awplus# show power-inline interface
```

To display the PoE port specific information for port1.0.1 to port1.0.3, use the following command:

```
awplus# show power-inline interface port1.0.1-port1.0.3
```

**Output** The following shows typical output.

**Example output from show power-inline interface**

```
awplus#show power-inline interface
Interface      Admin    Pri Oper      Power Device      Class  Max
              (mW)
port1.0.1/D    Enabled Low  Off        0      n/a            n/a    n/a
port1.0.2/D    Enabled Low  Off        0      n/a            n/a    n/a
port1.0.3/D    Enabled Low  Off        0      n/a            n/a    n/a
port1.0.4/D    Enabled Low  Off        0      n/a            n/a    n/a
...
```

**Parameters in show power-inline interface output**

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface | The PoE port(s) in the format port1.0.z, where z is the port number. After the port number, “/D” indicates the data pair and “/S” indicates the spare pair (for ports that support PoE++).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Admin     | The administrative state of PoE on a PoE port, either <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Pri       | The current PoE priorities for PoE ports on the PSE, as configured from a <b>power-inline priority</b> command: <ul style="list-style-type: none"> <li><b>Low</b> displays when the low parameter is issued. The lowest priority for a PoE enabled port (default).</li> <li><b>High</b> displays when the high parameter is issued. The second highest priority for a PoE enabled port.</li> <li><b>Crit</b> displays when the critical parameter is issued. The highest priority for a PoE enabled port.</li> </ul>                                                                                                                                                                                                                                                                                                         |
| Oper      | The current PoE port state when this command was issued: <ul style="list-style-type: none"> <li><b>Powered</b> displays if there is a PD connected and power is being supplied.</li> <li><b>Denied</b> displays if supplying power would make the switch go over the power budget.</li> <li><b>Off</b> displays if the port is not supplying power but has not been denied power by the switch. This is the default state for ports that are not connected to a PD.</li> <li><b>Disabled</b> displays if the PoE port is administratively disabled.</li> <li><b>Syncing</b> displays if PoE is still initializing the port when you issue the command.</li> <li><b>Fault</b> displays if there is a problem with PoE on the port.</li> <li><b>Unknown</b> displays if PoE cannot determine the state of the port.</li> </ul> |

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Power     | The power consumption in milliwatts (mW) for the PoE port when this command was entered.                                                                                                                                                                                                                                                                                                                                                  |
| Device    | The description of the connected PD, if a description has been added with the <b>power-inline description</b> command. No description is shown for PDs not configured with the <b>power-inline description</b> command.                                                                                                                                                                                                                   |
| Class     | The class of the connected PD, if power is being supplied to the PD from the PSE.<br><br>See the <b>PoE Feature Overview and Configuration Guide</b> for further information about power classes.                                                                                                                                                                                                                                         |
| Max (mW)  | The power in milliwatts (mW) allocated for the PoE port. Additionally, note the following is displayed per PoE port: <ul style="list-style-type: none"><li>• <b>[U]</b> if the power limit for a port was user configured (with the <b>power-inline max</b> command).</li><li>• <b>[L]</b> if the power limit for a port was supplied by LLDP.</li><li>• <b>[C]</b> if the power limit for a port was supplied by the PD class.</li></ul> |
| HANP      | Whether High Availability Network Power is enabled (on) or not (off) on the port. HANP is also known as Continuous PoE. It enables the switch to perform actions such as software upgrades without forcing the Powered Devices to power cycle. This allows, for example, IP cameras to buffer data instead of losing it. This column only displays if Continuous PoE has been enabled globally on the switch.                             |

[show power-inline interface detail](#)

**Command changes** Version 5.4.8-0.2: added to x550 series products

# show power-inline interface detail

**Overview** This command displays detailed information for one or more Power over Ethernet (PoE) ports.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show power-inline interface [*<port-list>*] detail

| Parameter                | Description                                                                          |
|--------------------------|--------------------------------------------------------------------------------------|
| <i>&lt;port-list&gt;</i> | Enter the PoE port(s) to display information about only the specified port or ports. |

**Mode** User Exec and Privileged Exec

**Usage notes** The power allocated to each port is listed in the **Power allocated** row, and is limited by the maximum power per Powered Device (PD) class, or a user configured power limit.

**Examples** To display detailed PoE port specific information for the port range port1.0.1 to port1.0.2, use the command:

```
awplus# show power-inline interface port1.0.1-port1.0.2 detail
```

**Output** The following shows typical output.

**Example output from show power-inline interface detail**

```
awplus#show power-inline interface port1.0.1 detail
Interface port1.0.1/D
  Powered device type: n/a
  PoE admin: on
  Configured Priority: Low
  Actual Priority: Low
  Detection status: Off
  Powered pairs: Data
  Autoclass: No
```

**Parameters in show power-inline interface detail output**

| Parameter                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                       | The PoE port(s) in the format port1.0.z, where z is the port number. After the port number, “/D” indicates the data pair and “/S” indicates the spare pair (for ports that support PoE++).                                                                                                                                                                                                                                                                                                                                                            |
| Powered device type             | The name of the PD, if connected and if power is being supplied to the PD from the PSE, configured with the <b>power-inline description</b> command. <b>n/a</b> displays if a description has not been configured for the PD.                                                                                                                                                                                                                                                                                                                         |
| PoE admin                       | The administrative state of PoE on a PoE capable port, either<br><br><b>Enabled</b> or <b>Disabled</b> as configured from the <b>power-inline enable</b> command or the <b>no power-inline enable</b> command respectively.                                                                                                                                                                                                                                                                                                                           |
| Priority                        | The PoE priority of a port, which is either <b>Low</b> , or <b>High</b> , or <b>Critical</b> , as configured by the <b>power-inline priority</b> command.                                                                                                                                                                                                                                                                                                                                                                                             |
| Detection status                | The current PSE PoE port state when this command was issued: <ul style="list-style-type: none"><li>• <b>Powered</b> displays when there is a PD connected and power is being supplied from the PSE.</li><li>• <b>Denied</b> displays when supplying power would make the PSE go over the power budget.</li><li>• <b>Disabled</b> displays when the PoE port is administratively disabled.</li><li>• <b>Off</b> displays when PoE has been disabled for the port.</li><li>• <b>Fault</b> displays when a PSE goes over its power allocation.</li></ul> |
| High Availability Network Power | Whether HANP is enabled or disabled on the port. HANP is also known as Continuous PoE. It enables the switch to perform actions such as software upgrades without forcing the Powered Devices to power cycle. This allows,                                                                                                                                                                                                                                                                                                                            |

| Parameter                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                    | for example, IP cameras to buffer data instead of losing it. Note that this information is only displayed if Continuous PoE is enabled globally on the switch.                                                                                                                                                                                                                                                                            |
| Current power consumption          | The power consumption for the PoE port when this command was entered. Note that the power consumption may have changed since the command was entered and the power is displayed.                                                                                                                                                                                                                                                          |
| Powered device class               | The class of the connected PD if connected, and if power is being supplied to the PD from the PSE.<br><br>See the <a href="#">PoE Feature Overview and Configuration Guide</a> for further information about power classes.                                                                                                                                                                                                               |
| Power allocated                    | The power in milliwatts (mW) allocated for the PoE port. Additionally, note the following as displayed per PoE port: <ul style="list-style-type: none"><li>• <b>[U]</b> if the power limit for a port was user configured (with the <b>power-inline max</b> command).</li><li>• <b>[L]</b> if the power limit for a port was supplied by LLDP.</li><li>• <b>[C]</b> if the power limit for a port was supplied by the PD class.</li></ul> |
| Detection of legacy devices is ... | The status of legacy PoE detection on the PoE port (enabled or disabled), as configured for the PoE port with the <b>power-inline allow-legacy</b> command. Legacy detection involves measuring for a large capacitance value to confirm the presence of a legacy PD.                                                                                                                                                                     |
| Powered pairs                      | The IEEE 802.3af and IEEE 802.3at standards allow for either <b>data</b> or <b>spare</b> twisted pairs to be used to transfer power to a PD.                                                                                                                                                                                                                                                                                              |

# Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure various IP features, including the following protocols:

- Address Resolution Protocol (ARP)
- ICMP Router Discovery Advertisements (IRDP)

For more information, see the **IP Feature Overview and Configuration Guide**.

## arp-aging-timeout

**Overview** This command sets a timeout period on dynamic ARP entries associated with a specific interface. If your device stops receiving traffic for the host specified in a dynamic ARP entry, it deletes the ARP entry from the ARP cache after this timeout is reached.

Your device times out dynamic ARP entries to ensure that the cache does not fill with entries for hosts that are no longer active. Static ARP entries are not aged or automatically deleted.

By default the time limit for dynamic ARP entries is 300 seconds on all interfaces.

The **no** variant of this command sets the time limit to the default of 300 seconds.

**Syntax** arp-aging-timeout <0-432000>  
no arp-aging timeout

| Parameter  | Description                    |
|------------|--------------------------------|
| <0-432000> | The timeout period in seconds. |

**Default** 300 seconds (5 minutes)

**Mode** Interface Configuration for a VLAN interface.

**Example** To set the ARP entries on interface vlan2 to time out after two minutes, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# arp-aging-timeout 120
```

**Related commands** [clear arp-cache](#)  
[show arp](#)

## arp-mac-disparity

**Overview** Use this command to enable the switch to support services like Microsoft Network Load Balancing (MS-NLB).

Such services use ARP with disparate MAC addresses to ensure that packets destined for a server cluster virtual address are sent to all servers in the cluster. Disparate MAC addresses mean that the MAC address in the “sender hardware address” field of an ARP reply is different to the MAC address in the “Source MAC address” field of the Ethernet header that the ARP packet is encapsulated in.

The **no** variant of this command reverts to the default behavior. See the Default section below for more information.

**Syntax** `arp-mac-disparity {multicast|multicast-igmp|unicast}`  
`no arp-mac-disparity {multicast|multicast-igmp|unicast}`

| Parameter      | Description                                                                                                                                                                                   |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| multicast      | Enables support of server clusters operating in multicast mode. Packets destined for the server cluster are flooded to all ports in the VLAN.                                                 |
| multicast-igmp | Enables support of server clusters operating in multicast/IGMP mode. In multicast/IGMP mode, the MS-NLB server cluster uses IGMP reports to forward server traffic to a limited set of ports. |
| unicast        | Enables support of server clusters operating in unicast mode. Packets destined for the server cluster are flooded to all ports in the VLAN.                                                   |

**Default** The default behavior upon receiving a Disparate ARP response depends on whether **arp-mac-disparity multicast** or **arp-mac-disparity multicast-igmp** has been configured on an interface.

- If one of these has been configured, then the default action is to flood the packets.
- If neither of these has been configured, then the default action is to drop the packets.
- The command **platform multicast-address-mismatch-action {drop|bridge}** overrides the default behavior regardless of the arp-mac-disparity configuration. An action of **bridge** will cause disparate ARPs to be flooded.

**Mode** Interface Configuration for a VLAN interface.

### Usage notes **Disabling L2 load balancing**

You cannot use the command **arp-mac-disparity** if L2 load balancing is enabled, due to a hashing incompatibility. Use the command **no platform load-balancing src-dst-mac** to turn off L2 load balancing.

#### **Multicast mode**

When you are using **multicast** mode, you can limit the number of ports that packets are flooded to, instead of flooding to all ports in the VLAN. To do this, specify the list of ports when creating the ARP entry.

For example, to flood only port1.0.1 to port1.0.3, use the commands:

```
awplus# configure terminal
awplus(config)# no platform load-balancing src-dst-mac
awplus(config)# interface vlan2
awplus(config-if)# arp-mac-disparity multicast
awplus(config-if)# arp 10.10.1.100
010e.11ff.2222 port1.0.1-port1.0.3
```

#### **Multicast IGMP mode**

You can enable Multicast-IGMP mode by using the command **arp-mac-disparity multicast-igmp**.

In this mode, the only difference to standard multicast mode is that the reception of IGMP reports now controls the ports to which the L3 switch floods traffic. That is, rather than simply flooding each packet destined for the NLB cluster IP address to all ports on the egress VLAN, those packets are only sent to the switchports in the VLAN that have received IGMP reports for the multicast group corresponding to the NLB cluster MAC address.

Like **arp-mac-disparity multicast**, the command **arp-mac-disparity multicast-igmp** puts the switch into a mode where it will accept Disparate ARP responses. Similarly, upon receiving a Disparate ARP response, an ARP entry is created for the IP/MAC in the content of the ARP packet. The difference with the **arp-mac-disparity multicast-igmp** command is that the egress port is set to the subset of ports in the VLAN that have received IGMP reports for the NLB cluster MAC address.

Note that the ARP entry is updated as ports join/leave the IGMP group. If no ports have received IGMP reports for the NLB cluster MAC address then the ARP entry will have no egress ports and will simply drop packets destined for the NLB cluster IP address.

Again, no FDB entry is created in response to receiving the ARP packet. However, since the NLB server is operating in multicast mode with the IGMP option set and is sending IGMP reports, an FDB entry will already exist for the IGMP group (and, as a result, the NLB cluster MAC address).

When the **arp-mac-disparity multicast-igmp** command is configured on the VLAN, ARP entries appear in the output of the command **show arp** like this:

```
awplus#show arp
```

| IP Address  | MAC Address    | Interface | Port       | Type    |
|-------------|----------------|-----------|------------|---------|
| 10.100.0.56 | 0100.5e7f.0038 | vlan200   | igmp-group | dynamic |

**Examples** To enable support for MS-NLB in unicast mode on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# no platform load-balancing src-dst-mac
awplus(config)# interface vlan2
awplus(config-if)# arp-mac-disparity unicast
```

To disable support for MS-NLB in unicast mode on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no arp-mac-disparity unicast
```

**Related commands**

- platform multicast-address-mismatch-action**
- show arp**

## arp

**Overview** This command adds a static ARP entry to the ARP cache. This is typically used to add entries for hosts that do not support ARP or to speed up the address resolution function for a host. The ARP entry must not already exist. Use the **alias** parameter to allow your device to respond to ARP requests for this IP address.

The **no** variant of this command removes the static ARP entry. Use the **clear arp-cache** to remove the dynamic ARP entries in the ARP cache.

**Syntax** `arp <ip-addr> <mac-address> [<port-number>] [alias]`  
`arp <ip-addr> <multicast-mac-address> [<port-list>]`  
`no arp <ip-addr>`

| Parameter                                  | Description                                                                                                                                          |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-addr&gt;</code>               | The IPv4 address of the device you are adding as a static ARP entry.                                                                                 |
| <code>&lt;mac-address&gt;</code>           | The MAC address of the device you are adding as a static ARP entry, in hexadecimal notation with the format HHHH.HHHH.HHHH.                          |
| <code>&lt;port-number&gt;</code>           | The port number associated with the IP address. Specify this when the IP address is part of a VLAN.                                                  |
| <code>&lt;multicast-mac-address&gt;</code> | The multicast MAC address for which you are adding a static ARP entry, in hexadecimal notation with the format HHHH.HHHH.HHHH.                       |
| <code>&lt;port-list&gt;</code>             | The list of port numbers associated with the IP address. You can only specify multiple egress ports when the MAC address is a multicast MAC address. |
| <code>alias</code>                         | Allows your device to respond to ARP requests for the IP address. Proxy ARP must be enabled on the interface before using this parameter.            |

**Mode** Global Configuration

**Usage notes** One use of this command is to limit packet flooding when using services like Microsoft Network Load Balancing (MS-NLB). With such services, packets destined for server cluster virtual address must be sent to all servers in the cluster. The server cluster can operate in multicast mode, in which it uses a multicast MAC address. To support this, this command allows you to create a static ARP entry with a multicast MAC address, and specify which ports the packets will be forwarded out.

Creating a static ARP entry enables the switch to correctly forward server cluster traffic. If you want the switch to also respond to pings from the server cluster, you need to also enable server cluster support, using the **arp-mac-disparity** command.

**Examples** To add the IP address 10.10.10.9 with the MAC address 0010.2533.4566 into the ARP cache, and have your device respond to ARP requests for this address, use the commands:

```
awplus# configure terminal
awplus(config)# arp 10.10.10.9 0010.2533.4566 alias
```

**Related commands** **arp-mac-disparity**  
**clear arp-cache**  
**show arp**

## arp log

**Overview** This command enables the logging of dynamic and static ARP entries in the ARP cache. The ARP cache contains mappings of device ports, VLAN IDs, and IP addresses to physical MAC addresses for hosts.

This command can display the MAC addresses in the ARP log either using the notation HHHH.HHHH.HHHH, or using the IEEE standard hexadecimal notation (HH-HH-HH-HH-HH-HH).

Use the **no** variant of this command to disable the logging of ARP entries.

**Syntax** `arp log [mac-address-format ieee]`  
`no arp log [mac-address-format ieee]`

| Parameter                            | Description                                                                                                                                    |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>mac-address-format ieee</code> | Display the MAC address in the standard IEEE format (HH-HH-HH-HH-HH-HH), instead of displaying the MAC address with the format HHHH.HHHH.HHHH. |

**Default** The ARP logging feature is disabled by default.

**Mode** Global Configuration

**Usage notes** You have the option to change how the MAC address is displayed in the ARP log message. The output can either use the notation HHHH.HHHH.HHHH or HH-HH-HH-HH-HH-HH.

Enter **arp log** to use HHHH.HHHH.HHHH notation.

Enter **arp log mac-address-format ieee** to use HH-HH-HH-HH-HH-HH notation.

Enter **no arp log mac-address-format ieee** to revert from HH-HH-HH-HH-HH-HH to HHHH.HHHH.HHHH.

Enter **no arp log** to disable ARP logging.

To display ARP log messages use the command **show log | include ARP\_LOG**.

**Examples** To enable ARP logging and specify that the MAC address in the log message is displayed in HHHH.HHHH.HHHH notation, use the following commands:

```
awplus# configure terminal
awplus(config)# arp log
```

To disable ARP logging on the device, use the following commands:

```
awplus# configure terminal
awplus(config)# no arp log
```

To enable ARP logging and specify that the MAC address in the log message is displayed in the standard IEEE format hexadecimal notation (HH-HH-HH-HH-HH-HH), use the following commands:

```
awplus# configure terminal
awplus(config)# arp log mac-address-format ieee
```

To leave ARP logging enabled, but stop using HH-HH-HH-HH-HH-HH format and use HHHH.HHHH.HHHH format instead, use the following commands:

```
awplus# configure terminal
awplus(config)# no arp log mac-address-format ieee
```

To display ARP log messages, use the following command:

```
awplus# show log | include ARP_LOG
```

**Output** The following shows typical output.

**Output from show log | include ARP\_LOG after enabling ARP logging using arp log. Note that this output uses HHHH.HHHH.HHHH format.**

```
awplus#configure terminal
awplus(config)#arp log
awplus(config)#exit
awplus#show log | include ARP_LOG

```

The following table lists the parameters shown in the output of the **show log | include ARP\_LOG** command. The ARP log message format is:

<date> <time> <severity> <hostname> <program-name>  
ARP\_LOG <port-number> <vid> <operation> <MAC> <IP>

**Parameters in the output from show log | include ARP\_LOG**

| Parameter     | Description                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ARP_LOG       | Indicates that ARP log entry information follows.                                                                                                                     |
| <port-number> | Indicates device port number for the ARP log entry.                                                                                                                   |
| <vid>         | Indicates the VLAN ID for the ARP log entry.                                                                                                                          |
| <operation>   | Indicates “add” if the ARP log entry displays an ARP addition. Indicates “del” if the ARP log entry displays an ARP deletion.                                         |
| <MAC>         | Indicates the MAC address for the ARP log entry, either in the default hexadecimal notation (HHHH.HHHH.HHHH) or in the IEEE standard format hexadecimal notation (HH- |

| Parameter | Description                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------|
|           | HH-HH-HH-HH-HH) as specified with the <b>arp log</b> or the <b>arp log mac-address-format ieee</b> command. |
| <IP>      | Indicates the IP address for the ARP log entry.                                                             |

[show running-config](#)

# arp opportunistic-nd

**Overview** Use this command to enable opportunistic neighbor discovery for the global ARP cache. This command changes the behavior for unsolicited ARP packet forwarding on the device.

**CAUTION:** *Opportunistic neighbor discovery can make your device more vulnerable to ARP/ND cache poisoning attacks. We recommend disabling it unless necessary.*

Use the **no** variant of this command to disable opportunistic neighbor discovery for the global ARP cache.

**Syntax** arp opportunistic-nd  
no arp opportunistic-nd

**Default** Opportunistic neighbor discovery is disabled by default.

**Mode** Global Configuration

**Usage notes** When opportunistic neighbor discovery is enabled, the device will reply to any received unsolicited ARP packets (but not gratuitous ARP packets). The source MAC address for the unsolicited ARP packet is added to the ARP cache, so the device forwards the ARP packet. When opportunistic neighbor discovery is disabled, the source MAC address for the ARP packet is not added to the ARP cache, so the ARP packet is not forwarded by the device.

**Examples** To enable opportunistic neighbor discovery for the global ARP cache, enter:

```
awplus# configure terminal
awplus(config)# arp opportunistic-nd
```

To disable opportunistic neighbor discovery for the global ARP cache, enter:

```
awplus# configure terminal
awplus(config)# no arp opportunistic-nd
```

[show arp](#)  
[show running-config interface](#)

# arp-loose-check

**Overview** Use this command to let AlliedWare Plus process ARPs that have a sender protocol address from outside the interface's local subnets.

Use the **no** variant of this command to return to the default ARP processing behavior. By default, AlliedWare Plus will only process ARP packets that are local to the incoming interface.

**Syntax** arp- loose-check  
no arp- loose-check

**Default** Disabled.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** By default, AlliedWare Plus will only process ARP packets that are local to the incoming interface, to prevent ARP poisoning. This means the packets must have:

- a sender protocol address inside one of the incoming interface's local subnets, and
- a target protocol address equal to one of the incoming interface's IP addresses.

If you enable loose ARP processing and then use the **no** variant of this command to return to default processing, you may need to clear the ARP cache. Use the **clear arp-cache** command. This will remove any undesired existing ARPs.

**Example** To process ARPs that have a sender protocol address from outside vlan2's local subnets, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# arp- loose-check
```

To return to the default behavior on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no arp- loose-check
```

**Related commands** **arp**  
**clear arp-cache**  
**show arp**

**Command changes** Version 5.5.2-0.1: command added

## arp-reply-bc-dmac

**Overview** Use this command to allow processing of ARP replies that arrive with a broadcast destination MAC (ffff.ffff.ffff). This makes neighbors reachable if they send ARP responses that contain a broadcast destination MAC.

Use the **no** variant of this command to turn off processing of ARP replies that arrive with a broadcast destination MAC.

**Syntax** arp-reply-bc-dmac  
no arp-reply-bc-dmac

**Default** By default, this functionality is disabled.

**Mode** Interface Configuration for VLAN interfaces.

**Example** To allow processing of ARP replies that arrive on vlan2 with a broadcast destination MAC, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# arp-reply-bc-dmac
```

**Related commands** [clear arp-cache](#)  
[show arp](#)

# clear arp-cache

**Overview** This command deletes dynamic ARP entries from the ARP cache. You can optionally specify the IPv4 address of an ARP entry to be cleared from the ARP cache.

**Syntax** clear arp-cache [*<ip-address>*]

| Parameter                 | Description                                                                |
|---------------------------|----------------------------------------------------------------------------|
| <i>&lt;ip-address&gt;</i> | The IPv4 address of an ARP entry that is to be cleared from the ARP cache. |

**Mode** Privileged Exec

**Usage notes** To display the entries in the ARP cache, use the [show arp](#) command. To remove static ARP entries, use the no variant of the [arp](#) command.

**Example** To clear all dynamic ARP entries, use the command:

```
awplus# clear arp-cache
```

To clear all dynamic ARP entries associated with the IPv4 address 192.168.1.1, use the command:

```
awplus# clear arp-cache 192.168.1.1
```

**Related commands** [arp-mac-disparity](#)

# debug ip packet interface

**Overview** The **debug ip packet interface** command enables IP packet debug and is controlled by the **terminal monitor** command.

If the optional **icmp** keyword is specified then ICMP packets are shown in the output.

The **no** variant of this command disables the **debug ip packet interface** command.

**Syntax** debug ip packet interface {<interface-name>|all} [address <ip-address>|verbose|hex|arp|udp|tcp|icmp]  
no debug ip packet interface [<interface-name>]

| Parameter        | Description                                                                                                                                                                                                                |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface-name> | Specify a single Layer 3 interface name (not a range of interfaces)<br><br>This keyword can be specified as either all or as a single Layer 3 interface to show debugging for either all interfaces or a single interface. |
| all              | Specify all Layer 3 interfaces on the device.                                                                                                                                                                              |
| <ip-address>     | Specify an IPv4 address.<br><br>If this keyword is specified, then only packets with the specified IP address as specified in the ip-address placeholder are shown in the output.                                          |
| verbose          | Specify <b>verbose</b> to output more of the IP packet.<br><br>If this keyword is specified then more of the packet is shown in the output.                                                                                |
| hex              | Specify <b>hex</b> to output the IP packet in hexadecimal.<br><br>If this keyword is specified, then the output for the packet is shown in hex.                                                                            |
| arp              | Specify <b>arp</b> to output ARP protocol packets.<br><br>If this keyword is specified, then ARP packets are shown in the output.                                                                                          |
| udp              | Specify <b>udp</b> to output UDP protocol packets.<br><br>If this keyword is specified then UDP packets are shown in the output.                                                                                           |
| tcp              | Specify <b>tcp</b> to output TCP protocol packets.<br><br>If this keyword is specified, then TCP packets are shown in the output.                                                                                          |
| icmp             | Specify <b>icmp</b> to output ICMP protocol packets.<br><br>If this keyword is specified, then ICMP packets are shown in the output.                                                                                       |

**Mode** Privileged Exec and Global Configuration

**Examples** To turn on ARP packet debugging on vlan2, use the command:

```
awplus# debug ip packet interface vlan2 arp
```

To turn off IP packet interface debugging on interface vlan2, use the command:

```
awplus# no debug ip packet interface vlan2
```

To turn on all packet debugging on all interfaces on the device, use the command:

```
awplus# debug ip packet interface all
```

To turn off IP packet interface debugging on all interfaces, use the command:

```
awplus# no debug ip packet interface
```

To turn on TCP packet debugging on vlan2 and IP address 192.168.2.4, use the command:

```
awplus# debug ip packet interface vlan2 address 192.168.2.4 tcp
```

## debug ip irdp

**Overview** This command enables debugging of ICMP Router Discovery Protocol (IRDP) events and messages on your device. IRDP debugging is disabled by default.

The **no** variant of this command disables IRDP debugging. Negating any packet debug mode will switch detail off.

**Syntax** debug ip irdp {event|nsm|receive|send|both|detail|all}  
no debug ip irdp {event|nsm|receive|send|both|detail|all}

| Parameter Description |                                                                                                                                                                                                                                                                |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| event                 | Enables debugging of IRDP events.                                                                                                                                                                                                                              |
| nsm                   | Enables debugging of IRDP processing of NSM messages.                                                                                                                                                                                                          |
| receive               | Enables debugging of IRDP input packet processing.                                                                                                                                                                                                             |
| send                  | Enables debugging of IRDP output packet processing.                                                                                                                                                                                                            |
| both                  | Enables debugging of both IRDP input and output packet processing.                                                                                                                                                                                             |
| detail                | Enables detailed debugging of both IRDP input and output packet processing. Note that setting detail also sets both, so if you set <b>detail</b> , the output will show "packet debugging mode is all". Negating any packet debug mode will switch detail off. |
| all                   | Enables all IRDP debugging types.                                                                                                                                                                                                                              |

**Default** IRDP protocol debugging is disabled by default.

**Mode** Privileged Exec and Global Configuration

**Examples** To enable IRDP input packet process debugging, use the following command:

```
awplus# debug ip irdp receive
```

To disable all IRDP debugging, use the following command:

```
awplus# no debug ip irdp all
```

**Related commands**

- ip irdp**
- router ip irdp**
- show ip irdp**
- undebug ip irdp**

# ip address (IP Addressing and Protocol)

**Overview** This command sets a static IP address on an interface.

The **no** variant of this command removes the IP address from the interface.

You cannot remove the primary address when a secondary address is present.

**Syntax** `ip address <ip-addr/prefix-length> [secondary] [label <label>]`  
`no ip address [<ip-addr/prefix-length>] [secondary]`

| Parameter                                  | Description                                                                                                      |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ip-addr/prefix-length&gt;</code> | The IPv4 address and prefix length you are assigning to the interface.                                           |
| <code>secondary</code>                     | Secondary IP address.                                                                                            |
| <code>label</code>                         | Adds a user-defined description of the secondary IP address.                                                     |
| <code>&lt;label&gt;</code>                 | A user-defined description of the secondary IP address. Valid characters are any printable character and spaces. |

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** To set the primary IP address on the interface, specify only **ip address** `<ip-addr/prefix-length>`. This overwrites any configured primary IP address. To add additional IP addresses on this interface, use the **secondary** parameter. You must configure a primary address on the interface before configuring a secondary address.

**NOTE:** Use `show ip interface`, instead of `show ip address`, when you need to view a secondary address configured on an interface. `show ip address` will only show the primary address, not a secondary address for an interface.

**Examples** To add the IP address 10.10.10.50/24 to the interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip address 10.10.10.50/24
```

To add the secondary IP address 10.10.11.50/24 to the same interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip address 10.10.11.50/24 secondary
```

To add the IP address 10.10.11.50/24 to the local loopback interface lo, use the following commands:

```
awplus# configure terminal
awplus(config)# interface lo
awplus(config-if)# ip address 10.10.11.50/24
```

**Related commands** **interface (to configure)**  
**show ip interface**  
**show running-config interface**

# ip forwarding

**Overview** This command enables IP forwarding on your device. When enabled, your device routes IP packets.

The **no** variant of this command disables IP forwarding on your device. Even when IP forwarding is not enabled, the device can still work as an IP host; in particular, it can be managed by IP-based applications, such as SNMP, Telnet and SSH.

**Syntax** ip forwarding  
no ip forwarding

**Default** IP forwarding is enabled by default.

**Mode** Global Configuration

**Examples** To enable your device to route IP packets, use the commands:

```
awplus# configure terminal
awplus(config)# ip forwarding
```

To stop your device from routing IP packets, use the commands

```
awplus# configure terminal
awplus(config)# no ip forwarding
```

**Related commands** [show ip forwarding](#)

## ip gratuitous-arp-link

**Overview** This command sets the Gratuitous ARP time limit for all interfaces. The time limit restricts the sending of Gratuitous ARP packets to one Gratuitous ARP packet within the time in seconds.

The **no** variant of the command sets the Gratuitous ARP time limit to the default.

**NOTE:** This command specifies time between sequences of Gratuitous ARP packets, and time between individual Gratuitous ARP packets occurring in a sequence, to allow legacy support for older devices and inter-operation between other devices that are not ready to receive and forward data until several seconds after linkup.

Additionally, jitter has been applied to the delay following linkup, so Gratuitous ARP packets applicable to a given port are spread over a period of 1 second so are not all sent at once. Remaining Gratuitous ARP packets in the sequence occur after a fixed delay from the first one.

**Syntax** ip gratuitous-arp-link <0-300>  
no ip gratuitous-arp-link

| Parameter | Description                                                                                                                                                                                                                             |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <0-300>   | Specify the minimum time between sequences of Gratuitous ARPs and the fixed time between Gratuitous ARPs occurring in a sequence, in seconds.<br><br>0 disables the sending of Gratuitous ARP packets.<br><br>The default is 8 seconds. |

**Default** The default Gratuitous ARP time limit for all interfaces is 8 seconds.

**Mode** Global Configuration

**Usage** Every switchport will send a sequence of 3 Gratuitous ARP packets to each VLAN that the switchport is a member of, whenever the switchport moves to the forwarding state. The first Gratuitous ARP packet is sent 1 second after the switchport becomes a forwarding switchport. The second and third Gratuitous ARP packets are each sent after the time period specified by the Gratuitous ARP time limit.

Additionally, the Gratuitous ARP time limit specifies the minimum time between the end of one Gratuitous ARP sequence and the start of another Gratuitous ARP sequence. When a link is flapping, the switchport's state is set to forwarding several times. The Gratuitous ARP time limit is imposed to prevent Gratuitous ARP packets from being sent undesirably often.

**Examples** To disable the sending of Gratuitous ARP packets, use the commands :

```
awplus# configure terminal
```

```
awplus(config)# ip gratuitous-arp-link 0
```

To restrict the sending of Gratuitous ARP packets to one every 20 seconds, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# ip gratuitous-arp-link 20
```

**Related Commands** [show running-config](#)

## ip irdp

**Overview** This command enables ICMP Router Discovery advertising on an interface. However, the interface does not send or process Router Discovery messages until at least one IP address is configured on the interface with the **ip address (IP Addressing and Protocol)** command.

The **no** variant of this command disables ICMP Router Discovery advertisements on an IP interface. All transmitting and processing of Router Discovery messages ceases immediately on the interface.

**Syntax** ip irdp  
no ip irdp

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To enable Router Discovery advertisements on v lan4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface v lan4
awplus(config-if)# ip irdp
```

To disable Router Discovery advertisements on v lan4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface v lan4
awplus(config-if)# no ip irdp
```

**Related commands** **ip address (IP Addressing and Protocol)**  
**show ip irdp**  
**show ip irdp interface**

## ip icmp error-interval

**Overview** Use this command to limit how often IPv4 ICMP error messages are sent. The maximum frequency of messages is specified in milliseconds. Use the **no** variant of this command to reset the frequency to the default.

**Syntax** `ip icmp error-interval <interval>`  
`no ip icmp error-interval`

| Parameter                     | Description                             |
|-------------------------------|-----------------------------------------|
| <code>&lt;interval&gt;</code> | 0-2147483647, interval in milliseconds. |

**Default** 1000

**Mode** Global Configuration

**Example** To configure the rate to be at most one packet every 10 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip icmp error-interval 10000
```

To reset the rate to the default of one packet every second, use the commands:

```
awplus# configure terminal
awplus(config)# no ip icmp error-interval
```

**Related commands** [ipv6 icmp error-interval](#)

## ip icmp-timestamp

**Overview** Use this command to allow ICMP timestamp request and response packets.

Use the **no** variant of this command to drop ICMP timestamp request and response packets.

You may wish to drop these packets because the ICMP timestamp response contains the device's date and time. This information could theoretically be used against some systems to exploit weak time-based random number generators in other services. In addition, it may be possible to fingerprint devices by analyzing their responses to invalid ICMP timestamp requests.

**Syntax** `ip icmp-timestamp`  
`no ip icmp-timestamp`

**Default** Allowed

**Mode** Global Configuration

**Example** To drop ICMP timestamp packets, use the commands:

```
awplus# configure terminal
awplus(config)# no ip icmp-timestamp
```

To allow ICMP timestamp packets again, use the commands:

```
awplus# configure terminal
awplus(config)# ip icmp-timestamp
```

## ip irdp address preference

**Overview** When multiple routers connected to a LAN are all sending Router Discovery advertisements, hosts need to be able to choose the best router to use. Therefore the IRDP defines a preference value to place in the Router Discovery advertisements. Hosts choose the router with the highest preference value.

This command sets the preference value to include in Router Discovery advertisements sent for the specified IP address.

The **no** variant of this command sets the preference for a specific address to the default of **0**.

**Syntax** `ip irdp address <ip-address> preference <0-2147483647>`  
`no ip irdp address <ip-address> preference`

| Parameter      | Description                                                                                       |
|----------------|---------------------------------------------------------------------------------------------------|
| <ip-address>   | The IP address to be advertised with the specified preference value.                              |
| <0-2147483647> | The preference value advertised. A higher number increases the preference level for this address. |

**Default** The default preference value is 0.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the preference value to 3000 for the address 192.168.1.1 advertised on vlan5, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ip irdp address 192.168.1.1 preference 3000
```

To set the preference value to the default of 0 for the address 192.168.1.1 advertised on vlan5, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# no ip irdp address 192.168.1.1 preference
```

**Related commands** [ip irdp](#)  
[ip irdp preference](#)  
[show ip irdp interface](#)

## ip irdp broadcast

**Overview** This command configures broadcast Router Discovery advertisements on an interface. The interface sends IRDP advertisements with the broadcast address (255.255.255.255) as the IP destination address.

The **no** variant of this command configures multicast Router Discovery advertisements on an interface. The interface sends IRDP advertisements with the all-system multicast address (224.0.0.1) as the IP destination address.

**Syntax** ip irdp broadcast  
no ip irdp broadcast

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To enable broadcast Router Discovery advertisements on vlan13, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan13
awplus(config-if)# ip irdp broadcast
```

To enable multicast Router Discovery advertisements on vlan13, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan13
awplus(config-if)# no ip irdp broadcast
```

**Related commands** [ip irdp](#)  
[ip irdp multicast](#)  
[show ip irdp interface](#)

## ip irdp holdtime

**Overview** This command sets the maximum length of time that the advertised addresses are to be considered as valid router addresses by hosts.

The **no** variant of this command resets the holdtime back to the default of 1800 seconds.

**Syntax** ip irdp holdtime <0-9000>  
no ip irdp holdtime

| Parameter | Description                                            |
|-----------|--------------------------------------------------------|
| <0-9000>  | The holdtime value in seconds of addresses advertised. |

**Default** The IRDP holdtime is set to 1800 seconds (30 minutes) by default.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the holdtime value of addresses advertised on v lan2 to 4000 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip irdp holdtime 4000
```

To set the holdtime value of addresses advertised on v lan2 back to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip irdp holdtime
```

**Related commands** [show ip irdp interface](#)

## ip irdp lifetime

**Overview** This command sets the maximum length of time that hosts should consider the Router Discovery advertised addresses as valid router addresses. If you change the lifetime value, also change the **maxadvertisementinterval** and the **minadvertisementinterval** to maintain the following ratios:

This command is synonymous with the **ip irdp hostname<0-9000>** command.

The **no** variant of this command sets the lifetime back to the default of 1800 seconds.

**Syntax** `ip irdp lifetime <0-9000>`  
`no ip irdp lifetime`

| Parameter                   | Description                                            |
|-----------------------------|--------------------------------------------------------|
| <code>&lt;0-9000&gt;</code> | Lifetime value in seconds of the advertised addresses. |

**Default** The lifetime value is 1800 seconds.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the lifetime value to 4000 seconds for addresses advertised on `vlan6`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan6
awplus(config-if)# ip irdp lifetime 4000
```

To set the lifetime value to the default of 1800 seconds for addresses advertised on `vlan6`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan6
awplus(config-if)# no ip irdp lifetime
```

**Related commands** [ip irdp](#)  
[ip irdp maxadvertinterval](#)  
[ip irdp minadvertinterval](#)  
[show ip irdp interface](#)

## ip irdp maxadvertinterval

**Overview** This command sets the maximum time allowed between sending router advertisements from the interface. If you change the **maxadvertisementinterval** value, also change the **lifetime** and the **minadvertisementinterval** to maintain the following ratios:

```
lifetime=3 x  
maxadvertisementinterval  
  
minadvertisementinterval=0.75  
x  
maxadvertisementinterval
```

You cannot set the maximum advertisement interval below the minimum interval. If you are lowering the maximum interval to a value below the current minimum interval, you must change the minimum value first.

The **no** variant of this command sets the **maxadvertinterval** back to the default of 600 seconds.

**Syntax** ip irdp maxadvertinterval <4-1800>  
no ip irdp maxadvertinterval

| Parameter | Description                                                            |
|-----------|------------------------------------------------------------------------|
| <4-1800>  | The maximum time, in seconds, between Router Discovery advertisements. |

**Default** The IRDP maximum advertisement interval is set to 600 seconds (10 minutes) by default.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the maximum interval between Router Discovery advertisements on vlan7 to 950 seconds, use the following commands:

```
awplus# configure terminal  
awplus(config)# interface vlan7  
awplus(config-if)# ip irdp maxadvertinterval 950
```

To set the maximum interval between advertisements on vlan7 back to the default, use the following commands:

```
awplus# configure terminal  
awplus(config)# interface vlan7  
awplus(config-if)# no ip irdp maxadvertinterval
```

**Related commands**

- ip irdp**
- ip irdp lifetime**
- ip irdp minadvertinterval**
- show ip irdp interface**

## ip irdp minadvertinterval

**Overview** This command sets the minimum time allowed between sending router advertisements from the interface. If you change the **minadvertisementinterval** value, also change the **lifetime** and the **maxadvertisementinterval** to maintain the following ratios:

```
lifetime=3 x
maxadvertisementinterval

minadvertisementinterval=0.75
x
maxadvertisementinterval
```

You cannot set the minimum advertisement interval above the maximum interval. If you are raising the minimum interval to a value above the current maximum interval, you must change the maximum value first.

The **no** variant of this command sets the **minadvertinterval** back to the default of 450 seconds.

**Syntax** ip irdp minadvertinterval <3-1800>  
no ip irdp minadvertinterval

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| <3-1800>  | The minimum time between advertisements in seconds. |

**Default** The IRDP minimum advertisement interval is set to 450 seconds (7.5 minutes) by default.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the minimum interval between advertisements on `vlan4` to 900 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# ip irdp minadvertinterval 900
```

To set the minimum interval between advertisements on `vlan4` back to the default of 450 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan4
awplus(config-if)# no ip irdp minadvertinterval
```

**Related commands**

- ip irdp**
- ip irdp lifetime**
- ip irdp maxadvertinterval**
- show ip irdp interface**

## ip irdp multicast

**Overview** This command configures multicast Router Discovery advertisements on an interface. The interface sends IRDP advertisements with the all-system multicast address (224.0.0.1) as the IP destination address.

The **no** variant of this command configures broadcast Router Discovery advertisements on an interface. The interface sends IRDP advertisements with the broadcast address (255.255.255.255) as the IP destination address.

The multicast address is the default IP destination address for Router Discovery advertisements.

**Syntax** `ip irdp multicast`  
`no ip irdp multicast`

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To enable multicast Router Discovery advertisements on `vlan5`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# ip irdp multicast
```

To enable broadcast Router Discovery advertisements on `vlan5`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan5
awplus(config-if)# no ip irdp multicast
```

**Related commands** [ip irdp](#)  
[ip irdp broadcast](#)  
[show ip irdp interface](#)

## ip irdp preference

**Overview** When multiple routers connected to a LAN are all sending Router Discovery advertisements, hosts need to be able to choose the best router to use. Therefore the IRDP defines a preference value to place in the Router Discovery advertisements. Hosts choose the router with the highest preference value.

This command sets the preference value to include in Router Discovery advertisements sent for the specified interface.

When this command is used, all IP addresses on the interface are assigned the same preference value, except the addresses that have specific preference value assignment using the command **ip irdp address preference**.

The **no** variant of this command sets the preference value to the default of 0.

**Syntax** ip irdp preference <0-2147483647>  
no ip irdp preference

| Parameter      | Description                                                                                                                     |
|----------------|---------------------------------------------------------------------------------------------------------------------------------|
| <0-2147483647> | The preference value for the interface. A higher number increases the preference level for addresses on the specific interface. |

**Default** The default preference value is 0.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the preference of addresses advertised on vlan6 to 500, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan6
awplus(config-if)# ip irdp preference 500
```

To set the preference value for addresses on vlan6 back to the default of 0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan6
awplus(config-if)# no ip irdp preference
```

**Related commands** **ip irdp**  
**ip irdp address preference**  
**show ip irdp interface**

## ip redirects

**Overview** This command enables the device to send ICMP redirects on one or more interfaces.

Use the **no** variant of this command to stop the device from sending ICMP redirects on one or more interfaces.

**Syntax** ip redirects  
no ip redirects

**Default** ICMP redirects are disabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** ICMP redirect messages are used to notify hosts that a better route is available to a destination.

ICMP redirects are used when a packet is routed into the device on the same interface that the packet is routed out of the device. ICMP redirects are only sent to packet sources that are directly connected to the device.

**Examples** To enable the device to send ICMP redirects on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip redirects
```

To stop the device from sending ICMP redirects on interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip redirects
```

## ip tcp synack-retries

**Overview** Use this command to specify how many times the switch will retry sending a SYN ACK for a TCP connection for which it has received a SYN but not an ACK. Such connections are called half-open TCP connections. This command allows you to influence how long half-open TCP connections take to time out.

Use the **no** variant of this command to return to the default setting of 5 retries.

**Syntax** ip tcp synack-retries <0-255>  
no ip tcp synack-retries

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| <0-255>   | Number of times to retry sending the SYN ACK |

**Default** 5 retries

**Mode** Global Configuration

**Usage notes** The following table shows the approximate correlation between the number of retries and the time half-open TCP connections take to time out.

| Number of retries | Approximate lower bound for the timeout |
|-------------------|-----------------------------------------|
| 0 retries         | 1 second                                |
| 1 retry           | 3 seconds                               |
| 2 retries         | 7 seconds                               |
| 3 retries         | 15 seconds                              |
| 4 retries         | 31 seconds                              |
| 5 retries         | 63 seconds                              |

**Example** To retry twice, which leads to a timeout of approximately 7 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip tcp synack-retries 2
```

**Related commands** [show running-config](#)

**Command changes** Version 5.4.7-0.2: command added

# ip tcp-timestamp

**Overview** Use this command to enable TCP timestamp responses.

Use the **no** variant of this command to disable TCP timestamp responses.

You may wish to disable timestamp responses because TCP timestamps may allow other parties to remotely calculate the system uptime and boot time of the device and the device's clock. To prevent this information leaking to potential attackers, we recommend you disable TCP timestamps on the device, unless you need to use them.

**Syntax** `ip tcp-timestamp`  
`no ip tcp-timestamp`

**Default** Enabled

**Mode** Global Configuration

**Example** To disable TCP timestamp responses, use the commands:

```
awplus# configure terminal
awplus(config)# no ip tcp-timestamp
```

To enable TCP timestamp responses again, use the commands:

```
awplus# configure terminal
awplus(config)# ip tcp-timestamp
```

**Related commands** [ip icmp-timestamp](#)

**Command changes** Version 5.5.2-0.1: command added

## ip unreachable

**Overview** Use this command to enable ICMP (Internet Control Message Protocol) type 3, destination unreachable, messages.

Use the **no** variant of this command to disable destination unreachable messages. This prevents an attacker from using these messages to discover the topology of a network.

**Syntax** ip unreachable  
no ip unreachable

**Default** Destination unreachable messages are enabled by default.

**Mode** Global Configuration

**Usage notes** When a device receives a packet for a destination that is unreachable it returns an ICMP type 3 message, this message includes a reason code, as per the table below. An attacker can use these messages to obtain information regarding the topology of a network. Disabling destination unreachable messages, using the **no ip unreachable** command, secures your network against this type of probing.

**NOTE:** *Disabling ICMP destination unreachable messages breaks applications such as traceroute and Path MTU Discovery (PMTUD), which depend on these messages to operate correctly.*

### ICMP type 3 reason codes and description

| Code | Description [RFC]                                  |
|------|----------------------------------------------------|
| 0    | Network unreachable [RFC792]                       |
| 1    | Host unreachable [RFC792]                          |
| 2    | Protocol unreachable [RFC792]                      |
| 3    | Port unreachable [RFC792]                          |
| 4    | Fragmentation required, and DF flag set [RFC792]   |
| 5    | Source route failed [RFC792]                       |
| 6    | Destination network unknown [RFC1122]              |
| 7    | Destination host unknown [RFC1122]                 |
| 8    | Source host isolated [RFC1122]                     |
| 9    | Network administratively prohibited [RFC768]       |
| 10   | Host administratively prohibited [RFC869]          |
| 11   | Network unreachable for Type of Service [RFC908]   |
| 12   | Host unreachable for Type of Service [RFC938]      |
| 13   | Communication administratively prohibited [RFC905] |
| 14   | Host Precedence Violation [RFC1812]                |
| 15   | Precedence cutoff in effect [RFC1812]              |

**Example** To disable destination unreachable messages, use the commands

```
awplus# configure terminal  
awplus(config)# no ip unreachable
```

To enable destination unreachable messages, use the commands

```
awplus# configure terminal  
awplus(config)# ip unreachable
```

# ping

**Overview** This command sends a query to another IPv4 host (send Echo Request messages).

**Syntax** `ping [ip] <host> [broadcast] [df-bit {yes|no}] [interval <0-128>] [pattern <hex-data-pattern>] [repeat {<1-2147483647>|continuous}] [size <36-18024>] [source <ip-addr>] [timeout <1-65535>] [tos <0-255>]`

| Parameter                  | Description                                                                                                                                                                                                          |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <host>                     | The destination IP address or hostname.                                                                                                                                                                              |
| broadcast                  | Allow pinging of a broadcast address.                                                                                                                                                                                |
| df-bit                     | Enable or disable the do-not-fragment bit in the IP header.                                                                                                                                                          |
| interval <0-128>           | Specify the time interval in seconds between sending ping packets. The default is 1. You can use decimal places to specify fractions of a second. For example, to ping every millisecond, set the interval to 0.001. |
| pattern <hex-data-pattern> | Specify the hex data pattern.                                                                                                                                                                                        |
| repeat                     | Specify the number of ping packets to send.                                                                                                                                                                          |
| <1-2147483647>             | Specify repeat count. The default is 5.                                                                                                                                                                              |
| continuous                 | Continuous ping                                                                                                                                                                                                      |
| size <36-18024>            | The number of data bytes to send, excluding the 8 byte ICMP header. The default is 56 (64 ICMP data bytes).                                                                                                          |
| source <ip-addr>           | The IP address of a configured IP interface to use as the source in the IP header of the ping packet.                                                                                                                |
| timeout <1-65535>          | The time in seconds to wait for echo replies if the ARP entry is present, before reporting that no reply was received. If no ARP entry is present, it does not wait.                                                 |
| tos <0-255>                | The value of the type of service in the IP header.                                                                                                                                                                   |

**Mode** User Exec and Privileged Exec

**Example** To ping the IP address 10.10.0.5 use the following command:

```
awplus# ping 10.10.0.5
```

# platform multicast-address-mismatch-action

**Overview** Use this command to change the action taken by the switch when it receives IP multicast packets that have mismatched destination MAC address and destination IP address. Such packets are used by services like Microsoft Network Load Balancing (MS-NLB), in which case they need to be flooded across the switch.

Use the **no** variant of this command to return to the default action.

**Syntax** platform multicast-address-mismatch-action {bridge|drop}  
no platform multicast-address-mismatch-action

| Parameter | Description                                                                 |
|-----------|-----------------------------------------------------------------------------|
| drop      | Drop IP multicast packets with mismatched destination addresses on ingress. |
| bridge    | Flood IP multicast packets with mismatched destination addresses.           |

**Default** The default behavior depends on whether **arp-mac-disparity multicast** or **arp-mac-disparity multicast-igmp** has been configured on an interface:

- If one of these has been configured, then the default action is to flood the packets.
- If neither of these has been configured, then the default action is to drop the packets.

**Mode** Global Configuration

**Example** To ensure that the switch floods packets it receives that have IP multicast packets with mismatched L2/L3 destination addresses, use the commands:

```
awplus# configure terminal
awplus(config)# platform multicast-address-mismatch-action
bridge
```

To return to the default, where the behavior depends on the **arp-mac-disparity** command setting, use the commands:

```
awplus# configure terminal
awplus(config)# no platform multicast-address-mismatch-action
```

**Related** [arp](#)  
**commands** [arp-mac-disparity](#)

**Command** Version 5.4.8-2.1: command added  
**changes**

## router ip irdp

**Overview** This command globally enables ICMP Router Discovery (IRDP) advertisements on your device. However, your device does not send or process IRDP messages until at least one interface is configured to use IP and has had IRDP enabled on the interface with the **ip irdp** command.

The **no** variant of this command globally disables IRDP advertisements on the device. All interfaces immediately stop transmitting and processing Router Discovery messages.

**Syntax** router ip irdp  
no router ip irdp

**Mode** Global Configuration

**Examples** To enable Router Discovery advertisements on your device, use the following commands:

```
awplus# configure terminal
awplus(config)# router ip irdp
```

To disable Router Discovery advertisements on your device, use the following commands:

```
awplus# configure terminal
awplus(config)# no router ip irdp
```

**Related commands** **ip irdp**  
**show ip irdp**

## show arp

**Overview** Use this command to display entries in the ARP routing and forwarding table—the ARP cache contains mappings of IP addresses to physical addresses for hosts. To have a dynamic entry in the ARP cache, a host must have used the ARP protocol to access another host.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show arp

**Mode** User Exec and Privileged Exec

**Usage notes** Running this command with no additional parameters will display all entries in the ARP routing and forwarding table.

**Example** To display all ARP entries in the ARP cache, use the following command:  
awplus# show arp

**Output** The following shows typical output.

### Example output from the show arp command

|                 |                |           |           |         |  |
|-----------------|----------------|-----------|-----------|---------|--|
| awplus#show arp |                |           |           |         |  |
| IP Address      | LL Address     | Interface | Port      | Type    |  |
| 192.168.27.10   | 192.168.4.1    | vlan1     | port1.0.1 | dynamic |  |
| 192.168.27.100  | 0000.daa.fcd24 | vlan1     | port1.0.2 | dynamic |  |
| ...             |                |           |           |         |  |

### Parameters in the output of the show arp command

| Parameter  | Meaning                                                                                                                                                                      |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address | IP address of the network device this entry maps to.                                                                                                                         |
| LL Address | Hardware address of the network device.                                                                                                                                      |
| Interface  | Interface over which the network device is accessed.                                                                                                                         |
| Port       | Physical port that the network device is attached to.                                                                                                                        |
| Type       | Whether the entry is a static or dynamic entry. Static entries are added using the <b>arp</b> command. Dynamic entries are learned from ARP request/reply message exchanges. |

**Related commands** **arp**  
**clear arp-cache**  
**show arp security**

**Command changes** Version 5.4.9-0.1: Link layer addresses now shown as the hardware address (MAC Address output parameter has been renamed to LL Address).

# show debugging ip packet

**Overview** Use this command to see what debugging is turned on for IP interfaces. IP interface debugging is set using the **debug ip packet interface** command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show debugging ip packet

**Mode** User Exec and Privileged Exec

**Example** To display the IP interface debugging status when the terminal monitor is off, use the commands:

```
awplus# terminal no monitor
awplus# show debugging ip packet
```

**Output** The following shows typical output.

**Example output from the show debugging ip packet command with terminal monitor off**

```
awplus#terminal no monitor
awplus#show debugging ip packet
IP debugging status:
interface all tcp (stopped)
...
```

**Example** To display the IP interface debugging status when the terminal monitor is on, use the commands:

```
awplus# terminal monitor
awplus# show debugging ip packet
```

**Output** The following shows typical output.

**Example output from the show debugging ip packet command with terminal monitor on**

```
awplus#terminal monitor
awplus#show debugging ip packet
IP debugging status:
interface all tcp (running)
...
```

**Related** [debug ip packet interface](#)  
**commands** [terminal monitor](#)

# show ip flooding-nexthops

**Overview** Use this command to display the static and dynamic ARP entries in the ARP cache that flood packets to multiple ports.

**Syntax** show ip flooding-nexthops

**Mode** User Exec and Privileged Exec

**Example** To display all of the flooding nexthop entries in the ARP cache, use the command:

```
awplus# show ip flooding-nexthops
```

**Output** The following shows typical output.

## Example output from show ip flooding-nexthops

|                                  |                |           |               |        |
|----------------------------------|----------------|-----------|---------------|--------|
| awplus#show ip flooding-nexthops |                |           |               |        |
| IP Address                       | MAC Address    | Interface | Flooding Mode | Type   |
| 11.11.11.10                      | 0300.0000.0011 | vlan1     | port-group    | static |

**Related commands** [show arp](#)

**Command changes** Version 5.4.8-2.1: command added

# show ip forwarding

**Overview** Use this command to display the IP forwarding status.

**Syntax** show ip forwarding

**Mode** User Exec and Privileged Exec

**Example** awplus# show ip forwarding

**Output** The following shows typical output.

## Example output from the show ip forwarding command

```
awplus#show ip forwarding
IP forwarding is on
```

**Related commands** [ip forwarding](#)

# show ip interface

**Overview** Use this command to display information about interfaces and the IP addresses assigned to them. To display information about a specific interface, specify the interface name with the command.

For information on filtering and saving command output, see the **“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide**.

**Syntax** show ip interface [<interface-list>] [brief]

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface-list> | The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• the loopback interface (lo)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. vlan10-20)</li><li>• a comma-separated list (e.g. vlan1,vlan10-20). Do not mix interface types in a list.</li></ul> The specified interfaces must exist. |

**Mode** User Exec and Privileged Exec

**Examples** To show brief information for the assigned IP address for interface vlan2 use the command:

```
awplus# show ip interface vlan2 brief
```

**Output** The following shows typical output.

## Example output from the show ip interface brief command

| Interface | IP-Address  | Status   | Protocol |
|-----------|-------------|----------|----------|
| port1.0.1 | unassigned  | admin up | down     |
| ...       |             |          |          |
| vlan1     | 192.168.1.1 | admin up | running  |
| ...       |             |          |          |

# show ip irdp

**Overview** This command displays whether IRDP is globally enabled on your device, and the status of the debugging modes.

If the **debug ip irdp** command has been set with the **detail** parameter then the **both** parameter is also set and the output will show “packet debugging mode is all”.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip irdp

**Mode** User Exec and Privileged Exec

**Example** To display global IRDP configuration, use the command:

```
awplus# show ip irdp
```

**Output** The following shows typical output.

## Example output from the show ip irdp command

```
IRDP is enabled
  event debugging is disabled
  nsm debugging is disabled
  packet debugging mode is disabled
```

## Example output from the show ip irdp command with debug ip irdp detail set

```
IRDP is enabled
  event debugging is disabled
  nsm debugging is disabled
  packet debugging mode is all
```

## Example output from the show ip irdp command with debug ip irdp both set

```
IRDP is enabled
  event debugging is disabled
  nsm debugging is disabled
  packet debugging mode is both
```

**Related commands** [debug ip irdp](#)  
[router ip irdp](#)

## show ip irdp interface

**Overview** This command displays the configuration of IRDP on all interfaces, or for a specified interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip irdp interface [*<interface-name>*]

| Parameter                     | Description                                                                         |
|-------------------------------|-------------------------------------------------------------------------------------|
| <i>&lt;interface-name&gt;</i> | Displays the interface status and configuration details of the specified interface. |

**Mode** User Exec and Privileged Exec

**Example** To display the IRDP configuration for `vlan4`, use the command:

```
awplus# show ip irdp interface vlan4
```

**Output** The following shows typical output.

**Example output from the show ip irdp interface command**

|                                   |  |              |                    |
|-----------------------------------|--|--------------|--------------------|
| vlan13 is up, line protocol is up |  |              |                    |
| ICMP Router Discovery Protocol    |  |              |                    |
| Sending mode                      |  | multicast    |                    |
| Router Lifetime                   |  | 1350 seconds |                    |
| Default Preference                |  | 0            |                    |
| Min Adv Interval                  |  | 450 seconds  |                    |
| Max Adv Interval                  |  | 600 seconds  |                    |
| Next advertisement in 551 seconds |  |              |                    |
| Non default prefix preferences    |  |              |                    |
| 192.168.1.1                       |  | preference   | 25000              |
|                                   |  |              |                    |
| In packets                        |  | 0            | Out packets 3      |
| In bad packets                    |  | 0            | Out bad packets 0  |
| In good packets                   |  | 0            | Out good packets 3 |
| In ignored packets                |  | 0            |                    |

**Parameters in the output of the show ip irdp interface command**

| Parameter                      | Description                                                                                                                                                                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sending mode                   | Whether this interface is sending broadcast or multicast router advertisements. This means the destination IP address of router advertisements will be either the multicast address 224.0.0.1, or the broadcast address 255.255.255.255.                                    |
| Router Lifetime                | The lifetime value set for router advertisements sent from this interface. This is the maximum time that other devices should treat the advertised address as valid.                                                                                                        |
| Default Preference             | The preference value for IP addresses as default router addresses, relative to other router addresses on the same subnet. This preference value is used for all IP addresses on this interface, except for those listed under the heading "non default prefix preferences". |
| Min Adv Interval               | Minimum time allowed between sending router advertisements from this interface.                                                                                                                                                                                             |
| Max Adv Interval               | Maximum time allowed between sending router advertisements from this interface.                                                                                                                                                                                             |
| Non default prefix preferences | List of the IP addresses on this interface that have been set with a specific router preference value. These addresses use the preference value listed beside them, rather than the interface's default preference value.                                                   |
| In packets                     | The total number of packets received by IRDP on this interface. IRDP processes all ICMP packets received on this interface.                                                                                                                                                 |
| Out packets                    | The number of packets sent by IRDP on this interface.                                                                                                                                                                                                                       |

| Parameter          | Description                                                                                            |
|--------------------|--------------------------------------------------------------------------------------------------------|
| In bad packets     | The number of packets received by IRDP that it has discarded because they do not conform or corrupted. |
| Out bad packets    | The number of packets that IRDP generated but failed to send to the network layer.                     |
| In good packets    | The number of packets received and processed by IRDP.                                                  |
| Out good packets   | The number of packets generated and successfully sent by IRDP.                                         |
| In ignored packets | The number of incoming packets ignored, like ICMP packets other than IRDP.                             |

**Related commands** [ip irdp](#)  
[show ip irdp](#)

# show ip sockets

**Overview** Use this command to display information about the IP or TCP sockets that are present on the device. It includes TCP and UDP listen sockets, and displays the associated IP address and port.

The information displayed for established TCP sessions includes the remote IP address, port, and session state. Raw IP protocol listen socket information is also displayed for protocols such as ICMP6, which are configured to receive IP packets with the associated protocol number.

For information on filtering and saving command output, see the **[“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)**.

**Syntax** show ip sockets

**Mode** Privileged Exec

**Usage notes** Use this command to verify that the socket being used is opening correctly. If there is a local and remote endpoint, a connection is established with the ports indicated.

Note that this command does not display sockets that are used internally for exchanging data between the various processes that exist on the device and are involved in its operation and management. It only displays sockets that are present for the purposes of communicating with other external devices.

**Example** To display IP sockets currently present on the device, use the command:  
awplus# show ip sockets

**Output** The following shows typical output.

**Example output from show ip sockets**

|                                     |                 |                |        |
|-------------------------------------|-----------------|----------------|--------|
| Socket information                  |                 |                |        |
| Not showing 40 local connections    |                 |                |        |
| Not showing 7 local listening ports |                 |                |        |
| Typ                                 | Local Address   | Remote Address | State  |
| tcp                                 | 0.0.0.0:111     | 0.0.0.0:*      | LISTEN |
| tcp                                 | 0.0.0.0:80      | 0.0.0.0:*      | LISTEN |
| tcp                                 | 0.0.0.0:23      | 0.0.0.0:*      | LISTEN |
| tcp                                 | 0.0.0.0:443     | 0.0.0.0:*      | LISTEN |
| tcp                                 | 0.0.0.0:4743    | 0.0.0.0:*      | LISTEN |
| tcp                                 | 0.0.0.0:873     | 0.0.0.0:*      | LISTEN |
| tcp                                 | :::23           | :::*           | LISTEN |
| udp                                 | 0.0.0.0:111     | 0.0.0.0:*      |        |

| udp                                 | :::161          | :::*           |        |
| raw                                 | 0.0.0.0:112     | 0.0.0.0:*      | 112    |
| raw                                 | :::58           | :::*           | 58     |
| raw                                 | :::112          | :::*           | 112    |

### Parameters in the output from show ip sockets

| Parameter                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Not showing<br><number><br>local<br>connections        | This field refers to established sessions between processes internal to the device, that are used in its operation and management. These sessions are not displayed as they are not useful to the user. <number> is some positive integer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Not showing<br><number><br>local<br>listening<br>ports | This field refers to listening sockets belonging to processes internal to the device, that are used in its operation and management. They are not available to receive data from other devices. These sessions are not displayed as they are not useful to the user. <number> is some positive integer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Typ                                                    | This column displays the type of the socket. Possible values for this column are:<br><br>tcp : IP Protocol 6<br><br>udp : IP Protocol 17<br><br>raw : Indicates that socket is for a non port-orientated protocol (i.e. a protocol other than TCP or UDP) where all packets of a specified IP protocol type are accepted. For raw socket entries the protocol type is indicated in subsequent columns.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Local<br>Address                                       | For TCP and UDP listening sockets this shows the destination IP address and destination TCP or UDP port number for which the socket will receive packets. The address and port are separated by ':'. If the socket will accept packets addressed to any of the device's IP addresses, the IP address will be 0.0.0.0 for IPv4 or :: for IPv6. For active TCP sessions the IP address will display which of the devices addresses the session was established with. For raw sockets this displays the IP address and IP protocol for which the socket will accept IP packets. The address and protocol are separated by ':'. If the socket will accept packets addressed to any of the device's IP addresses, the IP address will be 0.0.0.0 for IPv4 and :: for IPv6. IP Protocol assignments are described at: <a href="http://www.iana.org/assignments/protocol-numbers">www.iana.org/assignments/protocol-numbers</a> |
| Remote<br>Address                                      | For TCP and UDP listening sockets this shows the source IP address (either IPv4 or IPv6) and source TCP or UDP port number for which the socket will accept packets. The address and port are separated by ':'. If the socket will accept packets addressed from any IP address, the IP address will be 0.0.0.0 for IPv4 . This is the usual case for a listening socket. Normally for a listen socket any source port will be accepted. This is indicated by ". For active TCP sessions the IP address will display the remote address and port the session was established with. For raw sockets the entry in this column will be 0.0.0.0: for IPv4 .                                                                                                                                                                                                                                                                  |

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| State     | <p>This column shows the state of the socket. For TCP sockets this shows the state of the TCP state machine. For UDP sockets this column is blank. For raw sockets it contains the IP protocol number. The possible TCP states are:</p> <p>LISTEN<br/>SYN-SENT<br/>SYN-RECEIVED<br/>ESTABLISHED<br/>FIN-WAIT-1<br/>FIN-WAIT-2<br/>CLOSE-WAIT<br/>CLOSING<br/>LAST-ACK<br/>TIME-WAIT<br/>CLOSED</p> <p>RFC793 contains the TCP state machine diagram with Section 3.2 describing each of the states.</p> |

## show ip traffic

**Overview** Use this command to display statistics regarding IP traffic sent and received by all interfaces on the device, showing totals for IP and IPv6 and then broken down into sub-categories such as TCP, UDP, ICMP and their IPv6 equivalents when appropriate.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip traffic

**Mode** Privileged Exec

**Example** To display IP traffic statistics, use the command:

```
awplus# show ip traffic
```

**Output** The following shows typical output.

**Example output from the show ip traffic command**

```
awplus#show ip traffic
IP:
  168475 packets received
  168475 delivered
  208099 sent
  35 dropped due to missing route
  22646409 bytes received
  126783216 bytes sent
  InCsumErrors 0
  InNoECTPkts 168475
  InECT1Pkts 0
  InECT0Pkts 0
  InCEPkts 0
  In107 Destination Unreachable
  Out11 Destination Unreachable
IPv6:
  14 packets received
  14 received packets delivered
  18 packets transmitted
...
ICMP6:
  4 messages sent
...
UDP6:
  Udp6RcvbufErrors 0
...
UDPLite6:
  UdpLite6RcvbufErrors 0
...

TCP:
  8 remote connections established
...
UDP:
  79797 datagrams received
...
UDPLite:
  InCsumErrors 0
...
```

# tcpdump

**Overview** Use this command to start a tcpdump, which gives the same output as the Unix-like **tcpdump** command to display TCP/IP traffic. Press <ctrl> + c to stop a running tcpdump.

**Syntax** tcpdump <line>

| Parameter | Description                                                                                                                                                                          |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <line>    | Specify the dump options. For more information on the options for this placeholder see <a href="http://www.tcpdump.org/tcpdump_man.html">http://www.tcpdump.org/tcpdump_man.html</a> |

**Mode** Privileged Exec

**Example** To start a tcpdump running to capture IP packets, enter the command:  
awplus# tcpdump ip

**Output**

```
03:40:33.221337 IP 192.168.1.1 > 224.0.0.13: PIMv2, Hello,
length: 34
1 packets captured
2 packets received by filter
0 packets dropped by kernel
```

**Related commands** [debug ip packet interface](#)

# traceroute

**Overview** Use this command to trace the route to the specified IPv4 host.

**Syntax** `traceroute {<ip-addr>|<hostname>}`

| Parameter                     | Description                                                             |
|-------------------------------|-------------------------------------------------------------------------|
| <code>&lt;ip-addr&gt;</code>  | The destination IPv4 address. The IPv4 address uses the format A.B.C.D. |
| <code>&lt;hostname&gt;</code> | The destination hostname.                                               |

**Mode** User Exec and Privileged Exec

**Example** `awplus# traceroute 10.10.0.5`

# undebug ip packet interface

**Overview** This command applies the functionality of the no **debug ip packet interface**.

# undebug ip irdp

**Overview** This command applies the functionality of the no **debug ip irdp**.

# Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure the Domain Name Service (DNS) client.

For more information about DNS for Switches, see the **[Domain Name System \(DNS\) for AlliedWare Plus Switches Feature Overview and Configuration Guide](#)**.

# ip dns forwarding domain-list

**Overview** Use this command to create a domain-list that can be used as a suffix-list for DNS lookups. This command puts the device into a new mode where subsequent commands can be entered. The new mode is "Domain List Configuration" mode.

Use the **no** variant of this command to delete the domain-list.

**Syntax** `ip dns forwarding domain-list <domain-list-name>`  
`no ip dns forwarding domain-list <domain-list-name>`

| Parameter                             | Description       |
|---------------------------------------|-------------------|
| <code>&lt;domain-list-name&gt;</code> | Name of the list. |

**Mode** Global Configuration

**Usage notes** The domain list can be used by features that need to match against domains. A domain list by itself does nothing; it must be attached to another feature to have functionality (like a prefix-list). For example, the domain list can be used as a suffix list on an DNS name-server. The DNS server can be either statically configured, or learned over a PPP connection.

Note that this command is separate from the **ip domain-list** command, which is used by DNS client to append a domain on to the end of a partial hostname to form a fully-qualified domain.

**Examples** To create a domain list to include domains that are internal to the company such as "engineering.acme" or "intranet.acme", use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding domain-list corporatedomains
awplus(config-domain-list)# description internal network domain
awplus(config-domain-list)# domain engineering.acme
awplus(config-domain-list)# domain intranet.acme
```

To delete the domain list, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding domain-list
corporatedomains
```

**Related commands** [ip name-server](#)

# ip domain-list

**Overview** This command adds a domain to the DNS list. Domains are appended to incomplete host names in DNS requests. Each domain in this list is tried in turn in DNS lookups. This list is ordered so that the first entry you create is checked first.

The **no** variant of this command deletes a domain from the list.

**Syntax** `ip domain-list <domain-name>`  
`no ip domain-list <domain-name>`

| Parameter                        | Description                               |
|----------------------------------|-------------------------------------------|
| <code>&lt;domain-name&gt;</code> | Domain string, for example "company.com". |

**Mode** Global Configuration

**Usage notes** If there are no domains in the DNS list, then your device uses the domain specified with the **ip domain-name** command. If any domain exists in the DNS list, then the device does not use the domain set using the **ip domain-name** command.

**Example** To add the domain `example.net` to the DNS list, use the following commands:

```
awplus# configure terminal
awplus(config)# ip domain-list example.net
```

**Related commands** **ip domain-lookup**  
**ip domain-name**  
**show ip domain-list**

# ip domain-lookup

**Overview** This command enables the DNS client on your device. This allows you to use domain names instead of IP addresses in commands. The DNS client resolves the domain name into an IP address by sending a DNS inquiry to a DNS server, specified with the **ip name-server** command.

The **no** variant of this command disables the DNS client. The client will not attempt to resolve domain names. You must use IP addresses to specify hosts in commands.

**Syntax** ip domain-lookup  
no ip domain-lookup

**Mode** Global Configuration

**Usage notes** The client is enabled by default. However, it does not attempt DNS inquiries unless there is a DNS server configured.

**Examples** To enable the DNS client on your device, use the following commands:

```
awplus# configure terminal
awplus(config)# ip domain-lookup
```

To disable the DNS client on your device, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip domain-lookup
```

**Related commands** **ip domain-list**  
**ip domain-name**  
**ip name-server**  
**show hosts**  
**show ip name-server**

**Command changes** Version 5.4.8-1.1: via-relay parameter added

## ip domain-name

**Overview** This command sets a default domain for the DNS. The DNS client appends this domain to incomplete host-names in DNS requests.

The **no** variant of this command removes the domain-name previously set by this command.

**Syntax** `ip domain-name <domain-name>`  
`no ip domain-name <domain-name>`

**Mode** Global Configuration

**Usage notes** If there are no domains in the DNS list (created using the **ip domain-list** command) then your device uses the domain specified with this command. If any domain exists in the DNS list, then the device does not use the domain configured with this command.

When your device is using its DHCP client for an interface, it can receive Option 15 from the DHCP server. This option replaces the domain name set with this command.

**Example** To configure the domain name, enter the following commands:

```
awplus# configure terminal
awplus(config)# ip domain-name company.com
```

**Related commands** **ip domain-list**  
**show ip domain-list**  
**show ip domain-name**

## ip name-server

**Overview** Use this command to add IPv4 or IPv6 DNS server addresses. The DNS client on your device sends DNS queries to IP addresses in this list when trying to resolve a host name. Host names cannot be resolved until you have added at least one server to this list. A maximum of three name servers can be added to this list.

The **no** variant of this command removes the specified DNS name-server address.

**Syntax** `ip name-server <ip-addr>`  
`no ip name-server <ip-addr>`

| Parameter | Description                                                                                                                                                                                                                                                                         |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-addr> | The IP address of the DNS server that is being added to the name server list. The address is entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X:X for an IPv6 address.<br><br>The order that you enter the servers in, is the order in which they will be used. |

**Mode** Global Configuration

**Usage notes** To allow the device to operate as a DNS proxy, your device must have learned about a DNS name-server to forward requests to. Name-servers can be learned through the following means:

- Manual configuration, using the **ip name-server** command
- Learned from DHCP server with Option 6

Use this command to statically configure a DNS name-server for the device to use.

The order that you enter the servers in, is the order in which they will be used.

**Examples** To allow a device to send DNS queries to a DNS server with the IPv4 address 10.10.10.5, use the commands:

```
awplus# configure terminal
awplus(config)# ip name-server 10.10.10.5
```

To enable your device to send DNS queries to a DNS server with the IPv6 address 2001:0db8:010d::1, use the commands:

```
awplus# configure terminal
awplus(config)# ip name-server 2001:0db8:010d::1
```

**Related commands** **ip dns forwarding domain-list**  
**ip domain-list**  
**ip domain-lookup**  
**ip domain-name**  
**show ip name-server**

**Command changes** Version 5.4.6-2.1: VRF-lite support added to AR-series devices.

# ip name-server preferred-order

**Overview** Use this command to choose between using statically-configured DNS servers or dynamically-learned DNS servers.

Use the **no** variant of this command to set the DNS servers back to the default setting of dynamic.

**Syntax** `ip name-server preferred-order {dynamic|static}`  
`no ip name-server preferred-order`

| Parameter | Description                                  |
|-----------|----------------------------------------------|
| dynamic   | Use dynamically learned DNS servers first.   |
| static    | Use statically configured DNS servers first. |

**Default** dynamic

**Mode** Global Configuration

**Usage notes** This command is used to choose which DNS server set to use first. Select either the **dynamic** or **static** parameter.

**Examples** To configure the preference to use static servers first, use the commands:

```
awplus# configure terminal
awplus(config)# ip name-server preferred-order static
```

To configure the preference to use dynamically-learned servers first, use the commands:

```
awplus# configure terminal
awplus(config)# ip name-server preferred-order dynamic
```

or

```
awplus# configure terminal
awplus(config)# no ip name-server preferred-order
```

# show hosts

**Overview** This command shows the default domain, domain list, and name servers configured on your device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show hosts

**Mode** User Exec and Privileged Exec

**Example** To display the default domain, use the command:

```
awplus# show hosts
```

**Output** The following shows typical output.

**Example output from the show hosts command when no ip domain-lookup is configured**

```
awplus#show hosts

Default domain is not set
Name/address lookup is disabled
```

**Example output from the show hosts command when ip domain-lookup is configured**

```
awplus#show hosts

Default domain is mycompany.com
Domain list: company.com
Name/address lookup uses domain service
Name servers are 10.10.0.2 10.10.0.88
```

**Related commands**

- [ip domain-list](#)
- [ip domain-lookup](#)
- [ip domain-name](#)
- [ip name-server](#)

# show ip domain-list

**Overview** This command shows the domains configured in the domain list. The DNS client uses the domains in this list to append incomplete hostnames when sending a DNS inquiry to a DNS server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip domain-list

**Mode** User Exec and Privileged Exec

**Example** To display the list of domains in the domain list, use the command:

```
awplus# show ip domain-list
```

**Output** The following shows typical output.

**Example output from the show ip domain-list command**

```
awplus#show ip domain-list
alliedtelesis.com
mycompany.com
```

**Related commands** [ip domain-list](#)  
[ip domain-lookup](#)

# show ip domain-name

**Overview** This command shows the default domain configured on your device. When there are no entries in the DNS list, the DNS client appends this domain to incomplete hostnames when sending a DNS inquiry to a DNS server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip domain-name

**Mode** User Exec and Privileged Exec

**Example** To display the default domain configured on your device, use the command:

```
awplus# show ip domain-name
```

**Output** The following shows typical output.

**Example output from the show ip domain-name command**

```
awplus#show ip domain-name  
alliedtelesis.com
```

**Related commands** [ip domain-name](#)  
[ip domain-lookup](#)

# show ip name-server

**Overview** This command displays a list of IPv4 and IPv6 DNS server addresses that your device will send DNS requests to. This is a static list configured using the **ip name-server** command.

For information on filtering and saving command output, see the **“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide**.

**Syntax** show ip name-server

**Mode** User Exec and Privileged Exec

**Example** To display the list of DNS servers that your device sends DNS requests to, use the command:

```
awplus# show ip name-server
```

**Output** The following shows typical output.

**Example output from the show ip name-server command**

```
awplus# show ip name-server
10.10.0.123
10.10.0.124
2001:0db8:010d::1
```

# Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure IPv6. For more information, see the [IPv6 Feature Overview and Configuration Guide](#).

# clear ipv6 neighbors

**Overview** Use this command to clear all dynamic IPv6 neighbor entries.

**Syntax** `clear ipv6 neighbors`

**Mode** Privileged Exec

**Example** `awplus# clear ipv6 neighbors`

**Related commands** [ipv6 neighbor](#)  
[show ipv6 neighbors](#)

## ipv6 address

**Overview** Use this command to set the IPv6 address of an interface. The command also enables IPv6 on the interface, which creates an EUI-64 link-local address as well as enabling RA processing and SLAAC.

To stop the device from processing prefix information (routes and addresses from the received Router Advertisements) use the command **no ipv6 nd accept-ra-pinfo**.

To remove the EUI-64 link-local address, use the command **no ipv6 eui64-linklocal**.

Use the **no** variant of this command to remove the IPv6 address assigned and disable IPv6. Note that if no global addresses are left after removing the IPv6 address then IPv6 is disabled.

**Syntax** `ipv6 address <ipv6-addr/prefix-length>`  
`no ipv6 address <ipv6-addr/prefix-length>`

| Parameter                                    | Description                                                                                                                                       |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-addr/prefix-length&gt;</code> | Specifies the IPv6 address to be set. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. |

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** Note that the device keeps link-local addresses until you remove them with the **no** variant of the command that established them. See the **ipv6 enable** command for more information.

Also note that the device keeps the link-local address if the global address is removed using a command other than the command that was used to establish the link-local address. For example, if a link local address is established with the **ipv6 enable** command then it will not be removed using a **no ipv6 address** command.

**Examples** To assign the IPv6 address 2001:0db8::a2/64 to the VLAN interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::a2/64
```

To remove the IPv6 address 2001:0db8::a2/64 from the VLAN interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::a2/64
```

**Related commands**

- ipv6 address autoconfig**
- ipv6 address dhcp**
- ipv6 enable**
- ipv6 eui64-linklocal**
- show running-config**
- show ipv6 interface**
- show ipv6 route**

## ipv6 address autoconfig

**Overview** Use this command to enable IPv6 stateless address autoconfiguration (SLAAC) for an interface. This configures an IPv6 address on an interface derived from the MAC address on the interface.

Use the **no** variant of this command to disable IPv6 SLAAC on an interface. Note that if no global addresses are left after removing all IPv6 autoconfigured addresses then IPv6 is disabled.

**Syntax** `ipv6 address autoconfig`  
`no ipv6 address autoconfig`

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** Use this command to enable automatic configuration of IPv6 addresses using stateless autoconfiguration on an interface, and enable IPv6.

IPv6 hosts can configure themselves when connected to an IPv6 network using ICMPv6 (Internet Control Message Protocol version 6) router discovery messages. Configured routers respond with a Router Advertisement (RA) containing configuration parameters for IPv6 hosts.

The SLAAC process derives the interface identifier of the IPv6 address from the MAC address of the interface.

When applying SLAAC to an interface, note that the MAC address of the default VLAN is applied to the interface if the interface does not have its own MAC address.

Note that the device keeps link-local addresses until you remove them with the **no** variant of the command that established them. See the **ipv6 enable** command for more information.

Also note that the device keeps the link-local address if the global address is removed using a command other than the command that was used to establish the link-local address. For example, if a link local address is established with the **ipv6 enable** command then it will not be removed using a **no ipv6 address** command.

**Examples** To enable SLAAC on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address autoconfig
```

To disable SLAAC on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address autoconfig
```

**Related commands**

- ipv6 address**
- ipv6 enable**
- show ipv6 interface**
- show running-config**

## ipv6 address suffix

**Overview** Use this command to configure the suffix to use when generating an address from prefix information. Any addresses that were created with the EUI-64 suffix will be removed, and new addresses will be added after the next Router Advertisement.

Use the **no** variant of this command to set it back to the default of disabled or set to :: for the same result as the **no** variant.

**Syntax** `ipv6 address suffix <ipv6-addr-suffix>`  
`no ipv6 address suffix`

| Parameter                             | Description                                         |
|---------------------------------------|-----------------------------------------------------|
| <code>&lt;ipv6-addr-suffix&gt;</code> | In the format of ::X:X:X:X, for example ::a2d8:0fd8 |

**Default** Disabled

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Example** To configure the suffix to use when generating an address from prefix information on vlan2, use the command:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address suffix ::a2d8:0fd8
```

**Related commands** [ipv6 nd accept-ra-pinfo](#)  
[show running-config interface](#)

**Command changes** Version 5.4.8-2.1: command added

## ipv6 enable

**Overview** Use this command to enable automatic configuration of a link-local IPv6 address on an interface using Stateless Automatic Address Configuration (SLAAC). By default, the EUI-64 method is used to generate the link-local address.

Use the **no** variant of this command to disable IPv6 on an interface without a global address. Note, to stop EUI-64 from generating the automatic link-local address, use the command **no ipv6 eui64-linklocal**.

**Syntax** `ipv6 enable`  
`no ipv6 enable`

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** The **ipv6 enable** command automatically configures an IPv6 link-local address on the interface and enables the interface for IPv6 processing.

A link-local address is an IP (Internet Protocol) address that is only used for communications in the local network, or for a point-to-point connection. Routing does not forward packets with link-local addresses. IPv6 requires that a link-local address is assigned to each interface that has the IPv6 protocol enabled, and when addresses are assigned to interfaces for routing IPv6 packets.

Note that the device keeps link-local addresses until you remove them with the **no** variant of the command that established them.

Also note that the device keeps the link-local address if the global address is removed using a command other than the command that was used to establish the link-local address. For example, if a link local address is established with the **ipv6 enable** command then it will not be removed using a **no ipv6 address** command.

**Default** All interfaces default to IPv6-down with no address.

**Examples** To enable IPv6 with only a link-local IPv6 address on the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
```

To disable IPv6 with only a link-local IPv6 address on the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 enable
```

**Related commands**

- ipv6 address**
- ipv6 address autoconfig**
- ipv6 address dhcp**
- show ipv6 interface**
- show ipv6 route**
- show running-config**

## ipv6 eui64-linklocal

**Overview** When IPv6 is enabled on an interface, an EUI link-local address is generated and installed on the interface. In other words, **ipv6 eui64-linklocal** is enabled by default on any IPv6 enabled interface.

Use the **no** variant of this command to disallow the automatic generation of the EUI-64 link-local address on an IPv6 enabled interface.

**Syntax** `ipv6 eui64-linklocal`  
`no ipv6 eui64-linklocal`

**Default** The command **ipv6 eui64-linklocal** is enabled by default on any IPv6 enabled interface.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Example** To enable IPv6 on the interface `vlan1`, and use the link-local address of `fe80::1/10` instead of the EUI-64 link-local that is automatically generated, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# no ipv6 eui64-linklocal
awplus(config-if)# ipv6 address fe80::1/10
```

**Related commands** [ipv6 address](#)  
[ipv6 address autoconfig](#)  
[ipv6 enable](#)

**Command changes** Version 5.4.7-0.1: command added

# ipv6 forwarding

**Overview** Use this command to turn on IPv6 unicast routing for IPv6 packet forwarding.

Use this command globally on your device before using the **ipv6 enable** command on individual interfaces.

Use the **no** variant of this command to turn off IPv6 unicast routing. Note IPv6 unicast routing is disabled by default.

**Syntax** `ipv6 forwarding`  
`no ipv6 forwarding`

**Mode** Global Configuration

**Default** IPv6 unicast forwarding is disabled by default.

**Usage notes** Enable IPv6 unicast forwarding globally for all interfaces on your device with this command. Use the **no** variant of this command to disable IPv6 unicast forwarding globally for all interfaces on your device.

IPv6 unicast forwarding allows devices to communicate with devices that are more than one hop away, providing that there is a route to the destination address. If IPv6 forwarding is not enabled then pings to addresses on devices that are more than one hop away will fail, even if there is a route to the destination address.

**Examples** To enable IPv6 unicast routing, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
```

To disable IPv6 unicast routing, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 forwarding
```

**Related commands** **ipv6 enable**

## ipv6 icmp error-interval

**Overview** Use this command to limit how often IPv6 ICMP error messages are sent. The maximum frequency of messages is specified in milliseconds. Use the **no** variant of this command to reset the frequency to the default

**Syntax** `ipv6 icmp error-interval <interval>`  
`no ipv6 icmp error-interval`

| Parameter  | Description                             |
|------------|-----------------------------------------|
| <interval> | 0-2147483647, interval in milliseconds. |

**Default** 1000

**Mode** Global Configuration

**Example** To configure the rate to be at most one packet every 10 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 icmp error-interval 10000
```

To reset the rate to the default of one packet every second, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 icmp error-interval
```

**Related commands** [ip icmp error-interval](#)

# ipv6 multicast forward-slow-path-packet

**Overview** Use this command to enable multicast packets to be forwarded to the CPU. Enabling this command will ensure that the Layer 3 MTU is set correctly for each IP multicast group and will apply the value of the smallest MTU among the outgoing interfaces for the multicast group.

It will also ensure that a received packet that is larger than the MTU value will result in the generation of an ICMP Too Big message.

Use the **no** variant of this command to disable the above functionality.

**Syntax** `ipv6 multicast forward-slow-path-packet`  
`no ipv6 multicast forward-slow-path-packet`

**Default** Disabled.

**Mode** Privileged Exec

**Example** To enable the ipv6 multicast forward-slow-path-packet function, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast forward-slow-path-packet
```

**Related commands** [show ipv6 forwarding](#)

**Command changes** Version 5.5.4-2.3: VRF-lite support added for x530, x530L, x540L, x930, x950, SBx8100, SBx908 GEN2

## ipv6 nd accept-ra-default-routes

**Overview** Use this command to allow accepting and installing of default routes based on a received RA (Router Advertisement). The default route's destination is set to the source address of the received RA.

Use the **no** variant of this command to disable accepting RA-based default routes.

**Syntax** `ipv6 nd accept-ra-default-routes`  
`no ipv6 nd accept-ra-default-routes`

**Default** RA-based default routes are accepted by default.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Example** To enable RA-based default routes on vlan1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# no ipv6 nd accept-ra-pinfo
```

**Related commands** [ipv6 address](#)  
[ipv6 address autoconfig](#)  
[ipv6 enable](#)

# ipv6 nd accept-ra-pinfo

**Overview** Use this command to allow the processing of the prefix information included in a received RA (Router Advertisement) on an IPv6 enabled interface.

Use the **no** variant of this command to disable an IPv6 interface from using the prefix information within a received RA.

**Syntax** `ipv6 nd accept-ra-pinfo`  
`no ipv6 nd accept-ra-pinfo`

**Default** The command **ipv6 nd accept-ra-pinfo** is enabled by default on any IPv6 interface.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** By default, when IPv6 is enabled on an interface, SLAAC is also enabled. SLAAC addressing along with the EUI-64 process, uses the prefix information included in a received RA to generate an automatic link-local address on the IPv6 interface.

Note: an AlliedWare Plus device will, by default, add a prefix for the connected interface IPv6 address(es) to the RA it transmits. However, this behavior can be changed by using the command **no ipv6 nd prefix auto-advertise**, so there is no guarantee that an RA will contain a prefix.

**Example** To enable IPv6 on vlan1 without installing a SLAAC address on the interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# no ipv6 nd accept-ra-pinfo
```

**Related commands** [ipv6 address](#)  
[ipv6 address autoconfig](#)  
[ipv6 enable](#)

**Command changes** Version 5.4.7-0.1: command added

## ipv6 nd current-hoplimit

**Overview** Use this command to specify the advertised current hop limit used between IPv6 Routers.

Use the **no** variant of this command to reset the current advertised hop limit to the default of 0, which means no advertised current hop limit is specified.

**Syntax** `ipv6 nd current-hoplimit <hoplimit>`  
`no ipv6 nd current-hoplimit`

| Parameter  | Description                                                                               |
|------------|-------------------------------------------------------------------------------------------|
| <hoplimit> | Specifies the advertised current hop limit value.<br>Valid values are from 0 to 255 hops. |

**Default** 0 (No advertised current hop limit specified)

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the advertised current hop limit to 2 between IPv6 Routers on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd current-hoplimit 2
```

To reset the advertised current hop limit to the default 0 on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd current-hoplimit
```

**Related commands** [ipv6 nd managed-config-flag](#)  
[ipv6 nd prefix](#)  
[ipv6 nd suppress-ra](#)

## ipv6 nd dns search-list

**Overview** Use this command to specify a DNS Search List (DNSSL) to be included in the Router Advertisement for a given IPv6 interface.

Use the **no** variant of this command to remove a specified domain name. If no domain name is specified, then all domain names previously added will be deleted.

**Syntax** `ipv6 nd dns search-list <domain-name>`  
`no ipv6 nd dns search-list [<domain-name>]`

| Parameter                        | Description                                                                                    |
|----------------------------------|------------------------------------------------------------------------------------------------|
| <code>&lt;domain-name&gt;</code> | A string specifying the domain name to be added to the search list. For example, myexample.com |

**Default** No domain search list is included in router advertisements from any interface.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Example** To add the domain name 'myexample.com' to the search list for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd dns search-list myexample.com
```

To delete all domain names added previously, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd dns search-list
```

**Related commands** [ipv6 nd suppress-ra](#)

**Command changes** Version 5.5.0-2.5: command added

## ipv6 nd dns-server

**Overview** Use this command to advertise (in Router Advertisement messages) a DNS server for downstream devices to use.

Use the **no** variant of this command to delete one or all DNS server addresses.

**Syntax** `ipv6 nd dns-server <ip-add>`  
`no ipv6 nd dns-server [<ip-add>]`

| Parameter | Description                                                                 |
|-----------|-----------------------------------------------------------------------------|
| <ip-add>  | Advertise a particular IPv6 address as a DNS server for downstream devices. |

**Default** No DNS servers are advertised.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Example** To configure vlan2 to send RAs and advertise 2001:DB8::2 as a DNS server, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd suppress-ra
awplus(config-if)# no ipv6 nd accept-ra-pinfo
awplus(config-if)# ipv6 address 2001:DB8::1/64
awplus(config-if)# ipv6 nd dns-server 2001:DB8::2
```

To stop advertising any DNS servers on the selected interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd dns-server
```

**Related commands** [ipv6 nd accept-ra-pinfo](#)  
[ipv6 nd suppress-ra](#)  
[show ipv6 interface](#)

## ipv6 nd managed-config-flag

**Overview** Use this command to set the managed address configuration flag, contained within the router advertisement field.

Setting this flag indicates the operation of a stateful autoconfiguration protocol such as DHCPv6 for address autoconfiguration, and that address information (i.e. the network prefix) and other (non-address) information can be requested from the device.

An unset flag enables hosts receiving the advertisements to use a stateless autoconfiguration mechanism to establish their IPv6 addresses. The default is flag unset.

Use the **no** variant of this command to reset this command to its default of having the flag unset.

**Syntax** `ipv6 nd managed-config-flag`  
`no ipv6 nd managed-config-flag`

**Default** Unset

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** To enable the transmission of router advertisements, you must apply the **no** version of the **ipv6 nd suppress-ra**. This step is included in the example below.

**Example** To set the managed address configuration flag on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd managed-config-flag
awplus(config-if)# no ipv6 nd suppress-ra
```

**Related commands** **ipv6 nd suppress-ra**  
**ipv6 nd prefix**  
**ipv6 nd other-config-flag**

# ipv6 nd minimum-ra-interval

**Overview** Use this command in Interface Configuration mode to set a minimum Router Advertisement (RA) interval for an interface.

Use the **no** variant of this command in Interface Configuration mode to remove the minimum RA interval for an interface.

**Syntax** `ipv6 nd minimum-ra-interval <seconds>`  
`no ipv6 nd minimum-ra-interval`

| Parameter | Description                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------|
| <seconds> | Specifies the number of seconds between IPv6 Router Advertisements (RAs). Valid values are from 3 to 1350 seconds. |

**Default** The RA interval for an interface is unset by default.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the minimum RA interval for the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd minimum-ra-interval 60
```

To remove the minimum RA interval for the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd minimum-ra-interval
```

**Related commands**

- [ipv6 nd ra-interval](#)
- [ipv6 nd suppress-ra](#)
- [ipv6 nd prefix](#)
- [ipv6 nd other-config-flag](#)

## ipv6 nd other-config-flag

**Overview** Use this command to set the **other** stateful configuration flag (contained within the router advertisement field) to be used for IPv6 address auto-configuration. This flag is used to request the router to provide information in addition to providing addresses.

Setting the **ipv6 nd managed-config-flag** implies that the **ipv6 nd other-config-flag** will also be set.

Use **no** variant of this command to reset the value to the default.

**Syntax** `ipv6 nd other-config-flag`  
`no ipv6 nd other-config-flag`

**Default** Unset

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** To enable the transmission of router advertisements, you must apply the **no** version of the **ipv6 nd suppress-ra**. This step is included in the example below.

**Example** To set the IPv6 other-config-flag on the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd other-config-flag
awplus(config-if)# no ipv6 nd suppress-ra
```

**Related commands** **ipv6 nd suppress-ra**  
**ipv6 nd prefix**  
**ipv6 nd managed-config-flag**

## ipv6 nd prefix

**Overview** Use this command in Interface Configuration mode to specify the IPv6 prefix information that is advertised by the router advertisement for IPv6 address auto-configuration.

Use the **no** parameter with this command to reset the IPv6 prefix for an interface in Interface Configuration mode.

**Syntax** `ipv6 nd prefix <ipv6-prefix/length>`  
`ipv6 nd prefix <ipv6-prefix/length> <valid-lifetime>`  
`ipv6 nd prefix <ipv6-prefix/length> <valid-lifetime> <preferred-lifetime> [no-autoconfig]`  
`ipv6 nd prefix <ipv6-prefix/length> <valid-lifetime> <preferred-lifetime> off-link [no-autoconfig]`  
`no ipv6 nd prefix [<ipv6-addr/prefix-length>|all]`

| Parameter                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-prefix/length&gt;</code> | The prefix to be advertised by the router advertisement message.<br><br>The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64. The default is X:X::/64.                                                                                                                                                                                                                                 |
| <code>&lt;valid-lifetime&gt;</code>     | The the period during which the specified IPv6 address prefix is valid. This can be set to a value between 0 and 4294967295 seconds. The default is 2592000 (30 days).<br><br>Note that this period should be set to a value greater than that set for the prefix preferred-lifetime.                                                                                                                                                            |
| <code>&lt;preferred-lifetime&gt;</code> | Specifies the IPv6 prefix preferred lifetime. This is the period during which the IPv6 address prefix is considered a current (undeprecated) value. After this period, the command is still valid but should not be used in new communications. Set to a value between 0 and 4294967295 seconds. The default is 604800 seconds (7 days).<br><br>Note that this period should be set to a value less than that set for the prefix valid-lifetime. |
| <code>off-link</code>                   | Specify the IPv6 prefix off-link flag. The default is flag set.                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>no-autoconfig</code>              | Specify the IPv6 prefix no autoconfiguration flag. Setting this flag indicates that the prefix is not to be used for autoconfiguration. The default is flag set.                                                                                                                                                                                                                                                                                 |
| <code>all</code>                        | Specify all IPv6 prefixes associated with the interface.                                                                                                                                                                                                                                                                                                                                                                                         |

**Default** Valid-lifetime default is 2592000 seconds (30 days). Preferred-lifetime default is 604800 seconds (7 days).

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** This command specifies the IPv6 prefix flags that are advertised by the router advertisement message.

**Examples** To configure the device to issue router advertisements on vlan2, and advertise the address prefix of 2001:0db8::/64, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd prefix 2001:0db8::/64
```

To configure the device to issue router advertisements on vlan2, and advertise the address prefix of 2001:0db8::/64 with a valid lifetime of 10 days and a preferred lifetime of 5 days, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd prefix 2001:0db8::/64 864000 432000
```

To configure the device to issue router advertisements on vlan2 and advertise the address prefix of 2001:0db8::/64 with a valid lifetime of 10 days, a preferred lifetime of 5 days, and no prefix used for autoconfiguration, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd prefix 2001:0db8::/64 864000 432000
no-autoconfig
```

To reset router advertisements on vlan2, so the address prefix of 2001:0db8::/64 is not advertised from the device, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd prefix 2001:0db8::/64
```

To reset all router advertisements on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd prefix all
```

**Related commands** [ipv6 nd suppress-ra](#)

# ipv6 nd ra-interval

**Overview** Use this command to specify the interval between IPv6 Router Advertisements (RA) transmissions.

Use **no** parameter with this command to reset the value to the default value (600 seconds).

**Syntax** `ipv6 nd ra-interval <seconds>`  
`no ipv6 nd ra-interval`

| Parameter | Description                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------|
| <seconds> | Specifies the number of seconds between IPv6 Router Advertisements (RAs). Valid values are from 4 to 1800 seconds. |

**Default** 600 seconds.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** To enable the transmission of router advertisements, you must apply the **no** version of the **ipv6 nd suppress-ra**. This step is included in the example below.

**Example** To set the advertisements interval on vlan2 to be 60 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd ra-interval 60
awplus(config-if)# no ipv6 nd suppress-ra
```

To reset the advertisements interval on vlan2 to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd ra-interval
```

**Related commands** **ipv6 nd minimum-ra-interval**  
**ipv6 nd suppress-ra**  
**ipv6 nd prefix**

## ipv6 nd ra-lifetime

**Overview** Use this command to specify the time period that this router can usefully act as a default gateway for the network. Each router advertisement resets this time period.

Use **no** parameter with this command to reset the value to default.

**Syntax** `ipv6 nd ra-lifetime <seconds>`  
`no ipv6 nd ra-lifetime`

| Parameter | Description                                                                                                                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <seconds> | Time period in seconds. Valid values are from 0 to 9000.<br><br>Note that you should set this time period to a value greater than the value you have set using the <b>ipv6 nd ra-interval</b> command. |

**Default** 1800 seconds

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** This command specifies the lifetime of the current router to be announced in IPv6 Router Advertisements.

To enable the transmission of router advertisements, you must apply the **no** version of the **ipv6 nd suppress-ra**. This step is included in the example below.

**Examples** To set the advertisement lifetime of 8000 seconds on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd ra-lifetime 8000
awplus(config-if)# no ipv6 nd suppress-ra
```

To reset the advertisement lifetime to the default on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd ra-lifetime
```

**Related commands** **ipv6 nd suppress-ra**  
**ipv6 nd prefix**

## ipv6 nd raguard

**Overview** Use this command to apply the Router Advertisements (RA) Guard feature from the Interface Configuration mode for a device port. This blocks all RA messages received on a device port.

For more information about RA Guard, see the [IPv6 Feature Overview and Configuration Guide](#).

Use the **no** parameter with this command to disable RA Guard for a specified device port.

**Syntax** `ipv6 nd raguard`  
`no ipv6 nd raguard`

**Default** RA Guard is not disabled by default.

**Mode** Interface Configuration for a port.

**Usage notes** Router Advertisements (RAs) are used by Routers to announce themselves on the link. Applying RA Guard to a device port disallows Router Advertisements and redirect messages. RA Guard blocks RAs from untrusted hosts. Blocking RAs stops untrusted hosts from flooding malicious RAs and stops any misconfigured hosts from disrupting traffic on the local network.

Enabling RA Guard on a port blocks RAs from a connected host and indicates the port and host are untrusted. Disabling RA Guard on a port allows RAs from a connected host and indicates the port and host are trusted. Ports and hosts are trusted by default to allow RAs.

**Example** To enable RA Guard on port1.0.1-port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# ipv6 nd raguard
```

To verify RA Guard is enabled on port1.0.1, use the command:

```
awplus# show running-config interface port1.0.1
```

To disable RA Guard on port1.0.1-port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.4
awplus(config-if)# no ipv6 nd raguard
```

When RA Guard is disabled on a port it is not displayed in **show running-config** output.

**Output** Example output from using **show running-config interface port1.0.1** to verify RA Guard:

```
!  
interface port1.0.1  
  switchport mode access  
  
  ipv6 nd raguard  
!
```

**Related commands** [show running-config interface](#)

## ipv6 nd reachable-time

**Overview** Use this command to specify the reachable time in the router advertisement to be used for detecting reachability of the IPv6 neighbor. Use the **no** variant of this command to reset the value to default.

**Syntax** `ipv6 nd reachable-time <milliseconds>`  
`no ipv6 nd reachable-time`

| Parameter      | Description                                                                                                                                 |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <milliseconds> | Time period in milliseconds. Valid values are from 1000 to 3600000.<br><br>Setting this value to 0 indicates an unspecified reachable-time. |

**Default** 0 milliseconds

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Usage notes** This command specifies the reachable time of the current router to be announced in IPv6 Router Advertisements.  
  
To enable the transmission of router advertisements, you must apply the **no ipv6 nd suppress-ra** command. This instruction is included in the example shown below.

**Example** To set the reachable-time in router advertisements on the VLAN interface vlan2 to be 1800000 milliseconds, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd reachable-time 1800000
awplus(config-if)# no ipv6 nd suppress-ra
```

To reset the reachable-time in router advertisements on the VLAN interface vlan2 to an unspecified reachable-time (0 milliseconds), enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd reachable-time
```

**Related commands** [ipv6 nd suppress-ra](#)  
[ipv6 nd prefix](#)

## ipv6 nd retransmission-time

**Overview** Use this command to specify the advertised retransmission interval for Neighbor Solicitation in milliseconds between IPv6 Routers.

Use the **no** variant of this command to reset the retransmission time to the default (1 second).

**Syntax** `ipv6 nd retransmission-time <milliseconds>`  
`no ipv6 nd retransmission-time`

| Parameter      | Description                                                         |
|----------------|---------------------------------------------------------------------|
| <milliseconds> | Time period in milliseconds. Valid values are from 1000 to 3600000. |

**Default** 1000 milliseconds (1 second)

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Examples** To set the retransmission-time of Neighbor Solicitation on the VLAN interface vlan2 to be 800000 milliseconds, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd retransmission-time 800000
```

To reset the retransmission-time of Neighbor Solicitation on the VLAN interface vlan2 to the default 1000 milliseconds (1 second), enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd retransmission-time
```

**Related commands** [ipv6 nd suppress-ra](#)  
[ipv6 nd prefix](#)

## ipv6 nd route-information

**Overview** Use this command to supply more specific route information to be included in the RA (Router Advertisement) the device sends to downstream devices on the same link/LAN.

Use the **no** variant of this command to remove some or all route information.

**Syntax** `ipv6 nd route-information <ipv6-prefix/length> [<0-4294967295>|infinity|default] [low|medium|high]`  
`ipv6 nd route-information <ipv6-prefix/length>`  
`no ipv6 nd route-information <ipv6-prefix/length>`  
`no ipv6 nd route-information all`

| Parameter                                          | Description                                                                                                                                                                                                                                                                                      |
|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6-prefix/length&gt;</code>            | The IPv6 network prefix and prefix length entered in dotted decimal format for the IPv6 network prefix, then slash notation for the IPv6 prefix length in the format X:X::X/X/ M, e.g. 2001:db8::/64                                                                                             |
| <code>&lt;0-4294967295&gt; infinity default</code> | The length of time in seconds (relative to the time the packet is sent) that the prefix is valid for route determination. <ul style="list-style-type: none"><li>infinity - specifies that the route advertisement has an infinite lifetime.</li><li>default - is 3 * MaxRtrAdvInterval</li></ul> |
| <code>low medium high</code>                       | The preference value for the route information                                                                                                                                                                                                                                                   |

**Default** No route information option is included in router advertisement on any interface.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Example** To configure a route of 2001:DB8:1::/48 on vlan2, with a lifetime of 6000 seconds and a high preference, use the commands:

```
awplus# configure terminal
awplus(config)# int vlan2
awplus(config-if)# ipv6 nd route-information 2001:DB8:1::/48
6000 high
```

**Related commands** [ipv6 nd suppress-ra](#)

**Command changes** Version 5.5.0-2.4: command added

## ipv6 nd router-preference

**Overview** Use this command to set the default router preference in the router advertisements sent on a particular interface. You can use this setting to decide whether devices will use this router instead of an alternative router, by giving this router and the alternative router different values.

Use the **no** variant of this command to return the router preference to its default value.

**Syntax** `ipv6 nd router-preference {low|medium|high}`  
`no ipv6 nd router-preference`

| Parameter | Description                                                       |
|-----------|-------------------------------------------------------------------|
| low       | (0b11)<br>Preference for this router on this interface is low.    |
| medium    | (0b00)<br>Preference for this router on this interface is medium. |
| high      | (0b01)<br>Preference for this router on this interface is high.   |

**Default** Medium

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Example** To set the router preference to high on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd router-preference high
```

**Related commands** [ipv6 nd suppress-ra](#)  
[show ipv6 interface](#)

**Command changes** Version 5.5.1-0.1: command added

## ipv6 nd suppress-ra

**Overview** Use this command to inhibit IPv6 Router Advertisement (RA) transmission for the current interface. Router advertisements are used when applying IPv6 stateless auto-configuration.

Use the **no** parameter with this command to enable Router Advertisement transmission.

**Syntax** `ipv6 nd suppress-ra`  
`no ipv6 nd suppress-ra`

**Default** Router Advertisement (RA) transmission is suppressed by default.

**Mode** Interface Configuration for a VLAN interface or a local loopback interface.

**Example** To enable the transmission of router advertisements from vlan2 on the device, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd suppress-ra
```

**Related commands** [ipv6 nd ra-interval](#)  
[ipv6 nd router-preference](#)  
[ipv6 nd prefix](#)

## ipv6 neighbor

**Overview** Use this command to add a static IPv6 neighbor entry.

Use the **no** variant of this command to remove a specific IPv6 neighbor entry.

**Syntax** `ipv6 neighbor <ipv6-address> <vlan-name> <mac-address> <port-list>`  
`no ipv6 neighbor <ipv6-address> <vlan-name> <port-list>`

| Parameter      | Description                                                                            |
|----------------|----------------------------------------------------------------------------------------|
| <ipv6-address> | Specify the neighbor's IPv6 address in the format X:X::X:X.                            |
| <vlan-name>    | Specify the neighbor's VLAN name.                                                      |
| <mac-address>  | Specify the MAC hardware address in hexadecimal notation in the format HHHH.HHHH.HHHH. |
| <port-list>    | Specify the port number, or port range.                                                |

**Mode** Global Configuration

**Usage notes** Use this command to clear a specific IPv6 neighbor entry. To clear all dynamic address entries, use the **clear ipv6 neighbors** command.

**Example** To create a static neighbor entry for IPv6 address 2001:0db8::a2, on vlan2, with MAC address 0000.cd28.0880, on port1.0.1, use the command:

```
awplus# configure terminal
awplus(config)# ipv6 neighbor 2001:0db8::a2 vlan2
0000.cd28.0880 port1.0.1
```

**Related commands** **clear ipv6 neighbors**  
**show ipv6 neighbors**

## ipv6 opportunistic-nd

**Overview** Use this command to enable opportunistic neighbor discovery for the global IPv6 ND cache. Opportunistic neighbor discovery changes the behavior for unsolicited ICMPv6 ND packet forwarding on the device.

Use the **no** variant of this command to disable opportunistic neighbor discovery for the global IPv6 ND cache.

**Syntax** `ipv6 opportunistic-nd`  
`no ipv6 opportunistic-nd`

**Default** Opportunistic neighbor discovery is disabled by default.

**Mode** Global Configuration

**Usage notes** When opportunistic neighbor discovery is enabled, the device will reply to any received unsolicited ICMPv6 ND packets. The source MAC address for the unsolicited ICMPv6 ND packet is added to the IPv6 ND cache, so the device forwards the ICMPv6 ND packet. When opportunistic neighbor discovery is disabled, the source MAC address for the ICMPv6 packet is not added to the IPv6 ND cache, so the ICMPv6 ND packet is not forwarded by the device.

**Examples** To enable opportunistic neighbor discovery for the IPv6 ND cache, enter:

```
awplus# configure terminal
awplus(config)# ipv6 opportunistic-nd
```

To disable opportunistic neighbor discovery for the IPv6 ND cache, enter:

```
awplus# configure terminal
awplus(config)# no ipv6 opportunistic-nd
```

**Related commands** [arp opportunistic-nd](#)  
[show ipv6 neighbors](#)  
[show running-config interface](#)

# ipv6 route

**Overview** This command adds a static IPv6 route to the Routing Information Base (RIB). If this route is the best route for the destination, then your device adds it to the Forwarding Information Base (FIB). Your device uses the FIB to forward packets and to advertise routes to neighbors.

The **no** variant of this command removes the static route.

**Syntax** `ipv6 route <dest-prefix/length> {<gateway-ip>|<gateway-name>} [<src-prefix/length>] [<distvalue>] [description <description>]`  
`no ipv6 route <dest-prefix/length> {<gateway-ip>|<gateway-name>} [<src-prefix/length>] [<distvalue>]`

| Parameter                                 | Description                                                                                                                                                                                                                                                                        |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;dest-prefix/length&gt;</i>         | Specifies the destination prefix.<br><br>The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.                                                                                                                           |
| <i>&lt;gateway-ip&gt;</i>                 | Specifies the address of the gateway (or next hop). The IPv6 address uses the format X:X::X/X/Prefix-Length. The prefix-length is usually set between 0 and 64.                                                                                                                    |
| <i>&lt;gateway-name&gt;</i>               | Specifies the name of the interface for the gateway (or next hop).                                                                                                                                                                                                                 |
| <i>&lt;src-prefix/length&gt;</i>          | Specifies the source prefix. This is used for SADR - see the Usage notes.<br><br>The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.                                                                                   |
| <i>&lt;distvalue&gt;</i>                  | Specifies the administrative distance for the route. Valid values are from 1 to 255. You can use administrative distance to determine which routes take priority over other routes. The route with the lowest distance value is used.                                              |
| description<br><i>&lt;description&gt;</i> | A description to record the route's purpose. It can be up to 80 printable ASCII characters long, including spaces. The description does not affect routing or forwarding decisions made by the device. To see the description, use the command <b>show running-configuration</b> . |

**Mode** Global Configuration

**Usage notes** You can configure IPv6 static routes for Source Address Dependent Routing (SADR) by providing a source prefix. In 'normal' routing, when the device searches routes for a next hop to forward a packet to, the device chooses the next hop based only on the destination address of the packet. When you provide SADR information for a route, the device also inspects the source address and ensures it fits within the source prefix range you provided for this route.

Versions of AlliedWare Plus earlier than 5.5.1-2.1 do not support descriptions on static routes, so a start-up configuration that contains descriptions will be rejected by these older versions. If you add descriptions, be careful if you downgrade to an older AlliedWare Plus version.

**Example** To create a route with administrative distance of 32 to send packets to 2001:0db8::1/128 via vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 route 2001:0db8::1/128 vlan2 32
```

To use SADR to create a route for packets from 2001::/64 to 2223::/64, with a next hop of 2001::1, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 route 2223::/64 2001::1 2001::/64
```

To give a route a description of 'test' when creating it, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 route 2001:0db8::1/128 vlan2 description
test
```

To remove the description from a route, re-enter the route without specifying the **description** parameter:

```
awplus# configure terminal
awplus(config)# ipv6 route 2001:0db8::1/128 vlan2
```

**Related  
Commands** [show running-config](#)

Version 5.5.0-0.3: **src-prefix** parameter added

## ipv6 unreachables

**Overview** Use this command to enable ICMPv6 (Internet Control Message Protocol version 6) type 1, destination unreachable, messages.

Use the **no** variant of this command to disable destination unreachable messages. This prevents an attacker from using these messages to discover the topology of a network.

**Syntax** `ipv6 unreachables`  
`no ipv6 unreachables`

**Default** Destination unreachable messages are enabled by default.

**Mode** Global Configuration

**Usage notes** When a device receives a packet for a destination that is unreachable it returns an ICMPv6 type 1 message. This message includes a reason code, as per the table below. An attacker can use these messages to obtain information regarding the topology of a network. Disabling destination unreachable messages, using the **no ipv6 unreachables** command, secures your network against this type of probing.

**NOTE:** *Disabling ICMPv6 destination unreachable messages breaks applications such as traceroute, which depend on these messages to operate correctly.*

### ICMPv6 type 1 reason codes and description

| Code | Description [RFC]                                                    |
|------|----------------------------------------------------------------------|
| 0    | No route to destination [RFC4443]                                    |
| 1    | Communication with destination administratively prohibited [RFC4443] |
| 2    | Beyond scope of source address [RFC4443]                             |
| 3    | Address unreachable [RFC4443]                                        |
| 4    | Port unreachable [RFC4443]                                           |
| 5    | Source address failed ingress/egress policy [RFC4443]                |
| 6    | Reject route to destination [RFC4443]                                |
| 7    | Error in Source Routing Header [RFC6554]                             |

**Example** To disable destination unreachable messages, use the commands

```
awplus# configure terminal  
awplus(config)# no ipv6 unreachable
```

To enable destination unreachable messages, use the commands

```
awplus# configure terminal  
awplus(config)# ipv6 unreachable
```

# optimistic-nd

**Overview** Use this command to enable the optimistic neighbor discovery feature for both IPv4 and IPv6.

Use the **no** variant of this command to disable the optimistic neighbor discovery feature.

**Syntax** optimistic-nd  
no optimistic-nd

**Default** The optimistic neighbor discovery feature is enabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** The optimistic neighbor discovery feature allows the device, after learning an IPv4 or IPv6 neighbor, to refresh the neighbor before the neighbor is deleted from the hardware L3 switching table. The device puts the neighbor entry into the 'stale' state in the software switching table if it is not refreshed, then the 'stale' neighbors are deleted from the hardware L3 switching table.

The optimistic neighbor discovery feature enables the device to sustain L3 traffic switching to a neighbor without interruption. Without the optimistic neighbor discovery feature enabled L3 traffic is interrupted when a neighbor is 'stale' and is then deleted from the L3 switching table.

If a neighbor receiving optimistic neighbor solicitations does not answer optimistic neighbor solicitations with neighbor advertisements, then the neighbor will be put into the 'stale' state, and subsequently deleted from both the software and the hardware L3 switching tables.

**Examples** To enable the optimistic neighbor discovery feature on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# optimistic-nd
```

To disable the optimistic neighbor discovery feature on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no optimistic-nd
```

**Related commands** [show running-config](#)

## ping ipv6

**Overview** This command sends a query to another IPv6 host (send Echo Request messages).

**Syntax** ping ipv6 {<host>|<ipv6-address>} [repeat {<1-2147483647>|continuous}] [size <10-1452>] [interface <interface-list>] [timeout <1-65535>]

| Parameter                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ipv6-addr>                   | The destination IPv6 address. The IPv6 address uses the format X:X::X:X.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <hostname>                    | The destination hostname.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| repeat                        | Specify the number of ping packets to send.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <1-2147483647>                | Specify repeat count. The default is 5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| size <10-1452>                | The number of data bytes to send, excluding the 8 byte ICMP header. The default is 56 (64 ICMP data bytes).                                                                                                                                                                                                                                                                                                                                                                                                                     |
| interface<br><interface-list> | <p>The interface or range of configured IP interfaces to use as the source in the IP header of the ping packet. The interface can be one of:</p> <ul style="list-style-type: none"> <li>• a VLAN (e.g. vlan2)</li> <li>• the loopback interface (lo)</li> <li>• a continuous range of interfaces separated by a hyphen (e.g. vlan10-20)</li> <li>• a comma-separated list (e.g. vlan1,vlan10-20). Do not mix interface types in a list.</li> </ul> <p>You can only specify the interface when pinging a link local address.</p> |
| timeout<br><1-65535>          | The time in seconds to wait for echo replies if the ARP entry is present, before reporting that no reply was received. If no ARP entry is present, it does not wait.                                                                                                                                                                                                                                                                                                                                                            |

**Mode** User Exec and Privileged Exec

**Example** awplus# ping ipv6 2001:0db8::a2

**Related commands** traceroute ipv6

# show ipv6 forwarding

**Overview** Use this command to display IPv6 forwarding status.

**Syntax** show ipv6 forwarding

**Mode** User Exec and Privileged Exec

**Example** awplus# show ipv6 forwarding

**Output** The following shows typical output.

## Example output from the show ipv6 forwarding command

```
awplus#show ipv6 forwarding
ipv6 forwarding is on
```

# show ipv6 interface

**Overview** Use this command to display brief information about interfaces and the IPv6 address assigned to them.

**Syntax** `show ipv6 interface [brief|<interface-list>] [nd]`

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| brief            | Specify this optional parameter to display brief IPv6 interface information.                                                                                                                                                                                                                                                                                                                             |
| <interface-list> | The interfaces to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a VLAN (e.g. vlan2)</li><li>• the loopback interface (lo)</li><li>• a continuous range of interfaces separated by a hyphen (e.g. vlan10-20)</li><li>• a comma-separated list (e.g. vlan1,vlan10-20). Do not mix interface types in a list.</li></ul> The specified interfaces must exist. |
| nd               | Specify this optional parameter for Neighbor Discovery configurations.                                                                                                                                                                                                                                                                                                                                   |

**Mode** User Exec and Privileged Exec

**Examples** To display a brief list of all interfaces on a device, use the following command:

```
awplus# show ipv6 interface brief
```

**Output** The following shows typical output.

## Example output from the show ipv6 interface brief command

|                                  |                             |          |          |
|----------------------------------|-----------------------------|----------|----------|
| awplus#show ipv6 interface brief |                             |          |          |
| Interface                        | IPv6-Address                | Status   | Protocol |
| lo                               | unassigned                  | admin up | running  |
| vlan1                            | 2001:db8::1/48              | admin up | down     |
|                                  | fe80::215:77ff:fee9:5c50/64 |          |          |

# show ipv6 neighbors

**Overview** Use this command to display all IPv6 neighbors.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** show ipv6 neighbors

**Mode** User Exec and Privileged Exec

**Example** To display a device’s IPv6 neighbors, use the following command:

```
awplus# show ipv6 neighbors
```

**Output** The following shows typical output.

## Example output of the show ipv6 neighbors command

| IPv6 Address            | MAC Address    | Interface | Port | Type    |
|-------------------------|----------------|-----------|------|---------|
| fe80::290:bff:fe3e:44dc | 0090.0b3e.44dc | vlan1     | po3  | dynamic |
| fd32:b1f0:dff7:ab03::1  | 0090.0b3e.44dc | vlan1     | po3  | dynamic |
| fe80::2                 | eccd.6ddf.6d41 | vlan2     | po4  | static  |

## show ipv6 route

**Overview** Use this command to display the IPv6 routing table for a protocol or from a particular table.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 route [connected|database|rip|static|summary|<ipv6-address>|<ipv6-prefix/prefix-length>]`

| Parameter                     | Description                                                              |
|-------------------------------|--------------------------------------------------------------------------|
| connected                     | Displays only the routes learned from connected interfaces.              |
| database                      | Displays only the IPv6 routing information extracted from the database.  |
| rip                           | Displays only the routes learned from RIPng.                             |
| static                        | Displays only the IPv6 static routes you have configured.                |
| summary                       | Displays summary information from the IPv6 routing table.                |
| <ipv6-address>                | Displays the routes for the specified address in the IPv6 routing table. |
| <ipv6-prefix>/<prefix-length> | Displays only the routes for the specified IPv6 prefix.                  |

**Mode** User Exec and Privileged Exec

**Example** To display all IPv6 routes with all parameters turned on, use the following command:

```
awplus# show ipv6 route
```

To display all database entries for all IPv6 routes, use the following command:

```
awplus# show ipv6 route database
```

**Output** The following shows typical output.

**Example output of the show ipv6 route command**

```
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPF, B - BGP
S   ::/0 [1/0] via 2001::a:0:0:c0a8:a6, vlan10
C   2001:db8::a:0:0:0:0/64 via ::, vlan10
C   2001:db8::14:0:0:0:0/64 via ::, vlan20
C   2001:db8::0:0:0:0:0/64 via ::, vlan30
C   2001:db8::28:0:0:0:0/64 via ::, vlan40
C   2001:db8::fa:0:0:0:0/64 via ::, vlan250
C   2001:db8::/64 via ::, vlan250
C   2001:db8::/64 via ::, vlan40
C   2001:db8::/64 via ::, vlan20
C   2001:db8::/64 via ::, vlan10
```

**Output** The following shows typical output.

**Example output of the show ipv6 route database command**

```
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPF, B - BGP
> - selected route, * - FIB route, p - stale info
Timers: Uptime
S   ::/0 [1/0] via 2001::a:0:0:c0a8:a01 inactive, 6d22h12m
      [1/0] via 2001::fa:0:0:c0a8:fa01 inactive, 6d22h12m
```

**commands** [ipv6 route](#)

# show ipv6 route summary

**Overview** Use this command to display the summary of the current NSM RIB entries. For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ipv6 route summary

**Mode** User Exec and Privileged Exec

**Example** To display IP route summary, use the following command:  
awplus# show ipv6 route summary

**Output** The following shows typical output.

## Example output from the show ipv6 route summary command

```
IPv6 routing table name is Default-IPv6-Routing-Table(0)
IPv6 routing table maximum-paths is 4
RouteSource      Networks
connected        4
rip              5
Total            9
FIB              5
```

**Related commands** [show ip route database](#)

# traceroute ipv6

**Overview** Use this command to trace the route to the specified IPv6 host.

**Syntax** `traceroute ipv6 {<ipv6-addr>|<hostname>}`

| Parameter                      | Description                                                              |
|--------------------------------|--------------------------------------------------------------------------|
| <code>&lt;ipv6-addr&gt;</code> | The destination IPv6 address. The IPv6 address uses the format X:X::X:X. |
| <code>&lt;hostname&gt;</code>  | The destination hostname.                                                |

**Mode** User Exec and Privileged Exec

**Example** To run a traceroute for the IPv6 address 2001:0db8::a2, use the following command:

```
awplus# traceroute ipv6 2001:0db8::a2
```

**Related commands** [ping ipv6](#)

# Introduction

**Overview** This chapter provides an alphabetical reference of routing commands that are common across the routing IP protocols. For more information, see the [Route Selection Feature Overview and Configuration Guide](#).

# ip route

**Overview** This command adds a static route to the Routing Information Base (RIB). If this route is the best route for the destination, then your device adds it to the Forwarding Information Base (FIB). Your device uses the FIB to advertise routes to neighbors and forward packets.

The **no** variant of this command removes the static route from the RIB and FIB.

**Syntax** `ip route <subnet&mask> {<gateway-ip>|<interface>} [<distance>]  
[description <description>]`  
`no ip route <subnet&mask> {<gateway-ip>|<interface>}  
[<distance>]`

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <subnet&mask>                | The IPv4 address of the destination subnet defined using either a prefix length or a separate mask specified in one of the following formats: <ul style="list-style-type: none"> <li>The IPv4 subnet address in dotted decimal notation followed by the subnet mask, also in dotted decimal notation.</li> <li>The IPv4 subnet address in dotted decimal notation, followed by a forward slash, then the prefix length.</li> </ul> |
| <gateway-ip>                 | The IPv4 address of the gateway device.                                                                                                                                                                                                                                                                                                                                                                                            |
| <interface>                  | The interface that connects your device to the network. For a VLAN, enter the name of the VLAN or its VID.<br><br>You can also enter 'null' as an interface. Specify a 'null' interface to add a null or blackhole route to the device.<br><br>The gateway IP address or the interface is required.                                                                                                                                |
| <distance>                   | The administrative distance for the static route in the range 1 to 255. Static routes by default have an administrative distance of 1, which gives them the highest priority possible.                                                                                                                                                                                                                                             |
| description<br><description> | A description to record the route's purpose. It can be up to 80 printable ASCII characters long, including spaces. The description does not affect routing or forwarding decisions made by the device. To see the description, use the command <b>show running-configuration</b> .                                                                                                                                                 |

**Mode** Global Configuration

**Default** The default administrative distance for a static route is 1.

**Usage notes** You can use administrative distance to determine which routes take priority over other routes.

Specify a 'Null' interface to add a null or blackhole route to the switch. A null or blackhole route is a routing table entry that does not forward packets, so any packets sent to it are dropped.

Versions of AlliedWare Plus earlier than 5.5.1-2.1 do not support descriptions on static routes, so a start-up configuration that contains descriptions will be rejected by these older versions. If you add descriptions, be careful if you downgrade to an older AlliedWare Plus version.

**Examples** To add the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at 10.10.0.2 with the default administrative distance, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.3.0 255.255.255.0 10.10.0.2
```

To remove the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at 10.10.0.2 with the default administrative distance, use the commands:

```
awplus# configure terminal
awplus(config)# no ip route 192.168.3.0 255.255.255.0 10.10.0.2
```

To add the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at 10.10.0.2 with an administrative distance of 128, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.3.0 255.255.255.0 10.10.0.2 128
```

To give a route a description of 'test' when creating it, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.3.0/24 10.10.0.2 description
test
```

To remove the description from a route, re-enter the route without specifying the **description** parameter:

```
awplus# configure terminal
awplus(config)# ip route 192.168.3.0/24 10.10.0.2
```

**Related commands** [show ip route](#)  
[show ip route database](#)

# ipv6 route

**Overview** This command adds a static IPv6 route to the Routing Information Base (RIB). If this route is the best route for the destination, then your device adds it to the Forwarding Information Base (FIB). Your device uses the FIB to forward packets and to advertise routes to neighbors.

The **no** variant of this command removes the static route.

**Syntax** `ipv6 route <dest-prefix/length> {<gateway-ip>|<gateway-name>} [<src-prefix/length>] [<distvalue>] [description <description>]`  
`no ipv6 route <dest-prefix/length> {<gateway-ip>|<gateway-name>} [<src-prefix/length>] [<distvalue>]`

| Parameter                                 | Description                                                                                                                                                                                                                                                                        |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;dest-prefix/length&gt;</i>         | Specifies the destination prefix.<br><br>The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.                                                                                                                           |
| <i>&lt;gateway-ip&gt;</i>                 | Specifies the address of the gateway (or next hop). The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.                                                                                                                    |
| <i>&lt;gateway-name&gt;</i>               | Specifies the name of the interface for the gateway (or next hop).                                                                                                                                                                                                                 |
| <i>&lt;src-prefix/length&gt;</i>          | Specifies the source prefix. This is used for SADR - see the Usage notes.<br><br>The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.                                                                                   |
| <i>&lt;distvalue&gt;</i>                  | Specifies the administrative distance for the route. Valid values are from 1 to 255. You can use administrative distance to determine which routes take priority over other routes. The route with the lowest distance value is used.                                              |
| description<br><i>&lt;description&gt;</i> | A description to record the route's purpose. It can be up to 80 printable ASCII characters long, including spaces. The description does not affect routing or forwarding decisions made by the device. To see the description, use the command <b>show running-configuration</b> . |

**Mode** Global Configuration

**Usage notes** You can configure IPv6 static routes for Source Address Dependent Routing (SADR) by providing a source prefix. In 'normal' routing, when the device searches routes for a next hop to forward a packet to, the device chooses the next hop based only on the destination address of the packet. When you provide SADR information for a route, the device also inspects the source address and ensures it fits within the source prefix range you provided for this route.

Versions of AlliedWare Plus earlier than 5.5.1-2.1 do not support descriptions on static routes, so a start-up configuration that contains descriptions will be rejected by these older versions. If you add descriptions, be careful if you downgrade to an older AlliedWare Plus version.

**Example** To create a route with administrative distance of 32 to send packets to 2001:0db8::1/128 via vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 route 2001:0db8::1/128 vlan2 32
```

To use SADR to create a route for packets from 2001::/64 to 2223::/64, with a next hop of 2001::1, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 route 2223::/64 2001::1 2001::/64
```

To give a route a description of 'test' when creating it, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 route 2001:0db8::1/128 vlan2 description
test
```

To remove the description from a route, re-enter the route without specifying the **description** parameter:

```
awplus# configure terminal
awplus(config)# ipv6 route 2001:0db8::1/128 vlan2
```

**Related  
Commands** [show running-config](#)

changes** Version 5.5.1-2.1: **description** parameter added  
Version 5.5.0-0.3: **src-prefix** parameter added

## max-fib-routes

**Overview** This command enables you to control the maximum number of FIB routes configured. It operates by providing parameters that enable you to configure preset maximums and warning message thresholds.

**NOTE:** For static routes use the command.

Use the **no** variant of this command to set the maximum number of FIB routes to the default of 4294967294 FIB routes.

**Syntax** max-fib-routes <1-4294967294> [<1-100>|warning-only]  
no max-fib-routes

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                  |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| max-fib-routes | This is the maximum number of routes that can be stored in the device's Forwarding Information dataBase. In practice, other practical system limits would prevent this maximum being reached.                                                                                                                                                |
| <1-4294967294> | The allowable configurable range for setting the maximum number of FIB-routes.                                                                                                                                                                                                                                                               |
| <1-100>        | This parameter enables you to optionally apply a percentage value. This percentage will be based on the maximum number of FIB routes you have specified. This will cause a warning message to appear when your routes reach your specified percentage value. Routes can continue to be added until your configured maximum value is reached. |
| warning-only   | This parameter enables you to optionally apply a warning message. If you set this option a warning message will appear if your maximum configured value is reached. Routes can continue to be added until your device reaches either the maximum capacity value of 4294967294, or a practical system limit.                                  |

**Default** The default number of FIB routes is the maximum number of FIB routes (4294967294).

**Mode** Global Configuration

**Examples** To set the maximum number of dynamic routes to 2000 and warning threshold of 75%, use the following commands:

```
awplus# config terminal
awplus(config)# max-fib-routes 2000 75
```

# max-static-routes

**Overview** Use this command to set the maximum number of static routes, excluding FIB (Forwarding Information Base) routes.

**NOTE:** For FIB routes use the command.

Use the **no** variant of this command to set the maximum number of static routes to the default of 1000 static routes.

**Syntax** max-static-routes <1-1000>  
no max-static-routes

**Default** The default number of static routes is the maximum number of static routes (1000).

**Mode** Global Configuration

**Example** To reset the maximum number of static routes to the default maximum, use the command:

```
awplus# configure terminal
awplus(config)# no max-static-routes
```

**NOTE:** Static routes are applied before adding routes to the RIB (Routing Information Base). Therefore, rejected static routes will not appear in the running config.

**Related commands** [max-fib-routes](#)

# maximum-paths

**Overview** This command enables ECMP on your device, and sets the maximum number of paths that each route has in the Forwarding Information Base (FIB). ECMP is enabled by default.

The **no** variant of this command sets the maximum paths to the default of 4.

**Syntax** maximum-paths <1-8>  
no maximum-paths

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| <1-8>     | The maximum number of paths that a route can have in the FIB. |

**Default** By default the maximum number of paths is 4.

**Mode** Global Configuration

**Examples** To set the maximum number of paths for each route in the FIB to 5, use the commands:

```
awplus# configure terminal
awplus(config)# maximum-paths 5
```

To set the maximum paths for a route to the default of 4, use the commands:

```
awplus# configure terminal
awplus(config)# no maximum-paths
```

**Command changes** Version 5.5.2-2.2: command added to x330 and GS970EMX series

# show ip route

**Overview** Use this command to display routing entries in the FIB (Forwarding Information Base). The FIB contains the best routes to a destination, and your device uses these routes when forwarding traffic. You can display a subset of the entries in the FIB based on protocol.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

**Syntax** `show ip route [connected|rip|static|<ip-addr>|<ip-addr/prefix-length>]`

| Parameter               | Description                                                                             |
|-------------------------|-----------------------------------------------------------------------------------------|
| connected               | Displays only the routes learned from connected interfaces.                             |
| rip                     | Displays only the routes learned from RIP.                                              |
| static                  | Displays only the static routes you have configured.                                    |
| <ip-addr>               | Displays the routes for the specified address. Enter an IPv4 address.                   |
| <ip-addr/prefix-length> | Displays the routes for the specified network. Enter an IPv4 address and prefix length. |

**Mode** User Exec and Privileged Exec

**Examples** To display the static routes in the FIB, use the command:

```
awplus# show ip route static
```

**Output** Each entry in the output from this command has a code preceding it, indicating the source of the routing entry. The first few lines of the output list the possible codes that may be seen with the route entries.

Typically, route entries are composed of the following elements:

- code
- a second label indicating the sub-type of the route
- network or host IP address
- administrative distance and metric
- next hop IP address
- outgoing interface name
- time since route entry was added

**Example output from the show ip route command**

```
Codes: C - connected, S - static, R - RIP, B - BGP
       0 - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       * - candidate default

C       3.3.3.0/24 is directly connected, vlan1
C       10.10.31.0/24 is directly connected, vlan2
C       10.70.0.0/24 is directly connected, vlan4
C       33.33.33.33/32 is directly connected, lo
```

**Connected Route** An example of a connected route entry consists of:

```
C       10.10.31.0/24 is directly connected, vlan2
```

This route entry denotes:

- Route entries for network 10.10.31.0/24 are derived from the IP address of local interface vlan2.
- These routes are marked as Connected routes (C) and always preferred over routes for the same network learned from other routing protocols.

[show ip route database](#)

# show ip route database

**Overview** This command displays the routing entries in the RIB (Routing Information Base).

When multiple entries are available for the same prefix, RIB uses the routes' administrative distances to choose the best route. All best routes are entered into the FIB (Forwarding Information Base). To view the routes in the FIB, use the **show ip route** command.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > (output redirection token).

**Syntax** show ip route database [connected|rip|static]

| Parameter | Description                                                 |
|-----------|-------------------------------------------------------------|
| connected | Displays only the routes learned from connected interfaces. |
| rip       | Displays only the routes learned from RIP.                  |
| static    | Displays only the static routes you have configured.        |

**Mode** User Exec and Privileged Exec

**Example** To display the static routes in the RIB, use the command:

```
awplus# show ip route database static
```

**Output** The following shows typical output.

**Example output from the show ip route database command:**

```
Codes: C - connected, S - static, R - RIP, B - BGP
       0 - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
> - selected route, * - FIB route, p - stale info

C    *> 10.10.31.0/24 is directly connected, vlan2
S    *> 10.10.34.0/24 [1/0] via 10.10.31.16, vlan2
C    *> 10.30.0.0/24 is directly connected, vlan6
S    *> 11.22.11.0/24 [1/0] via 10.10.31.16, vlan2
S    *> 16.16.16.16/32 [1/0] via 10.10.31.16, vlan2
C    *> 45.45.45.45/32 is directly connected, lo
C    *> 127.0.0.0/8 is directly connected, lo
```

**Related commands** [maximum-paths](#)  
[show ip route](#)

# show ip route summary

**Overview** This command displays a summary of the current RIB (Routing Information Base) entries.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

**Syntax** show ip route summary

**Mode** User Exec and Privileged Exec

**Example** To display a summary of the current RIB entries, use the command:

```
awplus# show ip route summary
```

**Output** The following shows typical output.

## Example output from the show ip route summary command

```
IP routing table name is Default-IP-Routing-Table(0)
IP routing table maximum-paths is 4
Route Source      Networks
connected         5
Total             5
```

**Related commands** [show ip route](#)  
[show ip route database](#)

# show ipv6 route

**Overview** Use this command to display the IPv6 routing table for a protocol or from a particular table.

For information on filtering and saving command output, see the **[“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#)**.

**Syntax** `show ipv6 route [connected|database|rip|static|summary|<ipv6-address>|<ipv6-prefix/prefix-length>]`

| Parameter                     | Description                                                              |
|-------------------------------|--------------------------------------------------------------------------|
| connected                     | Displays only the routes learned from connected interfaces.              |
| database                      | Displays only the IPv6 routing information extracted from the database.  |
| rip                           | Displays only the routes learned from RIPng.                             |
| static                        | Displays only the IPv6 static routes you have configured.                |
| summary                       | Displays summary information from the IPv6 routing table.                |
| <ipv6-address>                | Displays the routes for the specified address in the IPv6 routing table. |
| <ipv6-prefix>/<prefix-length> | Displays only the routes for the specified IPv6 prefix.                  |

**Mode** User Exec and Privileged Exec

**Example** To display all IPv6 routes with all parameters turned on, use the following command:

```
awplus# show ipv6 route
```

To display all database entries for all IPv6 routes, use the following command:

```
awplus# show ipv6 route database
```

**Output** The following shows typical output.

**Example output of the show ipv6 route command**

```
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPF, B - BGP
S   ::/0 [1/0] via 2001::a:0:0:c0a8:a6, vlan10
C   2001:db8::a:0:0:0:0/64 via ::, vlan10
C   2001:db8::14:0:0:0:0/64 via ::, vlan20
C   2001:db8::0:0:0:0:0/64 via ::, vlan30
C   2001:db8::28:0:0:0:0/64 via ::, vlan40
C   2001:db8::fa:0:0:0:0/64 via ::, vlan250
C   2001:db8::/64 via ::, vlan250
C   2001:db8::/64 via ::, vlan40
C   2001:db8::/64 via ::, vlan20
C   2001:db8::/64 via ::, vlan10
```

**Output** The following shows typical output.

**Example output of the show ipv6 route database command**

```
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPF, B - BGP
> - selected route, * - FIB route, p - stale info
Timers: Uptime
S   ::/0 [1/0] via 2001::a:0:0:c0a8:a01 inactive, 6d22h12m
      [1/0] via 2001::fa:0:0:c0a8:fa01 inactive, 6d22h12m
```

# Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure RIP.

For information about configuring RIP, see the [RIP Feature Overview and Configuration Guide](#).

# accept-lifetime

**Overview** Use this command to specify the time period during which the authentication key on a key chain is received as valid.

Use the **no** variant of this command to remove a specified time period for an authentication key on a key chain as set previously with the **accept-lifetime** command.

**Syntax** `accept-lifetime <start-date> {<end-date>|  
duration <seconds>|infinite}  
no accept-lifetime`

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |            |                                                    |       |                             |         |                                                                                |        |                      |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|----------------------------------------------------|-------|-----------------------------|---------|--------------------------------------------------------------------------------|--------|----------------------|
| <start-date> | Specifies the start time and date in the format: <hh:mm:ss> <day> <month> <year> or <hh:mm:ss> <month> <day> <year>, where: <table><tr><td>&lt;hh:mm:ss&gt;</td><td>The time of the day, in hours, minutes and seconds</td></tr><tr><td>&lt;day&gt;</td><td>&lt;1-31&gt; The day of the month</td></tr><tr><td>&lt;month&gt;</td><td>The month of the year (the first three letters of the month, for example, Jan)</td></tr><tr><td>&lt;year&gt;</td><td>&lt;1993-2035&gt; The year</td></tr></table> | <hh:mm:ss> | The time of the day, in hours, minutes and seconds | <day> | <1-31> The day of the month | <month> | The month of the year (the first three letters of the month, for example, Jan) | <year> | <1993-2035> The year |
| <hh:mm:ss>   | The time of the day, in hours, minutes and seconds                                                                                                                                                                                                                                                                                                                                                                                                                                                     |            |                                                    |       |                             |         |                                                                                |        |                      |
| <day>        | <1-31> The day of the month                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |            |                                                    |       |                             |         |                                                                                |        |                      |
| <month>      | The month of the year (the first three letters of the month, for example, Jan)                                                                                                                                                                                                                                                                                                                                                                                                                         |            |                                                    |       |                             |         |                                                                                |        |                      |
| <year>       | <1993-2035> The year                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |            |                                                    |       |                             |         |                                                                                |        |                      |
| <end-date>   | Specifies the end time and date in the format: <hh:mm:ss> <day> <month> <year> or <hh:mm:ss> <month> <day> <year>, where: <table><tr><td>&lt;hh:mm:ss&gt;</td><td>The time of the day, in hours, minutes and seconds</td></tr><tr><td>&lt;day&gt;</td><td>&lt;1-31&gt; The day of the month</td></tr><tr><td>&lt;month&gt;</td><td>The month of the year (the first three letters of the month, for example, Jan)</td></tr><tr><td>&lt;year&gt;</td><td>&lt;1993-2035&gt; The year</td></tr></table>   | <hh:mm:ss> | The time of the day, in hours, minutes and seconds | <day> | <1-31> The day of the month | <month> | The month of the year (the first three letters of the month, for example, Jan) | <year> | <1993-2035> The year |
| <hh:mm:ss>   | The time of the day, in hours, minutes and seconds                                                                                                                                                                                                                                                                                                                                                                                                                                                     |            |                                                    |       |                             |         |                                                                                |        |                      |
| <day>        | <1-31> The day of the month                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |            |                                                    |       |                             |         |                                                                                |        |                      |
| <month>      | The month of the year (the first three letters of the month, for example, Jan)                                                                                                                                                                                                                                                                                                                                                                                                                         |            |                                                    |       |                             |         |                                                                                |        |                      |
| <year>       | <1993-2035> The year                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |            |                                                    |       |                             |         |                                                                                |        |                      |
| <seconds>    | <1-2147483646> Duration of the key in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |            |                                                    |       |                             |         |                                                                                |        |                      |
| infinite     | Never expires.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |            |                                                    |       |                             |         |                                                                                |        |                      |

**Mode** Keychain-key Configuration

**Examples** The following examples show the setting of accept-lifetime for key 1 on the key chain named "mychain".

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# accept-lifetime 03:03:01 Sep 3 2016
04:04:02 Oct 6 2016
```

or:

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# accept-lifetime 03:03:01 3 Sep 2016
04:04:02 6 Oct 2016
```

## alliedware-behavior

**Overview** This command configures your device to exhibit AlliedWare behavior when sending RIPv1 response/update messages. Configuring for this behavior may be necessary if you are replacing an AlliedWare device with an AlliedWare Plus device and wish to ensure consistent RIPv1 behavior.

Use the **no** variant of this command to implement AlliedWare Plus behavior.

This command has no impact on devices running RIPv2. Reception and transmission can be independently altered to conform to AlliedWare standard.

**Syntax** `alliedware-behavior {rip1-send|rip1-recv}`  
`no alliedware-behavior {rip1-send|rip1-recv}`

| Parameter              | Description                                                                               |
|------------------------|-------------------------------------------------------------------------------------------|
| <code>rip1-send</code> | Configures the router to behave in AlliedWare mode when <b>sending</b> update messages.   |
| <code>rip1-recv</code> | Configures the router to behave in AlliedWare mode when <b>receiving</b> update messages. |

**Default** By default when sending out RIPv1 updates on an interface, if the prefix (learned through RIPv2 or otherwise redistributed into RIP) being advertised does not match the subnetting used on the outgoing RIPv1 interface it will be filtered. The **alliedware-behavior** command returns your router's RIPv1 behavior to the AlliedWare format, where the prefix will be advertised as-is.

For example, if a RIPv1 update is being sent over interface 192.168.1.4/26, by default the prefix 192.168.1.64/26 will be advertised, but the prefix 192.168.1.144/28 will be filtered because the mask /28 does not match the interface's mask of /26. If **alliedware-behavior rip1-send** is configured, 192.168.1.144 would be sent as-is.

**Mode** Router Configuration

**Examples** To configure your device for **AlliedWare**-like behavior when sending and receiving RIPv1 update messages, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# alliedware-behavior rip1-send
awplus(config-router)# alliedware-behavior rip1-recv
```

To return your device to **AlliedWare Plus**-like behavior when sending and receiving RIPv1 update messages, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no alliedware-behavior rip1-send
awplus(config-router)# no alliedware-behavior rip1-recv
```

**Validation** **show ip protocols rip**  
**Commands** **show running-config**

**Related** **fullupdate (RIP)**  
**commands**

## cisco-metric-behavior (RIP)

**Overview** Use this command to enable or disable the RIP routing metric update to conform to Cisco's implementation. This command is provided to allow inter-operation with older Cisco devices that do not conform to the RFC standard for RIP route metrics.

Use the **no** variant of this command to disable this feature.

**Syntax** `cisco-metric-behavior {enable|disable}`  
`no cisco-metric-behavior`

| Parameter | Description                                         |
|-----------|-----------------------------------------------------|
| enable    | Enables updating the metric consistent with Cisco.  |
| disable   | Disables updating the metric consistent with Cisco. |

**Default** By default, the Cisco metric-behavior is disabled.

**Mode** Router Configuration

**Examples** To enable the routing metric update to behave as per the Cisco implementation, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# cisco-metric-behavior enable
```

To disable the routing metric update to behave as per the default setting, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no cisco-metric-behavior
```

**Validation Commands** `show running-config`

# clear ip rip route

**Overview** Use this command to clear specific data from the RIP routing table.

**Syntax** `clear ip rip route <ip-dest-network/prefix-length>`  
`clear ip rip route {static|connected|rip|ospf|invalid-routes|all}`

| Parameter                                    | Description                                                                                                                                             |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;ip-dest-network/prefix-length&gt;</i> | Removes entries which exactly match this destination address from RIP routing table. Enter the IP address and prefix length of the destination network. |
| static                                       | Removes static entries from the RIP routing table.                                                                                                      |
| connected                                    | Removes entries for connected routes from the RIP routing table.                                                                                        |
| rip                                          | Removes only RIP routes from the RIP routing table.                                                                                                     |
| ospf                                         | Removes only OSPF routes from the RIP routing table.                                                                                                    |
| invalid-routes                               | Removes routes with metric 16 immediately. Otherwise, these routes are not removed until RIP times out the route after 2 minutes.                       |
| all                                          | Clears the entire RIP routing table.                                                                                                                    |

**Mode** Privileged Exec

**Usage notes** Using this command with the **all** parameter clears the RIP table of all the routes.

**Examples** To clear the route 10.0.0.0/8 from the RIP routing table, use the following command:

```
awplus# clear ip rip route 10.0.0.0/8
```

## debug rip

**Overview** Use this command to specify the options for the displayed debugging information for RIP events and RIP packets.

Use the **no** variant of this command to disable the specified debug option.

**Syntax** debug rip {events|nsm|<packet>|all}  
no debug rip {events|nsm|<packet>|all}

| Parameter | Description                                                    |
|-----------|----------------------------------------------------------------|
| events    | RIP events debug information is displayed.                     |
| nsm       | RIP and NSM communication is displayed.                        |
| <packet>  | packet [recv send] [detail] Specifies RIP packets only.        |
| recv      | Specifies that information for received packets be displayed.  |
| send      | Specifies that information for sent packets be displayed.      |
| detail    | Displays detailed information for the sent or received packet. |
| all       | Displays all RIP debug information.                            |

**Default** Disabled

**Mode** Privileged Exec and Global Configuration

**Example** The following example displays information about the RIP packets that are received and sent out from the device.

```
awplus# debug rip packet
```

**Related commands** [undebug rip](#)

## default-information originate (RIP)

**Overview** Use this command to generate a default route into the Routing Information Protocol (RIP).

Use the **no** variant of this command to disable this feature.

**Syntax** default-information originate  
no default-information originate

**Default** Disabled

**Mode** Router Configuration

**Usage** If routes are being redistributed into RIP and the router's route table contains a default route, within one of the route categories that are being redistributed, the RIP protocol will advertise this default route, irrespective of whether the **default-information originate** command has been configured or not. However, if the router has not redistributed any default route into RIP, but you want RIP to advertise a default route anyway, then use this command.

This will cause RIP to create a default route entry in the RIP database. The entry will be of type RS (Rip Static). Unless actively filtered out, this default route will be advertised out every interface that is sending RIP. Split horizon does not apply to this route, as it is internally generated. This operates quite similarly to the OSPF **default-information originate always** command.

**Example** awplus# configure terminal  
awplus(config)# router rip  
awplus(config-router)# default-information originate

# default-metric (RIP)

**Overview** Use this command to specify the metrics to be assigned to redistributed RIP routes.

Use the **no** variant of this command to reset the RIP metric back to its default (1).

**Syntax** default-metric *<metric>*  
no default-metric [*<metric>*]

| Parameter             | Description                                       |
|-----------------------|---------------------------------------------------|
| <i>&lt;metric&gt;</i> | <1-16> Specifies the value of the default metric. |

**Default** By default, the RIP metric value is set to 1.

**Mode** RIP Router Configuration

**Usage notes** This command is used with the **redistribute (RIP)** command to make the routing protocol use the specified metric value for all redistributed routes, regardless of the original protocol that the route has been redistributed from.

**Examples** This example assigns the cost of 10 to the routes that are redistributed into RIP.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# default-metric 10
awplus(config-router)# redistribute ospf
awplus(config-router)# redistribute connected
```

**Related commands** **redistribute (RIP)**

## distance (RIP)

**Overview** This command sets the administrative distance for RIP routes. Your device uses this value to select between two or more routes to the same destination obtained from two different routing protocols. The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). For more information, see the [Route Selection Feature Overview and Configuration Guide](#).

The **no** variant of this command sets the administrative distance for the RIP route to the default of 120.

**Syntax** `distance <1-255> [<ip-addr/prefix-length> [<access-list>]]`  
`no distance [<1-255>] [<ip-addr/prefix-length> [<access-list>]]`

| Parameter                                  | Description                                                                                                                   |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;1-255&gt;</code>                 | The administrative distance value you are setting for this RIP route.                                                         |
| <code>&lt;ip-addr/prefix-length&gt;</code> | The network IP address and prefix-length that you are changing the administrative distance for.                               |
| <code>&lt;access-list&gt;</code>           | Specifies the access-list name. This access list specifies which routes within the specified network this command applies to. |

**Mode** RIP Router Configuration

**Examples** To set the administrative distance to 8 for the RIP routes within the 10.0.0.0/8 network that match the access-list "mylist", use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distance 8 10.0.0.0/8 mylist
```

To set the administrative distance to the default of 120 for the RIP routes within the 10.0.0.0/8 network that match the access-list "mylist", use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no distance 8 10.0.0.0/8 mylist
```

# distribute-list (RIP)

**Overview** Use this command to filter incoming or outgoing route updates using the access-list or the prefix-list.

Use the **no** variant of this command to disable this feature.

**Syntax** `distribute-list {<access-list> | prefix <prefix-list>} {in|out} [<interface>]`  
`no distribute-list {<access-list> | prefix <prefix-list>} {in|out} [<interface>]`

| Parameter     | Description                                           |
|---------------|-------------------------------------------------------|
| <access-list> | Specifies the IPv4 access-list number or name to use. |
| prefix        | Filter prefixes in routing updates.                   |
| <prefix-list> | Specifies the name of the IPv4 prefix-list to use.    |
| in            | Filter incoming routing updates.                      |
| out           | Filter outgoing routing updates.                      |
| <interface>   | The interface on which the filtering applies.         |

**Default** Disabled

**Mode** RIP Router Configuration

**Usage notes** Filter out incoming or outgoing route updates using an access-list or a prefix-list. If you do not specify the name of the interface, the filter will be applied to all interfaces.

**Examples** To apply an ACL called 'myfilter' to filter incoming routing updates on VLAN2, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distribute-list myfilter in vlan2
```

To apply a prefix list called 'myfilter' to filter incoming routing updates on VLAN2, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distribute-list prefix myfilter in vlan2
```

**Related commands** [access-list extended \(named\)](#)

## fullupdate (RIP)

**Overview** Use this command to specify which routes RIP should advertise when performing a triggered update. By default, when a triggered update is sent, RIP will only advertise those routes that have changed since the last update. When **fullupdate** is configured, the device advertises the full RIP route table in outgoing triggered updates, including routes that have not changed. This enables faster convergence times, or allows inter-operation with legacy network equipment, but at the expense of larger update messages.

Use the **no** variant of this command to disable this feature.

**Syntax** fullupdate  
no fullupdate

**Default** By default this feature is disabled.

**Mode** RIP Router Configuration

**Example** To enable the fullupdate (RIP) function, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# fullupdate
```

## ip summary-address rip

**Overview** Use this command to configure a summary IP address on a RIPv2 interface. Use the **no** variant of this command to remove a summary IP address from a selected RIPv2 interface.

**Syntax** `ip summary-address rip {<ip-address/prefix-length>}`  
`no ip summary-address rip {<ip-address/prefix-length>}`

| Parameter                                     | Description                               |
|-----------------------------------------------|-------------------------------------------|
| <code>&lt;ip-address/prefix-length&gt;</code> | The summary IPv4 address to be advertised |

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** Route summarization is a technique that helps network administrators reduce the size of the routing tables by advertising a single super-network that covers a range of subnets.

You statically configure an IP summary address on a router interface. The router then advertises the summary address downstream through this interface. This means that:

- all the routers that are downstream from the configured interface will receive only the summary route, and none of the child routes via the RIP advertisement.
- As long as at least one of the child routes is valid, the router will propagate the summary route. But when the last child that is part of the summarized range disappears, then the router will stop advertising the summary route through the interface.

This command will be rejected if there is no IP address configured on the interface.

**NOTE:** *Manual route summarization is not supported when the interface/router is running in RIPv1.*

**Example** The subnets 10.4.1.0/24, 10.4.2.128/25 and 10.4.3.0/24 can be summarized and advertised as 10.4.0.0/16 on vlan1 using the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip summary-address rip 10.4.0.0/16
```

**Related commands** [show ip rip database](#)  
[show ip protocols rip](#)

**Command changes** Version 5.4.8-0.2 command added

# ip rip authentication key-chain

**Overview** Use this command to enable RIPv2 authentication on an interface and specify the name of the key chain to be used.

Use the **no** variant of this command to disable this function.

**Syntax** ip rip authentication key-chain <key-chain-name>  
no ip rip authentication key-chain

| Parameter        | Description                                                                                       |
|------------------|---------------------------------------------------------------------------------------------------|
| <key-chain-name> | Specify the name of the key chain. This is an alpha-numeric string, but it cannot include spaces. |

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** Use this command to perform authentication on the interface. Not configuring the key chain results in no authentication at all.

The AlliedWare Plus™ implementation provides the choice of configuring authentication for single key or multiple keys at different times. Use the **ip rip authentication string** command for single key authentication. Use the **ip rip authentication key-chain** command for multiple keys authentication. See the **RIP Feature Overview and Configuration Guide** for illustrated RIP configuration examples.

For multiple key authentication, use the following steps to configure a route to enable RIPv2 authentication using multiple keys at different times:

1. Define a key chain with a key chain name, using the following commands:

```
awplus# configure terminal
awplus(config)# key chain <key-chain-name>
```

2. Define a key on this key chain, using the following command:

```
awplus(config-keychain)# key <keyid>
```

3. Define the password used by the key, using the following command:

```
awplus(config-keychain-key)# key-string <key-password>
```

4. Enable authentication on the desired interface and specify the key chain to be used, using the following commands:

```
awplus# configure terminal
awplus(config)# interface <id>
awplus(config-if)# ip rip authentication key-chain <key-chain-name>
```

5. Specify the mode of authentication for the given interface (text or MD5), using the following command:

```
awplus(config-if)# ip rip authentication mode {md5|text}
```

**Example 1** To use the key chain named 'mykey' on the interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication key-chain mykey
```

**Example 2** In the following example of a configuration for multiple keys authentication, a password 'toyota' is set for key 1 in key chain 'cars'. Authentication is enabled on vlan2 and the authentication mode is set to MD5:

```
awplus# configure terminal
awplus(config)# key chain cars
awplus(config-keychain)# key 1
awplus(config-keychain-key)# key-string toyota
awplus(config-keychain-key)# accept-lifetime 10:00:00 Oct 08
2021 duration 43200
awplus(config-keychain-key)# send-lifetime 10:00:00 Oct 08 2021
duration 43200
awplus(config-keychain-key)# exit
awplus(config-keychain)# exit
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication key-chain cars
awplus(config-if)# ip rip authentication mode md5
```

**Related commands**

- accept-lifetime**
- send-lifetime**
- ip rip authentication mode**
- ip rip authentication string**
- key**
- key chain**

## ip rip authentication mode

**Overview** Use this command to specify the type of authentication mode used for RIP v2 packets.

Use the **no** variant of this command to restore clear text authentication.

**Syntax** ip rip authentication mode {md5|text}  
no ip rip authentication mode

| Parameter | Description                                             |
|-----------|---------------------------------------------------------|
| md5       | Uses the keyed MD5 authentication algorithm.            |
| text      | Specifies clear text or simple password authentication. |

**Default** Text authentication is enabled

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** The AlliedWare Plus™ implementation provides the choice of configuring authentication for single key or multiple keys at different times. Use the **ip rip authentication string** command for single key authentication. Use the **ip rip authentication key-chain** command for multiple keys authentication. See the **RIP Feature Overview and Configuration Guide** for illustrated RIP configuration examples.

**Usage: single key** Use the following steps to configure a route to enable RIPv2 authentication using a single key or password:

1. Define the authentication string or password used by the key for the desired interface, using the following commands:

```
awplus# configure terminal
awplus(config)# interface <id>
awplus(config-if)# ip rip authentication string <auth-string>
```

2. Specify the mode of authentication for the given interface (text or MD5), using the following commands:

```
awplus# configure terminal
awplus(config)# interface <id>
awplus(config-if)# ip rip authentication mode {md5|text}
```

**Usage:** For multiple keys authentication, use the following steps to configure a route to enable RIPv2 authentication using multiple keys at different times:

1. Define a key chain with a key chain name, using the following commands:

```
awplus# configure terminal
```

```
awplus(config)# key chain <key-chain-name>
```

2. Define a key on this key chain using the following command:

```
awplus(config-keychain)# key <keyid>
```

3. Define the password used by the key, using the following command:

```
awplus(config-keychain-key)# key-string <key-password>
```

4. Enable authentication on the desired interface and specify the key chain to be used, using the following commands:

```
awplus(config-if)# ip rip authentication key-chain <key-chain-name>
```

5. Specify the mode of authentication for the given interface (text or MD5), using the following commands:

```
awplus(config-if)# ip rip authentication mode {md5|text}
```

**Example 1** To use MD5 authentication on the interface vlan2, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# interface vlan2
```

```
awplus(config-if)# ip rip authentication mode md5
```

**Example 2** In the following example of a configuration for multiple keys authentication, a password 'toyota' is set for key 1 in key chain 'cars'. Authentication is enabled on vlan2 and the authentication mode is set to MD5:

```
awplus# configure terminal
```

```
awplus(config)# key chain cars
```

```
awplus(config-keychain)# key 1
```

```
awplus(config-keychain-key)# key-string toyota
```

```
awplus(config-keychain-key)# accept-lifetime 10:00:00 Oct 08 2016 duration 43200
```

```
awplus(config-keychain-key)# send-lifetime 10:00:00 Oct 08 2016 duration 43200
```

```
awplus(config-keychain-key)# exit
```

```
awplus(config-keychain)# exit
```

```
awplus(config)# interface vlan2
```

```
awplus(config-if)# ip rip authentication key-chain cars
```

```
awplus(config-if)# ip rip authentication mode md5
```

**Related commands** [ip rip authentication string](#)  
[ip rip authentication key-chain](#)

## ip rip authentication string

**Overview** Use this command to specify the authentication string or password used by a key.

Use the **no** variant of this command to remove the authentication string.

**Syntax** `ip rip authentication string [encrypted] <auth-string>`  
`no ip rip authentication string`

| Parameter     | Description                                                                                                                                                                                                                                                      |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| encrypted     | Means that the password that follows is encoded, not plain text. This parameter is only used in generated configuration files. In configuration files, the device prints encrypted in front of passwords to indicate that it is displaying the encoded password. |
| <auth-string> | The authentication string or password used by a key. It is an alpha- numeric string and can include spaces.                                                                                                                                                      |

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** The AlliedWare Plus™ implementation provides the choice of configuring authentication for single key or multiple keys at different times. Use this command to specify the password for a single key on an interface. Use the [ip rip authentication key-chain](#) command for multiple keys authentication. For information about configuring RIP, see the [RIP Feature Overview and Configuration Guide](#).

Use the following steps to configure a route to enable RIPv2 authentication using a single key or password:

1. Define the authentication string or password used by the key for the desired interface, using the following commands:

```
awplus# configure terminal
```

```
awplus(config)# interface <id>
```

2. Specify the mode of authentication for the given interface (text or MD5), using the following commands:

```
awplus# configure terminal
```

```
awplus(config-if)# ip rip authentication string <auth-string>
```

```
awplus(config)# interface <id>
```

```
awplus(config-if)# ip rip authentication mode {md5|text}
```

**Example** To specify 'mykey' as the authentication string and use MD5 authentication for the VLAN interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip authentication string mykey
awplus(config-if)# ip rip authentication mode md5
```

Any RIP packet received on that interface should have the same string as its password.

**Related commands** [ip rip authentication key-chain](#)  
[ip rip authentication mode](#)

**Command changes** Version 5.5.4-0.1: **encrypted** parameter added

## ip rip receive-packet

**Overview** Use this command to configure the interface to enable the reception of RIP packets.

Use the **no** variant of this command to disable this feature.

**Syntax** ip rip receive-packet  
no ip rip receive-packet

**Default** Enabled

**Mode** Interface Configuration for a VLAN interface.

**Example** To turn on packet receiving on the interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip receive-packet
```

**Related commands** [ip rip send-packet](#)

## ip rip receive version

**Overview** Use this command to specify the version of RIP packets accepted on an interface and override the setting of the version command.

Use the **no** variant of this command to use the setting specified by the **version (RIP)**.

**Syntax** ip rip receive version [1] [2]  
no ip rip receive version

| Parameter | Description                                                     |
|-----------|-----------------------------------------------------------------|
| 1         | Specifies acceptance of RIP version 1 packets on the interface. |
| 2         | Specifies acceptance of RIP version 2 packets on the interface. |

**Default** Version 2

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to a specific interface and overrides the version specified by the **version (RIP)** command.

RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

**Example** To set the interface vlan2 to receive both RIP version 1 and 2 packets, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip receive version 1 2
```

**Related commands** **version (RIP)**

# ip rip send-packet

**Overview** Use this command to enable sending RIP packets through the current interface.

Use the **no** variant of this command to disable this feature.

**Syntax** ip rip send-packet  
no ip rip send-packet

**Default** Enabled

**Mode** Interface Configuration for a VLAN interface.

**Example** To turn on packet sending on the interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip send-packet
```

**Related commands** [ip rip receive-packet](#)

## ip rip send version

**Overview** Use this command in Interface Configuration mode to specify the version of RIP packets sent on an interface and override the setting of the **version (RIP)** command. This mechanism causes RIP version 2 interfaces to send multicast packets instead of broadcasting packets.

Use the **no** variant of this command to use the setting specified by the **version (RIP)** command.

**Syntax** ip rip send version {1|2|1 2|2 1}  
no ip rip send version

| Parameter | Description                                                                                |
|-----------|--------------------------------------------------------------------------------------------|
| 1         | Specifies the sending of RIP version 1 packets out of an interface.                        |
| 2         | Specifies the sending of RIP version 2 packets out of an interface.                        |
| 1 2       | Specifies the sending of both RIP version 1 and RIP version 2 packets out of an interface. |
| 2 1       | Specifies the sending of both RIP version 2 and RIP version 1 packets out of an interface. |

**Default** Version 2

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to a specific interface and overrides the version specified by the **version (RIP)** command.

RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces. Selecting version parameters 1 2 or 2 1 sends RIP version 1 and 2 packets.

Use the **ip rip send version 1-compatible** command in an environment where you cannot send multicast packets. For example, in environments where multicast is not enabled and where hosts do not listen to multicast.

**Examples** To set the interface vlan2 to send both RIP version 1 and 2 packets, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip send version 1 2
```

**Related commands** [ip rip send version 1-compatible version \(RIP\)](#)

# ip rip send version 1-compatible

**Overview** Use this command in Interface Configuration mode to send RIP version 1 compatible packets from a RIP version 2 interface to other RIP Interfaces. This mechanism causes RIP version 2 interfaces to send broadcast packets instead of multicasting packets, and is used in environments where multicast is not enabled or where hosts do not listen to multicast.

Use the **no** variant of this command to use the setting specified by the **version (RIP)** command, and disable the broadcast of RIP version 2 packets that are sent as broadcast packets.

**Syntax** ip rip send version 1-compatible  
no ip rip send version

| Parameter    | Description                                                                                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1-compatible | Specify this parameter to send RIP version 1 compatible packets from a version 2 RIP interface to other RIP interfaces.<br><br>This mechanism causes version 2 RIP interfaces to broadcast packets instead of multicasting packets. |

**Default** RIP version 2 is enabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to a specific interface and overrides the version specified by the **version (RIP)** command.

RIP can be run in version 1 compatible mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

Use the **ip rip send version** command in an environment where you can send multicast packets, for example, in environments where multicast is enabled and where hosts listen to multicast.

**Example** To set the interface vlan2 to send RIP version 1- compatible packets, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip send version 1-compatible
```

**Related** **ip rip send version**  
**commands** **version (RIP)**

## ip rip split-horizon

**Overview** Use this command to turn on the split-horizon mechanism on the interface.

Use the **no** variant of this command to disable this mechanism.

**Syntax** ip rip split-horizon [poisoned]  
no ip rip split-horizon

| Parameter | Description                                                                         |
|-----------|-------------------------------------------------------------------------------------|
| poisoned  | Performs split-horizon with poison-reverse. See "Usage" below for more information. |

**Default** Split horizon poisoned

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** Use this command to avoid including routes in updates sent to the same gateway from which they were learned. Without the **poisoned** parameter, using this command causes routes learned from a neighbor to be omitted from updates sent to that neighbor. With the **poisoned** parameter, using this command causes such routes to be included in updates, but sets their metrics to infinity. This advertises that these routes are not reachable.

**Example** To turn on split horizon poisoned on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip rip split-horizon poisoned
```

# key

**Overview** Use this command to manage, add and delete authentication keys in a key-chain.

Use the **no** variant of this command to delete the authentication key.

**Syntax** key <keyid>  
no key <keyid>

| Parameter | Description                           |
|-----------|---------------------------------------|
| <keyid>   | <0-2147483647> Key identifier number. |

**Mode** Keychain Configuration

**Usage** This command allows you to enter the keychain-key mode where a password can be set for the key.

**Example** The following example configures a key number 1 and shows the change into a **keychain- key** command mode prompt.

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)#
```

**Related commands** **key chain**  
**key-string**  
**accept-lifetime**  
**send-lifetime**

# key chain

**Overview** Use this command to enter the key chain management mode and to configure a key chain with a key chain name.

Use the **no** variant of this command to remove the key chain and all configured keys.

**Syntax** `key chain <key-chain-name>`  
`no key chain <key-chain-name>`

| Parameter                           | Description                                  |
|-------------------------------------|----------------------------------------------|
| <code>&lt;key-chain-name&gt;</code> | Specify the name of the key chain to manage. |

**Mode** Global Configuration

**Usage** This command allows you to enter the keychain mode from which you can specify keys on this key chain.

**Example** The following example shows the creation of a key chain named mychain and the change into **keychain** mode prompt.

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)#
```

**Related commands** [key](#)  
[key-string](#)  
[accept-lifetime](#)  
[send-lifetime](#)

# key-string

**Overview** Use this command to define the password to be used by a key.  
Use the **no** variant of this command to remove a password.

**Syntax** key-string [encrypted] <key-password>  
no key-string

| Parameter      | Description                                                                                                                                                                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| encrypted      | Means that the password that follows is encoded, not plain text. This parameter is only used in generated configuration files. In configuration files, the device prints encrypted in front of passwords to indicate that it is displaying the encoded password. |
| <key-password> | A string of characters to be used as a password by the key.                                                                                                                                                                                                      |

**Mode** Keychain-key Configuration

**Usage** Use this command to specify passwords for different keys.

**Examples** To set the password for 'key1' in the key chain named 'mychain' to 'VerySecret', use the commands:

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# key-string VerySecret
```

To remove the password for 'key1' in the key chain named 'mychain':

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# no key-string
```

**Related commands** [key](#)  
[key chain](#)  
[accept-lifetime](#)  
[send-lifetime](#)

**Command changes** Version 5.5.4-0.1: **encrypted** parameter added

## maximum-prefix

**Overview** Use this command to configure the maximum number of RIP routes stored by the device.

Use the **no** variant of this command to disable all limiting of the number of RIP routes stored by the device.

**Syntax** `maximum-prefix <maxprefix> [<threshold>]`  
`no maximum-prefix`

| Parameter                      | Description                                                                                                  |
|--------------------------------|--------------------------------------------------------------------------------------------------------------|
| <code>&lt;maxprefix&gt;</code> | <code>&lt;1-65535&gt;</code> The maximum number of RIP routes allowed.                                       |
| <code>&lt;threshold&gt;</code> | <code>&lt;1-100&gt;</code> Percentage of maximum routes to generate a warning. The default threshold is 75%. |

**Mode** Router Configuration

**Example** To configure the maximum number of RIP routes to 150, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# maximum-prefix 150
```

# neighbor (RIP)

**Overview** Use this command to specify a neighbor router. It is used for each router to which you wish to send unicast RIP updates.

Use the **no** variant of this command to stop sending unicast updates to the specific router.

**Syntax** neighbor <ip-address>  
no neighbor <ip-address>

| Parameter    | Description                                                                                  |
|--------------|----------------------------------------------------------------------------------------------|
| <ip-address> | The IP address of a neighboring router with which the routing information will be exchanged. |

**Default** Disabled

**Mode** Router Configuration

**Usage** Use this command to exchange nonbroadcast routing information. It can be used multiple times for additional neighbors.

The **passive-interface (RIP)** command disables sending routing updates on an interface. If you want to send routing updates only to specific neighbors, use the **passive-interface (RIP)** command and this **neighbor** command together.

**Example** To specify the neighbor router to 1.1.1.1, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# passive-interface vlan1
awplus(config-router)# neighbor 1.1.1.1
```

**Related commands** **passive-interface (RIP)**

# network (RIP)

**Overview** Use this command to activate the transmission of RIP routing information on the defined network.

Use the **no** variant of this command to remove the specified network or interface as one that runs RIP.

**Syntax** `network {<network-address>[/<subnet-mask>]|<interface>}`  
`no network {<network-address>[/<subnet-mask>]|<interface>}`

| Parameter                                                  | Description                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;network-address&gt;[/&lt;subnet-mask&gt;]</code> | <p>Specifies the network address to run RIP. Entering a subnet mask (or prefix length) for the network address is optional.</p> <p>Where no mask is entered, the device will attempt to apply a mask that is appropriate to the class (A, B, or C) of the address entered, e.g. an IP address of 10.0.0.0 will have a prefix length of 8 applied to it.</p> |
| <code>&lt;interface&gt;</code>                             | Specify an interface to run RIP.                                                                                                                                                                                                                                                                                                                            |

**Default** Disabled

**Mode** RIP Router Configuration

**Usage notes** Use this command to specify networks, by IP address or interface, to which routing updates will be sent and received. The connected routes corresponding to the specified network will be automatically advertised in RIP updates. RIP updates will be sent and received within the specified network.

**Example** Use the following commands to activate RIP routing updates on network 172.16.20.0/24:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# network 172.16.20.0/24
```

**Related commands** [show ip rip](#)  
[show running-config](#)  
[clear ip rip route](#)

## offset-list (RIP)

**Overview** Use this command to add an offset to the **in** and **out** metrics of routes learned through RIP.

Use the **no** variant of this command to remove the offset list.

**Syntax** `offset-list <access-list> {in|out} <offset> [<interface>]`  
`no offset-list <access-list> {in|out} <offset> [<interface>]`

| Parameter                        | Description                                                                                                      |
|----------------------------------|------------------------------------------------------------------------------------------------------------------|
| <code>&lt;access-list&gt;</code> | Specifies the access-list number or names to apply. Note that you can only use standard ACLs, not extended ACLs. |
| <code>in</code>                  | Indicates the access list will be used for metrics of incoming advertised routes.                                |
| <code>out</code>                 | Indicates the access list will be used for metrics of outgoing advertised routes.                                |
| <code>&lt;offset&gt;</code>      | <code>&lt;0-16&gt;</code> Specifies that the offset is used for metrics of networks matching the access list.    |
| <code>&lt;interface&gt;</code>   | An alphanumeric string that specifies the interface to match.                                                    |

**Default** The default offset value is the metric value of the interface over which the updates are being exchanged.

**Mode** RIP Router Configuration

**Usage** Use this command to specify the offset value that is added to the routing metric. When the networks match the access list the offset is applied to the metrics. No change occurs if the offset value is zero.

**Examples** In this example the router examines the RIP updates being sent out from interface `vlan2` and adds 5 hops to the routes matching the IP addresses specified in the access list 8. To do this, use these commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# offset-list 8 in 5 vlan2
```

**Related commands** [access-list \(extended numbered\)](#)

## passive-interface (RIP)

**Overview** Use this command to block RIP broadcasts on the interface.  
Use the **no** variant of this command to disable this function.

**Syntax** `passive-interface <interface>`  
`no passive-interface <interface>`

| Parameter                      | Description                   |
|--------------------------------|-------------------------------|
| <code>&lt;interface&gt;</code> | Specifies the interface name. |

**Default** Disabled

**Mode** RIP Router Configuration

**Example** Use the following commands to block RIP broadcasts on vlan2:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# passive-interface vlan2
```

**Related commands** [show ip rip](#)

## recv-buffer-size (RIP)

**Overview** Use this command to run-time configure the RIP UDP (User Datagram Protocol) receive-buffer size to improve UDP reliability by avoiding UDP receive buffer overrun.

Use the **no** variant of this command to reset the configured RIP UDP receive-buffer size to the system default (196608 bits).

**Syntax** `recv-buffer-size <8192-2147483647>`  
`no recv-buffer-size [<8192-2147483647>]`

| Parameter                            | Description                                                             |
|--------------------------------------|-------------------------------------------------------------------------|
| <code>&lt;8192-2147483647&gt;</code> | Specify the RIP UDP (User Datagram Protocol) buffer size value in bits. |

**Default** 196608 bits is the system default when reset using the **no** variant of this command.

**Mode** Router Configuration

**Examples** To run-time configure the RIP UDP, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# recv-buffer-size 23456789
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no recv-buffer-size 23456789
```

# redistribute (RIP)

**Overview** Use this command to redistribute information from other routing protocols into RIP.

Use the **no** variant of this command to disable the specified redistribution. The parameters **metric** and **route-map** may be used with the **no** variant, but have no effect.

**Syntax** `redistribute {connected|static|ospf} [metric <0-16>] [route-map <route-map>]`  
`no redistribute {connected|static|ospf} [metric] [route-map]`

| Parameter     | Description                                                                                                                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| route-map     | Optional. Specifies route-map that controls how routes are redistributed.                                                                                                                                                                    |
| <route-map>   | Optional. The name of the route map.                                                                                                                                                                                                         |
| connected     | Redistribute from connected routes.                                                                                                                                                                                                          |
| static        | Redistribute from static routes.                                                                                                                                                                                                             |
| ospf          | Redistribute from Open Shortest Path First (OSPF).                                                                                                                                                                                           |
| metric <0-16> | Optional. Sets the value of the metric that will be applied to routes redistributed into RIP from other protocols. If a value is not specified, and no value is specified using the <b>default-metric (RIP)</b> command, the default is one. |

**Default** By default, the RIP metric value is set to 1.

**Mode** RIP Router Configuration

**Example** To apply the metric value 15 to static routes being redistributed into RIP, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# redistribute static metric 15
```

**Related commands** **default-metric (RIP)**

# restart rip graceful

**Overview** Use this command to force the RIP process to restart, and optionally set the grace-period.

**Syntax** restart rip graceful [grace-period <1-65535>]

**Mode** Privileged Exec

**Default** The default RIP grace-period is 60 seconds.

**Usage notes** After this command is executed, the RIP process immediately shuts down. It notifies the system that RIP has performed a graceful shutdown. Routes that have been installed into the route table by RIP are preserved until the specified grace-period expires.

When a **restart rip graceful** command is issued, the RIP configuration is reloaded from the last saved configuration. Ensure you first enter the command **copy running-config startup-config**.

**Example** To apply a restart rip graceful setting, grace-period to 100 seconds use the following commands:

```
awplus# copy running-config startup-config
awplus# restart rip graceful grace-period 100
```

# rip restart grace-period

**Overview** Use this command to change the grace period of RIP graceful restart.  
Use the **no** variant of this command to disable this function.

**Syntax** rip restart grace-period <1-65535>  
no rip restart grace-period <1-65535>

**Mode** Global Configuration

**Default** The default RIP grace-period is 60 seconds.

**Usage notes** Use this command to enable the **Graceful Restart** feature on the RIP process. Entering this command configures a grace period for RIP.

**Example** awplus# configure terminal  
awplus(config)# rip restart grace-period 200

## route (RIP)

**Overview** Use this command to add a static RIP route.  
Use the **no** variant of this command to remove a static RIP route.

**Syntax** route <ip-addr/prefix-length>  
no route <ip-addr/prefix-length>

| Parameter               | Description                         |
|-------------------------|-------------------------------------|
| <ip-addr/prefix-length> | The IPv4 address and prefix length. |

**Default** No static RIP route is added by default.

**Mode** RIP Router Configuration

**Usage notes** Use this command to add a static RIP route. After adding the RIP route, the route can be checked in the RIP routing table.

**Example** To create a static RIP route to IP subnet 192.168.1.0/24, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# route 192.168.1.0/24
```

**Related commands** [show ip rip](#)  
[clear ip rip route](#)

## router rip

**Overview** Use this global command to enter Router Configuration mode to enable the RIP routing process.

Use the **no** variant of this command to disable the RIP routing process.

**Syntax** router rip  
no router rip

**Mode** Global Configuration

**Example** This command is used to begin the RIP routing process:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# version 1
awplus(config-router)# network 10.10.10.0/24
awplus(config-router)# network 10.10.11.0/24
awplus(config-router)# neighbor 10.10.10.10
```

**Related commands** [network \(RIP\)](#)  
[version \(RIP\)](#)

# send-lifetime

**Overview** Use this command to specify the time period during which the authentication key on a key chain can be sent.

**Syntax** send-lifetime <start-date> {<end-date>|  
duration <seconds>|infinite}  
no send-lifetime

| Parameter    | Description                                                                                                                 |
|--------------|-----------------------------------------------------------------------------------------------------------------------------|
| <start-date> | Specifies the start time and date in the format: <hh:mm:ss> <day> <month> <year> or <hh:mm:ss> <month> <day> <year>, where: |
|              | <hh:mm:ss> The time of the day, in hours, minutes and seconds                                                               |
|              | <day> <1-31> The day of the month                                                                                           |
|              | <month> The month of the year (the first three letters of the month, for example, Jan)                                      |
|              | <year> <1993-2035> The year                                                                                                 |
| <end-date>   | Specifies the end time and date in the format: <hh:mm:ss> <day> <month> <year> or <hh:mm:ss> <month> <day> <year>, where:   |
|              | <hh:mm:ss> The time of the day, in hours, minutes and seconds                                                               |
|              | <day> <1-31> The day of the month                                                                                           |
|              | <month> The month of the year (the first three letters of the month, for example, Jan)                                      |
|              | <year> <1993-2035> The year                                                                                                 |
| <seconds>    | <1-2147483646> Duration of the key in seconds.                                                                              |
| infinite     | Never expires.                                                                                                              |

**Mode** Keychain-key Configuration

**Example** The following example shows the setting of send-lifetime for key 1 on the key chain named "mychain".

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# send-lifetime 03:03:01 Jan 3 2016
04:04:02 Dec 6 2016
```

**Related commands**

- key**
- key-string**
- key chain**
- accept-lifetime**

## service rip

**Overview** Use this command to enable the RIP service.

Use the **no** version of the command to disable the RIP service if you are not using it.

**Syntax** service rip  
no service rip

**Default** Disabled

**Mode** Global Configuration

**Usage notes** This service is disabled by default, to reduce memory use on devices that are not using RIP. Enable it before configuring RIP.

If you disable the service, that change won't take effect until you save the configuration and restart the device.

**Examples** To enable the RIP service, use the commands:

```
awplus# configure terminal
awplus(config)# service rip
```

To disable the RIP service, use the commands:

```
awplus# configure terminal
awplus(config)# no service rip
```

% Save the config and restart the device for this change to take effect

```
awplus(config)# exit
awplus# write
awplus# reboot
```

**Command changes** Version 5.5.5-0.1: command added

## show debugging rip

**Overview** Use this command to display the RIP debugging status for these debugging options: nsm debugging, RIP event debugging, RIP packet debugging and RIP nsm debugging.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** show debugging rip

**Mode** User Exec and Privileged Exec

**Usage notes** Use this command to display the debug status of RIP.

**Example** awplus# show debugging rip

# show ip protocols rip

**Overview** Use this command to display RIP process parameters and statistics.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** show ip protocols rip

**Mode** User Exec and Privileged Exec

**Example** awplus# show ip protocols rip

**Output** The following shows typical output.

## Example output from the show ip protocols rip command

```
Routing Protocol is "rip"
Sending updates every 30 seconds with +/-50%, next due in 12
seconds
Timeout after 180 seconds, garbage collect after 120 seconds
Outgoing update filter list for all interface is not set
Incoming update filter list for all interface is not set
Default redistribution metric is 1
Redistributing: connected static
Default version control: send version 2, receive version 2
Interface          Send Recv  Key-chain
  vlan25             2      2
Routing for Networks:
  10.10.0.0/24
Routing Information Sources:
  Gateway            BadPackets BadRoutes  Distance Last Update
Distance: (default is 120)
```

# show ip rip

**Overview** Use this command to show RIP routes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip rip

**Mode** User Exec and Privileged Exec

**Example** awplus# show ip rip

**Output** The following shows typical output.

## Example output from the show ip rip command

```
awplus#show ip rip
Codes: R - RIP, Rc - RIP connected, Rs - RIP static
       C - Connected, S - Static, O - OSPF, B - BGP
Network      Next Hop Metric From If    Time
C 10.0.1.0/24      1      vlan20
S 10.10.10.0/24    1      vlan20
C 10.10.11.0/24    1      vlan20
S 192.168.101.0/24 1      vlan20
R 192.192.192.0/24 1      --
```

**Related commands** [route \(RIP\)](#)  
[network \(RIP\)](#)  
[clear ip rip route](#)

# show ip rip database

**Overview** Use this command to display information about the RIP database.

For information on filtering and saving command output, see the [“Getting\\_Started with AlliedWare Plus” Feature Overview and Configuration\\_Guide](#).

**Syntax** show ip rip database [full]

| Parameter | Description                                                     |
|-----------|-----------------------------------------------------------------|
| full      | Specify the full RIP database including sub-optimal RIP routes. |

**Mode** User Exec and Privileged Exec

**Example** awplus# show ip rip database  
awplus# show ip rip database full

**Related commands** [show ip rip](#)

## show ip rip interface

**Overview** Use this command to display information about the RIP interfaces. You can specify an interface name to display information about a specific interface.

**Syntax** show ip rip interface [<interface>]

| Parameter   | Description                                 |
|-------------|---------------------------------------------|
| <interface> | The interface to display information about. |

**Mode** User Exec and Privileged Exec

**Example** awplus# show ip rip interface

## timers (RIP)

**Overview** Use this command to adjust routing network timers.  
Use the **no** variant of this command to restore the defaults.

**Syntax** `timers basic <update> <timeout> <garbage>`  
`no timers basic`

| Parameter                    | Description                                                                                                                                                                                                                          |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;update&gt;</code>  | <code>&lt;5-2147483647&gt;</code><br>Specifies the period at which RIP route update packets are transmitted. The default is 30 seconds.                                                                                              |
| <code>&lt;timeout&gt;</code> | <code>&lt;5-2147483647&gt;</code><br>Specifies the routing information timeout timer in seconds. The default is 180 seconds. After this interval has elapsed and no updates for a route are received, the route is declared invalid. |
| <code>&lt;garbage&gt;</code> | <code>&lt;5-2147483647&gt;</code><br>Specifies the routing garbage collection timer in seconds. The default is 120 seconds.                                                                                                          |

**Default** Enabled

**Mode** RIP Router Configuration

**Usage notes** This command adjusts the RIP timing parameters.

The update timer is the time between sending out updates, that contain the complete routing table, to every neighboring router.

If an update for a given route has not been seen for the time specified by the timeout parameter, that route is no longer valid. However, it is retained in the routing table for a short time, with metric 16, so that neighbors are notified that the route has been dropped.

When the time specified by the garbage parameter expires the metric 16 route is finally removed from the routing table. Until the garbage time expires, the route is included in all updates sent by the router.

All the routers in the network must have the same timers to ensure the smooth operation of RIP throughout the network.

**Examples** To set the update timer to 30, the routing information timeout timer to 180, and the routing garbage collection timer to 120, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# timers basic 30 180 120
```

## undebg rip

**Overview** Use this command to disable the options set for debugging information of RIP events, packets and communication between RIP and NSM.

This command has the same effect as the **no debug rip** command.

**Syntax** undebg rip {all|events|nsm|<packet>}

| Parameter | Description                                                           |
|-----------|-----------------------------------------------------------------------|
| all       | Disables all RIP debugging.                                           |
| events    | Disables the logging of RIP events.                                   |
| nsm       | Disables the logging of RIP and NSM communication.                    |
| <packet>  | packet [recv send] [detail]<br>Disables the debugging of RIP packets. |
| recv      | Disables the logging of received packet information.                  |
| send      | Disables the logging of sent packet information.                      |
| detail    | Disables the logging of sent or received RIP packets.                 |

**Mode** Privileged Exec

**Example** To disable the options set for debugging RIP information events, use the following command:

```
awplus# undebg rip packet
```

**Related commands** [debug rip](#)

## version (RIP)

**Overview** Use this command to specify a RIP version used globally by the router.  
Use the **no** variant of this command to restore the default version.

**Syntax** version {1|2}  
no version

| Parameter | Description                              |
|-----------|------------------------------------------|
| 1 2       | Specifies the version of RIP processing. |

**Default** Version 2

**Mode** RIP Router Configuration

**Usage notes** RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

Setting the version command has no impact on receiving updates, only on sending them. The **ip rip send version** command overrides the value set by the **version (RIP)** command on an interface-specific basis. The **ip rip receive version** command allows you to configure a specific interface to accept only packets of the specified RIP version. The **ip rip receive version** command and the **ip rip send version** command override the value set by this command.

**Examples** To specify a RIP version, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# version 1
```

**Related commands** **ip rip receive version**  
**ip rip send version**  
**show running-config**

# Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Link Health Monitoring for switches.

For more information, see the [Link Health Monitoring for Switches Feature Overview and Configuration Guide](#).

## consecutive probe loss

**Overview** Use this command within a specific link performance profile to configure the allowable consecutive probe loss thresholds of probes that use that performance profile.

Use the **no** variant of this command to delete a consecutive probe loss threshold.

**Syntax** consecutive-probe-loss bad-when *<consecutive-probe-losses>*  
consecutive-probe-loss good-when *<consecutive-probe-successes>*  
consecutive-probe-loss unreachable-when *<consecutive-probe-losses>*  
no consecutive-probe-loss bad-when  
no consecutive-probe-loss good-when  
no consecutive-probe-loss unreachable-when

| Parameter                                                | Description                                                                                                                                      |
|----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| bad-when <i>&lt;consecutive-probe-losses&gt;</i>         | The number of probes that must be lost consecutively, at which point the associated link is considered to be bad, in a range of <1-100>.         |
| good-when <i>&lt;consecutive-probe-successes&gt;</i>     | The number of probes that must succeed consecutively, at which point the associated link is considered to be good, in a range of <1-100>.        |
| unreachable-when <i>&lt;consecutive-probe-losses&gt;</i> | The number of probes that must be lost consecutively, at which point the associated link is considered to be unreachable, in a range of <1-100>. |

**Default** The performance profile is disabled.

**Mode** Linkmon Profile Configuration

**Usage notes** These setting are all optional.

The **bad-when** parameter is used to set the thresholds where if the number of probe replies that have been lost consecutively is equal to or above this value, then that link is considered bad. If **bad-when** is not configured, this metric will never result in a link being considered bad.

The **unreachable-when** parameter is used to set the thresholds where if the number of probe replies that have been lost consecutively is equal to or above this value, then that link is considered unreachable or down. If **unreachable-when** is not configured, this metric will never result in a link being considered unreachable.

The **good-when** parameter is used to state the thresholds where if the number of probe replies that have been successfully received consecutively is equal to or above this value, then that link is considered good. If **good-when** is not configured, then when a link is considered bad or unreachable due to this metric, the first successful probe result will consider the link as good.

**Example** To configure the point at or above which consecutive probe loss is unacceptable to be 10, the point at or above which consecutive probe success is acceptable to be 5, and the point at or above which consecutive probe loss indicates the destination is unreachable to be 15 for performance profile named "profile0", use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon profile profile0
awplus(config-linkmon-profile)# consecutive-probe-loss bad-when
10
awplus(config-linkmon-profile)# consecutive-probe-loss good-when
5
awplus(config-linkmon-profile)# consecutive-probe-loss
unreachable-when 15
```

To delete consecutive-probe-loss thresholds in performance profile "profile0", use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon profile profile0
awplus(config-linkmon-profile)# no consecutive-probe-loss bad-
when
awplus(config-linkmon-profile)# no consecutive-probe-loss good-
when
awplus(config-linkmon-profile)# no consecutive-probe-loss
unreachable-when
```

**Command changes** Version 5.4.8-1.1: command added  
Version 5.5.1-0.1: command added to all AlliedWare Plus switches

## debug linkmon

**Overview** Use this command to enable Link Health Monitoring debugging.

Use the **no** variant of this command to disable Link Health Monitoring debugging.

**Syntax** debug linkmon [probe|ip-address|interface|trigger]  
no debug linkmon [probe|ip-address|interface|trigger]  
debug linkmon probe name <name>  
no debug linkmon probe name <name>

| Parameter  | Description                                                                          |
|------------|--------------------------------------------------------------------------------------|
| probe      | Link Health Monitoring probe.                                                        |
| ip-address | IP addresses that are of interest to Link Health Monitoring.                         |
| interface  | Interfaces that are of interest to Link Health Monitoring.                           |
| trigger    | This debug option will show debugging for Link Health Monitoring triggers.           |
| <name>     | The name identifying a Link Health Monitoring probe or Link Health Monitoring group. |

**Default** No debugging is enabled.

**Mode** Privileged Exec

**Usage notes** If **probe** is specified, then debug related to all Link Health Monitoring probes is enabled.

If **probe name** <name> is specified, then debug related to the named Link Health Monitoring probe is enabled.

If **ip-address** is specified, then debug related to configuration of IP addresses that are of interest to Link Health Monitoring are enabled. These IP addresses could influence Link Health Monitoring group members being considered up/down.

If **interface** is specified, then debug related to up/down state of Link Health Monitoring is enabled.

If **trigger** is specified, then debug related to Link Health Monitoring triggers is enabled.

**Example** To enable debugging on the Link Health Monitoring probe 'probe1', use the following command:

```
awplus# debug linkmon probe name probe1
```

To enable debugging on all Link Health Monitoring probes, use the following command:

```
awplus# debug linkmon probe
```

To disable debugging on all Link Health Monitoring probes, use the following command:

```
awplus# no debug linkmon probe
```

**Related commands** [linkmon probe](#)

**Command changes** Version 5.4.8-0.2: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

# destination (linkmon-probe)

**Overview** Use this command to set the destination of a Link Health Monitoring probe. This is a required configuration option for probes.

Use the **no** variant of this command to remove the destination of a probe.

**Syntax** destination {<ip-address>|<fqdn>}  
no destination

| Parameter    | Description                                                                                                                                              |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-address> | The destination of the probe, an IPv4 or IPv6 IP address.                                                                                                |
| <fqdn>       | The destination of the probe, an FQDN (fully qualified domain name). The IP address of the FQDN will be automatically resolved by the DNS on the device. |

**Mode** Linkmon ICMP Probe Configuration

**Example** To set the destination of a probe named 'probe1' to 192.168.2.200, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# destination 192.168.2.200
```

To set the destination of a probe named 'probe1' to 2001:db8:a0b:12f0::1, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# destination
2001:db8:a0b:12f0::1
```

To set the destination of a probe named 'probe1' to the FQDN of "google.com", use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# destination google.com
```

To remove the destination of a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no destination
```

**Related commands**  
**Command changes**

**linkmon probe**

Version 5.4.8-1.1: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

## dscp (linkmon-probe)

**Overview** Use this command to set the DSCP value of packets used for Link Health Monitoring probes.

Use the **no** variant of this command to set it back to the default.

**Syntax** dscp <dscp-value>  
no dscp

| Parameter    | Description                                          |
|--------------|------------------------------------------------------|
| <dscp-value> | The DSCP value for the probe packet in range <0-63>. |

**Default** The default DSCP value is 0.

**Mode** Linkmon ICMP Probe Configuration

**Example** To set the DSCP of a probe named 'probe1' to 10, use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# dscp 10
```

To set the DSCP of a probe named 'probe1' back to default, use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# no dscp
```

**Related commands** [linkmon probe](#)

**Command changes** Version 5.4.8-1.1: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

## egress interface (linkmon-probe)

**Overview** Use this command to force a Link Health Monitoring probe to egress out of a specific interface.

Use the **no** variant of this command to return interface selection back to the default behavior.

**Syntax** egress interface <interface>

no egress interface

| Parameter   | Description                                                                                                                                   |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <interface> | The name of the egress interface for the probe. The specified egress interface needs to be locally configured and in an up and running state. |

**Default** No egress interface is defined by default. The egress interface will be selected using standard routing behavior to reach the probe's destination.

**Mode** Linkmon HTTP Probe Configuration, or Linkmon ICMP Probe Configuration

**Example** To set the egress interface for a probe named 'probe1' to 'vlan2', use the following commands:

```
awplus(config)# linkmon probe name probe1
```

```
awplus(config-linkmon-icmp-probe)# egress interface vlan2
```

To set the egress interface for a probe named 'probe1' back to the default, use the following commands:

```
awplus(config)# linkmon probe name probe1
```

```
awplus(config-linkmon-icmp-probe)# no egress interface
```

**Command changes** Version 5.4.8-1.1: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

## enable (linkmon-probe)

**Overview** Use this command to enable individual Link Health Monitoring probes. When a probe is enabled, it will begin transmitting, processing, and storing results.

Use the **no** variant of this command to disable a probe.

**Syntax** enable  
no enable

**Default** Disabled

**Mode** Linkmon HTTP Probe Configuration, or Linkmon ICMP Probe Configuration

**Example** To enable a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# enable
```

To disable a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# no enable
```

**Related commands** [linkmon probe](#)

**Command changes** Version 5.4.8-1.1: command added  
Version 5.5.1-0.1: command added to all AlliedWare Plus switches

## interval (linkmon-probe)

**Overview** Use this command to set the interval between Link Health Monitoring probe packets.

Use the **no** variant of this command to set the interval back to the default.

**Syntax** `interval <probe-interval>`  
`no interval`

| Parameter                           | Description                                                                                                                                                           |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;probe-interval&gt;</code> | The gap between probes being transmitted. For ICMP probes, this is a range of 100-10000 milliseconds. For HTTP probes, this is a range of 30000-3600000 milliseconds. |

**Default** For ICMP probes, the default interval is 1000 milliseconds. For HTTP probes, the default interval is 60000 milliseconds.

**Mode** Linkmon HTTP Probe Configuration, or Linkmon ICMP Probe Configuration

**Example** To set the interval of a probe named 'probe1' to 100, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# interval 100
```

To set the interval of a probe named 'probe1' back to default, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no interval
```

**Related commands** [linkmon probe](#)

**Command changes** Version 5.4.8-1.1: command added  
Version 5.5.1-0.1: command added to all AlliedWare Plus switches

## ip-version (linkmon-probe)

**Overview** Use this command to set the IP version for the Link Health Monitoring ICMP probe.

Use the **no** variant of this command to set it back to the default.

**Syntax** ip-version {4|6}  
no ip-version

| Parameter | Description                        |
|-----------|------------------------------------|
| 4         | Internet Protocol (IPv4)           |
| 6         | Internet Protocol version 6 (IPv6) |

**Default** IPv4

**Mode** Linkmon HTTP Probe Configuration, or Linkmon ICMP Probe Configuration

**Example** To set the IP version as IPv6 for a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1
```

```
awplus(config-linkmon-icmp-probe)# ip-version 6
```

To set the IP version back to the default for a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1
```

```
awplus(config-linkmon-icmp-probe)# no ip-version
```

**Command changes** Version 5.4.8-1.1: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

# jitter

**Overview** Use this command to configure the thresholds for the jitter metric. This metric is used to judge whether probes associated with this performance profile are good or bad.

Use the **no** variant of this command to remove jitter bad-above and jitter good-below ranges.

**Syntax** jitter bad-above <unacceptable-jitter-point>  
jitter good-below <acceptable-jitter-point>  
no jitter bad-above  
no jitter good-below

| Parameter                            | Description                                                                                                                                                                                                                                            |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bad-above<unacceptable-jitter-point> | The point above which jitter is unacceptable in range <1-1000> in milliseconds.<br><br>When a probe associated with this profile has a jitter result greater than this value, the associated Link Health Monitoring member will be considered 'bad'.   |
| good-below<acceptable-jitter-point>  | The point at or below which jitter is acceptable in range <1-1000> in milliseconds.<br><br>When a probe associated with this profile has a jitter result less than this value, the associated Link Health Monitoring member will be considered 'good'. |

**Mode** Linkmon Profile Configuration

**Usage notes** If only **bad-above** is configured, then if the probe results indicate a link is above this value, then that link is considered bad. As soon as the results fall below this value, the link will be immediately considered good.

The combination of these two parameters allow for hysteresis, which may prevent link-flapping behavior. For example, with a **bad-above** value of 100, and a **good-below** value of 90, if the jitter rises to 100 the link will be marked 'bad', but it will not be marked 'good' until it reaches or falls below 90.

If only **good-below** is configured, then probe results will not cause a link to be considered bad.

**Example** To configure the point above which jitter is unacceptable to be 100ms and the point at or below which jitter is acceptable to be 90ms for a performance profile named 'profile1', use the following commands:

```
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)# jitter bad-above 100
awplus(config-linkmon-profile)# jitter good-below 90
```

To delete the jitter ranges for a performance profile named 'profile1', use the following commands:

```
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)# no jitter bad-above
awplus(config-linkmon-profile)# no jitter good-below
```

**Related commands** [latency](#)  
[linkmon probe](#)  
[linkmon profile](#)

**Command changes** Version 5.4.8-0.2: command added  
Version 5.5.1-0.1: command added to all AlliedWare Plus switches

# latency

**Overview** Use this command to configure the thresholds for the latency metric. This metric is used to judge whether probes associated with this performance profile are good or bad.

Use the **no** variant of this command to remove latency bad-above and latency good-below ranges.

**Syntax** latency bad-above *<unacceptable-latency-point>*  
latency good-below *<acceptable-latency-point>*  
no latency bad-above  
no latency good-below

| Parameter                                           | Description                                                                                                                                                                                                                                                       |
|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| bad-above <i>&lt;unacceptable-latency-point&gt;</i> | The point above which latency is unacceptable in range <i>&lt;1-2000&gt;</i> in milliseconds.<br>When a probe associated with this profile has a latency result greater than this value, the associated Link Health Monitoring member will be considered 'bad'.   |
| good-below <i>&lt;acceptable-latency-point&gt;</i>  | The point at or below which latency is acceptable in range <i>&lt;1-2000&gt;</i> in milliseconds.<br>When a probe associated with this profile has a latency result less than this value, the associated Link Health Monitoring member will be considered 'good'. |

**Mode** Linkmon Profile Configuration

**Usage notes** If only **bad-above** is configured, then if the probe results indicate a link is above this value, then that link is considered bad. As soon as the results fall below this value, the link will be immediately considered good.

The combination of these two parameters allow for hysteresis, which may prevent link-flapping behavior. For example, with a **bad-above** value of 100, and a **good-below** value of 90, if the latency rises to 100 the link will be marked 'bad', but it will not be marked 'good' until it reaches or falls below 90.

If only **good-below** is configured, then probe results will not cause a link to be considered bad.

**Example** To configure the point above which latency is unacceptable to be 100ms and the point at or below which latency is acceptable to be 90ms for a performance profile named 'profile1', use the following commands:

```
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)# latency bad-above 100
awplus(config-linkmon-profile)# latency good-below 90
```

To delete the latency ranges for a performance profile named 'profile1', use the following commands:

```
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)# no latency bad-above
awplus(config-linkmon-profile)# no latency good-below
```

**Related commands** [jitter](#)

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

## linkmon probe

**Overview** Use this command to create a Link Health Monitoring probe and enter the appropriate Link Health Monitoring Probe Configuration Mode where this probe can be configured.

Use the **no** variant of this command to delete the Link Health Monitoring probe.

**Syntax** linkmon probe name <probe-name> [type {icmp-ping|http-get}]  
no linkmon probe name <probe-name>

| Parameter    | Description                                                                                                                                                                                                                    |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <probe-name> | The name of the probe.                                                                                                                                                                                                         |
| type         | The type of the probe. Indicates the packet type or protocol used by the probe, either of icmp-ping (ICMP) or http-get (HTTP). This parameter is optional. If not entered, a newly created probe's type defaults to icmp-ping. |

**Default** The default probe type for a newly created probe is **icmp-ping**. The optional parameter **type** is only required to create a probe type other than the default. The **type** parameter is not required when editing an existing probe or deleting a probe.

**Mode** Global Configuration

**Usage notes** The optional probe **type** parameter represents the packet type or protocol used in the transmission of the probe. A probe of type **icmp-ping** will present some different configuration options to a probe of type **http-get**.

An **icmp-ping** Link Health Monitoring probe requires a destination, and must be enabled for probing to begin.

An **http-get** Link Health Monitoring probe requires a URL, and must be enabled for probing to begin.

**Example** To create a probe named 'probe1' using the default probe type and enter Link Health Monitoring ICMP Probe Configuration Mode to configure it, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)#
```

To create a probe named 'probe1' using the default ICMP probe type and enter Link Health Monitoring ICMP Probe Configuration Mode to configure it, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name probe1 type icmp-ping
awplus(config-linkmon-icmp-probe)#
```

To create a probe named 'probe1' using the HTTP probe type and enter Link Health Monitoring HTTP Probe Configuration Mode to configure it, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name probe1 http-probe
awplus(config-linkmon-http-probe)#
```

To remove a probe named 'probe1', use the following commands:

```
awplus# configure terminal
awplus(config)# no linkmon probe name probe1
```

**Related commands**

- interval (linkmon-probe)**
- jitter**
- latency**
- linkmon probe-history**
- linkmon profile**
- show linkmon probe**
- show linkmon probe-history**
- size (linkmon-probe)**

**Command changes**

- Version 5.4.8-0.2: command added
- Version 5.4.8-1.1: now operates as a modal command, with the new type parameter used to determine whether to enter ICMP or HTTP probe mode
- Version 5.5.1-0.1: command added to all AlliedWare Plus switches

## linkmon probe-history

**Overview** Use this command to create a collection instance that records the metrics gathered by a Link Health Monitoring probe.

Use the **no** variant of this command to remove the specified collection instance.

**Syntax** linkmon probe-history [<1-65535>] probe <probe-name> interval <1-2678400> buckets <1-65535>  
no linkmon probe-history <1-65535>

| Parameter               | Description                                                                                                              |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------|
| probe-history <1-65535> | The ID of the probe history collection instance. If this is not set on creation then it will be automatically allocated. |
| probe <probe-name>      | The name of the probe to record metrics for.                                                                             |
| interval <1-2678400>    | The interval that metrics are collated, in seconds.                                                                      |
| buckets <1-65535>       | The maximum number of metric history samples.                                                                            |

**Mode** Global Configuration

**Usage notes** Metrics are collated every **interval** seconds. Up to **buckets** samples of metrics are collated.

Different **interval** and **buckets** values can be used to record specific kinds of histories. For example, an **interval** value of 1 and a **buckets** value of 3600 would record per second metrics of a probe for an hour. An **interval** value of 3600 and a **buckets** value of 744 would record per hour metrics of a probe for 31 days.

Using the Web API, metric values for a sample are returned as a sum and a count. The sum can be divided by the count for an average. For example, if 10 probes have been sent during a history interval, then the metric counts would be 10 for a sample, and the sum would be the total of the metric values.

If a probe receives no reply then no metric is recorded.

Packet loss is not recorded exactly. Instead the probes sent and probe replies received is recorded.

**CAUTION:** *This configuration option can consume a large amount of RAM on the device, particularly if you configure high numbers of buckets. The memory is reserved when the command is entered, so if the memory consumption from this command is too high, entering the command will trigger the device's low memory management procedure. The device will continue to operate when it reaches a low memory state, but if available memory decreases further into a critical zone, a warning message will be printed and the device will reboot.*

**Example** To create a Link Health Monitoring probe history collection instance with an ID of 10 for a probe named 'probe1' that collates metrics every second while keeping up to 300 samples, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# linkmon probe-history 10 probe probe1 interval 1  
buckets 300
```

To create a Link Health Monitoring probe history collection instance with an automatically allocated ID for a probe named 'probe1' that collates metrics every 60 seconds while keeping up to 3600 samples, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# linkmon probe-history probe probe1 interval 60  
buckets 3600
```

**Related commands** [linkmon probe](#)

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

# linkmon profile

**Overview** Use this command to create a Link Health Monitoring performance profile and enter Linkmon Profile Configuration mode where this profile can be configured.

Use the **no** variant of this command to remove a configured performance profile.

**Syntax** linkmon profile *<profile-name>*  
no linkmon profile *<profile-name>*

| Parameter                   | Description                          |
|-----------------------------|--------------------------------------|
| <i>&lt;profile-name&gt;</i> | The name of the performance profile. |

**Mode** Global Configuration

**Example** To create a new performance profile named 'profile1', use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon profile profile1
awplus(config-linkmon-profile)#
```

To remove a performance profile named 'profile1', use the following commands:

```
awplus# configure terminal
awplus(config)# no linkmon profile profile1
```

**Related commands** [jitter](#)

## sample-size (linkmon-probe)

**Overview** Use this command to set the sample size used for calculating latency and jitter metrics for a Link Health Monitoring probe.

Use the **no** variant of this command to set the sample size back to the default value.

**Syntax** sample-size <1-100>  
no sample-size

| Parameter | Description                                                                         |
|-----------|-------------------------------------------------------------------------------------|
| <1-100>   | The number of probe samples to use when calculating the latency and jitter metrics. |

**Default** The default sample size is 5.

**Mode** Linkmon ICMP Probe Configuration

**Example** To set the sample size a probe named 'probe1' to 10, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# sample-size 10
```

To set the sample size a probe named 'probe1' back to the default, use the following commands:

```
awplus(config)# linkmon probe name probe1
awplus(config-linkmon-icmp-probe)# no sample-size
```

**Related commands** [linkmon probe](#)

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

## service linkmon

**Overview** Use this command to enable the Link Health Monitoring service. This is required before any other link health monitoring configuration can be entered.

Use the **no** variant of this command to disable the Link Health Monitoring service.

**Syntax** service linkmon  
no service linkmon

**Default** The Link Health Monitoring service is disabled.

**Mode** Global Configuration

**Example** To enable the Link Health Monitoring service, use the commands:

```
awplus# configure terminal
awplus(config)# service linkmon
```

To disable the Link Health Monitoring service, use the commands:

```
awplus# configure terminal
awplus(config)# no service linkmon
```

## show linkmon probe

**Overview** Use this command to display output for one or all link monitoring probes.

**Syntax** show linkmon probe [*<probe-name>*]

| Parameter                 | Description                                |
|---------------------------|--------------------------------------------|
| <i>&lt;probe-name&gt;</i> | The name of the specific probe to display. |

**Mode** User Exec and Privileged Exec

**Example** To show the output for all link monitoring probes, use the following command:

```
awplus# show linkmon probe
```

To show the output for a link monitoring probe named 'probe1', use the following command:

```
awplus# show linkmon probe probe1
```

**Output** The following shows typical output.

**Example output from show linkmon probe**

```
awplus#show linkmon probe
Probe Name      : my_probe_1

**Parameters in the output from show linkmon probe**

| Parameter  | Description                                                                                                                                                                |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name       | The name of the probe.                                                                                                                                                     |
| Status     | Whether the probe is enabled or disabled. If it is enabled, then the device will attempt to send probes if the link is up. If it is disabled, then no probes will be sent. |
| Type       | The type of probe packet sent.                                                                                                                                             |
| IP version | The IP version being used, IPv4 or IPv6.                                                                                                                                   |

| Parameter           | Description                                                                         |
|---------------------|-------------------------------------------------------------------------------------|
| Destination         | The destination IP address that the probes are sent to.                             |
| Egress Interface    | The interface that the probe packets should egress.                                 |
| Source              | The source IP address or interface.                                                 |
| DSCP                | The DSCP value to use when sending the packet.                                      |
| Packet Size         | The size of a probe packet.                                                         |
| Interval            | The number of milliseconds between sending out each probe.                          |
| Sample Size         | The number of probe results to use when calculating the latency and jitter metrics. |
| Latency             | The average latency based on the last <b>sample size</b> samples.                   |
| Jitter              | The average jitter based on the last <b>sample size</b> samples.                    |
| Packet Loss         | The percentage of packets lost based on the last 100 probes.                        |
| Probes Sent         | The number of probe packets that have been sent.                                    |
| Last Probe Sent     | The time that the last probe packet was sent.                                       |
| Last Probe Received | The time that the device last successfully received a probe packet.                 |

## show linkmon probe-history

**Overview** Use this command to show information about Link Health Monitoring probe metric history collection instances.

**Syntax** show linkmon probe-history [<1-65535>|probe <probe-name>]

| Parameter    | Description                                            |
|--------------|--------------------------------------------------------|
| <1-65535>    | The ID of the collection instance to show history for. |
| <probe-name> | The name of the probe to show history for.             |

**Mode** User Exec and Privileged Exec

**Example** To show all Link Health Monitoring probe history collection instances, use the following command:

```
awplus# show linkmon probe-history
```

To show a Link Health Monitoring probe history collection instance with the ID of '10', use the following command:

```
awplus# show linkmon probe-history 10
```

To show all Link Health Monitoring probe history collection instances that are using a probe named 'probe1', use the following command:

```
awplus# show linkmon probe-history probe probe1
```

**Output** The following shows typical output.

**Example output from show linkmon probe-history**

```
awplus#show linkmon probe-history
```

| ID     | Interval (s) | Buckets | Latency (ms): Min | Max   | Avg      |
|--------|--------------|---------|-------------------|-------|----------|
| Probe  |              |         | Jitter (ms): Min  | Max   | Avg      |
|        |              |         | Packets: Tx       | Rx    | Loss (%) |
| 10     | 1            | 300/300 | 94                | 105   | 99       |
| PROBE1 |              |         | 2                 | 11    | 6        |
|        |              |         | 2978              | 2978  | 0.00     |
| 20     | 5            | 300/300 | 97                | 102   | 99       |
| PROBE1 |              |         | 4                 | 9     | 6        |
|        |              |         | 14892             | 14892 | 0.00     |
| 30     | 10           | 300/300 | 98                | 101   | 100      |
| PROBE1 |              |         | 5                 | 8     | 6        |
|        |              |         | 29785             | 29785 | 0.00     |

**Parameters in the output from show linkmon probe-history**

| Parameter    | Description                                                  |
|--------------|--------------------------------------------------------------|
| ID           | The ID of the Link Health Monitoring probe-history.          |
| Probe        | The name of the probe that this history is for.              |
| Interval     | The amount of time between each history sample (in seconds). |
| Buckets      | The total number of samples that are stored.                 |
| Latency min  | The minimum latency that is in the history.                  |
| Latency max  | The maximum latency that is in the history.                  |
| Latency avg  | The average latency of the samples stored in the history.    |
| Jitter min   | The minimum jitter that is in the history.                   |
| Jitter max   | The maximum jitter that is in the history.                   |
| Jitter avg   | The average jitter of the samples stored in the history.     |
| Packets Tx   | The total number of packets transmitted in this history.     |
| Packets Rx   | The total number of packets received in this history.        |
| Packets Loss | The percentage of packets lost in the history.               |

# show linkmon trigger

**Overview** Use this command to view the status of link health monitoring probe type triggers.

**Syntax** show linkmon trigger [<1-250>]

| Parameter | Description                                          |
|-----------|------------------------------------------------------|
| <1-250>   | The trigger ID for a link health monitoring trigger. |

**Mode** Privileged Exec

**Example** To view the status of all link health monitoring triggers, use the command:

```
awplus# show linkmon trigger
```

To view the status of link health monitoring trigger 1, use the command:

```
awplus# show linkmon trigger 1
```

**Output** The following shows typical output.

**Example output from show linkmon trigger**

```
awplus#show linkmon trigger
Trigger 1
-----
Match State:          bad
Change Count:         5
Last Change:

**Parameters in the output from show linkmon trigger**

| Parameter      | Description                                                                          |
|----------------|--------------------------------------------------------------------------------------|
| Match State    | If the state of the probe is the same as the match state, the trigger will activate. |
| Change Count   | The number of times the probe has changed state.                                     |
| Current State  | The current state of the probe.                                                      |
| Previous State | The previous state of the probe.                                                     |
| Change Time    | The timestamp when the probe last changed state.                                     |
| Cause          | The reason why the probe last changed state.                                         |
| Probe          | The name of the probe.                                                               |
| Enabled        | Whether the probe is enabled.                                                        |
| Latency        | The last latency metric of the probe.                                                |
| Jitter         | The last jitter metric of the probe.                                                 |
| Loss Rate      | The loss rate of the probe, up to 100 metric results calculated.                     |

| Parameter           | Description                                                                                                                             |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Consecutive Success | The number of probes that have consecutively succeeded.                                                                                 |
| Profile             | The name of the profile the probe results are being compared to. The profile determines the acceptable jitter, latency, and probe loss. |

**Related commands** [show linkmon probe](#)

**Command changes** Version 5.5.1-0.1: command added

## size (linkmon-probe)

**Overview** Use this command to set the size of the packets used by a Link Health Monitoring probe.

Use the **no** variant of this command to set the size back to the default.

**Syntax** size <64-1500>  
no size

| Parameter | Description                            |
|-----------|----------------------------------------|
| <64-1500> | The size of the probe packet in bytes. |

**Default** The default packet size is 100 bytes.

**Mode** Linkmon ICMP Probe Configuration

**Example** To set the size of a probe named 'probe1' to 1000, use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# size 1000
```

To set the size of a probe named 'probe1' back to the default, use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# no size
```

**Related commands** [linkmon probe](#)

**Command changes** Version 5.4.8-1.1: command added  
Version 5.5.1-0.1: command added to all AlliedWare Plus switches

## source (linkmon-probe)

**Overview** Use this command to set the source IP address or interface for a Link Health Monitoring probe.

Use the **no** variant of this command to return it to the default.

**Syntax** source {<interface>|<ip-address>}  
no source

| Parameter    | Description                                                                                                                                                                                         |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <interface>  | The name of the interface that probes are sourcing from. The specified interface needs to be locally configured with at least one valid IPv4 address, and the interface is in up and running state. |
| <ip-address> | The source IPv4 address for this probe. The specified IP address needs to be locally configured on an interface that is in an up-and-running state.                                                 |

**Default** No source IP address is defined by default. The source IP address will be selected using standard routing behavior to reach the probe's destination.

**Mode** Linkmon ICMP Probe Configuration

**Example** To set the source interface as 'lo' for a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# source lo
```

To set the source interface back to default for a probe named 'probe1', use the following commands:

```
awplus(config)# linkmon probe name probe1  
awplus(config-linkmon-icmp-probe)# no source
```

**Related commands** [linkmon probe](#)

**Command changes** Version 5.4.8-1.1: command added

Version 5.5.1-0.1: command added to all AlliedWare Plus switches

## url (linkmon-probe)

**Overview** Use this command to set the destination URL of a Link Health Monitoring probe. This is a required configuration option for http-get probes.

Use the **no** variant of this command to remove the URL.

**Syntax** url <url>  
no url

| Parameter | Description                                                                                                                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <url>     | The destination the probe is being sent to. The URL must use ASCII characters and conform to the URL syntax in RFC 3986, with http or https protocol at the start and an optional port number on the end, such as :80, :443 or :8080. |

**Mode** Linkmon HTTP Probe Configuration

**Example** To set the destination URL of a Link Health Monitoring probe named "test-probe", use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name test-probe type http
awplus(config-linkmon-http-probe)# url http://
www.alliedtelesis.co.nz/
```

Some other examples of supported URL formats:

```
awplus(config-linkmon-http-probe)# url https://www.facebook.com/
awplus(config-linkmon-http-probe)# url http://
intranet.atlnz.lc:8080
```

To remove the URL, use the following commands:

```
awplus# configure terminal
awplus(config)# linkmon probe name test-probe type http
awplus(config-linkmon-http-probe)# no url
```

# Introduction

**Overview** Devices running AlliedWare Plus use IGMP (Internet Group Management Protocol) and MLD (Multicast Listener Discovery) to track which multicast groups their clients belong to. This enables them to send the correct multimedia streams to the correct destinations. IGMP is used for IPv4 multicasting, and MLD is used for IPv6 multicasting.

This chapter describes the commands to configure IGMP Querier behaviour and selection and IGMP Snooping.

# clear ip igmp

**Overview** Use this command to clear all IGMP group membership records on all interfaces where it is configured .

**Syntax** clear ip igmp

**Mode** Privileged Exec

**Example** To delete all IGMP records, use the command  
awplus# clear ip igmp

**Related commands**

- clear ip igmp group
- clear ip igmp interface
- show ip igmp interface
- show running-config

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# clear ip igmp group

**Overview** Use this command to clear IGMP group membership records for a specific group on either all interfaces, a single interface, or for a range of interfaces.

**Syntax** clear ip igmp group \*  
clear ip igmp group <ip-address> <interface>

| Parameter    | Description                                                                                                    |
|--------------|----------------------------------------------------------------------------------------------------------------|
| *            | Clears all groups on all interfaces. This has the same effect as the <b>clear ip igmp</b> command.             |
| <ip-address> | Specifies the group whose membership records will be cleared from all interfaces, entered in the form A.B.C.D. |
| <interface>  | Specifies the name of the interface; all groups learned on this interface are deleted.                         |

**Mode** Privileged Exec

**Usage notes** This command applies to groups learned by IGMP or IGMP Snooping.  
In addition to the group, an interface can be specified. Specifying this will mean that only entries with the group learned on the interface will be deleted.

**Examples** To delete all group records, use the command:

```
awplus# clear ip igmp group *
```

To delete records for 224.1.1.1 on vlan1, use the command:

```
awplus# clear ip igmp group 224.1.1.1 vlan1
```

**Related commands** [clear ip igmp](#)  
[clear ip igmp interface](#)  
[show ip igmp interface](#)  
[show running-config](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# clear ip igmp interface

**Overview** Use this command to clear IGMP group membership records on a particular interface.

**Syntax** clear ip igmp interface <interface>

| Parameter   | Description                                                                            |
|-------------|----------------------------------------------------------------------------------------|
| <interface> | Specifies the name of the interface. All groups learned on this interface are deleted. |

**Mode** Privileged Exec

**Usage notes** This command applies to interfaces configured for IGMP or IGMP Snooping.

**Example** To delete records for vlan1, use the command:

```
awplus# clear ip igmp interface vlan1
```

**Related commands**

- clear ip igmp
- clear ip igmp group
- show ip igmp interface
- show running-config

**Command changes**

- Version 5.4.7-1.1: VRF-lite support added SBx8100.
- Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

## debug igmp

**Overview** Use this command to enable debugging of either all IGMP or a specific component of IGMP.

Use the **no** variant of this command to disable all IGMP debugging, or debugging of a specific component of IGMP.

**Syntax** `debug igmp {all|decode|encode|events|fsm|tib}`  
`no debug igmp {all|decode|encode|events|fsm|tib}`

| Parameter | Description                                   |
|-----------|-----------------------------------------------|
| all       | Enable or disable all debug options for IGMP  |
| decode    | Debug of IGMP packets that have been received |
| encode    | Debug of IGMP packets that have been sent     |
| events    | Debug IGMP events                             |
| fsm       | Debug IGMP Finite State Machine (FSM)         |
| tib       | Debug IGMP Tree Information Base (TIB)        |

**Modes** Privileged Exec and Global Configuration

**Example** `awplus# configure terminal`  
`awplus(config)# debug igmp all`

**Related commands** [show debugging igmp](#)  
[undebug igmp](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

## ip igmp

**Overview** Use this command to enable IGMP on an interface. The command configures the device as an IGMP querier.

Use the **no** variant of this command to return all IGMP related configuration to the default on this interface.

**Syntax** `ip igmp`  
`no ip igmp`

**Default** Disabled

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** An IP address must be assigned to the interface first, before this command will work.

**Example** To specify an interface as an IGMP querier, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp
```

**Related commands** [show ip igmp interface](#)  
[show running-config](#)

## ip igmp access-group

**Overview** This command adds an access control list to a VLAN interface configured for IGMP or IGMP Snooping. The access control list is used to control and filter the multicast groups learned on the VLAN interface.

The **no** variant of this command disables the access control filtering on the interface.

**Syntax** `ip igmp access-group {<access-list-number>|<access-list-name>}`  
`no ip igmp access-group`

| Parameter                               | Description                                          |
|-----------------------------------------|------------------------------------------------------|
| <code>&lt;access-list-number&gt;</code> | Standard IP access-list number, in the range <1-99>. |
| <code>&lt;access-list-name&gt;</code>   | Standard IP access-list name.                        |

**Default** By default there are no access lists configured on any interface.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to VLAN interfaces configured for IGMP or IGMP Snooping.

**Example** In the following example, hosts serviced by VLAN interface vlan2 can only join the group 225.2.2.2:

```
awplus# configure terminal
awplus(config)# access-list 1 permit 225.2.2.2 0.0.0.0
awplus(config)# interface vlan2
awplus(config-if)# ip igmp access-group 1
```

## ip igmp flood-group

**Overview** Use this command to configure a static multicast group that will flood matching packets to all ports in the VLAN and not mirror any packets matching that group to the CPU.

Use the **no** variant of this command to remove an IGMP flooding group.

**Syntax** `ip igmp flood-group <ip-address> [<vlan-id>]`  
`no ip igmp flood-group <ip-address>`

| Parameter                       | Description                                                                    |
|---------------------------------|--------------------------------------------------------------------------------|
| <code>&lt;ip-address&gt;</code> | Standard IP Multicast group address, entered in the form A.B.C.D.              |
| <code>&lt;vlan-id&gt;</code>    | Layer 3 downstream interface list for Layer 3 forwarding of multicast packets. |

**Default** Not set.

**Mode** Interface Configuration

**Usage notes** Multicast packets from an unregistered source will be mirrored to the CPU to ensure IGMP and PIM-SM knows about the group. In certain networks, it is possible for a large number of packets with a number of different sources destined for the same group address, to overwhelm a switches hardware table. This could cause packets to be stuck mirrored to the CPU forever, resulting in high CPU usage and in some cases stack failovers.

This command adds an all sources multicast entry into the switches multicast hardware table, to flood multicast packets to all ports within the VLAN without mirroring the traffic to CPU. This significantly reduces the number of hardware entries consumed.

The Layer 3 variant of this command:

`ip igmp flood-group <ip-address> <vlan-id>`

is only supported on one VLAN group address. Any number of the Layer 2 variants can be used.

**Example** To configure an IGMP flooding group to Layer 2 ports only, use the following commands. This will flood any UDP packet to group 239.255.255.250 to all ports in vlan1:

```
awplus# configure terminal
awplus(config)# int vlan1
awplus(config-if)# ip igmp flood-group 239.255.255.250
```

To configure an IGMP flooding group to Layer 2 ports and Layer 3 forwarding, use the following commands. This will flood any UDP packet to group 239.255.255.250 to all ports in vlan2 and forward any UDP packet to all ports in vlan3:

```
awplus# configure terminal
awplus(config)# int vlan2
awplus(config-if)# ip igmp flood-group 239.255.255.250 vlan3
```

To remove an IGMP flooding group from vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# int vlan2
awplus(config-if)# no ip igmp flood-group 239.255.255.250
```

IGMP Flooding Groups are integrated into the existing command: **show ip igmp groups**

**Output** The following shows typical output.

**Example output from show ip igmp groups**

```
awplus#show ip igmp groups
IGMP Connected Group Membership
Group Address    Interface    Uptime      Expires      Last Reporter
239.255.255.250  vlan3000    01:20:59    stopped      0.0.0.0
```

**Related commands** **ip igmp static-group**

**Command changes** Version 5.5.0-2.3: command added

## ip igmp flood specific-query

**Overview** Use this command if you want IGMP to flood specific queries to all VLAN member ports, instead of only sending the queries to multicast group member ports.

Use the **no** variant of this command if you want IGMP to only send the queries to multicast group member ports.

**Syntax** ip igmp flood specific-query  
no ip igmp flood specific-query

**Default** By default, specific queries are flooded to all VLAN member ports.

**Mode** Global Configuration

**Usage** In an L2 switched network running IGMP, it is considered more robust to flood all specific queries. In most cases, the benefit of flooding specific queries to all VLAN member ports outweighs the disadvantages.

However, sometimes this is not the case. For example, if hosts with very low CPU capability receive specific queries for multicast groups they are not members of, their performance may degrade unacceptably. In this situation, it is desirable for IGMP to send specific queries to known member ports only. This minimizes the performance degradation of such hosts. In those circumstances, use this command to turn off flooding of specific queries.

**Example** To cause IGMP to flood specific queries only to multicast group member ports, use the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp flood specific-query
```

**Related commands** [show ip igmp interface](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

## ip igmp immediate-leave

**Overview** In IGMP version 2, use this command to minimize the leave latency of IGMP memberships for specified multicast groups. The specified access list number or name defines the multicast groups in which the immediate leave feature is enabled.

Use the **no** variant of this command to disable this feature.

**Syntax** `ip igmp immediate-leave group-list {<access-list-number>|  
<access-list-number-expanded>|  
<access-list-name>}  
no ip igmp immediate-leave`

| Parameter                                        | Description                                                    |
|--------------------------------------------------|----------------------------------------------------------------|
| <code>&lt;access-list-number&gt;</code>          | Access-list number, in the range <1-99>.                       |
| <code>&lt;access-list-number-expanded&gt;</code> | Access-list number (expanded range), in the range <1300-1999>. |
| <code>&lt;access-list-name&gt;</code>            | Standard IP access-list name.                                  |

**Default** Disabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to VLAN interfaces configured for IGMP or IGMP Snooping.

**Example** The following example shows how to enable the immediate-leave feature on the VLAN interface vlan2 for a specific range of multicast groups:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp immediate-leave group-list 34
awplus(config-if)# exit
awplus(config)# access-list 34 permit 225.192.20.0 0.0.0.255
```

**Related commands** [ip igmp last-member-query-interval](#)

# ip igmp last-member-query-count

**Overview** Use this command to set the last-member query-count value for an interface.

Use the **no** variant of this command to return to the default on an interface.

**Syntax** ip igmp last-member-query-count <2-7>  
no ip igmp last-member-query-count

| Parameter | Description                    |
|-----------|--------------------------------|
| <2-7>     | Last member query count value. |

**Default** The default last member query count value is 2.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to VLAN interfaces configured for IGMP or IGMP Snooping.

**Example** To set the last-member query-count to 3 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp last-member-query-count 3
```

**Related commands** [ip igmp last-member-query-interval](#)  
[ip igmp startup-query-count](#)  
[show ip igmp interface](#)  
[show running-config](#)

# ip igmp last-member-query-interval

**Overview** Use this command to configure the frequency at which the router sends IGMP group specific host query messages.

Use the **no** variant of this command to set this frequency to the default.

**Syntax** `ip igmp last-member-query-interval <interval>`  
`no ip igmp last-member-query-interval`

| Parameter  | Description                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------|
| <interval> | The frequency in milliseconds at which IGMP group-specific host query messages are sent, in the range 1000-25500. |

**Default** 1000 milliseconds

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to VLAN interfaces configured for IGMP or IGMP Snooping.

**Example** To change the IGMP group-specific host query message interval to 2 seconds (2000 milliseconds) on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp last-member-query-interval 2000
```

**Related commands** [ip igmp last-member-query-count](#)  
[show ip igmp interface](#)  
[show running-config](#)

## ip igmp limit

**Overview** Use this command to configure the limit on the maximum number of group membership entries for the device as a whole or for the specified interface (if in interface mode). Once the specified number of group memberships is reached, all further membership reports will be ignored.

Optionally, you can configure an access-list to stop certain addresses from being subject to the limit.

Use the **no** variant of this command to unset the limit and any specified exception access-list.

**Syntax** `ip igmp limit <limit-value> [except {<access-list-number>|<access-list-number-expanded>|<access-list-name>}]`  
`no ip igmp limit`

| Parameter                                        | Description                                                     |
|--------------------------------------------------|-----------------------------------------------------------------|
| <code>&lt;limit-value&gt;</code>                 | Maximum number of group membership entries, from 2 to 512.      |
| <code>&lt;access-list-number&gt;</code>          | Access-list number, in the range 1 to 99.                       |
| <code>&lt;access-list-number-expanded&gt;</code> | Access-list number (expanded range), in the range 1300 to 1999. |
| <code>&lt;access-list-name&gt;</code>            | IP access-list name.                                            |

**Default** 512

**Mode** Global Configuration and Interface Configuration for a VLAN interface.

**Usage notes** This command applies to VLAN interfaces configured for IGMP or IGMP Snooping.

**Example** To configure an IGMP limit of 100 group membership entries on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp limit 100
```

To configure an IGMP limit of 100 group membership entries across all interfaces on which IGMP is enabled, and exclude group 224.1.1.1 from this limitation, use the commands:

```
awplus# configure terminal
awplus(config)# access-list 1 permit 224.1.1.1 0.0.0.0
awplus(config)# ip igmp limit 100 except 1
```

## ip igmp maximum-groups

**Overview** Use this command to set a limit, per switch port, on the number of IGMP groups clients can join. This stops a single client from using all the switch's available group-entry resources, and ensures that clients on all ports have a chance to join IGMP groups.

Use the **no** variant of this command to remove the limit.

**Syntax** `ip igmp maximum-groups <0-65535>`  
`no ip igmp maximum-groups`

| Parameter                    | Description                                                                               |
|------------------------------|-------------------------------------------------------------------------------------------|
| <code>&lt;0-65535&gt;</code> | The maximum number of IGMP groups clients can join on this switch port. 0 means no limit. |

**Default** The default is 0, which means no limit

**Mode** Interface mode for a switch port

**Usage notes** We recommend using this command with IGMP snooping fast leave on the relevant VLANs. To enable fast leave, use the command:

```
awplus(config-if)# ip igmp snooping fast-leave
```

The device keeps count of the number of groups learned by each port. This counter is incremented when group joins are received via IGMP reports. It is decremented when:

- Group memberships time out
- Group leaves are received via leave messages or reports

Also, the port's group counter is cleared when:

- The port goes down
- You run the command **clear ip igmp group \***
- The port is removed from a VLAN

You can see the current value of the group counter by using either of the commands:

```
awplus# show ip igmp snooping statistics interface <port-list>
```

```
awplus# show ip igmp interface <port>
```

**Example** To limit clients to 10 groups on port 1.0.1, which is in vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# ip igmp maximum-groups 10
awplus(config-if)# exit
awplus(config)# interface vlan1
awplus(config-if)# ip igmp snooping fast-leave
```

**Related commands**

- clear ip igmp group**
- ip igmp snooping fast-leave**
- show ip igmp interface**
- show ip igmp snooping statistics**

## ip igmp querier-timeout

**Overview** Use this command to configure the timeout period before the device takes over as the querier for the interface after the previous querier has stopped querying.

Use the **no** variant of this command to restore the default.

**Syntax** `ip igmp querier-timeout <timeout>`  
`no ip igmp querier-timeout`

| Parameter | Description                                                            |
|-----------|------------------------------------------------------------------------|
| <timeout> | IGMP querier timeout interval value in seconds, in the range 1- 65535. |

**Default** The default timeout interval is 255 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to VLAN interfaces configured for IGMP.  
The timeout value should not be less than the current active querier's general query interval.

**Example** To configure the device to wait 130 seconds from the time it received the last query before it takes over as the querier for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp querier-timeout 130
```

**Related commands** [ip igmp query-interval](#)  
[show ip igmp interface](#)  
[show running-config](#)

## ip igmp query-holdtime

**Overview** This command sets the time that an IGMP Querier waits after receiving a query solicitation before it sends an IGMP Query. IGMP General Query messages will not be sent during the hold time interval.

Use the **no** variant of this command to return to the default query hold time period.

**Syntax** ip igmp query-holdtime *<interval>*  
no ip igmp query-holdtime

| Parameter               | Description                                                    |
|-------------------------|----------------------------------------------------------------|
| <i>&lt;interval&gt;</i> | Query interval value in milliseconds, in the range <100-5000>. |

**Default** By default the delay before sending IGMP General Query messages is 500 milliseconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** Use this command to configure a value for the IGMP query hold time in the current network. IGMP Queries can be generated after receiving Query Solicitation (QS) packets and there is a possibility of a DoS (Denial of Service) attack if a stream of Query Solicitation (QS) packets are sent to the IGMP Querier, eliciting a rapid stream of IGMP Queries. This command applies to interfaces on which the device is acting as an IGMP Querier.

Use the **ip igmp query-interval** command when a delay for IGMP general query messages is required and IGMP general query messages are required. The **ip igmp query-holdtime** command stops IGMP query messages during the configured holdtime interval, so the rate of IGMP Queries that can be sent out of an interface can be restricted.

See the **IGMP Feature Overview and Configuration Guide** for introductory information about the Query Solicitation feature.

**Examples** To set the IGMP query holdtime to 900 ms for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-holdtime 900
```

To reset the IGMP query holdtime to the default (500 ms) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-holdtime
```

**Related commands**

- ip igmp query-interval**
- ip igmp snooping tcn query solicit**
- show ip igmp interface**
- show running-config**

## ip igmp query-interval

**Overview** Use this command to configure the period for sending IGMP General Query messages.

The IGMP query interval specifies the time between IGMP General Query messages being sent.

Use the **no** variant of this command to return to the default query interval period.

**NOTE:** The IGMP query interval must be greater than IGMP query maximum response time.

**Syntax** `ip igmp query-interval <interval>`  
`no ip igmp query-interval`

| Parameter  | Description                                              |
|------------|----------------------------------------------------------|
| <interval> | Query interval value in seconds, in the range <2-18000>. |

**Default** The default IGMP query interval is 125 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to interfaces configured for IGMP. Note that the IGMP query interval is automatically set to a greater value than the IGMP query max response time.

For example, if you set the IGMP query max response time to 2 seconds using the **ip igmp query-max-response-time** command, and the IGMP query interval is currently less than 3 seconds, then the IGMP query interval period will be automatically reconfigured to be 3 seconds, so it is greater than the IGMP query maximum response time.

Use the **ip igmp query-interval** command when a non-default interval for IGMP General Query messages is required.

The **ip igmp query-holdtime** command can occasionally delay the sending of IGMP Queries.

**Examples** To set the period between IGMP host-query messages to 3 minutes (180 seconds) for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-interval 180
```

To reset the period between sending IGMP host-query messages to the default (125 seconds) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-interval
```

**Related commands**

- ip igmp query-holdtime**
- ip igmp query-max-response-time**
- ip igmp startup-query-interval**
- show ip igmp interface**
- show running-config**

## ip igmp query-max-response-time

**Overview** Use this command to configure the maximum response time advertised in IGMP Queries.

Use the **no** variant of this command to restore the default.

**NOTE:** The IGMP query maximum response time must be less than the IGMP query interval.

**Syntax** ip igmp query-max-response-time <response-time>  
no ip igmp query-max-response-time

| Parameter       | Description                                          |
|-----------------|------------------------------------------------------|
| <response-time> | Response time value in seconds, in the range 1-3180. |

**Default** The default IGMP query maximum response time is 10 seconds.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to interfaces configured for IGMP.

Note that the IGMP query interval is automatically set to a greater value than the IGMP query maximum response time.

For example, if you set the IGMP query interval to 3 seconds using the **ip igmp query-interval** command, and the current IGMP query interval is less than 3 seconds, then the IGMP query maximum response time will be automatically reconfigured to be 2 seconds, so it is less than the IGMP query interval time.

To get the network to converge faster, use the **ip igmp query-max-response-time** command and set a low response time value, such as one or two seconds, so that the clients will respond immediately with a report as a response to the IGMP Queries.

**Examples** To set a maximum response time of 8 seconds for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp query-max-response-time 8
```

To reset the default maximum response time to the default (10 seconds) for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp query-max-response-time
```

**Related commands**

- ip igmp query-interval**
- show ip igmp interface**
- show running-config**

## ip igmp ra-option

**Overview** Use this command to enable strict Router Alert (RA) option validation. With strict RA option enabled, IGMP packets without RA options are ignored.  
Use the **no** variant of this command to disable strict RA option validation.

**Syntax** ip igmp ra-option  
no ip igmp ra-option

**Default** The default state of RA validation is unset.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to interfaces configured for IGMP and IGMP Snooping.

**Examples** To enable strict Router Alert (RA) option validation on vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp ra-option
```

## ip igmp robustness-variable

**Overview** Use this command to change the robustness variable value on an interface.

Use the **no** variant of this command to return to the default on an interface.

**Syntax** ip igmp robustness-variable <1-7>  
no ip igmp robustness-variable

| Parameter | Description                    |
|-----------|--------------------------------|
| <1-7>     | The robustness variable value. |

**Default** The default robustness variable value is 2.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to interfaces configured for IGMP and IGMP Snooping.

**Examples** To set the robustness variable to 3 on vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp robustness-variable 3
```

**Related commands** [show ip igmp interface](#)  
[show running-config](#)

## ip igmp snooping

**Overview** Use this command to enable IGMP Snooping. When this command is used in the Global Configuration mode, IGMP Snooping is enabled at the device level. When this command is used in Interface Configuration mode, IGMP Snooping is enabled for the specified VLANs.

Use the **no** variant of this command to either globally disable IGMP Snooping, or disable IGMP Snooping on a specified interface.

**NOTE:** *IGMP snooping cannot be disabled on an interface if IGMP snooping has already been disabled globally. IGMP snooping can be disabled on both an interface and globally if disabled on the interface first and then disabled globally.*

**Syntax** `ip igmp snooping`  
`no ip igmp snooping`

**Default** By default, IGMP Snooping is enabled both globally and on all VLANs.

**Mode** Global Configuration and Interface Configuration for a VLAN interface.

**Usage notes** It is possible to disable IGMP snooping globally or on a per-VLAN basis, using the command **no ipv6 igmp snooping**. However, we recommend leaving IGMP snooping enabled unless an Allied Telesis support representative tells you to disable it, even if you are not actively using the device for multicast.

For IGMP snooping to operate on particular VLAN interfaces, it must be enabled both globally by using this command in Global Configuration mode, and on individual VLAN interfaces by using this command in Interface Configuration mode (both are enabled by default).

**Examples** To enable IGMP Snooping on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# ip igmp snooping
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping
```

**Related commands** [ipv6 mld snooping](#)  
[show ip igmp interface](#)  
[show running-config](#)

## ip igmp snooping fast-leave

**Overview** Use this command to enable IGMP Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing. The IGMP group-membership entry is removed as soon as an IGMP leave group message is received, without sending out a group-specific query.

Use the **no** variant of this command to disable fast-leave processing.

**Syntax** `ip igmp snooping fast-leave`  
`no ip igmp snooping fast-leave`

**Default** IGMP Snooping fast-leave processing is disabled.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This IGMP Snooping command can only be configured on VLAN interfaces.

**Example** To enable fast-leave processing on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping fast-leave
```

**Related commands** [show ip igmp interface](#)  
[show running-config](#)

## ip igmp snooping mrouter

**Overview** Use this command to statically configure the specified port as a multicast router port for IGMP Snooping for an interface. This command applies to interfaces configured for IGMP Snooping.

Use the **no** variant of this command to remove the static configuration of the port as a multicast router port.

**Syntax** `ip igmp snooping mrouter interface <port>`  
`no ip igmp snooping mrouter interface <port>`

| Parameter | Description                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------|
| <port>    | The port may be a device port (e.g. port1.0.2), a static channel group (e.g. sa3), or a dynamic (LACP) channel group (e.g. po4). |

**Mode** Interface Configuration for a VLAN interface.

**Example** To configure port1.0.2 statically as a multicast router interface for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping mrouter interface port1.0.2
```

**Related commands** [show ip igmp snooping mrouter](#)

## ip igmp snooping querier

**Overview** Use this command to enable IGMP querier operation when no multicast routing protocol is configured. When enabled, the IGMP Snooping querier sends out periodic IGMP queries for all interfaces. This command applies to interfaces configured for IGMP Snooping.

Use the **no** variant of this command to disable IGMP querier configuration.

**Syntax** `ip igmp snooping querier`  
`no ip igmp snooping querier`

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** The IGMP Snooping querier uses the 0.0.0.0 Source IP address because it only masquerades as a proxy IGMP querier for faster network convergence.

It does not start, or automatically cease, the IGMP Querier operation if it detects query message(s) from a multicast router.

If an IP address is assigned to a VLAN, which has IGMP querier enabled on it, then the IGMP Snooping querier uses the VLAN's IP address as the Source IP Address in IGMP queries.

The IGMP Snooping Querier will not stop sending IGMP Queries if there is another IGMP Snooping Querier in the network with a lower Source IP Address.

**NOTE:** *Do not enable the IGMP Snooping Querier feature on a Layer 2 device when there is an operational IGMP Querier in the network.*

**Example** To configure vlan2 as a Snooping querier, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping querier
```

**Related commands** [show ip igmp interface](#)  
[show running-config](#)

# ip igmp snooping report-suppression

**Overview** Use this command to enable report suppression for IGMP versions 1 and 2. This command applies to interfaces configured for IGMP Snooping.

Report suppression stops reports being sent to an upstream multicast router port when there are already downstream ports for this group on this interface.

Use the **no** variant of this command to disable report suppression.

**Syntax** `ip igmp snooping report-suppression`  
`no ip igmp snooping report-suppression`

**Default** Report suppression does not apply to IGMPv3, and is turned on by default for IGMPv1 and IGMPv2 reports.

**Mode** Interface Configuration for a VLAN interface.

**Example** To enable report suppression for IGMPv2 reports for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp version 2
awplus(config-if)# ip igmp snooping report-suppression
```

**Related commands** [show ip igmp interface](#)  
[show running-config](#)

## ip igmp snooping routermode

**Overview** Use this command to set the destination IP addresses as router multicast addresses.

Use the **no** variant of this command to set it to the default. You can also remove a specified IP address from a custom list of multicast addresses.

**Syntax** `ip igmp snooping routermode {all|default|ip|multicastrouter|  
address <ip-address>}`  
`no ip igmp snooping routermode [address <ip-address>]`

| Parameter            | Description                                                                                                                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| all                  | All reserved multicast addresses (224.0.0.x).<br>Packets from all possible addresses in range 224.0.0.x are treated as coming from routers.                                                              |
| default              | Default set of reserved multicast addresses.<br>Packets from 224.0.0.1, 224.0.0.2, 224.0.0.4, 224.0.0.5, 224.0.0.6, 224.0.0.9, 224.0.0.13, 224.0.0.15 and 224.0.0.24 are treated as coming from routers. |
| ip                   | Custom reserved multicast addresses.<br>Packets from custom IP address in the 224.0.0.x range are treated as coming from routers.                                                                        |
| multicastrouter      | Packets from DVMRP (224.0.0.4) and PIM (224.0.0.13) multicast addresses are treated as coming from routers.                                                                                              |
| address <ip-address> | Packets from the specified multicast address are treated as coming from routers. The address must be in the 224.0.0.x range.                                                                             |

**Default** The default routermode is **default** (not **all**) and shows the following reserved multicast addresses:

|                            |
|----------------------------|
| Router mode.....Def        |
| Reserved multicast address |
| 224.0.0.1                  |
| 224.0.0.2                  |
| 224.0.0.4                  |
| 224.0.0.5                  |
| 224.0.0.6                  |
| 224.0.0.9                  |
| 224.0.0.13                 |
| 224.0.0.15                 |
| 224.0.0.24                 |

**Mode** Global Configuration

**Examples** To set **ip igmp snooping routermode** for all default reserved addresses enter:

```
awplus(config)# ip igmp snooping routermode default
```

To remove the multicast address 224.0.0.5 from the custom list of multicast addresses enter:

```
awplus(config)# no ip igmp snooping routermode address 224.0.0.5
```

**Related commands** **ip igmp trusted**  
**show ip igmp snooping routermode**

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

## ip igmp snooping source-timeout

**Overview** Use this command to set the global IGMP Snooping source time-out value (in seconds) on the switch.

Use the **no** variant of this command to set the source time-out value to be the same as the group membership timeout.

**Syntax** `ip igmp snooping source-timeout <timeout>`  
`no ip igmp snooping source-timeout <timeout>`

| Parameter | Description                         |
|-----------|-------------------------------------|
| <timeout> | Time-out value in seconds <0-86400> |

**Default** Global IGMP Snooping source-timeout is disabled by default, and unregistered multicast will be timed-out like normal entries.

Interface IGMP Snooping source timeout is disabled by default, and unregistered multicast will be timed-out like normal entries.

**Mode** Interface/Global Configuration

**Usage notes** The timeout determines how long unregistered multicast entries will be kept for. If the value '0' is specified, then effectively all unregistered multicast entries will never be timed out, and can only be cleared by using the command **clear ip igmp group**. The interface settings will always take precedence over the global setting.

**Example** To configure IGMP Snooping source timeout on 'vlan1', use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip igmp snooping source-timeout 200
```

**Related commands** [show ip igmp snooping source-timeout](#)

## ip igmp snooping tcn query solicit

**Overview** Use this command to enable IGMP (Internet Group Management Protocol) Snooping TCN (Topology Change Notification) Query Solicitation feature. When this command is used in the Global Configuration mode, Query Solicitation is enabled.

Use the **no** variant of this command to disable IGMP Snooping TCN Query Solicitation. When the **no** variant of this command is used in Interface Configuration mode, this overrides the Global Configuration mode setting and Query Solicitation is disabled.

**Syntax** `ip igmp snooping tcn query solicit`  
`no ip igmp snooping tcn query solicit`

**Default** IGMP Snooping TCN Query Solicitation is disabled by default on the device, unless the device is the Master Node in an EPSR ring, or is the Root Bridge in a Spanning Tree.

When the device is the Master Node in an EPSR ring, or the device is the Root Bridge in a Spanning Tree, then IGMP Snooping TCN Query Solicitation is enabled by default and cannot be disabled using the Global Configuration mode command. However, Query Solicitation can be disabled for specified interfaces using the **no** variant of this command from the Interface Configuration mode.

**Mode** Global Configuration, and Interface Configuration for a VLAN interface.

**Usage notes** Once enabled, if the device is not an IGMP Querier, on detecting a topology change, the device generates IGMP Query Solicit messages that are sent to all the ports of the vlan configured for IGMP Snooping on the device.

On a device that is not the Master Node in an EPSR ring or the Root Bridge in a Spanning Tree, Query Solicitation can be disabled using the **no** variant of this command after being enabled.

If the device that detects a topology change is an IGMP Querier then the device will generate an IGMP Query message.

Note that the **no** variant of this command when issued in Global Configuration mode has no effect on a device that is the Master Node in an EPSR ring or on a device that is a Root Bridge in a Spanning Tree. Query Solicitation is not disabled for the device these instances. However, Query Solicitation can be disabled on a per-vlan basis from the Interface Configuration mode.

See the following state table that shows when Query Solicit messages are sent in these instances:

| Command issued from Global Configuration | Command issued from Interface Configuration | Device is STP Root Bridge or the EPSR Master Node | IGMP Query Solicit message sent on VLAN |
|------------------------------------------|---------------------------------------------|---------------------------------------------------|-----------------------------------------|
| No                                       | Yes                                         | Yes                                               | Yes                                     |
| Yes                                      | No                                          | Yes                                               | No                                      |
| Yes                                      | Yes                                         | Yes                                               | Yes                                     |

See the [IGMP Feature Overview and Configuration Guide](#) for introductory information about the Query Solicitation feature.

**Examples** To enable Query Solicitation on a device, use the commands:

```
awplus# configure terminal
awplus(config)# ip igmp snooping tcn query solicit
```

To disable Query Solicitation on a device, use the commands:

```
awplus# configure terminal
awplus(config)# no ip igmp snooping tcn query solicit
```

To enable Query Solicitation for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp snooping tcn query solicit
```

To disable Query Solicitation for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip igmp snooping tcn query solicit
```

**Related commands** **ip igmp query-holdtime**  
**show ip igmp interface**  
**show running-config**

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

## ip igmp source-address-check

**Overview** This command enables the checking of the Source Address for an IGMP Report, rejecting any IGMP Reports originating on devices outside of the local subnet.

Use the **no** variant of this command to disable the checking of the Source Address for an IGMP Report, which allows IGMP Reports from devices outside of the local subnet.

**Syntax** `ip igmp source-address-check`  
`no ip igmp source-address-check`

**Default** Source address checking for IGMP Reports is enabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This is a security feature, and should be enabled unless IGMP Reports from outside the local subnet are expected, for example, if Multicast VLAN Registration is active in the network.

The no variant of this command is required to disable the IGMP Report source address checking feature in networks that use Multicast VLAN Registration to allow IGMP Reports from devices outside of the local subnet.

**Examples** To deny IGMP Reports from outside the current subnet for vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan20
awplus(config-if)# ip igmp source-address-check
```

To allow IGMP Reports from outside the current subnet for vlan10, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip igmp source-address-check
```

**Related commands** [show ip igmp interface](#)  
[show running-config](#)

## ip igmp static-group

**Overview** Use this command to statically configure multicast group membership entries on a VLAN interface, or to statically forward a multicast channel out a particular port or port range.

To statically add only a group membership, do not specify any parameters.

To statically add a (\*,g) entry to forward a channel out of a port, specify only the multicast group address and the switch port range.

To statically add an (s,g) entry to forward a channel out of a port, specify the multicast group address, the source IP address, and the switch port range.

Use the **no** variant of this command to delete static group membership entries.

**Syntax** `ip igmp static-group <ip-address> [source {<ip-source-addr>}]  
[interface <port>]`  
`no ip igmp static-group <ip-address> [source {<ip-source-addr>}]  
[interface <port>]`

| Parameter        | Description                                                                                                                                                                                        |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-address>     | Standard IP Multicast group address, entered in the form A.B.C.D, to be configured as a static group member.                                                                                       |
| source           | Optional.                                                                                                                                                                                          |
| <ip-source-addr> | Standard IP source address, entered in the form A.B.C.D, to be configured as a static source from where multicast packets originate.                                                               |
| interface        | Use this parameter to specify a specific switch port or switch port range to statically forward the multicast group out of. If not used, static configuration is applied on all ports in the VLAN. |
| <port>           | The port or port range to statically forward the group out of. The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2).    |

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** This command applies to IGMP operation, or to IGMP Snooping on a VLAN interface.

**Example** The following example show how to statically add group and source records for IGMP on vlan3:

```
awplus# configure terminal
awplus(config)# interface vlan3
awplus(config-if)# ip igmp
awplus(config-if)# ip igmp static-group 226.1.2.4 source
10.2.3.4
```

## ip igmp startup-query-count

**Overview** Use this command to configure the IGMP startup query count for an interface. The IGMP startup query count is the number of IGMP General Query messages sent by a querier at startup. The default IGMP startup query count is 2.

Use the **no** variant of this command to return an interface's configured IGMP startup query count to the default.

**Syntax** `ip igmp startup-query-count <startup-query-count>`  
`no ip igmp startup-query-count`

| Parameter                                | Description                                              |
|------------------------------------------|----------------------------------------------------------|
| <code>&lt;startup-query-count&gt;</code> | Specify the IGMP startup query count, in the range 2-10. |

**Default** The default IGMP startup query count is 2.

**Mode** Interface Configuration for a VLAN interface.

**Example** To set the IGMP startup query count to 4 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp startup-query-count 4
```

**Related commands** [ip igmp last-member-query-count](#)  
[ip igmp startup-query-interval](#)

## ip igmp startup-query-interval

**Overview** Use this command to configure the IGMP startup query interval for an interface. The IGMP startup query interval is the amount of time in seconds between successive IGMP General Query messages sent by a querier during startup. The default IGMP startup query interval is one quarter of the IGMP query interval value.

**Syntax** `ip igmp startup-query-interval <startup-query-interval>`  
`no ip igmp startup-query-interval`

| Parameter                                   | Description                                                                                                                              |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;startup-query-interval&gt;</code> | Specify the IGMP startup query interval, in the range of 2-1800 seconds. The value must be one quarter of the IGMP query interval value. |

**Default** The default IGMP startup query interval is one quarter of the IGMP query interval value.

**NOTE:** *The IGMP startup query interval must be one quarter of the IGMP query interval.*

**Mode** Interface Configuration for a VLAN interface.

**Example** To set the IGMP startup query interval to 15 seconds for vlan2, which is one quarter of the IGMP query interval of 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp query-interval 60
awplus(config-if)# ip igmp startup-query-interval 15
```

**Related commands** [ip igmp last-member-query-interval](#)  
[ip igmp query-interval](#)  
[ip igmp startup-query-count](#)

## ip igmp trusted

**Overview** Use this command to allow IGMP to process packets received on certain trusted ports only.

Use the **no** variant of this command to stop IGMP from processing specified packets if the packets are received on the specified ports or aggregator.

**Syntax** `ip igmp trusted {all|query|report|routermode}`  
`no ip igmp trusted {all|query|report|routermode}`

| Parameter  | Description                                                                                        |
|------------|----------------------------------------------------------------------------------------------------|
| all        | Specifies whether or not the interface is allowed to receive all IGMP and other routermode packets |
| query      | Specifies whether or not the interface is allowed to receive IGMP queries                          |
| report     | Specifies whether or not the interface is allowed to receive IGMP membership reports               |
| routermode | Specifies whether or not the interface is allowed to receive routermode packets                    |

**Default** By default, all ports and aggregators are trusted interfaces, so IGMP is allowed to process all IGMP query, report, and router mode packets arriving on all interfaces.

**Mode** Interface mode for one or more switch ports or aggregators

**Usage** Because all ports are trusted by default, use this command in its **no** variant to stop IGMP processing packets on ports you do not trust.

For example, you can use this command to make sure that only ports attached to approved IGMP routers are treated as router ports.

**Example** To stop ports port1.0.3-port1.0.6 from being treated as router ports by IGMP, use the commands:

```
awplus(config)# interface port1.0.3-port1.0.6
awplus(config-if)# no ip igmp trusted routermode
```

## ip igmp version

**Overview** Use this command to set the current IGMP version (IGMP version 1, 2 or 3) on an interface.

Use the **no** variant of this command to return to the default version.

**Syntax** ip igmp version <1-3>  
no ip igmp version

| Parameter     | Description                  |
|---------------|------------------------------|
| version <1-3> | IGMP protocol version number |

**Default** The default IGMP version is 3.

**Mode** Interface Configuration for a VLAN interface.

**Example** To set the IGMP version to 2 for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip igmp version 2
```

**Related commands** [show ip igmp interface](#)

# show debugging igmp

**Overview** Use this command to see what debugging is turned on for IGMP.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show debugging igmp

**Mode** User Exec and Privileged Exec

**Example** To display the IGMP debugging options set, enter the command:  
awplus# show debugging igmp

**Output** The following shows typical output.

## Example output from the show debugging igmp command

```
IGMP Debugging status:
IGMP Decoder debugging is on
IGMP Encoder debugging is on
IGMP Events debugging is on
IGMP FSM debugging is on
IGMP Tree-Info-Base (TIB) debugging is on
```

**Related commands** [debug igmp](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

## show ip igmp groups

**Overview** Use this command to display the multicast groups with receivers directly connected to the router, and learned through IGMP.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip igmp groups [brief]  
show ip igmp groups <ip-address> [detail]  
show ip igmp groups <interface> [<ip-address>] [detail]

| Parameter    | Description                                                  |
|--------------|--------------------------------------------------------------|
| <ip-address> | Address of the multicast group, entered in the form A.B.C.D. |
| <interface>  | Interface name for which to display local information.       |
| brief        | Brief display of all interfaces.                             |
| detail       | Detailed display of the interface.                           |

**Mode** User Exec and Privileged Exec

**Example** The following command displays local-membership information for all ports in all interfaces:

```
awplus# show ip igmp groups
```

**Output** The following shows typical output.

**Example output from show ip igmp groups**

| IGMP Connected Group Membership |           |          |          |               |
|---------------------------------|-----------|----------|----------|---------------|
| Group Address                   | Interface | Uptime   | Expires  | Last Reporter |
| 224.0.1.1                       | port1.0.1 | 00:00:09 | 00:04:17 | 10.10.0.82    |
| 224.0.1.24                      | port1.0.2 | 00:00:06 | 00:04:14 | 10.10.0.84    |
| ...                             |           |          |          |               |

**Parameters in the output of show ip igmp groups**

| Parameter     | Description                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------|
| Group Address | Address of the multicast group.                                                                              |
| Interface     | Port through which the group is reachable.                                                                   |
| Uptime        | The time in weeks, days, hours, minutes, and seconds that this multicast group has been known to the device. |
| Expires       | Time (in hours, minutes, and seconds) until the entry expires.                                               |
| Last Reporter | Last host to report being a member of the multicast group.                                                   |

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.  
Version 5.4.8-2.3: **brief** parameter added.

## show ip igmp interface

**Overview** Use this command to display the state of IGMP Snooping for a specified VLAN, or all VLANs. IGMP is shown as Active or Disabled in the show output. You can also display the number of groups a switch port belongs to.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip igmp interface [*<interface>*]

| Parameter                | Description                                                                                                                                                                                                                                                     |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&lt;interface&gt;</i> | The name of the interface.<br><br>If you specify a switch port number, the output displays the number of groups the port belongs to, and the port’s group membership limit, if a limit has been set (with the command <a href="#">ip igmp maximum-groups</a> ). |

**Mode** User Exec and Privileged Exec

**Output** The following output shows IGMP interface status for vlan2 with IGMP Snooping enabled:

```
awplus#show ip igmp interface vlan2
Interface vlan2 (Index 202)
  IGMP Disabled, Inactive, Version 3 (default)
  IGMP interface has 0 group-record states
  IGMP activity: 0 joins, 0 leaves
  IGMP robustness variable is 2
  IGMP last member query count is 2
  IGMP query interval is 125 seconds

  IGMP query holdtime is 500 milliseconds
  IGMP querier timeout is 255 seconds
  IGMP max query response time is 10 seconds
  Last member query response interval is 1000 milliseconds
  Group Membership interval is 260 seconds
  Strict IGMPv3 ToS checking is disabled on this interface
  Source Address checking is enabled
  IGMP Snooping is globally enabled
  IGMP Snooping query solicitation is globally disabled
  Num. query-solicit packets: 57 sent, 0 recvd
  IGMP Snooping is enabled on this interface
  IGMP Snooping fast-leave is not enabled
  IGMP Snooping querier is not enabled
  IGMP Snooping report suppression is enabled
```

The following output shows IGMP interface status for vlan2 with IGMP Snooping disabled:

```
awplus#show ip igmp interface vlan2
Interface vlan2 (Index 202)
  IGMP Disabled, Inactive, Version 3 (default)
  IGMP interface has 0 group-record states
  IGMP activity: 0 joins, 0 leaves
  IGMP robustness variable is 2
  IGMP last member query count is 2
  IGMP query interval is 125 seconds

  IGMP query holdtime is 500 milliseconds
  IGMP querier timeout is 255 seconds
  IGMP max query response time is 10 seconds
  Last member query response interval is 1000 milliseconds
  Group Membership interval is 260 seconds
  Strict IGMPv3 ToS checking is disabled on this interface
  Source Address checking is enabled
  IGMP Snooping is globally enabled
  IGMP Snooping query solicitation is globally disabled
  Num. query-solicit packets: 57 sent, 0 recvd
  IGMP Snooping is not enabled on this interface
  IGMP Snooping fast-leave is not enabled
  IGMP Snooping querier is not enabled
  IGMP Snooping report suppression is enabled
```

The following output displays membership information for port1.0.1:

```
awplus#show ip igmp interface port1.0.1
IGMP information for port1.0.1
  Maximum groups limit set: 10
  Number of groups port belongs to: 0
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip igmp snooping mrrouter

**Overview** Use this command to display the multicast router ports, both static and dynamic, in a VLAN.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip igmp snooping mrrouter [interface <interface>]

| Parameter   | Description                     |
|-------------|---------------------------------|
| interface   | A specific interface.           |
| <interface> | The name of the VLAN interface. |

**Mode** User Exec and Privileged Exec

**Example** To show all multicast router interfaces, use the command:

```
awplus# show ip igmp snooping mrrouter
```

To show the multicast router interfaces in vlan1, use the command:

```
awplus# show ip igmp snooping mrrouter interface vlan1
```

**Output** The following shows typical output.

## Example output from show ip igmp snooping mrrouter

| VLAN | Interface | Static/Dynamic        |
|------|-----------|-----------------------|
| 1    | port1.0.1 | Statically configured |
| 200  | port1.0.2 | Statically configured |

## Example output from show ip igmp snooping mrrouter interface vlan1

| VLAN | Interface | Static/Dynamic        |
|------|-----------|-----------------------|
| 1    | port1.0.1 | Statically configured |

**Related commands** [ip igmp snooping mrrouter](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip igmp snooping routermode

**Overview** Use this command to display the current router mode and the list of IP addresses set as router multicast addresses from the **ip igmp snooping routermode** command.

For information on filtering and saving command output, see the **“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide**.

**Syntax** show ip igmp snooping routermode

**Mode** User Exec and Privileged Exec

**Example** To show the router mode and the list of router multicast addresses, use the command:

```
awplus# show ip igmp snooping routermode
```

**Output** The following shows typical output.

## Example output from show ip igmp snooping routermode

```
awplus#show ip igmp snooping routermode
Router mode.....Def
Reserved multicast address

    224.0.0.1
    224.0.0.2
    224.0.0.4
    224.0.0.5
    224.0.0.6
    224.0.0.9
    224.0.0.13
    224.0.0.15
    224.0.0.24
```

**Related commands** **ip igmp snooping routermode**

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip igmp snooping source-timeout

**Overview** Use this command to display the configured IGMP snooping source timeouts for a specified VLAN or VLAN range.

**Syntax** `show ip igmp snooping source-timeout [interface] <interface-range>]`

| Parameter         | Description                                  |
|-------------------|----------------------------------------------|
| <interface-range> | The name of the VLAN interface or VLAN range |

**Mode** Privileged Exec

**Example** To display the configured IGMP snooping source timeouts for all VLANs, use the command:

```
awplus# show ip igmp snooping source-timeout
```

**Output** The following shows typical output.

## Example output from show ip igmp snooping source-timeout

```
awplus#show ip igmp snooping source-timeout
Global IGMP snooping source-timeout is enabled (60 secs)

vlan1          enabled (300 secs)
vlan2          inherits global setting
vlan1000       inherits global settingawplus#show ip igmp snooping
source-timeout int vlan1
Global IGMP snooping source-timeout is enabled (60 secs)vlan1
enabled (300 secs)
```

**Related commands** [ip igmp snooping source-timeout](#)

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# show ip igmp snooping statistics

**Overview** Use this command to display IGMP Snooping statistics data.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip igmp snooping statistics interface <interface-range> [group [<ip-address>]]`

| Parameter    | Description                                                                                                                                                                                                                                                                 |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ip-address> | Optionally specify the address of the multicast group, entered in the form A.B.C.D.                                                                                                                                                                                         |
| <interface>  | Specify the name of the interface or interface range. If you specify a port number, the output displays the number of groups the port belongs to, and the port's group membership limit, if a limit has been set (with the command <a href="#">ip igmp maximum-groups</a> ) |

**Mode** Privileged Exec

**Example** To display IGMP statistical information for **vlan1** and **vlan2**, use the command:

```
awplus# show ip igmp snooping statistics interface vlan1-vlan2
```

**Output** The following shows typical output.

**Example output from the show ip igmp snooping statistics command for VLANs**

```
awplus#show ip igmp interface vlan1-vlan2
IGMP Snooping statistics for vlan1
Interface:      port1.0.1
Group:          224.1.1.1
Uptime:         00:00:09
Group mode:     Exclude (Expires: 00:04:10)
Last reporter:  10.4.4.5
Source list is empty
IGMP Snooping statistics for vlan2
Interface:      port1.0.2
Group:          224.1.1.2
Uptime:         00:00:19
Group mode:     Exclude (Expires: 00:05:10)
Last reporter:  10.4.4.6
Source list is empty
```

**Example output from the show ip igmp snooping statistics command for a switch port**

```
awplus#show ip igmp interface port1.0.1
IGMP information for port1.0.1
  Maximum groups limit set: 10
  Number of groups port belongs to: 0
```

**Command changes** Version 5.4.7-1.1: VRF-lite support added SBx8100.  
Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

# undebbug igmp

**Overview** This command applies the functionality of the no **debug igmp**.

# Introduction

**Overview** This chapter provides an alphabetical reference of configuration, clear, and show commands related to MLD Snooping.

# clear ipv6 mld

**Overview** Use this command to clear all MLD local memberships on all interfaces.

**Syntax** `clear ipv6 mld`

**Mode** Privileged Exec

**Example** To clear all MLD local memberships on all interfaces, use the command:

```
awplus# clear ipv6 mld
```

**Related commands** [clear ipv6 mld group](#)  
[clear ipv6 mld interface](#)

## clear ipv6 mld group

**Overview** Use this command to clear MLD specific local-membership(s) on all interfaces, for all groups or a particular group.

**Syntax** `clear ipv6 mld group {*|<ipv6-address>}`

| Parameter      | Description                                                                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| *              | Clears all groups on all interfaces. This is an alias to the <b>clear ipv6 mld</b> command.                                                                                            |
| <ipv6-address> | Specify the group address for which MLD local-memberships are to be cleared from all interfaces.<br><br>Specify the IPv6 multicast group address in the format in the format X:X::X:X. |

**Mode** Privileged Exec

**Example** To clear all groups on all interfaces, use the command:  
`awplus# clear ipv6 mld group *`

**Related commands** **clear ipv6 mld**  
**clear ipv6 mld interface**

# clear ipv6 mld interface

**Overview** Use this command to clear MLD interface entries.

**Syntax** `clear ipv6 mld interface <interface>`

| Parameter   | Description                                                                          |
|-------------|--------------------------------------------------------------------------------------|
| <interface> | Specifies name of the interface; all groups learned from this interface are deleted. |

**Mode** Privileged Exec

**Example** To clear the entries from vlan2, use the command:

```
awplus# clear ipv6 mld interface vlan2
```

**Related commands** [clear ipv6 mld](#)  
[clear ipv6 mld group](#)

## debug mld

**Overview** Use this command to enable all MLD debugging modes, or a specific MLD debugging mode.

Use the **no** variant of this command to disable all MLD debugging modes, or a specific MLD debugging mode.

**Syntax** debug mld {all|decode|encode|events|fsm|tib}  
no debug mld {all|decode|encode|events|fsm|tib}

| Parameter | Description                            |
|-----------|----------------------------------------|
| all       | Debug all MLD.                         |
| decode    | Debug MLD decoding.                    |
| encode    | Debug MLD encoding.                    |
| events    | Debug MLD events.                      |
| fsm       | Debug MLD Finite State Machine (FSM).  |
| tib       | Debug MLD Tree Information Base (TIB). |

**Mode** Privileged Exec and Global Configuration

**Examples** awplus# configure terminal  
awplus(config)# debug mld all  
awplus# configure terminal  
awplus(config)# debug mld decode  
awplus# configure terminal  
awplus(config)# debug mld encode  
awplus# configure terminal  
awplus(config)# debug mld events

**Related commands** [show debugging mld](#)

## ipv6 mld immediate-leave

**Overview** Use this command to minimize the leave latency of MLD memberships.  
Use the **no** variant of this command to disable this feature.

**Syntax** `ipv6 mld immediate-leave group-list <IPv6-access-list-name>`  
`no ipv6 mld immediate-leave`

| Parameter                                  | Description                                                                                                                                                                                                                                          |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;IPv6-access-list-name&gt;</code> | Specify a Standard or an Extended software IPv6 access-list name that defines multicast groups in which the immediate leave feature is enabled.<br><br>See <a href="#">IPv6 Software Access Control List (ACL) Commands</a> for supported IPv6 ACLs. |

**Default** Disabled

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Example** The following example shows how to enable the immediate-leave feature on an interface for a specific range of multicast groups. In this example, the router assumes that the group access-list consists of groups that have only one node membership at a time per interface:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld immediate-leave v6grp
awplus(config-if)# exit
```

## ipv6 mld limit

**Overview** Use this command to configure a limit on the maximum number of group memberships that may be learned. The limit may be set for the device as a whole, or for a specific interface.

Once the specified group membership limit is reached, all further local-memberships will be ignored.

Optionally, an exception access-list can be configured to specify the group-address(es) that are exempted from being subject to the limit.

Use the **no** variant of this command to unset the limit and any specified exception access-list.

**Syntax** `ipv6 mld limit <limitvalue> [except <IPv6-access-list-name>]`  
`no ipv6 mld limit`

| Parameter               | Description                                                                                                                                                                                                                                                         |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <limitvalue>            | <2-512> Maximum number of group membership states.                                                                                                                                                                                                                  |
| <IPv6-access-list-name> | Specify a Standard or an Extended software IPv6 access-list name that defines multicast groups, which are exempted from being subject to the configured limit.<br><br>See <a href="#">IPv6 Software Access Control List (ACL) Commands</a> for supported IPv6 ACLs. |

**Default** The default limit, which is reset by the **no** variant of this command, is the same as maximum number of group membership entries that can be learned with the **ipv6 mld limit** command.

The default limit of group membership entries that can be learned is 512 entries.

**Mode** Global Configuration and Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage notes** This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

**Examples** The following example configures an MLD limit of 100 group-memberships across all VLAN interfaces on which MLD is enabled, and excludes groups in the range ff1e:0db8:0001::/64 from this limitation:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 access-list standard v6grp permit
ff1e:0db8:0001::/64
awplus(config)# ipv6 mld limit 100 except v6grp
```

The following example configures an MLD limit of 100 group-membership states on the VLAN interface vlan2:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld limit 100
```

The following example configures an MLD limit of 100 group-membership states on the VLAN interfaces vlan2-vlan4:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld limit 100
```

## ipv6 mld snooping

**Overview** Use this command to enable MLD Snooping. When this command is issued in the Global Configuration mode, MLD Snooping is enabled globally for the device. When this command is issued in Interface mode for a VLAN then MLD Snooping is enabled for the specified VLAN. Note that MLD Snooping is enabled on the VLAN only if it is enabled globally and on the VLAN.

Use the **no** variant of this command to globally disable MLD Snooping in Global Configuration mode, or for the specified VLAN interface in Interface mode.

**NOTE:** *There is a 100 MLD interface limit when applying MLD commands to multiple VLANs. Only the first 100 VLANs have the required multicast structures added to the interfaces that allow multicast routing.*

**Syntax** `ipv6 mld snooping`  
`no ipv6 mld snooping`

**Default** By default, MLD Snooping is enabled both globally and on all VLANs.

**Mode** Global Configuration and Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage notes** It is possible to disable MLD snooping globally or on a per-VLAN basis, using the command **no ipv6 mld snooping**. However, we recommend leaving MLD snooping enabled unless an Allied Telesis support representative tells you to disable it, even if you are not actively using the device for multicast.

For MLD Snooping to operate on particular VLAN interfaces, it must be enabled both globally by using this command in Global Configuration mode, and on individual VLAN interfaces by using this command in Interface Configuration mode (both are enabled by default).

MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

**Examples** To configure MLD Snooping on the VLAN interfaces vlan2-vlan4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping
```

To disable MLD Snooping for the VLAN interfaces vlan2-vlan4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config)# no ipv6 mld snooping
```

To configure MLD Snooping globally for the device, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 mld snooping
```

To disable MLD Snooping globally for the device, enter the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 mld snooping
```

## ipv6 mld snooping fast-leave

**Overview** Use this command to enable MLD Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing; the MLD group-membership is removed as soon as an MLD leave group message is received, without sending out a group-specific query.

Use the **no** variant of this command to disable fast-leave processing.

**Syntax** `ipv6 mld snooping fast-leave`  
`no ipv6 mld snooping fast-leave`

**Default** MLD Snooping fast-leave processing is disabled.

**Mode** Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

**Usage notes** This MLD Snooping command can only be configured on VLAN interfaces.

**Examples** This example shows how to enable fast-leave processing on the VLAN interface `vlan2`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping fast-leave
```

This example shows how to enable fast-leave processing on the VLAN interface `vlan2-vlan4`.

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping fast-leave
```

## ipv6 mld snooping mrouter

**Overview** Use this command to statically configure the specified port as a Multicast Router interface for MLD Snooping within the specified VLAN.
