no atmf virtual-crosslink id <local-id>
```

Parameter	Description
`id <local-id>`	ID of the local tunnel port, a value between 1 and 4094.
`ip <local-ip>`	IPv4 address of the local tunnel port in a.b.c.d format.
`remote-id <remote-id>`	ID of the remote tunnel port, a value between 1 and 4094.
`remote-ip <remote-ip>`	IPv4 address of the remote tunnel port in a.b.c.d format.
`remote-host <domainname>`	The domain name of the remote node.

Default No AMF virtual crosslinks are created by default.

Mode Global Configuration

Usage notes

This command allows a virtual tunnel to be created between two remote sites over a Layer 3 link. The tunnel encapsulates AMF packets and allows them to be sent transparently across a Wide Area Network (WAN) such as the Internet.

Configuration involves creating a local tunnel ID, a local IP address, a remote tunnel ID, and a remote IP address or domain name. Each side of the tunnel must be configured with the same, but mirrored parameters.

NOTE: *Virtual crosslinks are not supported on AMF container masters, therefore if multiple tenants on a single VAA host are configured for secure mode, only a single AMF master is supported per area.*

Example

To setup a virtual link from a local site, 'siteA', to a remote site, 'siteB', (assuming there is already IP connectivity between the sites), run the following commands at the local site:

```
siteA# configure terminal
siteA(config)# atmf virtual-crosslink id 5 ip 192.168.100.1
 remote-id 10 remote-ip 192.168.200.1
```

At the remote site, run the commands:

```
siteB# configure terminal
siteB(config)# atmf virtual-crosslink id 10 ip 192.168.200.1
 remote-id 5 remote-ip 192.168.100.1
```

To remove this virtual crosslink, run the following commands on the local site:

```
siteA# configure terminal
siteA(config)# no atmf virtual-crosslink id 5
```

On the remote site, run the commands:

```
siteB# configure terminal
siteB(config)# no atmf virtual-crosslink id 10
```

Command changes

Version 5.5.2-0.1: **remote-host** parameter added

Version 5.4.7-0.3: command added

atmf virtual-link

Overview This command creates one or more Layer 2 tunnels that enable AMF nodes to transparently communicate across a wide area network using Layer 2 connectivity protocols.

Once connected through the tunnel, the remote member will have the same AMF capabilities as a directly connected AMF member.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove the specified virtual link.

Syntax

```
atmf virtual-link id <1-4094> ip <a.b.c.d> remote-id <1-4094>
 remote-ip <a.b.c.d> [remote-area <area-name>]
```

```
atmf virtual-link id <1-4094> interface <interface-name> remote-
id <1-4094> remote-ip <a.b.c.d> [remote-area <area-name>]
```

```
atmf virtual-link id <1-4094> ip <a.b.c.d> remote-id <1-4094>
 remote-host <domainname> [remote-area <area-name>]
```

```
atmf virtual-link id <1-4094> interface <interface-name> remote-
id <1-4094> remote-host <domainname> [remote-area <area-name>]
```

```
no atmf virtual-link id <1-4094>
```

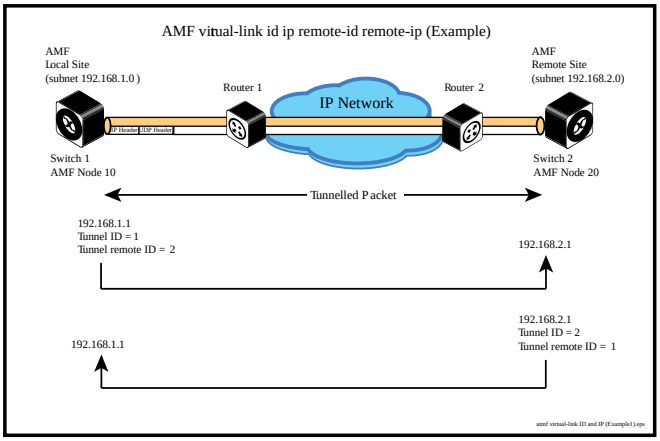
Parameter	Description
`id <1-4094>`	ID of the local tunnel point, in the range 1 to 4094.
`ip <a.b.c.d>`	Specify the local IP address of the local interface for the virtual-link (alternatively you can specify the interface's name, see below).
`interface <interface-name>`	Specify the local interface name for the virtual-link. This allows you to use a dynamic, rather than a static, local IP address.
`remote-id <1-4094>`	The ID of the (same) tunnel that will be applied by the remote node. Note that this must match the local-id that is defined on the remote node. This means that (for the same tunnel) the local and remote tunnel IDs are reversed on the local and remote nodes.
`remote-ip <a.b.c.d>`	The IP address of the remote node.
`remote-host <domainname>`	The domain name of the remote node.
`remote-area <area-name>`	The name of the remote area connected to this virtual-link.

Mode Global Configuration

Usage notes The Layer 2 tunnel that this command creates enables a local AMF session to appear to pass transparently across a Wide Area Network (WAN) such as the Internet. The addresses configured as the local and remote tunnel IP addresses must have IP connectivity to each other. If the tunnel is configured to connect a head office and branch office over the Internet, typically this would involve using some type of managed WAN service such as a site-to-site VPN. Tunnels are only supported using IPv4.

Configuration involves creating a local tunnel ID, a local IP address, a remote tunnel ID and a remote IP address or domain name. A reciprocal configuration is also required on the corresponding remote device. The local tunnel ID must be unique to the device on which it is configured.

If an interface acquires its IP address dynamically then the local side of the tunnel can be specified by using the interface's name instead of using its IP address. When using a dynamic local address the remote address of the other side of the virtual-link must be configured with either:



- the IP address of the NAT device the dynamically configured interface is behind, or
- 0.0.0.0, if the virtual-link is configured as a secure virtual-link.

For instructions on how to configure dynamic IP addresses on virtual-links, see the **AMF Feature Overview and Configuration Guide**.

The tunneled link may operate via external (non AlliedWare Plus) routers in order to provide wide area network connectivity. However in this configuration, the routers perform a conventional router to router connection. The protocol tunneling function is accomplished by the AMF nodes.

NOTE: *AMF cannot achieve zero touch replacement of the remote device that terminates the tunnel connection, because you must pre-configure the local IP address and tunnel ID on that remote device.*

Example 1 Use the following commands to create the tunnel shown in the figure below.

AMF virtual link example

```
Node_10(config)# atmf virtual-link id 1 ip 192.168.1.1 remote-id
 2 remote-ip 192.168.2.1
Node_20(config)# atmf virtual-link id 2 ip 192.168.2.1 remote-id
 1 remote-ip 192.168.1.1
```

Example 2 To set up an area virtual link to a remote site (assuming IP connectivity between the sites already), one site must run the following commands:

```
SiteA# configure terminal
SiteA(config)# atmf virtual-link id 5 ip 192.168.100.1 remote-id
 10 remote-ip 192.168.200.1 remote-area SiteB-AREA
```

The second site must run the following commands:

```
SiteB# configure terminal
SiteB(config)# atmf virtual-link id 10 ip 192.168.200.1 remote-
id 5 remote-ip 192.168.100.1 remote-area SiteA-AREA
```

Before you can apply the above **`atmf virtual-link`** command, you must configure the area names *SiteB-AREA* and *SiteA-AREA*.

Command changes

Version 5.5.2-0.1: **remote-host** parameter added

Version 5.4.9-0.1: **interface** parameter added

atmf virtual-link description

Overview Use this command to add a description to an existing AMF virtual-link.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove a description from an AMF virtual-link.

Syntax

```
atmf virtual-link id <1-4094> description <description>
no atmf virtual-link id <1-4094> description
```

Parameter	Description
`id <1-4094>`	ID of the local tunnel point.
`<description>`	A description for the virtual-link.

Default No description is set by default.

Mode Global Configuration

Example To add a description to the virtual-link with id ‘5’, use the commands:

```
awplus# configure terminal
awplus(config)# atmf virtual-link id 5 description TO SITE B
```

To remove a description from the virtual-link with id ‘5’, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf virtual-link id 5
```

Related commands

atmf virtual-link

show atmf links

show atmf virtual-links

atmf virtual-link protection

Overview Use this command to add protection to an existing AMF virtual-link. Secure AMF virtual-links encapsulate the L2TPv3 frames of the virtual-link with IPsec.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove protection from an AMF virtual-link.

Syntax `atmf virtual-link id <1-4094> protection ipsec key [8] <key-string>`

`no atmf virtual-link id <1-4094> protection`

Parameter		Description
`id`		Specify the link ID.
	`<`	Link ID in the range 1 to 4094
	`p`	Protection is on for this link.
	`i`	Security provided using IPsec.
	`k`	Set the shared key.
	`8`	Specifies a string in an encrypted format instead of plain text. The running config will display the new password as an encrypted string even if password encryption is turned off.
	`<s`	Specify the shared key for the link.

Default Protection is off by default.

Mode Global Configuration

Usage notes Considered the following limitations when creating a secure virtual-link:

- Switch devices support a maximum of 20 downstream AMF nodes when using a secure virtual-link as an uplink.
- When there are two or more AMF members behind a shared NAT device, only one of the members will be able to use secure virtual-links.
- An AMF multi-tenant environment supports a maximum cumulative total of 1200 secure virtual-links across all AMF containers.

Example To create and configure a virtual link with protection, first create the virtual-link:

```
Host-A# configure terminal
Host-A(config)# atmf virtual-link id 1 ip 192.168.1.1 remote-id
 2 remote-ip 192.168.2.1
```

The enable protection on the virtual link:

```
Host-A(config)# atmf virtual-link id 1 protection ipsec key
 securepassword
```

Repeat these steps on the other side of the link:

```
Host-B(config)# atmf virtual-link id 2 ip 192.168.2.1 remote-id
 1 remote-ip 192.168.1.1
Host-B(config)# atmf virtual-link id 2 protection ipsec key
 securepassword
```

Command changes Version 5.4.9-0.1: command added

atmf working-set

Overview Use this command to execute commands across an individually listed set of AMF nodes or across a named group of nodes.

Note that this command can only be run on a master node.

Use the **no** variant of this command to remove members or groups from the current working-set.

Syntax

```
atmf working-set {[<node-list>]|[group {<group-list>|all|local|current}]}
no atmf working-set {[<node-list>]|[group <group-list>]}
```

Parameter	Description
<node-list>	A comma delimited list (without spaces) of nodes to be included in the working-set.
`group`	The AMF group.
<group-list>	A comma delimited list (without spaces) of groups to be included in the working-set. Note that this can include either defined groups, or any of the Automatic, or Implicit Groups shown earlier in the bulleted list of groups.
`all`	All nodes in the AMF.
`local`	Local node Running this command with the parameters **`group local`** will return you to the local prompt and local node connectivity.
`current`	Nodes in current list.

Mode Privileged Exec

Usage notes

You can put AMF nodes into groups by using the **atmf group (membership)**.

This command opens a session on multiple network devices. When you change the working set to anything other than the local device, the prompt will change to the AMF network name, followed by the size of the working set, shown in square brackets. This command has to be run at privilege level 15.

In addition to the user defined groups, the following system assigned groups are automatically created:

- Implicit Groups
  - local: The originating node.
  - current: All nodes that comprise the current working-set.
  - all: All nodes in the AMF.
- Automatic Groups - These can be defined by hardware architecture, e.g. x510, x610, x8100, AR3050S or AR4050S, or by certain AMF nodal designations such as master.

Note that the Implicit Groups do not appear in **show atmf group** command output.

If a node is an AMF master it will be automatically added to the master group.

Example 1

To add all nodes in the AMF to the working-set, use the command:

```
node1# atmf working-set group all
```

NOTE: *This command adds the implicit group "all" to the working set, where "all" comprises all nodes in the AMF.*

This command displays an output screen similar to the one shown below:

```
=========================================
node1, node2, node3, node4, node5, node6:
=========================================

Working set join

ATMF_NETWORK_Name[6]#
```

Example 2 To return to the local prompt, and connect to only the local node, use the command:

```
ATMF_Network_Name[6]# atmf working-set group local
node1#
```

The following table describes the meaning of the prompts in this example.

Parameter	Description
ATMF_Network_Name	The name of the AMF network, as set by the **atmf network-name**.
[6]	The number of nodes in the working-set.
node1	The name of the local node, as set by the **hostname**.

bridge-group (amf-container)

Overview Use this command to connect an AMF container to a bridge created on a Virtual AMF Appliance (VAA) virtual machine for AMF Cloud. This allows the AMF container to connect to a physical network.

Note that this command is only available on AMF Cloud, not on AlliedWare Plus switches.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the **AMF Feature Overview and Configuration Guide** for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove a bridge-group from an AMF container.

Syntax

```
bridge-group <bridge-id>
no bridge-group
```

Parameter	Description
<bridge-id>	The ID of the bridge group to join, a number between 1 and 64.

Mode AMF Container Configuration

Usage notes Each container has two virtual interfaces:

1. Interface eth0, used to connect to the AMF controller on the VAA host via an AMF area-link, and configured using this **area-link** command.
2. Interface eth1, used to connect to the outside world using a bridged L2 network link, and configured using the **bridge-group** command.

Before using this command, a bridge must be created with the same bridge-id on the VAA host using the **bridge <bridge-id>** command.

See the **AMF Feature Overview and Configuration Guide** for more information on configuring the bridge.

Example To assign a bridge group to AMF container 'vac-wlg-1', use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# bridge-group 1
```

Related commands

clear application-proxy threat-protection

Overview Use this command to clear the threat protection for a specified address.

Syntax
```
clear application-proxy threat-protection {<ip-address>|
<mac-address>|all}
```

Parameter	Description
<ip-address>	The IPv4 address you wish to clear the threat for, in A.B.C.D format.
<mac-address>	The MAC address you wish to clear the threat for, in HHHH.HHHH.HHHH format.
`all`	Clear the threat for all IPv4 and MAC addresses.

Mode Privileged Exec

Example To clear the threat for 10.34.199.117, use the command:
```
awplus# clear application-proxy threat-protection 10.34.199.117
```

Related commands
application-proxy quarantine-vlan

Command changes Version 5.4.7-2.2: command added

clear atmf links

Overview Use this command with no parameters to manually reset all the AMF links on a device. You can optionally specify an interface or range of interfaces to reset the links on.

Certain events or topology changes can cause AMF links to be incorrect or outdated. Clearing the links forces AMF to relearn the information from neighboring nodes and create a fresh, correct, view of the network.

Syntax

```
clear atmf links [<interface-list>]
```

Parameter	Description
<interface-list>	The interfaces or ports to perform the reset on. An interface-list can be: • a switchport (e.g. port1.0.1) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a local port (e.g. of0) • You can specify a continuous range of interfaces separated by a hyphen, or a comma-separated list (e.g. port1.0.1, port1.0.4-port1.0.18). The specified interfaces must exist. If this parameter is left out then all links of the specified type will be reset on the device.

Mode Privileged Exec

Example To clear all AMF links on a device, use the following command:

```
awplus# clear atmf links
```

To clear all AMF links on port1.0.1 to port1.0.4 and static aggregator sa1, use the following command:

```
awplus# clear atmf links port1.0.1-port1.0.4,sa1
```

Related commands **clear atmf links virtual**

show atmf links

Command changes Version 5.4.8-2.1: command added

clear atmf links virtual

Overview Use this command with no parameters to manually reset all the AMF virtual links on a device. You can, optionally, specify a comma separated list of virtual links to reset.

Certain events or topology changes can cause AMF links to be incorrect or outdated. Clearing the links forces AMF to relearn the information from neighboring nodes and create a fresh, correct view of the network.

Syntax

```
clear atmf links virtual [<virtuallink-list>]
```

Parameter	Description
<virtuallink-list>	A single, or list, of AMF virtual link identifiers to reset. This must be a comma separated list of links e.g. *vlink1, vlink2, vlink3*. Specifying a link range e.g *vlink1-vlink3* is not supported.

Mode Privileged Exec

Example To clear all AMF virtual links on a device, use the following command:

```
awplus# clear atmf links virtual
```

To clear AMF virtual links vlink11 and vlink21, use the following command:

```
awplus# clear atmf links virtual vlink11,vlink22
```

Related commands **clear atmf links**

show atmf links

Command changes Version 5.4.8-2.1: command added

clear atmf links statistics

Overview This command resets the values of all AMF link, port, and global statistics to zero.

Syntax
```
clear atmf links statistics
```

Mode Privilege Exec

Example To reset the AMF link statistics values, use the command:
```
node_1# clear atmf links statistics
```

Related commands **show atmf links statistics**

clear atmf recovery-file

Overview Use this command to delete all of a node's recovery files. It deletes the recovery files stored on:

- the local node,
- neighbor nodes, and
- external media (USB or SD card).

Syntax

```
clear atmf recovery-file
```

Mode Privileged Exec

Usage notes AMF recovery files are created for nodes with special links. Special links include:

- virtual links,
- area links terminating on an AMF master, and
- area virtual links terminating on an AMF master.

An AMF node with one of these special links pushes its startup configuration to its neighbors and to any attached external media. It then fetches and applies this configuration at recovery time. This configuration enables it to contact the AMF master and initiate a recovery.

Recovery files can become out of date if:

- a node's neighbor is off line when changes are made to its configuration, or
- when a node no longer contains a special link.

Example To clear a node's recovery files, use the command:

```
node1# clear atmf recovery-file
```

Output The following shows typical output.

If AlliedWare Plus detects that a node contains a special link then the following message is displayed

```
node1#clear atmf recovery-file
% Warning: ATMF recovery files have been removed.
ATMF recovery may fail. Please save running-configuration.
```

Related commands show atmf recovery-file

Command changes Version 5.4.8-0.2: command added

clear atmf secure-mode certificates

Overview Use this command to remove all certificates from an AMF member or master. AMF nodes will need to be re-authorized once this command has been run.

Syntax
```
clear atmf secure-mode certificates
```

Mode Privileged Exec

Example To clear all certificates from an AMF node, use the command:

```
awplus# clear atmf secure-mode certificates
```

If this is the only master on the network you will see the following warning:

```
% Warning: This node is the only master in the network!
All the nodes will become isolated and refuse to join any ATMF
 network. The certificates on all the isolated nodes must be
 cleared before rejoining an ATMF network will be possible.

To clear certificates a reboot of the device is required.
Clear certificates and Reboot ? (y/n):
```

On an AMF member you will see the following message:

```
To clear certificates a reboot of the device is required.
Clear certificates and Reboot ? (y/n):
```

Command changes Version 5.4.7-0.3: command added

clear atmf secure-mode statistics

Overview Use this command to reset all secure mode statistics to 0.

Syntax
```
clear atmf secure-mode statistics
```

Mode Privileged Exec

Example To reset the AMF secure mode statistics information, use the command:
```
awplus# clear atmf secure-mode statistic
```

Related commands **show atmf secure-mode**
show atmf secure-mode statistics

Command changes Version 5.4.7-0.3: command added

clone (amf-provision)

Overview This command sets up a space on the backup media for use with a provisioned node and copies into it almost all files and directories from a chosen backup or provisioned node.

Alternatively, you can set up a new, unique provisioned node by using the command **create (amf-provision)**.

Syntax `clone <source-nodename>`

Parameter	Description
<source-nodename>	The name of the node whose configuration is to be copied for loading to the clone.

Mode AMF Provisioning

Usage notes This command is only available on master nodes in the AMF network.

When using this command it is important to be aware of the following:

- A copy of *<media>*:atmf/*<atmf_name>*/nodes/*<source_node>*/flash will be made for the provisioned node and stored in the backup media.
- The directory *<node_backup_dir>*/flash/.config/ssh is excluded from the copy.
- All contents of *<root_backup_dir>*/nodes/*<nodename>* will be deleted or overwritten.
- Settings for the expected location of other provisioned nodes are excluded from the copy.

The active and backup configuration files are automatically modified in the following ways:

- The **hostname** command is modified to match the name of the provisioned node.
- The **stack virtual-chassis-id** command is removed, if present.

Example To copy from the backup of 'device2' to create backup files for the new provisioned node 'device3' use the following command:

```
device1# atmf provision node device3
device1(atmf-provision)# clone device2
```

Sample output from the `clone` command

```
device1# atmf provision node device3
device1(atmf-provision)#clone device2
Copying...
Successful operation
```

To confirm that a new provisioned node has been cloned, use the command:

```
device1# show atmf backup
```

The output from this command is shown in the following figure, and shows the details of the new provisioned node 'device3'.

Sample output from the `show atmf backup` command

```
device1#show atmf backup

Scheduled Backup ...... Enabled

Command changes

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

configure boot config (amf-provision)

Overview This command sets the configuration file to use during the next boot cycle. This command can also set a backup configuration file to use if the main configuration file cannot be accessed for an AMF provisioned node. To unset the boot configuration or the backup boot configuration use the **no boot** command.

Syntax

```
configure boot config [backup] <file-path|URL>
configure no boot config [backup]
```

Parameter	Description
backup	Specify that this is the backup configuration file.
<file-path|URL>	The path or URL and name of the configuration file.

Default No boot configuration files or backup configuration files are specified for the provisioned node.

Mode AMF Provisioning

Usage notes When using this command to set a backup configuration file, the specified AMF provisioned node must exist. The specified file must exist in the flash directory created for the provisioned node in the AMF remote backup media.

Examples To set the configuration file 'branch.cfg' on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot config branch.cfg
```

To set the configuration file 'backup.cfg' as the backup to the main configuration file on the AMF provisioned node 'node1', use the command:

```
MasterNodeName(atmf-provision)# configure boot config backup
 usb:/atmf/amf_net/nodes/node1/config/backup.cfg
```

To unset the boot configuration, use the command:

```
MasterNodeName(atmf-provision)# configure no boot config
```

To unset the backup boot configuration, use the command:

```
MasterNodeName(atmf-provision)# configure no boot config backup
```

Command changes

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

configure boot system (amf-provision)

Overview This command sets the release file that will load onto a specified provisioned node during the next boot cycle. This command can also set the backup release file to be loaded for an AMF provisioned node. To unset the boot system release file or the backup boot release file use the **no boot** command.

Use the **no** variant of this command to return to the default.

This command can only be run on AMF master nodes.

Syntax

```
configure boot system [backup] <file-path|URL>
configure no boot system [backup]
```

Parameter	Description
<file-path|URL>	The path or URL and name of the release file.

Default No boot release file or backup release files are specified for the provisioned node.

Mode AMF Provisioning

Usage notes When using this command to set a backup release file, the specified AMF provisioned node must exist. The specified file must exist in the flash directory created for the provisioned node in the AMF remote backup media.

Examples

To set the release file x930-5.4.9-0.1.rel on the AMF provisioned node ‘node1’, use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot system
 x930-5.4.9-0.1.rel
```

To set the backup release file x930-5.4.8-2.5.rel as the backup to the main release file on the AMF provisioned node ‘node1’, use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot system backup
 card:/atmf/amf_net/nodes/node1/flash/x930-5.4.8-2.5.rel
```

To unset the boot release, use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure no boot system
```

To unset the backup boot release, use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure no boot system backup
```

Command changes

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

copy (amf-provision)

Overview Use this command to copy configuration and release files for the node you are provisioning.

For more information about using the copy command see **copy (filename)** in the File and Configuration Management chapter.

Syntax

```
copy [force] <source-name> <destination-name>
```

Parameter	Description
`force`	This parameter forces the copy command to overwrite the destination file, if it already exists, without prompting the user for confirmation.
<source-name>	The filename and path of the source file. See the **Introduction** of the File and Configuration Management chapter for valid syntax.
<destination-name>	The filename and path for the destination file. See **Introduction** of the File and Configuration Management chapter for valid syntax.

Mode AMF Provisioning

Example To copy a configuration file named current.cfg from Node_4's Flash into the future_node directory, and set that configuration file to load onto future_node, use the following commands:

```
node_4# atmf provision node future_node
node_4(atmf-provision)# create
node_4(atmf-provision)# locate
node_4(atmf-provision)# copy flash:current.cfg ./future_node.cfg
node_4(atmf-provision)# configure boot config future_node.cfg
```

create (amf-provision)

delete (amf-provision)

locate (amf-provision)

show atmf provision nodes

Command changes Version 5.4.9-2.1: command added

create (amf-provision)

Overview This command sets up an empty directory on the backup media for use with a provisioned node. This directory can have configuration and release files copied to it from existing devices. Alternatively, the configuration files can be created by the user.

An alternative way to create a new provisioned node is with the command **clone (amf-provision)**.

This command can only run on AMF master nodes.

Syntax

```
create
```

Mode AMF Provisioning

Usage notes This command is only available on master nodes in the AMF network.

A date and time is assigned to the new provisioning directory reflecting when this command was executed. If there is a backup or provisioned node with the same name on another AMF master then the most recent one will be used.

Example To create a new provisioned node named “device2” use the command:

```
device1# atmf provision node device2
device1(atmf-provision)# create
```

Running this command will create the following directories:

- <*media*>:atmf/<*atmf_name*>/nodes/<*node*>
- <*media*>:atmf/<*atmf_name*>/nodes/<*node*>/flash

To confirm the new node’s settings, use the command:

```
device1# show atmf backup
```

The output for the **show atmf backup** command is shown in the following figure, and shows details for the new provisioned node ‘device2’.

Sample output from the show atmf backup command

```
device1#show atmf backup

Scheduled Backup ...... Enabled
  Schedule ............ 1 per day starting at 03:00

Command changes Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

debug atmf

Overview This command enables the AMF debugging facilities, and displays information that is relevant (only) to the current node. The detail of the debugging displayed depends on the parameters specified.

If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

The **no** variant of this command disables either all AMF debugging information, or only the particular information as selected by the command's parameters.

Syntax

```
debug atmf [link|crosslink|arealink|database|neighbor|error|all]
no debug atmf [link|crosslink|arealink|database|neighbor|error|
all]
```

Parameter	Description
`link`	Output displays debugging information relating to uplink or downlink information.
`crosslink`	Output displays all crosslink events.
`arealink`	Output displays all arealink events.
`database`	Output displays only notable database events.
`neighbor`	Output displays only notable AMF neighbor events.
`error`	Output displays AMF error events.
`all`	Output displays all AMF events.

Default All debugging facilities are disabled.

Mode User Exec and Global Configuration

Usage notes If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

NOTE: *An alias to the variant of this command is .*

Examples To enable all AMF debugging, use the command:

```
node_1# debug atmf
```

To enable AMF uplink and downlink debugging, use the command:

```
node_1# debug atmf link
```

To enable AMF error debugging, use the command:

```
node_1# debug atmf error
```

Related commands **no debug all**

debug atmf packet

Overview This command configures AMF Packet debugging parameters. The debug only displays information relevant to the current node. The command has following parameters:

Syntax
```
debug atmf packet [direction {rx|tx|both}] [level {1|2|3}]
 [timeout <seconds>] [num-pkts <quantity>] [filter {node <name>|
interface <ifname>} [pkt-type [1][2][3][4][5][6][7][8][9][10]
[11][12][13]]]
```

Simplified Syntax

`debug atmf packet`		`[direction {rx|tx|both}]`
		`[level {[1][2|3}]`
		`[timeout <seconds>]`
		`[num-pkts <quantity>]`
`debug atmf packet`	`filter`	`[node <name>]`
		`[interface <ifname>]`
		`[pkt-type [1][2][3][4][5][6][7][8][9][10][11][12][13]]`

NOTE: *You can combine the syntax components shown, but when doing so, you must retain their original order.*

Default Level 1, both Tx and Rx, a timeout of 60 seconds with no filters applied.

NOTE: *An alias to the variant of this command - - can be found elsewhere in this chapter.*

Mode User Exec and Global Configuration

Usage notes If no additional parameters are specified, then the command output will apply a default selection of parameters shown below:

Parameter	Description
`direction`	Sets debug to packet received, transmitted, or both
`rx`	packets received by this node
`tx`	Packets sent from this node
`1`	AMF Packet Control header Information, Packet Sequence Number. Enter 1 to select this level.
`2`	AMF Detailed Packet Information. Enter 2 to select this level.
`3`	AMF Packet HEX dump. Enter 3 to select this level.
`timeout`	Sets the execution timeout for packet logging
<seconds>	Seconds
`num-pkts`	Sets the number of packets to be dumped
<quantity>	The actual number of packets
`filter`	Sets debug to filter packets
`node`	Sets the filter on packets for a particular Node
<name>	The name of the remote node
`interface`	Sets the filter to dump packets from an interface (portx.x.x) on the local node
<ifname>	Interface port or virtual-link
`pkt-type`	Sets the filter on packets with a particular AMF packet type
`1`	Crosslink Hello BPDU packet with crosslink links information. Enter 1 to select this packet type.
`2`	Crosslink Hello BPDU packet with downlink domain information. Enter 2 to select this packet type.
`3`	Crosslink Hello BPDU packet with uplink information. Enter 3 to select this packet type.

Parameter	Description
4	Downlink and uplink hello BPDU packets. Enter 4 to select this packet type.
5	Non broadcast hello unicast packets. Enter 5 to select this packet type.
6	Stack hello unicast packets. Enter 6 to select this packet type.
7	Database description. Enter 7 to select this packet type.
8	DBE request. Enter 8 to select this packet type.
9	DBE update. Enter 9 to select this packet type.
10	DBE bitmap update. Enter 10 to select this packet type.
11	DBE acknowledgment. Enter 11 to select this packet type.
12	Area Hello Packets. Enter 12 to select this packet type.
13	Gateway Hello Packets. Enter 13 to select this packet type.

Examples To set a packet debug on node 1 with level 1 and no timeout, use the command:

```
node_1# debug atmf packet direction tx timeout 0
```

To set a packet debug with level 3 and filter packets received from AMF node 1:

```
node_1# debug atmf packet direction tx level 3 filter node_1
```

To enable send and receive 500 packets only on vlink1 for packet types 1, 7, and 11, use the command:

```
node_1# debug atmf packet num-pkts 500 filter interface vlink1
 pkt-type 1 7 11
```

This example applies the **debug atmf packet** command and combines many of its options:

```
node_1# debug atmf packet direction rx level 1 num-pkts 60
 filter node x930 interface port1.0.1 pkt-type 4 7 10
```

delete (amf-provision)

Overview This command deletes files that have been created for loading onto a provisioned node. It can only be run on master nodes.

Syntax

```
delete
```

Mode AMF Provisioning

Usage notes This command is only available on master nodes in the AMF network. The command will only work if the provisioned node specified in the command has already been set up (although the device itself is still yet to be installed). Otherwise, an error message is shown when the command is run.

You may want to use the **delete** command to delete a provisioned node that was created in error or that is no longer needed.

This command cannot be used to delete backups created by the AMF backup procedure. In this case, use the command **atmf backup delete** to delete the files.

NOTE: *This command allows provisioned entries to be deleted even if they have been referenced by the command, so take care to only delete unwanted entries.*

Example To delete backup files for a provisioned node named device3 use the command:

```
device1# atmf provision node device3
device1(atmf-provision)# delete
```

To confirm that the backup files for provisioned node device3 have been deleted use the command:

```
device1# show atmf backup
```

The output should show that the provisioned node device3 no longer exists in the backup file, as shown in the figure below:

Sample output showing the `show atmf backup` command

```
device1#show atmf backup

Scheduled Backup ...... Enabled
  Schedule ............ 1 per day starting at 03:00
  Next Backup Time .... 01 Oct 2016 03:00
Backup Bandwidth ...... Unlimited
Backup Media .......... USB (Total 7446.0MB, Free 7297.0MB)
Server Config ..........
  Synchronization ..... Unsynchronized
    Last Run .......... -
   1 .................. Unconfigured
   2 .................. Unconfigured

Command changes Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

discovery

Overview Use this command to specify how AMF learns about guest nodes.

AMF nodes gather information about guest nodes by using one of the internally defined discovery methods: dynamic, static, or agent.

Dynamic learning (the default method) means that AMF learns the guest's IP and MAC addresses from LLDP or DHCP snooping. Dynamic learning is only supported when using IPv4. For IPv6, use static learning.

With dynamic learning, ensure that the command **ip dhcp snooping delete-by-linkdown** is set.

Static learning uses the **switchport atmf-guestlink** command to specify the guest class name and IP address of the guest node attached to each individual switch port. AMF then learns the MAC addresses of each of the guests of that class from ARP or Neighbor discovery tables.

If you are using the static method, ensure that you have configured the appropriate class type for each of your statically discovered guest nodes.

Agent learning uses the AMF agent to retrieve the guest's IP and MAC address. It is only available on guest nodes that support ATMF agent, such as TQ5403 series access points. For step-by-step instructions on using agent discovery for auto-recovery of an TQ5403 series AP, see the **AMF Feature Overview and Configuration Guide**.

The **no** variant of this command returns the discovery method to **dynamic**.

Syntax

```
discovery [dynamic|static|agent]
no discovery
```

Parameter	Description
`dynamic`	Learned from DCHCP Snooping or LLDP.
`static`	Statically assigned.
`agent`	Learned from the AMF agent.

Default Dynamic

Mode AMF Guest Configuration

Usage notes This command is one of several modal commands that are configured and applied for a specific guest-class (mode). Its settings are automatically applied to a guest-node link by the **switchport atmf-guestlink** command.

NOTE: *AMF guest nodes are not supported on ports using the OpenFlow protocol.*

Example 1 To configure static discovery for the guest-class 'camera', use the following commands:

```
Node1# configure terminal

Node1(config)# atmf guest-class camera

Node1(config-atmf-guest)# discovery static
```

Example 2 To return the discovery method for the guest class TQ6602 to its default of **dynamic**, use the following commands:

```
Node1# configure terminal

Node1(config)# atmf guest-class TQ6602

Node1(config-atmf-guest)# no discovery
```

Related commands

atmf guest-class

Command changes Version 5.5.3-0.1: **agent** parameter added

description (amf-container)

Overview Use this command to set the description on an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the**AMF Feature Overview and Configuration Guide** for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove the description from an AMF container.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	Enter up to 128 characters of text describing the AMF container.

Mode AMF Container Configuration

Example To set the description for AMF container “vac-wlg-1” to “Wellington area”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# description Wellington area
```

To remove the description for AMF container “vac-wlg-1”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# no description
```

Related commands **atmf container**

show atmf container

Command changes Version 5.4.7-0.1: command added

erase factory-default

Overview This command erases all data from NVS and all data from flash **except** the following:

- the boot release file (a .rel file) and its release setting file
- all license files
- the latest GUI release file

The device is then rebooted and returned to its factory default condition. The device can then be used for AMF automatic node recovery.

Syntax

```
erase factory-default
```

Mode Privileged Exec

Usage notes This command is an alias to the **atmf cleanup** command.

Note that you cannot use this command if you have **strict-user-process-control** enabled. Disable it before entering the **`erase factory-default`** command.

Note that this command can only be used on standalone switches, not stacked switches.

Example To erase data, use the command:

```
Node_1# erase factory-default
This command will erase all NVS, all flash contents except for
 the boot release, a GUI resource file, and any license files,
 and then reboot the switch. Continue? (y/n):y
```

Related commands **atmf cleanup**

firmware-url

Overview Use this command to specify the location of an AP guest node's firmware file when preparing the AP for auto-recovery. AMF cannot back up AP firmware files (only configuration files), so you need to store the firmware file somewhere accessible and use this command to provide the AlliedWare Plus device with the file's location.

For step-by-step instructions for auto-recovery of an TQ5403 series AP, see the **AMF Feature Overview and Configuration Guide**.

Use the **no** variant of this command to remove the URL.

Syntax

```
firmware-url <name>
no firmware-url
```

Parameter	Description
<name>	The file's directory or filename. We recommend specifying a directory because that makes it easier to keep the firmware file up to date. The following protocols are supported: http, https, tftp, usb, and card. Do not change the firmware file's filename.

Default No URL is configured

Mode AMF Guest Configuration

Example To specify, on a device named node2, that the firmware file for a TQ5403 AP is stored in the top level of a USB stick, use the commands:

```
node2# configure terminal
node2(config)# atmf guest-class TQ5403
node2(config-guest)# firmware-url usb:
```

To specify, on a device named node2, that the firmware file for a TQ5403 AP is stored on a TFTP server with an address of 192.168.2.1, use the commands:

```
node2# configure terminal
node2(config)# atmf guest-class TQ5403
node2(config-guest)# firmware-url tftp://192.168.2.1/
```

Related commands

- **atmf guest-class**
- **discovery**

- **show atmf guests detail**
- **switchport atmf-guestlink**

Command changes

Version 5.5.3-0.1: command added

http-enable

Overview This command is used to enable GUI access to a guest node. When **http-enable** is configured, the port number is set to its default of 80. If the guest node is using a different port for HTTP, you can configure this using the **port** parameter.

This command is used to inform the GUI that this device has an HTTP interface at the specified port number so that a suitable URL can be provided to the user.

Use the **no** variant of this command to disable HTTP.

Syntax

```
http-enable [port <port-number>]
no http-enable
```

Parameter	Description
port	TCP port number.
<port-number>	The port number to be configured.

Default Not set

Mode AMF Guest Configuration

Usage notes If **http-enable** is selected without a **port** parameter the port number will default to 80.

Example To enable HTTP access to a guest node on port 80 (the default), use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# http-enable
```

To enable HTTP access to a guest node on port 400, use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# http-enable port 400
```

To disable HTTP access to a guest node, use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# no http-enable
```

Related commands

atmf guest-class

switchport atmf-guestlink

show atmf links guest

show atmf nodes

identity (amf-provision)

Overview Use this command to create an identity token for provisioning an isolated AMF node. An isolated node is an AMF member that is only connected to the rest of the AMF network via a virtual-link.

This command allows these nodes, which have no AMF neighbors, to be identified for provisioning purposes. They are identified using an identity token which is based on either the next-hop MAC address of the provisioned node, or the serial number of the device being provisioned. This identity token is stored on the AMF master.

Use the **no** variant of this command to remove the identity token for a node.

Syntax

```
identity mac-address <mac-address> prefix <ip-address/prefix-length>
identity serial-number <serial-number> prefix <ip-address/prefix-length>
no identity
```

Parameter	Description
`mac-address`	Specify the next-hop MAC address of the device being provisioned.
<mac-address>	MAC address of the port the provisioned node is connected to, in the format xxxx.xxxx.xxxx.
`serial-number`	Specify the serial number of the device to be provisioned.
<serial-number>	Serial number of the device that is being provisioned.
`prefix`	IPv4 address, and prefix length, of the virtual-link interface on the isolated node
<ip-address/prefix-length>	IPv4 address, and prefix length, in A.B.C.D/M format.

Mode AMF Provisioning

Usage notes To provision an isolated node, first create a configuration for the node using the **create (amf-provision)** and/or the **clone (amf-provision)** commands.

Then create an identity token for the provisioned node by either specifying its next-hop MAC address or by specifying the serial number of the replacement device. The advantage of using the next-hop MAC address is that any device, regardless of its serial number, can be added to the network but using the serial number maybe preferred in situations where the next-hop MAC address is not easy to obtain.

The **atmf recovery-server** option must be enabled on the AMF master before attempting to provision the device. This option allows the AMF master to process recovery requests from isolated AMF nodes.

See the **AMF Feature Overview and Configuration Guide** for information on preparing your network for recovering or provisioning isolated nodes.

Example To create a identity token on your AMF master for a device named “my-x930” with serial number “A10064A172100008”, use the command:

```
awplus# atmf provision node my-x930
awplus(atmf-provision)# identity serial-number A10064A172100008
 prefix 192.168.2.25/24
```

To create a identity token on your AMF master for a device named “my-x930” with next-hop MAC address ”0000.cd28.0880”, use the command:

```
awplus# atmf provision node my-x930
awplus(atmf-provision)# identity mac-address 0000.cd28.0880
 prefix 192.168.2.25/24
```

To delete the identity token from your AMF master for a device named “my-x930”, use the command:

```
awplus# atmf provision node my-x930
awplus(atmf-provision)# no identity
```

Command changes

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

Version 5.4.7-2.1: command added

license-cert (amf-provision)

Overview This command is used to set up the license certificate for a provisioned node.

The certificate file usually has all the license details for the network, and can be stored anywhere in the network. This command makes a hidden copy of the certificate file and stores it in the space set up for the provisioned node on AMF backup media.

For node provisioning, the new device has not yet been part of the AMF network, so the user is unlikely to know its product ID or its MAC address. When such a device joins the network, assuming that this command has been applied successfully, the copy of the certificate file will be applied automatically to the provisioned node.

Once the new device has been resurrected on the network and the certificate file has been downloaded to the provisioned node, the hidden copy of the certificate file is deleted from AMF backup media.

Use the **no** variant of this command to set it back to the default.

This command can only be run on AMF master nodes.

Syntax

```
license-cert <file-path|URL>
no license-cert
```

Parameter	Description
<file-path|URL>	The name of the certificate file. This can include the file-path of the file.

Default No license certificate file is specified for the provisioned node.

Mode AMF Provisioning

Usage notes This command is only available on master nodes in the AMF network. It will only operate if the provisioned node specified in the command has already been set up, and if the license certification is present in the backup file. Otherwise, an error message is shown when the command is run.

Example 1 To apply the license certificate 'cert1.txt' stored on a TFTP server for AMF provisioned node "device2", use the command:

```
device1# atmf provision node device2
device1(atmf-provision)# license-cert tftp://192.168.1.1/
cert1.txt
```

Example 2 To apply the license certificate 'cert2.txt' stored in the AMF master's flash directory for AMF provisioned node 'host2', use the command:

```
device1# atmf provision node host2
device1(atmf-provision)# license-cert /cert2.txt
```

To confirm that the license certificate has been applied to the provisioned node, use the command **show atmf provision nodes**. The output from this command is shown below, and displays license certification details in the last line.

Sample output from the `show atmf provision nodes` command

```
device1#show atmf provision nodes

locate (amf-provision)

show atmf provision nodes

Command changes Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

locate (amf-provision)

Overview This command changes the present working directory to the directory of a provisioned node. This makes it easier to edit files and create a unique provisioned node in the backup.

This command can only be run on AMF master nodes.

NOTE: *We advise that after running this command, you return to a known working directory, typically flash.*

Syntax

```
locate
```

Mode AMF Provisioning

Example To change the working directory that happens to be on device1 to the directory of provisioned node device2, use the following command:

```
device1# atmf provision node device2
device1[atmf-provision]# locate
```

The directory of the node device2 should now be the working directory. You can use the command **pwd** to check this, as shown in the following figure.

Sample output from the `pwd` command

```
device2#pwd
card:/atmf/building_2/nodes/device2/flash
```

The output above shows that the working directory is now the flash of device2.

Command changes

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

log event-host

Overview Use this command to set up an external host to log AMF topology events through Vista Manager. This command is run on the Master device.

Use the **no** variant of this command to disable log events through Vista Manager.

Syntax

```
log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event
no log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event
```

Parameter	Description
<ipv4-addr>	ipv4 address of the event host
<ipv6-addr>	ipv6 address of the event host

Default Log events are disabled by default.

Mode Global Configuration

Usage notes Event hosts are set so syslog sends the messages out as they come.

Note that there is a difference between log event and log host messages:

- Log event messages are sent out as they come by syslog
- Log host messages are set to wait for a number of messages (20) to send them out together for traffic optimization.

Example To enable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
Node1(config)# log event-host 192.0.2.31 atmf-topology-event
```

To disable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
Node1(config)# no log event-host 192.0.2.31 atmf-topology-event
```

Related commands **atmf topology-gui enable**

login-fallback enable

Overview Use this command to enable login fallback on TQ model AMF guest nodes.This allows AMF to try the factory default username and password if the guest node's saved username and password fail.

Use the **no** variant of this command to disable login fallback.

Syntax
```
login-fallback enable
no login-fallback enable
```

Default Disabled

Mode AMF Guest Configuration

Usage notes This feature is only supported on TQ model guest nodes.

Login fallback means: if a guest node's saved username and password fail, AMF will try to connect to the node using the factory default username and password (manager/friend). When a new TQ replaces an existing TQ, this allows the new TQ to be discovered and managed as an AMF guest node. AMF can then start the AMF guest node recovery procedure.

Example To use the login fallback feature, first create an AMF guest class for TQ model APs. Then enable the login fall back feature.

For example, to enable login fallback on the guest-class AT-TQ5k, use the commands:

```
node1#configuration terminal
node1(config)#atmf guest-class AT-TQ5k
node1(config-atmf-guest)#login-fallback enable
node1(config-atmf-guest)#end
node1#
```

Related commands
- **atmf guest-class**
- **modeltype**
- **switchport atmf-guestlink**
- **show atmf links guest**

Command changes Version 5.5.0-1.1: command added

modeltype

Overview This command sets the expected model type of the guest node. The model type will default to **other** if nothing is set.

Use the **no** variant of this command to reset the model type to **other**.

Syntax

```
modeltype {alliedware|aw+|onvif|tq|other}
no modeltype
```

Parameter	Description
`alliedware`	A legacy Allied Telesis operating system.
`aw+`	The Allied Telesis AlliedWare Plus operating system.
`onvif`	ONVIF (Open Network Video Interface Forum) Profile Q devices
`tq`	An Allied Telesis TQ Series wireless access point.
`other`	Used where the model type is outside the above definitions.

Default Default to **other**

Mode AMF Guest Configuration

Examples To assign the model type **tq** to the guest-class called 'tq_device', use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class tq_device
node1(config-atmf-guest)# modeltype tq
```

To remove the model type **tq** from the guest-class called 'tq_device', and reset it to the default of **other**, use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class tq_device
node1(config-atmf-guest)# no modeltype
```

Command changes Version 5.4.9-2.1: **onvif** parameter added

service atmf-application-proxy

Overview Use this command to enable the AMF Application Proxy service. This service distributes messages across all AMF nodes.

Currently this is used for threat protection. When an AMF Security (AMF-Sec) Controller detects a threat, it issues a request to block the address the threat originated from. The AMF Application Proxy service distributes this message to all AMF nodes. An AMF master accepts this block request and instructs the subordinate AMF node to block the relevant device.

Use the **no** variant of this command to disable the AMF Application Proxy service.

Syntax
```
service atmf-application-proxy
no service atmf-application-proxy
```

Default The AMF Application Proxy service is disabled by default.

Mode Global Configuration

Usage notes The AMF master maintains a list of all threats and will send this list to any AMF node, or VCS member, when it boots and joins the AMF network.

In order for this to work the follow must be configured:

- the AMF Application Proxy service on all AMF nodes that need to receive the messages.
- the Hypertext Transfer Protocol (HTTP) service on all nodes that are running the AMF Application Proxy service (see **service http**).

Example To enable the AMF Application Proxy service, use the commands
```
awplus# configure terminal
awplus(config)# service atmf-application-proxy
```
To disable the AMF Application Proxy service, use the commands
```
awplus# configure terminal
awplus(config)# no service atmf-application-proxy
```

Related commands

Command changes Version 5.4.7-2.2: command added

show application-proxy threat-protection

Overview Use this command to list all the IP addresses blocked by the AMF Application Proxy

service. It also shows the global threat-detection configuration.

Syntax

```
show application-proxy threat-protection [all]
```

Parameter	Description
`all`	Include information for non-local blocks.

Mode Privileged Exec

Example To list the addresses blocked by the AMF Application Proxy service, use the command:

```
awplus# show application-proxy threat-protection
```

Output The following shows typical output.

Example output from `show application-proxy threat-protection`

```
awplus#show application-proxy threat-protection
Quarantine Vlan           : vlan200
Global IP-Filter          : Enabled
IP-Filter Limit Exceeded  : 0
Redirect-URL              : http://my.dom/help.html

Client IP        Interface    MAC Address     VLAN      Action
-----------------------------------------------------------------
10.34.199.110    -            -               -      link-down
10.34.199.116    port1.0.3    001a.eb93.ec5d  1           drop
10.1.179.1       *            *               *      ip-filter
...
```

Parameters in the output from `show application-proxy threat-protection`

Parameter	Description
`Quarantine Vlan`	The name of the quarantine VLAN.
`Global IP-Filter`	The status of global IP filtering.
`IP-Filter Limit Exceeded`	The number of times an ACL failed to be installed due to insufficient space.
`Redirect-URL`	The URL a blocked user is redirected to.

show application-proxy whitelist advertised-address

Overview Use this command to show the Layer 3 interface and its IPv4 address that is advertised as the application-proxy whitelist address.

Syntax
```
show application-proxy whitelist advertised-address
```

Mode Privileged Exec

Example To display the interface and IPv4 address advertised as the application-proxy whitelist address, use the command:

```
awplus# show application-proxy whitelist advertised-address
```

Output The following shows typical output.

Example output from `show application-proxy whitelist advertised-address`

```
awplus#show application-proxy whitelist advertised-address
ATMF Application Proxy Whitelist advertised-address:

application-proxy whitelist server

Command changes Version 5.4.9-1.1: command added

show application-proxy whitelist interface

Overview Use this command to display the status of port authentication on the specified interface.

Syntax

```
show application-proxy whitelist interface [<interface-list>]
```

Parameter	Description
<interface-list>	The interfaces or ports to display information about. An interface-list can be: • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4) • a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list. The specified interface must exist.

Mode Privileged Exec

Example To display the port authentication information for all interfaces, use the command:

```
awplus# show application-proxy whitelist interface
```

To display the port authentication information for port1.0.4, use the command

```
awplus# show application-proxy whitelist interface port1.0.4
```

Output The following shows typical output.

Example output from `show application-proxy whitelist interface`

```
awplus#sh application-proxy whitelist interface
Authentication Info for interface port1.0.1
  portEnabled: false - portControl: Auto
  portStatus: Unknown

Command changes Version 5.4.9-0.1: command added

show application-proxy whitelist supplicant

Overview Use this command to display the current configuration and status for each supplicant attached to an application-proxy whitelist port.

Syntax
```
show application-proxy whitelist supplicant [interface
 <interface-list>|<mac-addr>|brief]
```

Parameter	Description
`interface <interface-list>`	The interfaces or ports to display information about. An interface-list can be: • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4) • a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list. The specified interface must exist.
`<mac-addr>`	MAC (hardware) address of the supplicant.Entry format is HHHH.HHHH.HHHH (hexadecimal)
`brief`	Brief summary of the supplicant state.

Mode Privileged Exec

Example To display the supplicant information for all ports, use the command:

```
awplus# show application-proxy whitelist supplicant
```

To display the supplicant information for port1.0.4, use the command:

```
awplus# show application-proxy whitelist supplicant
 interface port1.0.4
```

Output The following shows typical output.

Example output from `show application-proxy whitelist supplicant`

Command changes Version 5.4.9-0.1: command added

show atmf

Overview Displays information about the current AMF node.

Syntax

```
show atmf [summary|tech|nodes|session]
```

Parameter	Description
summary	Displays summary information about the current AMF node.
tech	Displays global AMF information.
nodes	Displays a list of AMF nodes together with brief details.
session	Displays information on an AMF session.

Default Only summary information is displayed.

Mode User Exec and Privileged Exec

Usage notes AMF uses internal VLANs to communicate between nodes about the state of the AMF network. Two VLANs have been selected specifically for this purpose. Once these have been assigned, they are reserved for AMF and cannot be used for other purposes

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Example 1 To show summary information on AMF node_1 use the following command:

```
node_1# show atmf summary
```

Output from the `show atmf summary` command

```
node_1#show atmf summary
ATMF Summary Information:

ATMF Status           : Enabled
Network Name          : Test_network
Node Name             : node_1
Role                  : Master
Restricted login      : Disabled
Current ATMF Nodes    : 3
```

Example 2 To show information specific to AMF nodes use the following command:

```
node_1# show atmf nodes
```

Example 3 The **show amf session** command displays all CLI (Command Line Interface) sessions for users that are currently logged in and running a CLI session.

To display AMF active sessions, use the following command:

```
node_1# show atmf session
```

For example, in the output below, node_1 and node_5 have active users logged in.

Output from the show atmf session command

```
node_1#show atmf session

CLI Session Neighbors

Session ID                          : 73518
Node Name                           : node_1

DBE Request List Length             : 0
```

Example 4 The AMF tech command collects all the AMF commands, and displays them. You can use this command when you want to see an overview of the AMF network.

To display AMF technical information, use the following command:

```
node_1# show atmf tech
```

Output from the `show atmf tech` command

```
node_1#show atmf tech
ATMF Summary Information:

ATMF Status           : Enabled

Parameter definitions from the `show atmf tech` command

Parameter	Definition
`ATMF Status`	The Node's AMF status, either Enabled or Disabled.
`Network Name`	The AMF network that a particular node belongs to.
`Node Name`	The name assigned to a particular node.

Parameter	Definition
Role	The role configured for this AMF device, either Master or Member.
Current ATMF Nodes	The count of AMF nodes in an AMF Network.
Node Address	An address used to access a remotely located node (.atmf).
Node ID	A unique identifier assigned to a Node on an AMF network.
Node Depth	The number of nodes in path from this node to level of the AMF root nod It can be thought of as the vertical depth of the AMF network from a particular node to the zero level of the AMF root node.
Domain State	The state of Node in a Domain in AMF network as Controller/Backup.
Recovery State	The AMF node recovery status. Indicates whether a node recovery is in progress on this device - Auto, Manual, or None.
Management VLAN	The VLAN created for traffic between Nodes of different domain (up/dow links). • VLAN ID - In this example VLAN 4092 is configured as the Managemer VLAN. • Management Subnet - Network prefix for the subnet. • Management IP Address - The IP address allocated for this traffic. • Management Mask - The subnet mask used to create a subnet for this traffic (255.255.128.0).
Domain VLAN	The VLAN assigned for traffic between Nodes of same domain (crosslink) • VLAN ID - In this example VLAN 4091 is configured as the domain VLA • Domain Subnet. The subnet address used for this traffic. • Domain IP Address. The IP address allocated for this traffic. • Domain Mask. The subnet mask used to create a subnet for this traffic (255.255.128.0).
Device Type	The Product Series name.
ATMF Master	Whether the node is an AMF master node for its area ('Y' if it is and 'N' if it not).
SC	The device configuration, one of C - Chassis (SBx8100 Series), S - Stackable (VCS) or N - Standalone.
Parent	The node to which the current node has an active uplink.
Node Depth	The number of nodes in the path from this node to the master node.

Related commands **show atmf detail**

show atmf area

Overview Use this command to display information about an AMF area. On AMF controllers, this command displays all areas that the controller is aware of. On remote AMF masters, this command displays the controller area and the remote local area. On gateways, this command displays the controller area and remote master area.

Syntax `show atmf area [detail] [<area-name>]`

Parameter	Description
`detail`	Displays detailed information
`<area-name>`	Displays information about master and gateway nodes in the specified area only.

Mode Privileged Exec

Example 1 To show information about all areas, use the command:

```
controller-1# show atmf area
```

The following figure shows example output from running this command on a controller.

Example output from the `show atmf area` command on a Controller.

```
controller-1#show atmf area

  ATMF Area Information:

  * = Local area

  Area               Area   Local         Remote        Remote         Node
  Name               ID     Gateway       Gateway       Master         Count
-------------------------------------------------------------------------------
* NZ                 1      Reachable     N/A           N/A             3
  Wellington         2      Reachable     Reachable     Auth OK         120
  Canterbury         3      Reachable     Reachable     Auth Error      -

  Auckland           100    Reachable     Reachable     Auth Start      -
  Southland          120    Reachable     Reachable     Auth OK         54

  Area count:        6                           Area node count:     177
```

The following figure shows example output from running this command on a remote master.

Example output from the `show atmf area` command on a remote master.

```
Canterbury#show atmf area

  ATMF Area Information:

  * = Local area

  Area               Area   Local         Remote        Remote         Node
  Name               ID     Gateway       Gateway       Master         Count
-------------------------------------------------------------------------------
  NZ                 1      Reachable     N/A           N/A             -
* Canterbury         3      Reachable     N/A           N/A             40

  Area count:        2                        Local area node count:     40
```

Parameter definitions from the `show atmf area` command

Parameter	Definition
*	Indicates the area of the device on which the command is being run.
Area Name	The name of each area.
Area ID	The ID of the area.
Local Gateway	Whether the local gateway node is reachable or not.
Remote Gateway	Whether the remote gateway node is reachable or not. This is one of the following:

Parameter	Definition
	• Reachable, if the link has been established. • Unreachable, if a link to the remote area has not been established. This could mean that a port or vlan is down, or that inconsistent VLANs have been configured using the **switchport atmf-arealink** command. • N/A for the area of the controller or remote master on which the command is being run, because the gateway node on that device is local. • Auth Start, which may indicate that the area names match on the controller and remote master, but the IDs do not match. • Auth Error, which indicates that the areas tried to authenticate but there is a problem. For example, the passwords configured on the controller and remote master may not match, or a password may be missing on the remote master.# • Auth OK, which indicates that area authentication was successful and you can now use the **atmf select-area** command.
`Remote Master`	Whether the remote master node is reachable or not. This is N/A for the area of the controller or remote master on which the command is being run, because the master node on that device is local.
`Node Count`	The number of nodes in the area.
`Area Count`	The number of areas controlled by the controller.
`Area Node Count`	The total number of nodes in the area.

Example 2 To show detailed information about the areas, use the command:

```
controller-1# show atmf area detail
```

The following figure shows example output from running this command.

Output from the `show atmf area detail` command

```
controller-1#show atmf area detail

 ATMF Area Detail Information:

 Controller distance       : 0

 Controller Id             : 21
 Backup Available          : FALSE

 Area Id                   : 2
 Gateway Node Name         : controller-1
 Gateway Node Id           : 342
 Gateway Ifindex           : 6013

show atmf area nodes-detail

show atmf area guests

Overview This command will display details of all guests that the controller is aware of.

Syntax `show atmf area guests [<area-name> [<node-name>]]`

Parameter	Description
<area-name>	The area name for guest information
<node-name>	The name of the node that connects to the guests.

Default n/a

Mode User Exec/Privileged Exec

Example 1 To display atmf area guest nodes on a controller, use the command,

```
GuestNode[1]#show atmf area guests
```

Output The following shows typical output.

Example output from the `show atmf area guests` command

```
main-building Area Guest Node Information:
Device          MAC                                             IP/IPv6
Type            Address         Parent          Port            Address
-------------------------------------------------------------------------------
-               0008.5d10.7635  x230            1.0.3           192.168.5.4

main-building guest node count 4

GuestNode[1]#
```

Parameters in the output from `show atmf area guests` command

Parameter	Description
Device Type	The device type as read from the guest node.
MAC Address	The MAC address of the guest-node
Parent	The device that directly connects to the guest-node
Port	The port number on the parent node that connects to the guest node.
IP/IPv6	The IP or IPv6 address of the guest node.

Related commands

show atmf area

show atmf area nodes

show atmf backup guest

show atmf area guests-detail

show atmf area guests-detail

Overview This command displays the local and remote guest information from an AMF controller.

Syntax

```
show atmf area guests-detail [<area-name> [<node-name>]]
```

Parameter	Description
<area-name>	The name assigned to the AMF area. An area is an AMF network that is under the control of an AMF Controller.
<node-name>	The name assigned to the network node.

Mode Privileged Exec

Example To display detailed information for all guest nodes attached to “node1”, which is located within the area named “northern”, use the following command:

```
AMF_controller#show atmf area guests-detail northern node1
```

Output The following shows typical output.

Example output from the `show atmf guest detail` command.

```
#show atmf guest detail

Node Name                          : Node1
Port Name                          : port1.0.5
Ifindex                            : 5005
Guest Description                  : tq4600
Device Type                        : AT-TQ4600
Configuration Mismatch             : No
Backup Supported                   : Yes
MAC Address                        : eccd.6df2.da60
IP Address                         : 192.168.4.50

```

Parameters shown in the output of the show atmf guest detail command

Parameter	Description
`Node Name`	The name of the guest's parent node.
`Port Name`	The port on the parent node that connects to the guest.
`IFindex`	An internal index number that maps to the port number on the parent node.
`Guest Description`	A brief description of the guest node as manually entered into the **description (interface)** command for the guest node port on the parent node.
`Device Type`	The device type as supplied by the guest node itself.
`Backup Supported`	Indicates whether AMF supports backup of this guest node.
`MAC Address`	The MAC address of the guest node.
`IP Address`	The IP address of the guest node.
`IPv6 Address`	The IPv6 address of the guest node.
`HTTP Port`	The HTTP port enables you to specify a port when enabling http to allow a URL for the http user

Parameter	Description
	interface of a Guest Node. This is determined by the **http-enable** command.
`Firmware Version`	The firmware version that the guest node is currently running.

Related commands

show atmf area nodes-detail

show atmf area guests

show atmf area nodes

Overview Use this command to display summarized information about an AMF controller's remote nodes.

Note that this command can only be run from a controller node.

Syntax `show atmf area nodes <area-name> [<node-name>]`

Parameter	Description
<area-name>	Displays information about nodes in the specified area.
<node-name>	Displays information about the specified node.

Mode Privileged Exec

Usage notes If you do not limit the output to a single area or node, this command lists all remote nodes that the controller is aware of. This can be a very large number of nodes.

Example To show summarized information for all the nodes in area 'Wellington', use the command:

```
controller-1# show atmf area nodes Wellington
```

The following figure shows partial example output from running this command.

Output from the `show atmf area nodes Wellington` command

```
controller-1#show atmf area nodes Wellington

 Wellington Area Node Information:
 Node          Device             ATMF           Parent                      Node
 Name          Type               Master  SC     Domain                      Depth
 ---------------------------------------------------------------------------------
 well-gate     x230-18GP          N       N      well-master                 1
 well-master   AT-x930-28GPX      Y       N      none                        0

Wellington node count 2
```

Parameter definitions from the `show atmf area nodes` command

Parameter	Definition
`Node Name`	The name assigned to a particular node.
`Device Type`	The Product series name.
`ATMF Master`	Whether the node is an AMF master node for its area ('Y' if it is and 'N' if it is not).
`SC`	The device configuration, one of C - Chassis (SBx8100 series), S - Stackable (VCS) or N - Standalone.
`Parent Domain`	The node to which the current node has an active uplink.
`Node Depth`	The number of nodes in the path from this node to the master node.

show atmf area summary

Overview Use this command to display a summary of IPv6 addresses used by AMF, for one or all of the areas controlled by an AMF controller.

Syntax

```
show atmf area summary [<area-name>]
```

Parameter	Description
<area-name>	Displays information for the specified area only.

Mode Privileged Exec

Example 1 To show a summary of IPv6 addresses used by AMF, for all of the areas controlled by controller-1, use the command:

```
controller-1# show atmf area summary
```

The following figure shows example output from running this command.

Output from the `show atmf area summary` command

```
controller-1#show atmf area summary

 ATMF Area Summary Information:

Management Information
 Local IPv6 Address              : fd00:4154:4d46:1::15

Area Information
 Area Name                       : NZ (Local)
 Area ID                         : 1
 Area Master IPv6 Address        : -

 Area Name                       : Wellington
 Area ID                         : 2
 Area Master IPv6 Address        : fd00:4154:4d46:2::149

 Area Name                       : Canterbury
 Area ID                         : 3

show atmf authorization

Overview Use this command on an AMF master to display the authorization status of other AMF members and masters on the network.

On an AMF controller this command will show the authorization status of remote area AMF masters.

Syntax

```
show atmf authorization {current|pending|provisional}
```

Parameter	Description
`current`	Show the status of all authorized nodes.
`pending`	Show the status of unauthorized nodes in the pending queue. These are nodes that enabled secure mode with **atmf secure-mode** but have not yet been authorized with **atmf authorize**.
`provisional`	Show the status of provisionally authorized nodes. These are nodes that have been provisioned with **atmf authorize provision**.

Mode Privileged Exec

Example To display all authorized AMF nodes on an AMF controller or AMF master, use the command:

```
awplus# show atmf authorization current
```

To display AMF nodes which are requesting authorization on an AMF controller or AMF master, use the command:

```
awplus# show atmf authorization pending
```

To display AMF nodes which have provisional authorization, use the command:

```
awplus# show atmf authorization provisional
```

Output The following shows typical output.

Example output from `show atmf authorization current`

```
  NZ Authorized Nodes:
  Node Name             Signer                Expires
-----------------------------------------------------------------
  master_1              master_1              4 Mar 2017
  area_1_node_1         master_1              4 Mar 2017
  area_1_node_2         master_1              4 Mar 2017
```

Parameters in the output from `show atmf authorization current`

Parameter	Description
`Node Name`	AMF node name of the authorized node.
`Signer`	Name of the AMF master that authorized the node.
`Expires`	Expiry date of the authorization. Authorization expiry time is set using **atmf secure-mode certificate expiry**.

Output The following shows typical output.

Example output from `show atmf authorization pending`

```
  Pending Authorizations:

  NZ Requests:
  Node Name           Product          Parent Node      Interface
-------------------------------------------------------------------
  area_1_node_3       x230-18GP        master_1         port1.2.9
  area_1_node_4       x510-52GTX       master_1         sa1
```

Parameters in the output from `show atmf authorization pending`

Parameter	Description
`Node Name`	Name of the node that is requesting authorization.
`Product`	Product name.
`Parent Node`	Authorization authority of the requesting node.
`Interface`	Interface that the authorization request came in on.

Output The following shows typical output.

Example output from `show atmf authorization provisional`

```
 ATMF Provisional Authorization:

  Area - Node Name                  Start                  Timeout
  or MAC Address      Interface     Time                   Minutes
-------------------------------------------------------------------
  3333.4444.5555                    5 Sep 2016 02:35:54     3
  1111.2222.3333                    5 Sep 2016 02:35:24     60
  NZ - blue           port1.0.3     5 Sep 2016 02:35:06     60
```

Parameters in the output from `show atmf authorization provisional`

Parameter	Description
`Area - Node Name or MAC Address`	MAC address or node name of the node that has been provisionally authorized.
`Interface`	Interface that the node has been provisioned on.
`Start Time`	Time the node was provisioned.
`Timeout Minutes`	Length of time from `Start Time` until the provisional authorization expires.

show atmf backup

Overview This command displays information about AMF backup status for all the nodes in an AMF network. It can only be run on AMF master and controller nodes.

Syntax

```
show atmf backup
show atmf backup logs
show atmf backup server-status
show atmf backup synchronize [logs]
```

Parameter	Description
`logs`	Displays detailed log information.
`server-status`	Displays connectivity diagnostics information for each configured remote file server.
`synchronize`	Display the file server synchronization status
`logs`	For each remote file server, display the logs for the last synchronization

Mode Privileged Exec

Example 1 To display the AMF backup information, use the command:

```
node_1# show atmf backup
```

To display log messages to do with backups, use the command:

```
node_1# show atmf backup logs
```

Output from `show atmf backup`

```
Node_1# show atmf backup
ScheduledBackup ......Enabled

Example 3 To display the AMF backup information with the optional parameter **server-status**, use the command:

```
Node_1# show atmf backup server-status
```

```
Node1#sh atmf backup server-status

Id   Last Check    State
-----------------------------------
1    186 s         File server ready
2    1 s           SSH no route to host
```

Parameter definitions from the `show atmf backup` command

Parameter	Definition
`Scheduled Backup`	Indicates whether AMF backup scheduling is enabled or disabled.
`Schedule`	Displays the configured backup schedule.
`Next Backup Time`	Displays the date and time of the next scheduled.
`Backup Media`	The current backup medium in use. This will be one of USB, SD, or NONE. Utilized and available memory (MB) will be indicated if backup media memory is present.
`Current Action`	The task that the AMF backup mechanism is currently performing. This will be a combination of either (Idle, Starting, Doing, Stopping), or (manual, scheduled).
`Started`	The date and time that the currently executing task was initiated in the format DD MMM YYYY HH:MM
`Current Node`	The name of the node that is currently being backed up.
`Backup Redundancy`	Whether backup redundancy is enabled or disabled.
`Local media`	The local media to be used for backup redundancy; SD, USB, INTERNAL, or NONE, and total and free memory available on the media.
`State`	Whether SD or USB media is installed and available for backup redundancy. May be Active (if backup redundancy is functional—requires both the local redundant backup media and a remote server to be configured and available) or Inactive.
`Node Name`	The name of the node that is storing backup data - on its backup media.
`Date`	The data of the last backup in the format DD MMM YYYY.
`Time`	The time of the last backup in the format HH:MM:SS.
`In ATMF`	Whether the node shown is active in the AMF network, (Yes or No).
`On Media`	Whether the node shown has a backup on the backup media (Yes or No).
`Status`	The output can contain one of four values: • “-” meaning that the status file cannot be found or cannot be read. • “Errors” meaning that there are issues - note that the backup may still be deemed successful depending on the errors. • “Stopped” meaning that the backup attempt was manually aborted. • “Good” meaning that the backup was completed successfully. • “In Progress” meaning that the backup is currently running on that node.

Parameter	Definition
`Log File Location`	All backup attempts will generate a result log file in the identified directory based on the node name. In the above example this would be: card:/amf/office/logs/rsync_amf_testbox1.log.
`Log Details`	The contents of the backup log file.
`server-status`	Displays connectivity diagnostics information for each configured remove file server.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Related commands

show atmf

atmf network-name

show atmf backup area

Overview Use this command to display backup status information for the master nodes in one or more areas.

Note that this command is only available on AMF controllers.

Syntax `show atmf backup area [<area-name> [<node-name>]] [logs]`

Parameter	Description
`logs`	Displays the logs for the last backup of each node.
<area-name>	Displays information about nodes in the specified area.
<node-name>	Displays information about the specified node.

Mode Privileged Exec

Example To show information about backups for an area, use the command:

```
controller-1# show atmf backup area
```

Output from the `show atmf backup area` command

```
controller-1#show atmf backup area

show atmf backup guest

Overview This command displays backup status information of guest nodes in an AMF network.This command can only be run on a device configured as an AMF Master and has an AMF guest license.

Syntax

```
show atmf backup guest [<node-name> [<guest-port>]] [logs]
```

Parameter	Description
<node-name>	The name of parent guest node
<guest-port>	The port number on the parent node

Mode User Exec/Privileged Exec

Example On the switch named x930-master, to display information about the AMF backup guest status, use the command:

```
x930-master# show atmf backup guest
```

Output The following shows typical output.

Example output from show atmf backup guest

```
x930-master#sh atmf backup guest

```

Parameters in the output from show atmf backup guest

Parameter	Description
Guest Backup	The status of the guest node backup process
Scheduled Backup	The timing configured for guest backups.
Schedule	Displays the configured backup schedule.
Next Backup Time	The time the next backup process will be initiated.
Backup Bandwidth	The bandwidth limit applied to the backup data flow measured in kilo Bytes /second. Note that unlimited means there is no limit set specifically for the backup data flow.
Backup Media	Detail of the memory media used to store the backup files and the current memory capacity available.

show atmf container

Overview Use this command to display information about the AMF containers created on a a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the**AMF Feature Overview and_Configuration Guide** for more information on running multiple tenants on a single VAA host.

Syntax `show atmf container [detail] [<container-name>]`

Parameter	Description
`detail`	Show detailed information.
<container-name>	The name of the AMF container you wish to display information for.

Mode Privileged Exec

Output The following shows typical output.

Example output from `show atmf container`

```
awplus#show atmf container

ATMF Container Information:

  Container       Area        Bridge   State      Memory    CPU%
 ------------------------------------------------------------------
  vac-wlg-1       wlg         br1      running    70.3 MB   1.2
  vac-akl-1       akl         br2      stopped    0 bytes   0.0
  vac-nsn-1       nsn         br3      running    53.2 MB   0.7

Current ATMF Container count: 3
```

Example output from `show atmf container vac-wlg-1`

```
awplus#show atmf container vac-wlg-1

ATMF Container Information:

  Container       Area        Bridge   State      Memory    CPU%
 ------------------------------------------------------------------
  vac-wlg-1       wlg         br1      running    70.3 MB   1.2

Current ATMF Container count: 1
```

Parameters in the output from `show atmf container`

Parameter	Description
`Container`	Name of the AMF container.
`Area`	Name of the area the container is in.
`Bridge`	Name of the bridge connecting the container to the physical network.
`State`	Container state, `running` or `stopped`. This is set with the **state** command.
`Memory`	The amount of memory the container is using on the VAA host.
`CPU%`	The percentage of CPU time the container is using on the VAA, at the time the show command is run.

Example output from `show atmf container detail vac-wlg-1`

```
awplus#show atmf container detail vac-wlg-1

ATMF Container Information:

Name: vac-wlg-1
State: RUNNING
PID: 980
IP: 172.31.0.1
IP: 192.168.0.2
IP: fd00:4154:4d46:3c::1
CPU use: 3.95 seconds
Memory use: 67.07 MiB
```

```
Memory use: 0 bytes
Link: vethP31UFA
TX bytes: 166.01 KiB
RX bytes: 141.44 KiB
Total bytes: 307.45 KiB
Link: vethYCT7BB
TX bytes: 674.27 KiB
RX bytes: 698.27 KiB
Total bytes: 1.34 MiB
```

Parameters in the output from `show atmf container detail`

Parameter	Description
`Name`	Name of the AMF container.
`State`	Container state, `RUNNING` or `STOPPED`. This is set with the **state** command.
`PID`	Internal container id.
`IP`	This lists the IP addresses used by the container. These include the eth1 IP address and the AMF management IP address.
`CPU use`	The CPU usage of the container since it was enabled.
`Memory use`	Container memory usage.
`Link`	Each container has two links: **1.** An AMF area-link, this connects the container to the AMF controller and uses virtual interface eth0 on the AMF container. **2.** A bridged L2 network link, this connects the container to the outside world and uses the virtual interface eth1 on the AMF container. See the **AMF Feature Overview and Configuration_Guide** for more information on these links.
`TX/RX bytes`	Bytes sent and received on a link.
`Total bytes`	Total bytes transferred on a link.

Command changes Version 5.4.7-0.1: command added

show atmf detail

Overview This command displays details about an AMF node. It can only be run on AMF master and controller nodes.

Syntax

```
show atmf detail
```

Parameter	Description
`detail`	Displays output in greater depth.

Mode Privileged Exec

Example 1 To display the AMF node1 information in detail, use the command:

```
controller-1# show atmf detail
```

A typical output screen from this command is shown below:

```
atmf-1#show atmf detail
ATMF Detail Information:

Network Name                        : Test_network
Network Mtu                         : 1300
Node Name                           : controller-1
Node Address                        : controller-1.atmf
Node ID                             : 342
Node Depth                          : 0
Domain State                        : BackupDomainController
Recovery State                      : None
Recovery Over ETH Ports             : Disabled
Log Verbose Setting                 : Verbose
Topology GUI                        : Disabled

Management VLAN
 VLAN ID                            : 4000
 Management Subnet                  : 172.31.0.0
 Management IP Address              : 172.31.1.86
 Management Mask                    : 255.255.128.0
 Management IPv6 Address            : fd00:4154:4d46:1::156
 Management IPv6 Prefix Length      : 64

Domain VLAN
 VLAN ID                            : 4091
 Domain Subnet                      : 172.31.128.0
 Domain IP Address                  : 172.31.129.86
 Domain Mask                        : 255.255.128.0
```

Parameter definitions from the `show atmf detail` command

Parameter	Definition
`Network MTU`	The network MTU for the ATMF network.
`Network Name`	The AMF network that a particular node belongs to.
`Node Name`	The name assigned to a particular node.
`Node Address`	An address used to access a remotely located node. This is simply the Node Name plus the dotted suffix atmf (.atmf).
`Node ID`	A unique identifier assigned to a node on an AMF network.
`Node Depth`	The number of nodes in the path from this node to the level of the AMF root node. It can be thought of as the vertical depth of the AMF network from a particular node to the zero level of the AMF root node.
`Domain State`	The state of a node in a Domain in an AMF network as Controller/Backup.
`Recovery State`	The AMF node recovery status. Indicates whether a node recovery is in progress on this device - Auto, Manual, or None.

Parameter	Definition
`Recovery Over ETH Ports`	Allow AMF recovery over the Eth port on an AR-series device.
`Log Verbose Setting`	The state of the **atmf log-verbose** command.
`Topology GUI`	This feature allows your AMF network to interact with Vista Manager EX and must be enabled on your AMF master.
`Management VLAN`	The VLAN created for traffic between nodes of different domain (up/down links). • VLAN ID - in this example VLAN 4092 is configured as the Management VLAN. • Management Subnet - the network prefix for the subnet. • Management IP Address - the IP address allocated for this traffic. • Management Mask - the subnet mask used to create a subnet for this traffic (255.255.128.0).
`Domain VLAN`	The VLAN assigned for traffic between nodes of the same domain (crosslink). • VLAN ID - in this example VLAN 4091 is configured as the domain VLAN. • Domain Subnet - the subnet address used for this traffic. • Domain IP Address - the IP address allocated for this traffic. • Domain Mask - the subnet mask used to create a subnet for this traffic (255.255.128.0).
`Node Depth`	The number of nodes in the path from this node to the core domain.

show atmf group

Overview This command can be used to display the group membership within to a particular AMF node. It can also be used with the working-set command to display group membership within a working set.

Each node in the AMF is automatically added to the group that is appropriate to its hardware architecture, e.g. x510, x230. Nodes that are configured as masters are automatically assigned to the master group.

You can create arbitrary groups of AMF members based on your own selection criteria. You can then assign commands collectively to any of these groups.

Syntax

```
show atmf group [user-defined|automatic]
```

Parameter	Description
`user-defined`	User-defined-group information display.
`automatic`	Automatic group information display.

Default All groups are displayed

Mode Privileged Exec

Example 1 To display group membership of node2, use the following command:

```
node2# show atmf group
```

A typical output screen from this command is shown below:

```
ATMF group information
master, x510
node2#
```

This screen shows that node2 contains the groups **master** and **x510**. Note that although the node also contains the implicit groups, these do not appear in the show output.

Example 2 The following commands (entered on *node2*) will display all the automatic groups within the working set containing *node1* and all nodes that have been pre-defined to contain the *sysadmin* group:

First define the working-set:

```
node1# #atmf working-set node1 group sysadmin
```

A typical output screen from this command is shown below:

```
ATMF group information

master, poe, x8100

================================================
node1, node2, node3, node4, node5, node6:
================================================

ATMF group information

sysadmin, x8100

AMF_NETWORK[6]#
```

This confirms that the six nodes (*node1* to *node6*) are now members of the working-set and that these nodes reside within the *AMF-NETWORK*.

Note that to run this command, you must have previously entered the command **atmf working-set**. This can be seen from the network level prompt, which in this case is *AMF_NETWORK[6]#*.

Sample output from the `show atmf group` command for a working set.

```
AMF_NETWORK[6]#show atmf group
==============================
node3, node4, node5, node6:
==============================

ATMF group information

edge_switches, x510
```

Parameter definitions from the `show atmf group` command for a working set

Parameter	Definition
`ATMF group information`	Displays a list of nodes and the groups that they belong to, for example: • master - Shows a common group name for Nodes configured as AMF masters. • Hardware Arch - Shows a group for all Nodes sharing a common Hardware architecture, e.g. x8100, x230, for example. • User-defined - Arbitrary groups created by the user for AMF nodes.

show atmf group members

Overview This command will display all group memberships within an AMF working-set. Each node in the AMF working set is automatically added to automatic groups which are defined by hardware architecture, e.g. x510, x230. Nodes that are configured as masters are automatically assigned to the master group. Users can define arbitrary groupings of AMF members based on their own criteria, which can be used to select groups of nodes.

Syntax

```
show atmf group members [user-defined|automatic]
```

Parameter	Description
`user-defined`	User defined group membership display.
`automatic`	Automatic group membership display.

Mode Privileged Exec

Example To display group membership of all nodes in a working-set, use the command:

```
ATMF_NETWORK[9]# show atmf group members
```

Sample output from the `show atmf group members` command

```
ATMF Group membership

Automatic        Total
Groups           Members   Members
-----------------------------------------------------------------
master           1         Building_1
poe              1         HW_Team1
x510             3         SW_Team1 SW_Team2 SW_Team3
x930             1         HW_Team1
x8100            2         Building_1 Building_2

ATMF Group membership

User-defined     Total
Groups           Members   Members
-----------------------------------------------------------------
marketing          1       Bld1_Floor_1
software           3       SW_Team1 SW_Team2 SW_Team3
```

Parameter definitions from the `show atmf group members` command

Parameter	Definition
`Automatic Groups`	Lists the Automatic Groups and their nodal composition. The sample output shows AMF nodes based on the same Hardware type or belonging to the same Master group.
`User-defined Groups`	Shows the grouping of AMF nodes in user defined groups.
`Total Members`	Shows the total number of members in each group.
`Members`	Shows the list of AMF nodes in each group.

Related commands

show atmf group

show atmf

atmf group (membership)

show atmf guests

Overview This command is available on any AMF master or controller in the network. It displays a summary of the AMF guest nodes that exist in the AMF network, including device type, parent node, and IP address.

Syntax
```
show atmf guests
```

Mode User Exec/Privileged Exec

Usage notes Use this command to display all guest nodes in a network. If you want to see only the guests attached to a single node, use the **show atmf links guest** command, which shows information about the guest nodes and also about their link to their parent node.

Example To display the AMF guest output, use the command:
```
awplus# show atmf guests
```

Output The following shows typical output.

Example output from the `show atmf guests` command

```
master#show atmf guests

  Guest Information:

  Device          Device          Parent      Guest     IP/IPv6
  Name            Type            Node        Port      Address
-------------------------------------------------------------------------
  node1-2.0.1     x600-24Ts       node1       2.0.1     192.168.2.10
  wireless-zone1  AT-TQ4600       node2       1.0.1     192.168.1.10
  wireless-zone2  AT-TQ4600       node2       1.0.2     192.168.1.12

  Current ATMF guest node count 3
```

Parameters shown in the output of the show atmf guests command

Parameter	Description
Device Name	The name that is discovered from the device, or failing that, a name that is auto-assigned by AMF. The auto-assigned name consists of:<parent node name>-<attached port number>You can change this by configuring a description on the port.
Device Type	The product name of the guest node, which is discovered from the device. If no device type can be discovered, this shows the name of the AMF guest-class that has been assigned to the guest node by the **atmf guest-class** command.
Parent Node	The name of the AMF node that directly connects to the guest node.
Guest Port	The port on the parent node that directly connects to the guest node.
IP/IPv6 Address	The address discovered from the node, or statically configured on the parent node's attached port.

Related commands

atmf guest-class

switchport atmf-guestlink

show atmf backup guest

show atmf links guest

show atmf guests detail

Overview This command is available on any AMF master in the network. It displays details about the AMF guest nodes that exist in the AMF network, such as device type, IP address, MAC address etc.

Syntax

```
show atmf guests detail [<node-name>] [<guest-port>]
```

Parameter	Description
<node-name>	The name of the guest node's parent.
<guest-port>	The port name on the parent node.

Mode User Exec/Privileged Exec

Usage notes If you want to see only the guests attached to a single node, you can use either:

- this command and specify the node name, or
- **show atmf links guest detail**, which shows information about the guest nodes and also about their link to their parent node.

Note that the parameters that are displayed depend on the guest node's model.

Example To display the AMF guest output, use the command:

```
awplus# show atmf guests detail
```

Output The following shows typical output.

Example output from `show atmf guests detail`

```
master#show atmf guests detail

ATMF Guest Node Information:

Node Name                          : master
Port Name                          : port1.0.9
Ifindex                            : 5009
Guest Description                  : red-1.0.9
Device Type                        : x600-24Ts
Backup Supported                   : No
MAC Address                        : 0000.cd38.0c4d
IP Address                         : 192.168.1.5
IPv6 Address                       : Not Set
HTTP Port                          : 0
Firmware Version                   : 5.4.2-0.1

 Node Name                         : node1
 Port Name                         : port1.0.13
 Ifindex                           : 5013
 Guest Description                 : node1-1.0.13
 Device Type                       : AT-TQ4600
 Backup Supported                  : Yes
 MAC Address                       : eccd.6df2.daa0
 IP Address                        : 192.168.5.6
 IPv6 Address                      : Not Set
 HTTP Port                         : 80
 Firmware Version                  : 3.1.0 B01
```

Parameters in the output from show atmf guests detail.

Parameter	Description
`Node Name`	The name of the parent node, which is the AMF node that directly connects to the guest node.
`Port Name`	The port on the parent node that connects to the guest.
`IfIndex`	An internal index number that maps to the port number on the parent node.
`Guest Description`	A description that is discovered from the device, or failing that, auto-assigned by AMF. The auto-assigned name consists of: <parent node name>-<attached port number>. You can change this by configuring a description on the port.
`Device Type`	The product name of the guest node, which is discovered from the device. If no device type can be discovered, this shows the name of the AMF guest-class that has been assigned to the guest node by the **atmf guest-class** command.
`Username`	The user name configured on the guest node.
`Backup Supported`	Whether the guest node supports AMF backup functionality.

Parameter	Description
`MAC Address`	The MAC address of the guest node.
`IP Address`	The IP address of the guest node.
`IPv6 Address`	The IPv6 address of the guest node.
`Firmware Version`	The version of the firmware operating on the guest node.
`HTTP port`	The HTTP port as specified with the **http-enable** command when defining a guest class. You can set this if the guest node provides an HTTP user interface on a non-standard port (any port other than port 80).

Related commands

atmf guest-class

switchport atmf-guestlink

show atmf backup guest

show atmf links

Overview This command displays information about AMF links on a switch. The display output contains link status state information.

Syntax

```
show atmf links [brief]
```

Parameter	Description
brief	A brief summary of AMF links, their configuration and status.

Mode User Exec and Privileged Exec

Usage notes The **show atmf links** and **show atmf links brief** commands both produce a table of summarized link information. For a more detailed view use the **show atmf links detail** command.

This command does not show links that are configured on provisioned ports.

Example To display a brief summary of the AMF links, use the following command:

```
node-1# show atmf links brief
```

Example output from show atmf links brief

```
Example-core# show atmf links

ATMF Link Brief Information:

Local      Link       Link    ATMF         Adjacent       Adjacent    Link
Port       Type       Status  State        Node           Ifindex     State
-------------------------------------------------------------------------------
1.0.10     Crosslink  Down    Init         *crosslink1     -          Blocking
1.0.14     Crosslink  Down    Init         *crosslink2     -          Blocking
1.0.1      Downlink   Down    Init         -               -          Blocking
1.0.2      Downlink   Up      Full         Node2           5001       Forwarding
1.0.8      Downlink   Up      Full         downlink1       5001       Forwarding

* = Provisioned.
```

Parameter in the output from `show atmf links brief`

Parameter	Definition
`Local Port`	Shows the local port on the selected node.
`Link Type`	Shows link type as Uplink or Downlink (parent and child) or Cross-link (nodes in same domain).
`Link Status`	Shows the link status of the local port on the node as either Up or Down.
`ATMF State`	Shows AMF state of the local port: • Init - Link is down. • Hold - Link transitioned to up state, but waiting for hold period to ensure link is stable. • Incompatible - Neighbor rejected the link because of inconsistency in AMF configurations. • OneWay - Link is up and has waited the hold down period and now attempting to link to another unit in another domain. • OneWaySim - Device is running in secure mode and link is up but waiting for authorization from an AMF master. • Full - Link hello packets are sent and received from its neighbor with its own node id. • Shutdown - Link has been shut down by user configuration.
`Adjacent Node`	Shows the Adjacent AMF Node to the one being configured.
`Adjacent IF Index`	Shows the IF index for the Adjacent AMF Node connected to the node being configured.
`Link State`	Shows the state of the AMF link. Valid states are either Forwarding or Blocking.

show atmf links detail

show atmf links guest

show atmf links guest detail

show atmf links statistics

show atmf nodes

show atmf links detail

Overview This command displays detailed information on all the links configured in the AMF network. It can only be run on AMF master and controller nodes.

Syntax

```
show atmf links detail
```

Parameter	Description
`detail`	Detailed AMF links information.

Mode User Exec

Usage notes For summarized link information see the **show atmf links** command.

This command does not show links that are configured on provisioned ports.

Example To display the AMF link details use this command:

```
device1# show atmf links detail
```

The output from this command will display all the internal data held for AMF links. The following example gives details of the links that are summarized in the example in **show atmf links**.

Sample output from the `show atmf links detail` command

```
device1# show atmf links detail

Parameter definitions from the `show atmf links detail` command output

Parameter	Definition
`Crosslink Ports Information`	Show details of all Crosslink ports on this Node: • Port - Name of the Port or static aggregation (sa<*>). • Ifindex - Interface index for the crosslink port. • VR ID - Virtual router id for the crosslink port. • Port Status - Status of the local port on the Node as UP or DOWN. • Port State - AMF State of the local port. • • Init - Link is down. • Hold - Link transitioned to up state, but waiting for hold period to ensure link is stable. • Incompatible - Neighbor rejected the link because of inconsistency in AMF configurations. • OneWay - Link is up and has waited the hold down period and now attempting to link to • another unit in another domain • Full - Link hello packets are sent and received from its neighbor with its own node id. • Shutdown - Link has been shut down by user configuration. Port BPDU Receive Count - The number of AMF protocol PDU's received. • Adjacent Node Name - The name of the adjacent node connected to this node. • Adjacent Ifindex - Adjacent AMF Node connected to this Node. • Adjacent VR ID - Virtual router id of the adjacent node in the domain. • Adjacent MAC - MAC address of the adjacent node in the domain. • Port Last Message Response - Response from the remote neighbor to our AMF last hello packet.

Parameter	Definition
`Link State Entries`	Shows all the link state database entries: • Node.Ifindex - Shows adjacent Node names and Interface index. • Transaction ID - Shows transaction id of the current crosslink transaction. • MAC Address - Shows adjacent Node MAC addresses. • Link State - Shows AMF states of adjacent nodes on the link.
`Domain Nodes Tree`	Shows all the nodes in the domain: • Node - Name of the node in the domain. • Links on Node - Number of crosslinks on a vertex/node. • Link no - Shows adjacent Node names and Interface index. • Forwarding State - Shows state of AMF link Forwarding/Blocking.
`Crosslink Transaction Entries`	Shows all the transaction entries: • Node - Name of the AMF node. • Transaction ID - transaction id of the node. • Uplink Transaction ID - transaction id of the remote node.
`Uplink Information`	Show all uplink entries. • Waiting for Sync - Flag if uplinks are currently waiting for synchronization. • Transaction ID - Shows transaction id of the local node. • Number of Links - Number of up downlinks in the domain. • Number of Local Uplinks - Number of uplinks on this node to the parent domain. • Originating Node - Node originating the uplink information. • Domain - Name of the parent uplink domain. • Node - Name of the node in the parent domain, that is connected to the current domain. • Ifindex - Interface index of the parent node's link to the current domain. • VR ID - Virtual router id of the parent node’s link to the current domain. • Transaction ID - Transaction identifier for the neighbor in crosslink. • Flags - Used in domain messages to exchange the state: ATMF_DOMAIN_FLAG_DOWN = 0 ATMF_DOMAIN_FLAG_UP = 1 ATMF_DOMAIN_FLAG_BLOCK = 2 ATMF_DOMAIN_FLAG_NOT_PRESENT = 4 ATMF_DOMAIN_FLAG_NO_NODE = 8 ATMF_DOMAIN_FLAG_NOT_ACTIVE_PARENT = 16 ATMF_DOMAIN_FLAG_NOT_LINKS = 32 ATMF_DOMAIN_FLAG_NO_CONFIG = 64 • Domain Controller - Domain Controller in the uplink domain

Parameter	Definition
	• Domain Controller MAC - MAC address of Domain Controller in uplink domain
`Downlink Domain Information`	Shows all the downlink entries: • Domain - Name of the downlink domain. • Domain Controller - Controller of the downlink domain. • Domain Controller MAC - MAC address of the domain controller. • Number of Links - Total number of links to this domain from the Node. • Number of Links Up - Total number of links that are in UP state. • Number of Links on This Node - Number of links terminating on this node. • Links are Blocked - 0 links are not blocked to the domain. 1 All links are blocked to the domain.
`Node Transaction List`	List of transactions from this downlink domain node. • Node - 0 links are not blocked to the domain. 1 All links are blocked to the domain. • Transaction ID - Transaction id for this node. • Domain List: Shows list of nodes in the current domain and their links to the downlink domain.: • Domain - Domain name of the downlink node. • Node - Name of the node in the current domain. • Ifindex - Interface index for the link from the node to the downlink domain. • Transaction ID - Transaction id of the node in the current domain. • Flags - As mentioned above.
`Up/Downlink Ports Information`	Shows all the configured up and down link ports on this node: • Port - Name of the local port. • Ifindex - Interface index of the local port. • VR ID - Virtual router id for the local port. • Port Status - Shows status of the local port on the Node as UP/ DOWN. • Port State - AMF state of the local port. • Adjacent Node - nodename of the adjacent node. • Adjacent Internal ID - Unique node identifier of the remote node. • Adjacent Ifindex - Interface index for the port of adjacent AMF node. • Adjacent Board ID - Product identifier for the adjacent node. • Adjacent VR ID - Virtual router id for the port on adjacent AMF node. • Adjacent MAC - MAC address for the port on adjacent AMF node. • Adjacent Domain Controller - nodename of the Domain controller for Adjacent AMF node. • Adjacent Domain Controller MAC - MAC address of the Domain controller for Adjacent AMF node. • Port Forwarding State - Local port forwarding state Forwarding or Blocking. • Port BPDU Receive Count - count of AMF protocol PDU's received.

Parameter	Definition
	• Port Sequence Number - hello sequence number, incremented every time the data in the hello packet changes. • Port Adjacent Sequence Number - remote ends sequence number used to check if we need to process this packet or just note it arrived. • Port Last Message Response - response from the remote neighbor to our last hello packet.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Related commands

no debug all

clear atmf links statistics

show atmf

show atmf links guest

Overview This command displays information about guest nodes visible to an AMF device.

Syntax

```
show atmf links guest [interface <interface-range>]
```

Parameter	Description
`interface <interface-range>`	Select a specific range of ports to display information about guest nodes.

Default With no parameters specified this command will display its standard output for all ports with guest nodes connected.

Mode User Exec/Privileged Exec

Usage notes Use this command to display the guest nodes connected to a single parent node. If you want to see a list of all the guests in the AMF network, use **show atmf guests**.

Example 1 To display information about AMF guests that are connectible from node1, use the command:

```
node1# show atmf links guest
```

Output The following shows typical output.

Example output from `show atmf links guest`

```
node1#sh atmf links guest

Guest Link Information:

DC = Discovery configuration
  S = static D = dynamic

Local    Guest         Model        MAC             IP / IPv6
Port     Class         Type      DC Address         Address
-------------------------------------------------------------------
1.0.1    -             other     D  0013.1a1e.4589  192.168.1.2
1.0.2    aastra-phone  other     D  0008.5d10.7635  192.168.1.3
1.0.3    cisco-phone2  other     S  -               192.168.2.1
1.0.4    panasonic...  other     D  0800.239e.f1fe  192.168.1.5
```

Parameters in the output from show atmf links guest

Parameter	Description
`Local Port`	The port on the parent node that connects to the guest.
`Guest Class`	The name of the ATMF guest-class that has been assigned to the guest node by the **atmf guest-class** command.
`Model Type`	The model type of the guest node, as entered by the **modeltype** command. Can be one of the following: • alliedware • aw+ • tq • other
`DC`	The discovery method as applied by the **discovery** command. This can be either dynamic (D) or static (S).
`MAC Address`	The MAC address of the guest node.
`IP / IPv6 Address`	The IP address of the guest node.

show atmf links guest detail

Overview This command displays detailed information about guest nodes visible to an AMF device.

Syntax

```
show atmf links guest detail [interface <interface-range>]
```

Parameter	Description
`interface <interface-range>`	Select a specific range of ports to display information about guest nodes.

Mode User Exec and Privileged Exec

Usage notes Use this command to display the guest nodes connected to a single parent node. If you want to see a list of all the guests in the AMF network, use **show atmf guests detail**.

Note that the parameters that are displayed depend on the guest node's model and state.

Example To display detailed information about AMF guests, use the command:

```
node1# show atmf links guest detail
```

Output The following shows typical output.

Example output from `show atmf links guest detail`

```
node1#show atmf links guest detail

Detailed Guest Link Information:

Interface                          : port1.0.13
Link State                         : Down
Class Name                         : test
Model Type                         : Other
Discovery Method                   : Static
IP Address                         : 192.168.1.13
Node State                         : Down

Interface                          : port1.0.5
Link State                         : Full
Class Name                         : tq_device
Model Type                         : TQ
Discovery Method                   : Dynamic
IP Address                         : 192.168.1.221
Username                           : manager
Login Fallback                     : Yes
Node State                         : Full
Backup Supported                   : Yes
MAC address                        : 001a.ebab.d2e0
Device Type                        : AT-TQ4600
Description                        : AP221
Firmware Version                   : 3.2.1 B02
HTTP port                          : 80
```

Parameters in the output from show atmf links guest detail

Parameter	Description
`Interface`	The port on the parent node that connects to the guest.
`Link State`	The state of the link to the guest node; one of: • Down: The physical link is down. • Up: The physical link has come up, but it is still during a timeout period that is enforced to allow other links to come up. • Learn: The timeout period described above has elapsed, and the link is now learning information from the AMF guest node. You can see what information it is learning from the "Node State" field below. • Full: The node connected by this link has joined the AMF network. • Fail: The port is physically up but something has prevented the guest node from joining the AMF network.
`Class Name`	The name of the ATMF guest-class that has been assigned to the guest node by the **atmf guest-class** command.

Parameter	Description
Model Type	The model type of the guest node, as entered by the **modeltype** command. The mode type can be one of the following: • alliedware • aw+ • onvif • tq • other
Discovery Method	The discovery method as applied by the **discovery** command. This can be either dynamic or static.
IP Address	The IP address of the guest node.
Username	The user name configured on the guest node.
Login Fallback	Whether the guest node supports Login Fallback. For TQ model guest nodes, when login fallback is enabled, if a guest node is replaced, then AMF logs in to the new TQ using the factory default manager/friend settings. The new TQ is then discovered and managed as an AMF guest node by an AMF master or member. This means any backed up settings for the replaced guest node can also be recovered.
Node state	The state of the guest node; one of: • Down: The initial state when a link to a guest node is first configured. This is also the state if the physical link goes down. • Getting IP: The AMF device is in the process of retrieving the IP address of the guest node. • Getting Mac: The AMF device is in the process of retrieving the MAC address of the guest node. • Getting Info: The AMF device is in the process of retrieving any other available information from the guest (firmware version etc). The information available depends on what device the guest node is. • Full: The AMF device has retrieved all necessary information and the guest node has joined the AMF network. Once this state is reached, the Link State also changes to “Full”. • Failure: The physical link is up but the AMF member has failed to retrieve enough information to allow the guest node to join the AMF network.
Backup Supported	Whether the guest node supports AMF backup functionality.
MAC Address	The MAC address of the guest node.
Device Type	Model information for the guest node. This field shows the model information that AMF retrieved from the guest node. In contrast, the Model Type

Parameter	Description
	shows what a user entered as the type of device they intended this guest node to be.
`Description`	By default, this is a concatenation of the guest node's parent node and the port to which it is attached. You can change it by configuring a description on the port.
`Serial Number`	The serial number of the guest node.
`Firmware Name`	The name of the firmware operating on the guest node.
`Firmware Version`	The version of the firmware operating on the guest node.
`HTTP port`	The HTTP port as specified with the **http-enable** command when defining a guest class. You can set this if the guest node provides an HTTP user interface on a non-standard port (any port other than port 80).

Command changes

Version 5.5.0-1.1: **`Login Fallback`** parameter added

show atmf links statistics

Overview This command displays details of the AMF links configured on the device and also displays statistics about the AMF packet exchanges between the devices.

It is also possible to display the AMF link configuration and packet exchange statistics for a specified interface.

This command can only be run on AMF master and controller nodes

Syntax `show atmf links statistics [interface [<port-number>]]`

Parameter	Description
`interface`	Specifies that the command applies to a specific interface (port) or range of ports. Where both the interface and port number are unspecified, full statistics (not just those relating to ports will be displayed.
<port-number>	Enter the port number for which statistics are required. A port range, a static channel or LACP link can also be specified. Where no port number is specified, statistics will be displayed for all ports on the device.

Mode User Exec

Example 1 To display AMF link statistics for the whole device, use the command:

```
device1# show atmf links statistics
```

Sample output from the `show atmf links statistics` command

```
ATMF Statistics:

                                   Receive        Transmit
------------------------------------------------------------------------------
Arealink Hello                       318            327

------------------------------------------------------------------------------
vlink2000             393            0             417          0

ATMF Packet Discards:
Type0   0           : Gateway hello msg received from unexpected neighbor
Type1   0           : Stack hello msg received from unexpected neighbor
Type2   0           : Discard TX update bitmap packet - bad checksum
Type3   0           : Discard TX update packet - neighbor not in correct state
Type4   0           : Discard update packet - bad checksum or type
Type5   0           : Discard update packet - neighbor not in correct state
Type6   0           : Discard update bitmap packet - bad checksum or type

Type7   0           : Incarnation is not possible with the data received
Type8   0           : Discard crosslink hello received - not correct state
Type9   0           : Discard crosslink domain hello received on non crosslink
Type10  0           : Discard crosslink domain hello - not in correct state
Type11  0           : Crosslink uplink hello received on non crosslink port
Type12  0           : Discard crosslink uplink hello - not in correct state
Type13  0           : Wrong network-name for this ATMF
Type14  0           : Packet received on port is too long
Type15  0           : Bad protocol version, received on port
Type16  0           : Bad packet checksum calculation

Type17  0           : Bad authentication type
Type18  0           : Bad simple password
Type19  0           : Unsupported authentication type
Type20  0           : Discard packet - unknown neighbor
Type21  0           : Discard packet - port is shutdown
Type22  0           : Non broadcast hello msg received from unexpected neighbor
Type23  0           : Arealink hello msg received on non arealink port
Type24  0           : Discard arealink hello packet - not in correct state
```

```
Type25  0            : Discard arealink hello packet - failed basic processing

Type26  0            : Discard unicast packet - MAC address does not match node
Type27  0            : AMF Master license node limit exceeded
```

Example 2 To display the AMF links statistics on interface port1.0.4, use the command:

```
device1# show atmf links statistics interface port1.0.4
```

Sample output from the `show atmf links statistics` command for interface port1.0.4

```
device1# show atmf links statistics interface port1.0.4

ATMF Port Statistics:

                                          Transmit       Receive
-------------------------------------------------------------------
port1.0.4  Crosslink Hello                   231            232
port1.0.4  Crosslink Hello Domain            116            116
port1.0.4  Crosslink Hello Uplink            116            115
port1.0.4  Hello Link                        0              0
port1.0.4  Arealink Hello                    0              0
```

Parameter definitions from the `show atmf links statistics` command output

Parameter	Definition
Receive	Shows a count of AMF protocol packets received per message type.
Transmit	Shows the number of AMF protocol packets transmitted per messag type.
Database Entries	Shows the number of AMF elements existing in the distributed database.
Database Full Ages	Shows the number of times the entries aged in the database.
ATMF Packet Discards	Shows the number of discarded packets of each type.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Related commands

no debug all

clear atmf links statistics

show atmf

show atmf nodes

Overview This command displays nodes currently configured within the AMF network.

Note that the output also tells you whether or not node map exchange is active. Node map exchange improves the tracking of nodes joining and leaving an AMF network. This improves the efficiency of AMF networks. Node map exchange is only available if every node in your AMF network is running version 5.4.6-2.1 or later. We recommend running the latest version on all nodes in your network, so you receive the advantages of node map exchange and other improvements.

Syntax

```
show atmf nodes [guest|all]
```

Parameter	Description
guest	Display only guest nodes in the AMF network.
	Display all nodes in the AMF network, including guest nodes.

Mode Privileged Exec

Usage notes You can use this command to display one of three sets of nodes:

- all nodes except guest nodes, by specifying **show atmf nodes**
- all nodes including guest nodes, by specifying **show atmf nodes all**
- only guest nodes, by specifying **show atmf nodes guest**

Examples To display AMF information for all nodes except guest nodes, use the command:

```
node1# show atmf nodes
```

Sample output from show atmf nodes

```
node1#show atmf nodes guest

Node Information:

  * = Local device

 SC = Switch Configuration:
  C = Chassis   S = Stackable   N = Standalone

  Node                Device            ATMF         Parent             Node
  Name                Type              Master  SC   Domain             Depth
-------------------------------------------------------------------------------
* M1                  x510-28GTX          Y     S    none                 0
  N3                  x230-18GP           N     N    M1                   1
  N1                  AR4050S             N     N    M1                   1

 Node map exchange is active
 Current ATMF node count 3
```

To display AMF information for all nodes, including guest nodes, use the command:

```
node1# show atmf nodes all
```

Sample output from `show atmf nodes all`. In this example, not all nodes support node map exchange, as shown by the message at the end

```
node1#show atmf nodes all

 Node and Guest Information:

  * = Local device

 SC = Switch Configuration:
  C = Chassis   S = Stackable   N = Standalone G = Guest

  Node/Guest           Device             ATMF         Parent              Node
  Name                 Type               Master  SC   Domain              Depth
-------------------------------------------------------------------------------
* M1                   x510-28GTX           Y     S    none                  0
  N3                   x230-18GP            N     N    M1                    1
  N1                   AR4050S              N     N    M1                    1
  N3-1.0.24            AT-TQ4600            N     G    N3                    -

Node map exchange is inactive
Firmware on some nodes does not support node map exchange, eg AR4050S
Current ATMF node count 4 (guests 1)
```

To display AMF information for guest nodes only, use the command:

```
node1# show atmf nodes guest
```

Sample output from `show atmf nodes guest`

```
node1#show atmf nodes guest

Guest Information:
Device        MAC                                    IP/IPv6
Name          Address         Parent           Port  Address
-------------------------------------------------------------------------------
 aastra-...    0008.5d10.7635  Node-1            1.0.2    192.168.4.7
poe-1.0.1     0013.1a1e.4589  Node-1           1.0.1    192.168.4.6
ip-camera     0800.239e.f1fe  Node-1           1.0.4    192.168.4.8
tq4600        eccd.6df2.da60  Node-1           1.0.5    192.168.4.50
```

Related commands

show atmf

show atmf area nodes

discovery

http-enable

show atmf backup guest

show atmf provision nodes

Overview This command displays information about each provisioned node with details about date and time of creation, boot and configuration files available in the backup, and license files present in the provisioned backup. This includes nodes that have joined the network but are yet to run their first backup.

This command can only be run on AMF master and controller nodes.

Syntax

```
show atmf provision nodes
```

Mode Privileged Exec

Usage notes This command will only work if provisioned nodes have already been set up. Otherwise, an error message is shown when the command is run.

Example To show the details of all the provisioned nodes in the backup use the command:

```
NodeName# show atmf provision nodes
```

Sample output from the `show atmf provision nodes` command

```
device1#show atmf provision nodes

ATMF Provisioned Node Information:

show atmf recovery-file

Overview Use this command to display the recovery file information for an AMF node.

AMF recovery files are created for nodes with special links. Special links include:

- virtual links,
- area links terminating on an AMF master, and
- area virtual links terminating on an AMF master.

Syntax
```
show atmf recovery-file
```

Mode Privileged Exec

Example To display recovery file information for an AMF node, use the command:
```
node1# show atmf recovery-file
```

Output The following shows typical output.

Example output from `show atmf recovery-file`

```
node1#show atmf recovery-file

ATMF Recovery File Info: Special Link Present
Location                    Date         Time
USB storage device          30 Apr 2018  14:50:32
Master                      30 Apr 2018  14:56:45
node1                       30 Apr 2018  14:56:45
node3                       30 Apr 2018  14:56:45
```

Related commands **clear atmf recovery-file**

Command changes Version 5.4.8-0.2: command added

show atmf secure-mode

Overview Use this command to display an overview of the secure mode status of an AMF network.

Syntax
```
show atmf secure-mode
```

Mode Privileged Exec

Example To display an overview of AMF secure mode on an AMF master or member node, use the command:

```
awplus# show atmf secure-mode
```

Output The following shows typical output.

Example output from `show atmf secure-mode` on an AMF master

```
ATMF Secure Mode:

Secure Mode Status                : Enabled
Certificate Expiry                : 180 Days
Certificates Total                : 8
Certificates Revoked              : 0
Certificates Rejected             : 0
Certificates Active               : 8

Provisional Authorization         : 0
Pending Requests                  : 0

Trusted Master                    : master_1
Trusted Master                    : master_2

Key Fingerprint:
  48:37:d9:a0:37:32:22:9b:5c:22:da:a2:62:49:a7:e5:a9:bc:12:88
```

Example output from `show atmf secure-mode` on an AMF node

```
ATMF Secure Mode:

Secure Mode Status                : Enabled
Trusted Master                    : master_1
Trusted Master                    : master_2

Key Fingerprint:
  93:f0:52:a9:74:8f:ae:ea:5b:e2:ee:62:cb:6b:21:22:5a:08:db:98
```

Parameters in the output from `show atmf secure-mode`

Parameter	Description
`Secure Mode Status`	Shows the status of secure mode, `Enabled` or `Disabled`.
`Certificate Expiry`	Certificate expiry time. Set with **atmf secure-mode certificate expiry**
`Certificates Total`	Total number of certificates.
`Certificates Revoked`	Certificates that have been revoked by the AMF master.
`Certificates Rejected`	Certificates that have been rejected by the AMF master.
`Certificates Active`	Certificates that are currently active.
`Provisional Authorization`	Number of nodes with provisional authorization. For more information use the **show atmf authorization** **`provisional`** command.
`Pending Requests`	Number of nodes waiting for authorization on the AMF master. For more information use the **show atmf authorization** **`pending`** command.
`Trusted Master`	List of trusted masters in the AMF area.

Parameter	Description
`Key Fingerprint`	The AMF node's key fingerprint.

Command changes

Version 5.4.7-0.3: command added

show atmf secure-mode audit

Overview Use this command to detect security vulnerabilities on a node.

Syntax
```
show atmf secure-mode audit
```

Mode Privileged Exec

Example To display AMF secure mode link audits for a node, use the command
```
awplus# show atmf secure-mode audit
```

Output The following shows typical output.

Example output from `show atmf secure-mode audit`

```
ATMF Secure Mode Audit:

Warning   : The default username and password is enabled.
Good      : SNMP V1 or V2 is disabled.
Warning   : Telnet server is enabled.
Good      : ATMF is enabled. Secure-Mode is on.
Good      : ATMF Topology-GUI is disabled. No trustpoints configured.

ATMF Secure Mode Log Events:

------------------------------------------------------------------------
2017 Feb 2 00:59:25 user.notice node1 ATMF[848]: Sec_Audit - ATMF Secure
Mode is enabled.
2017 Feb 2 01:30:00 user.notice node1 ATMF[848]: Sec_Audit - Established
secure connection to area_1_node_1 on interface vlink1.
```

Parameters in the output from `show atmf secure-mode audit link`

Parameter	Description
`ATMF Secure Mode Audit`	A list of security recommendations to secure the AMF network. Items prefaced with `Warning` need to be fixed. In the sample above the default username and password, and telnet, should be disabled.
`ATMF Secure Mode Log Events`	A list of recorded secure mode log events.

Related commands **show atmf secure-mode**

Command changes Version 5.4.7-0.3: command added

show atmf secure-mode audit link

Overview Use this command to detect security vulnerabilities by identifying devices that are connected to a secure mode node that are not in secure mode or are not authorized.

Syntax
```
show atmf secure-mode audit link
```

Mode Privileged Exec

Example To display AMF secure mode link audits for a node, use the command
```
awplus# show atmf secure-mode audit link
```

Output The following shows typical output.

Example output from `show atmf secure-mode audit link`

```
ATMF Secure Mode Audit Link:

 * ATMF links connected to devices which are not authorized
   or are not in secure-mode.

Port       Link Type  Discovered           Node/Area Name
-----------------------------------------------------------
vlink1     Downlink   16/02/2017 09:28:22  Member3
```

Parameters in the output from `show atmf secure-mode audit link`

Parameter	Description
`Port`	Port name on local device.
`Link Type`	Link type.
`Discovered`	Date discovered
`Node/Area Name`	Node or area name of remote device.

Related commands **show atmf**

show atmf secure-mode

Command changes Version 5.4.7-0.3: command added

show atmf secure-mode certificates

Overview Use this command to display the certificate status details when secure mode is enabled on an AMF network.

Syntax
```
show atmf secure-mode certificates [detail] [area <area-name>]
 [node <node-name>]
```

Parameter	Description
`detail`	Display detailed certificate information.
`area`	Specify an AMF area.
<area-name>	The AMF area you want to see the certificate information for.
`node`	Specify an AMF node.
<node-name>	The AMF node you want to see information for.

Mode Privileged Exec

Example To display AMF secure mode certificates on a master or member node, use the command:

```
awplus# show atmf secure-mode certificates
```

To display detailed information about AMF secure mode certificates for a node named “area_2_node_1” in an area named “area-2”, use the command:

```
awplus# show atmf secure-mode certificates detail area area-2
 node area_2_node_1
```

Output The following shows typical output.

Example output from `show atmf secure-mode certificates`

```
  Area-1 Certificates:
  Node Name             Signer                Expires               Status
-------------------------------------------------------------------------------
  area_1_node_1         master_1              11 Mar 2017
                        master_2              4 Mar 2017            Active
  area_1_node_2         master_1              11 Mar 2017
                        master_2              4 Mar 2017            Revoked

  Area-2 Certificates:
  Node Name             Signer                Expires               Status
-------------------------------------------------------------------------------
  area_2_node_1         master_1              18 Mar 2017           Active
  area_2_node_2         master_1              18 Mar 2017           Rejected
```

Parameters in the output from `show atmf secure-mode certificates`

Parameter	Description
`Node Name`	Name of AMF node the certificate was issued to.
`Signer`	Name of AMF master that issued the certificate.
`Expires`	Certificate expiry date.
`Status`	The status column will display `Active` before a member node is trusted, and can be accessed using AMF commands. Valid statuses are `Active`, `Revoked`, and `Rejected`.

Output The following shows typical output.

Example output from `show atmf secure-mode certificates detail area area-2 node area_2_node_1`

```
 Certificates Detail:

-------------------------------------------------------------------------------
area_2_node_1 (area:area-2)
  MAC Address     : 0000.cd37.0003
  Status          : Active
  Serial Number   : A24SC8001
  Product         : x510-28GTX
  Key Fingerprint : cd:b4:c9:cd:7b:87:6a:30:98:25:d7:3c:89:8e:cb:74:e8:91:56:9d
  Flags           : 00000011
  Signer          : master_1
  Expiry Date     : 18 Mar 2017 21:17:42
```

Parameters in the output from `show atmf secure-mode certificates detail`

Parameter	Description
`MAC Address`	MAC address of AMF node.
`Status`	The device status will show `Active` if a member node is trusted, and can be accessed using AMF commands. Valid statuses are `Active`, `Revoked`, and `Rejected`.
`Serial Number`	Device serial number.
`Product`	Device product type.
`Key Fingerprint`	AMF node key fingerprint.
`Flags`	Internal AMF information.
`Signer`	Name of AMF master that issued the certificate.
`Expiry Date`	Certificate expiry date.

show atmf secure-mode sa

Overview Use this command to display the security associations on the network. This is the list of links and neighbors that are trusted.

Syntax

```
show atmf secure-mode sa [detail] [link|neighbor|broadcast]
```

Parameter	Description
`detail`	Display detailed security association information.
`link`	Display security associations for type links.
`neighbor`	Display security associations for type neighbors.
`broadcast`	Display security associations for type broadcast.

Mode Privileged Exec

Example To display an overview of AMF secure mode security associations on a master or member node, use the command:

```
awplus# show atmf secure-mode sa
```

To display a detailed overview of AMF secure mode neighbor security associations on a master or member node, use the command:

```
awplus# show atmf secure-mode sa detail neighbor
```

Output The following shows typical output.

Example output from `show atmf secure-mode sa`

```
  ATMF Security Associations:

  Type                        State           ID            Details
-------------------------------------------------------------------------------

```

Parameters in the output from `show atmf secure-mode sa`

Parameter	Description
`Type`	Security Association (SA) types: • Link - SA for link • CrossLink - SA for crosslink • AreaLink - SA for area link • Neighbor Node - SA for node neighbor relationship • Neighbor Gateway - SA for gateway neighbor relationship • Neighbor Cntl-Master - SA for controller/master neighbor relationship • Broadcast - SA for working-set broadcast requests
`State`	Current state of the Security Association. The state must be `Complete` before a member node is trusted, and can be accessed using AMF commands. • CA Exchg Init - SA is ready to begin the SA exchange process • CA Exchg - SA is currently exchanging CAs • Cert Exchg - SA is currently exchanging certificates • Key Exchg - SA is currently exchanging ephemeral keys • Complete - SA exchange has completed
`ID`	Security Association ID. • For Neighbor types this is the remote node ID. • For Link types this is the local ifindex. • For Broadcast type this is always 4095.
`Details`	Human readable translation of ID. • For Neighbor types this is the node name • For Link types this is the interface name
`Remote MAC Address`	MAC address of the remote partner of the security association.
`Flags`	Internal AMF information.

Command changes

Version 5.4.7-0.3: command added

show atmf secure-mode statistics

Overview Use this command to display AMF secure mode statistics. These statistics are from when AMF secure mode was first enabled or the statistics were cleared with the **clear atmf secure-mode statistics** command.

Syntax
```
show atmf secure-mode statistics
```

Mode Privileged Exec

Example To display AMF secure mode statistics on a master or member node, use the command:

```
awplus# show atmf secure-mode statistics
```

Output The following shows typical output.

Example output from `show atmf secure-mode statistics` on an AMF master.

```
ATMF Secure Mode Statistics:

Certificates:
New ............. 7              Expired .......... 0
Updated ......... 7              Deleted .......... 0
Revoked ......... 1              Renewed .......... 2
Rejected ........ 1              Re-authorized .... 1

Parameter definitions from the `show atmf tech` command

Parameter	Definition
`ATMF Status`	Shows status of AMF feature on the Node as Enabled/Disabled.
`Network Name`	The name of the AMF network to which this node belongs.
`Node Name`	The name assigned to the node within the AMF network.

Parameter	Definition
Role	The role configured on the device within the AMF - either master or member.
Current ATMF Nodes	A count of the AMF nodes in the AMF network.
Node Address	The identity of a node (in the format name.atmf) that enables its access it from a remote location.
Node ID	A unique identifier assigned to an AMF node.
Node Depth	The number of nodes in the path from this node to the core domain.
Domain State	A node's state within an AMF Domain - either controller or backup.
Recovery State	The AMF node recovery status. Indicates whether a node recovery is in progress on this device - either Auto, Manual, or None.
Management VLAN	The VLAN created for traffic between nodes of different domains (up/down links). VLAN ID - In this example VLAN 4092 is configured as the Management VLAN. Management Subnet - the Network prefix for the subnet. Management IP Address - the IP address allocated for this traffic. Management Mask - the Netmask used to create a subnet for this traffic 255.255.128.0 (= prefix /17)
Domain VLAN	The VLAN assigned for traffic between Nodes of same domain (crosslink). VLAN ID - In this example VLAN 4091 is configured as the domain VLAN. Domain Subnet - the Subnet address used for this traffic. Domain IP Address - the IP address allocated for this traffic. Domain Mask - the Netmask used to create a subnet for this traffic 255.255.128.0 (= prefix /17)
Device Type	Shows the Product Series Name.
ATMF Master	Indicates the node's membership of the core domain (membership is indicated by Y)
SC	Shows switch configuration: • C - Chassis (such as SBx8100 series) • S - Stackable (VCS)

Parameter	Definition
	• N - Standalone
Parent	A node that is connected to the present node's uplink, i.e. one layer higher in the hierarchy.
Node Depth	Shows the number of nodes in path from the current node to the Core domain.

NOTE: *The command can produce very large output. For this reason only the most significant terms are defined in this table.*

show atmf virtual-links

Overview This command displays a summary of all virtual links (L2TP tunnels) currently in the running configuration.

Syntax
```
show atmf virtual-links [macaddr]
show atmf virtual-links [id <1-4094>] [remote-id <1-4094>]
show atmf virtual-links detail [id <1-4094>]
```

Parameter	Description
`macaddr`	Display the virtual AMF links' MAC addresses.
`id <1-4094>`	ID of the local virtual link.
`remote-id <1-4094>`	ID of the remote virtual link
`detail`	Display information about a specific virtual link ID or range of virtual link IDs. Displays information such as: local and remote IP address, link type, packets received and transmitted.

Mode Privileged Exec

Example 1 To display AMF virtual links, use the command:

```
node_1# show atmf virtual-links
```

Example output from `show atmf virtual-links`

```
ATMF Virtual-Link Information:

Local     Local                Remote               Tunnel    Tunnel
Port      ID   IP              ID   IP              Protect   State
-------------------------------------------------------------------------
vlink1    1    172.16.24.2     2    1.0.0.2         -         Complete
vlink2    2    172.16.24.2*    10   172.16.24.3*    ipsec     Complete
vlink3    3    (eth0)*         1    1.2.3.4         -         AcquireLocal

* = Dynamic Address.

Virtual Links Configured: 3
```

In the above example, a centrally located switch has the IP address space 192.0.2.x/24. It has two VLANs assigned the subnets 192.0.2.33 and 192.0.2.65 using the prefix /27. Each subnet connects to a virtual link. The first link has the IP address 192.168.1.1 and has a Local ID of 1. The second has the IP address 192.168.2.1 and has the Local ID of 2.

Example 2 To display details about AMF virtual link with ID 1, use the command:

```
node_1# show atmf virtual-links detail id 1
```

Example output from show atmf virtual-links

```
  Virtual Link Detailed Information:

  ID 1     Description          : None
  ID 1     Local IP Address     : 192.168.5.1
  ID 1     Remote ID            : 1
  ID 1     Remote IP Address    : 192.168.5.20
  ID 1     Link Type            : virtual-link
  ID 1     Packets Received     : 236465
  ID 1     Packets Transmitted  : 192626
```

Example 3 To display AMF virtual links' MAC address information, use the command:

```
node_1# show atmf virtual-links macaddr
```

Example output from show atmf virtual-links macaddr

```
ATMF Link Remote Information:

ATMF Management Bridge Information:

Bridge: br-atmfmgmt

port no mac addr                is local?       ageing timer
  1     00:00:cd:27:c2:07       yes                0.00
  2     8e:c7:ae:81:7e:68       yes                0.00
  2     00:00:cd:28:bf:e7       no                 0.01
```

Parameters in the output from show atmf virtual-links

Parameter	Definition
Local Port	The tunnel name e.g. vlink1, vlink2, equivalent to an L2TP tunnel.
Local ID	The local ID of the virtual link. This matches the vlink<number>
Tunnel Protect	Tunnel protection protocol.
Tunnel State	The operational state of the vlink (either Up or Down). This state is always displayed once a vlink has been created.
mac addr	AMF virtual links terminate on an internal soft bridge. The "show atmf virtual-links macaddress" command displays MAC Address information.
is local?	Indicates whether the MAC displayed is for a local or a remote device.
ageing timer	Indicates the current aging state for each MAC address.

Related commands atmf virtual-link

show atmf working-set

Overview This command displays the nodes that form the current AMF working-set.

Syntax
```
show atmf working-set
```

Mode Privileged Exec

Example To show current members of the working-set, use the command:

```
ATMF_NETWORK[6]# show atmf working-set
```

Sample output from the `show atmf working-set` command.

```
ATMF Working Set Nodes:
node1, node2, node3, node4, node5, node6
Working set contains 6 nodes
```

Related commands
- **atmf working-set**

show debugging atmf

Overview Use this command to see what debugging is turned on for AMF.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Syntax

```
show debugging atmf
```

Mode Privileged Exec

Example To display the AMF debugging status, use the command:

```
node_1# show debugging atmf
```

Sample output from the `show debugging atmf` command.

```
node_1# show debugging atmf
ATMF debugging status:
ATMF arealink debugging is on
ATMF link debugging is on
ATMF crosslink debugging is on
ATMF database debugging is on
ATMF neighbor debugging is on
ATMF packet debugging is on
ATMF error debugging is on
```

Related commands **debug atmf packet**

show debugging atmf packet

Overview Use this command to see what debugging is turned on for AMF Packet debug.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Syntax

```
show debugging atmf packet
```

Mode User Exec and Privileged Exec

Example To display the AMF packet debugging status, use the command:

```
node_1# show debug atmf packet
```

Sample output from the `show debugging atmf packet` command.

```
ATMF packet debugging is on
=== ATMF Packet Debugging Parameters===
Node Name: x908
Port name: port1.1.1
Limit: 500 packets
Direction: TX
Info Level: Level 2
Packet Type Bitmap:
2. Crosslink Hello BPDU pkt with downlink domain info
3. Crosslink Hello BPDU pkt with uplink info
4. Down and up link Hello BPDU pkts
6. Stack hello unicast pkts
8. DBE request
9. DBE update
10. DBE bitmap update
```

Related commands

debug atmf

debug atmf packet

show running-config atmf

Overview This command displays the running system information that is specific to AMF.

Syntax
```
show running-config atmf
```

Mode User Exec and Global Configuration

Example To display the current configuration of AMF, use the following commands:

```
node_1# show running-config atmf
```

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Related commands
show running-config
no debug all

state

Overview This command sets the running state of an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the**AMF Feature Overview and Configuration Guide** for more information on running multiple tenants on a single VAA host.

Syntax

```
state {enable|disable}
```

Parameter	Description
`disable`	Stop the AMF container. The container's state changes to `stopped`.
`enable`	Start the AMF container. The container's state changes to `running`.

Default By default, **`state`** is disabled.

Mode AMF Container Configuration

Usage notes

The first time the **`state enable`** command is executed on a container it assigns the container to an area and configures it as an AMF master. This is achieved by automatically adding the following configuration to the AMF container:

```
atmf network-name <AMF network-name>
atmf master
atmf area <container area-name> <container area-id> local
atmf area <container area-name> password <container area-password>
atmf area <host area-name> <host area-id>

interface eth0
 atmf-arealink remote-area <host area-name> vlan 4094
```

For this reason the **`state enable`** command should be run after the container has been created with the **atmf container** command and an area-link configured with the **area-link** command.

Once the start-up configuration has been saved from within the AMF container, all further configuration changes need to be made manually.

Example To start the AMF container “vac-wlg-1” use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# state enable
```

To stop the AMF container “vac-wlg-1” use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# state disable
```

Related commands **atmf container**

show atmf container

Command changes Version 5.4.7-0.1: command added

switchport atmf-agentlink

Overview Use this command to configure a link between this device and an x600 Series switch, in order to integrate the x600 Series switch into your AMF network. The x600 Series switch is called an “AMF agent”, and the link between the x600 and this device is called an “agent link”.

The x600 Series switch must be running version 5.4.2-3.16 or later.

Use the **no** variant of this command to remove the agent link. If the x600 Series switch is still connected to the switch port, it will no longer be part of the AMF network.

Syntax

```
switchport atmf-agentlink
no switchport atmf-agentlink
```

Default By default, no agent links exist and x600 Series switches are not visible to AMF networks.

Mode Interface mode for a switch port. Note that the link between the x600 and the AMF network must be a single link, not an aggregated link.

Usage notes The x600 Series switch provides the following information to the AMF node that it is connected to:

- The MAC address
- The IPv4 address
- The IPv6 address
- The name/type of the device (Allied Telesis x600)
- The name of the current firmware
- The version of the current firmware
- The configuration name

AMF guestnode also makes most of this information available from x600 Series switches, but requires configuration with DHCP and/or LLDP. AMF agent is simpler; as soon the x600 is connected to an appropriately configured port of an AMF node, it is immediately integrated into the AMF network.

To see information about the x600 Series switch, use the **`show atmf links guest detail`** command.

Example To configure port1.0.1 as an agent link, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport atmf-agentlink
```

Related commands **show atmf links guest**

switchport atmf-arealink

Overview This command enables you to configure a port or aggregator to be an AMF area link. AMF area links are designed to operate between two nodes in different areas in an AMF network.

Use the **no** variant of this command to remove any AMF area link that may exist for the selected port or aggregated link.

This command is only available on AMF controllers and master nodes.

Syntax

```
switchport atmf-arealink remote-area <area-name> vlan <2-4094>
no switchport atmf-arealink
```

Parameter	Description
<area-name>	The name of the remote area that the port is connecting to.
<2-4094>	The VLAN ID for the link. This VLAN cannot be used for any other purpose, and the same VLAN ID must be used at each end of the link.

Default No arealinks are configured.

Mode Interface Configuration for a switchport, a static aggregator, or a dynamic channel group.

Usage notes Run this command on the port or aggregator at both ends of the link.

Each area must have the area-name configured, and the same area password must exist on both ends of the link.

Running this command will automatically place the port or static aggregator into trunk mode (i.e. switchport mode trunk) and will synchronize the area information stored on the two nodes.

You can configure multiple arealinks between two area nodes, but only one arealink at any time will be in use. All other arealinks will block information, to prevent network storms.

For AMF links, we recommend not using VCStack ports that are configured as network ports. During AMF recovery, these ports revert to their default state of being VCStack ports, so AMF cannot use them for auto-recovery. We recommend using standard network ports instead of VCStack ports for AMF links, so you can take advantage of AMF recovery.

NOTE: *See the command to configure an AMF area link on an AR-series Eth interface.*

Example To make switchport port1.0.2 an arealink to the 'Auckland' area on VLAN 6, use the commands:

```
controller-1# configure terminal
controller-1(config)# interface port1.0.2
controller-1(config-if)# switchport atmf-arealink remote-area
 Auckland vlan 6
```

To remove switchport port1.0.1 as an AMF area link, use the commands:

```
controller-1# configure terminal
controller-1(config)# interface port1.0.1
controller-1(config-if)# no switchport atmf-arealink
```

Related commands

atmf area

atmf area password

atmf virtual-link

show atmf links

switchport atmf-crosslink

Overview This command configures the selected port, statically aggregated link or dynamic channel group (LACP) to be an AMF crosslink. Running this command will automatically place the port or aggregator into trunk mode (i.e. **switchport mode trunk**).

The connection between two AMF masters must utilize a crosslink. Crosslinks are used to carry the AMF control information between master nodes. Multiple crosslinks can be configured between two master nodes, but only one crosslink can be active at any particular time. All other crosslinks between masters will be placed in the blocking state, in order to prevent broadcast storms.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove any crosslink that may exist for the selected port or aggregated link.

Syntax

```
switchport atmf-crosslink
no switchport atmf-crosslink
```

Mode Interface Configuration for a switchport, a static aggregator or a dynamic channel group.

Usage notes Crosslinks can be used anywhere within an AMF network. They have the effect of separating the AMF network into separate domains.

Where this command is used, it is also good practice to use the **switchport trunk native vlan** command with the parameter **none** selected. This is to prevent a network storm on a topology of ring connected devices.

For AMF links, we recommend not using VCStack ports that are configured as network ports. During AMF recovery, these ports revert to their default state of being VCStack ports, so AMF cannot use them for auto-recovery. We recommend using standard network ports instead of VCStack ports for AMF links, so you can take advantage of AMF recovery.

Example 1 To make switchport port1.0.1 an AMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# switchport atmf-crosslink
```

Example 2 This example is shown twice. Example 2A is the most basic command sequence. Example 2B is a good practice equivalent that avoids problems such as broadcast storms that can otherwise occur.

Example 2A To make static aggregator sa1 an AMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
```

Example 2B To make static aggregator sa1 an AMF crosslink, use the following commands for good practice:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
Node_1(config-if)# switchport trunk allowed vlan add 2
Node_1(config-if)# switchport trunk native vlan none
```

In this example VLAN 2 is assigned to the static aggregator, and the native VLAN (VLAN 1) is explicitly excluded from the aggregated ports and the crosslink assigned to it.

NOTE: *The AMF management and domain VLANs are automatically added to the aggregator and the crosslink.*

Related commands **show atmf links statistics**

switchport atmf-guestlink

Overview

Guest links are used to provide basic AMF functionality to non AMF capable devices. Guest links can be configured for either a selected switch port or a range of switch ports and use generic protocols to collect status and configuration information that the guest devices make available.

Use the **no** variant of this command to remove the guest node functionality from the selected port or ports.

NOTE: *AMF guest nodes are not supported on ports using the OpenFlow protocol.*

Syntax

```
switchport atmf-guestlink [class <guest-class>] [ip <A.B.C.D>|
 ipv6 <X:X::X:X>]
no switchport atmf-guestlink
```

Parameter	Description
`class`	Set a guest class
<guest-class>	The name of the guest class.
`ip`	Specifies that the address following will have an IPv4 format
<A.B.C.D>	The guest node's IP address in IPv4 format.
`ipv6`	Specifies that the address following will have an IPv6 format
<X:X::X:X>	The guest node's IP address in IPv6 format.

Default

No guest links are configured.

Mode

Interface

Example 1

To configure switchport port1.0.1 to be a guest link, that will connect to a guest node having a guest class of **camera** and an IPv4 address of **192.168.3.3**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink class camera ip
 192.168.3.3
```

Example 2 To configure switchport port1.0.1 to be a guest link, which will connect to a guest node having a guest class of **phone** and an IPv6 address of **2001:db8:21e:10d::5**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink class phone ipv6
 2000:db8:21e:10d::5
```

Example 3 To configure switchport port1.0.1 to be a guest link, using the default model type and learning method address, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink
```

Example 4 To configure switchports port1.0.1 to port1.0.3 to be guest links, for the guest class **camera**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1-port1.0.3
node1(config-if)# switchport atmf-guestlink class camera
```

Example 5 To remove the guest-link functionality from switchport port1.0.1, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# no switchport atmf-guestlink
```

switchport atmf-link

Overview This command enables you to configure a port or aggregator to be an up/down AMF link. Running this command will automatically place the port or aggregator into trunk mode. If the port was previously configured in access mode, the configured access VLAN will be removed.

Use the **no** variant of this command to remove any AMF link that may exist for the selected port or aggregated link.

Syntax

```
switchport atmf-link
no switchport atmf-link
```

Mode Interface Configuration for a switchport, a static aggregator or a dynamic channel group.

Usage notes Up/down links and virtual links interconnect domains in a vertical hierarchy, with the highest domain being the core domain. In effect, they form a tree of interconnected AMF domains. This tree must be loop-free. Therefore you must configure your up/down and virtual links so that no loops are formed.

Within each domain, cross-links between AMF nodes define those nodes as siblings within the same domain. You can form rings by combining cross-links with up/down links and/or virtual links, as long as each AMF domain links upwards to only a single parent domain. Each domain may link downwards to multiple child domains.

For AMF links, we recommend not using VCStack ports that are configured as network ports. During AMF recovery, these ports revert to their default state of being VCStack ports, so AMF cannot use them for auto-recovery. We recommend using standard network ports instead of VCStack ports for AMF links, so you can take advantage of AMF recovery.

NOTE: *See the command to configure an AMF up/down link on an AR-series Eth interface.*

Example To configure switchport port1.0.1 as an AMF up/down link, use the commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# switchport atmf-link
```

To remove switchport port1.0.1 as an AMF up/down link, use the commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# no switchport atmf-link
```

type atmf guest

Overview This command configures a trigger to activate when an AMF guest node joins or leaves.

Syntax

```
type atmf guest {join|leave}
```

Parameter	Description
join	AMF guest node joins.
leave	AMF guest node leaves.

Mode Trigger Configuration

Example To configure trigger 86 to activate when an AMF guest node leaves, use the following commands:

```
awplus(config)# trigger 86
awplus(config-trigger)# type atmf guest leave
```

Related commands show trigger

Command changes Version 5.5.1-1.1: command added

type atmf node

Overview This command configures a trigger to activate when an AMF node joins or leaves.

Syntax

```
type atmf node {join|leave}
```

Parameter	Description
join	AMF node joins.
leave	AMF node leaves.

Mode Trigger Configuration

Example 1 To configure trigger 5 to activate when an AMF node leaves, use the following commands. In this example the command is entered on node-1:

```
node1(config)# trigger 5
node1(config-trigger)# type atmf node leave
```

Example 2 The following commands will configure trigger 5 to activate if an AMF node join event occurs on any node within the working set:

```
node1# atmf working-set group all
```

This command returns the following display:

```
====================
node1, node2, node3:
====================

Working set join
```

Note that the running the above command changes the prompt from the name of the local node, to the name of the AMF-Network followed, in square brackets, by the number of member nodes in the working set.

```
AMF-Net[3]# conf t
AMF-Net[3](config)# trigger 5
AMF-Net[3](config-trigger)# type atmf node leave
AMF-Net[3](config-trigger)# description “E-mail on AMF Exit”
AMF-Net[3](config-trigger)# active
```

Enter the name of the script to run at the trigger event.

```
AMF-Net[3](config-trigger)# script 1 email_me.scp
AMF-Net[3](config-trigger)# end
```

Display the trigger configurations

```
AMF-Net[3]# show trigger
```

This command returns the following display:

```
=======
node1:
=======

Related commands **show trigger**

undebug atmf

Overview This command is an alias for the **no** variant of the **debug atmf**.

username (atmf-guest)

Overview This command enables you to assign a **username** to a guest class. Guests may require a username and possibly also a password. The password must be between 1 and 32 characters and will allow spaces.

Syntax

```
username <name> password [8] <userpass>
no username
```

Parameter	Description
<name>	User name of the guest node.
8	The parameter **8** means that the password that follows is in hashed form, not plain text. Do not type this 8 when creating a password with this command; it is only used in configuration files. In configuration files, the device prints 8 in front of passwords, to indicate that it is displaying the password in its hashed form.
<userpass>	The password to be entered for the guest node.

Default No usernames are configured

Mode AMF Guest Configuration

Example To assign the user name ‘reception’ and the password of ‘secret’ to an AMF guest node that has the guest class of ‘phone1’ use the following commands:

```
node1# configure terminal
node1(config)# amf guest-class phone1
node1(config-atmf-guest)# username reception password secret
```

To remove a guest node username and password for the user guest class ‘phone1’, use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class phone1
node1(config-atmf-guest)# no username
```

Introduction

Overview This chapter provides an alphabetical reference of commands used to configure Autonomous Wave Control (AWC).

AWC is an advanced network technology that utilizes game theory to deliver significant improvements in wireless network connectivity and performance. AWC can automatically minimize coverage gaps and reduce Access Point (AP) interference and respond to network configuration changes and bandwidth demands from user devices.

You can configure AWC through the command line, or through the Device GUI.

For more information, see the **Vista Manager mini User Guide**.

3gpp-info (wireless-network-passpoint-dot11u)

Overview Use this command to set the 3GPP (802.11u 3rd Generation Partnership Project) cellular network information.

Use the **no** variant of this command to revert to the default value.

Syntax

```
3gpp-info <code-list>
no 3gpp-info
```

Parameter	Description
<code-list>	Enter the MCC (Mobile Country Code) and MNC (Mobile Network Code): • MCC must be a 3 digit decimal number • MNC must be a 2 or 3 digit decimal number • MCC and MNC must be separated by commas • If setting multiple combinations of MCC and MNC, they must be separated by semicolons. • A maximum of 100 characters can be set including commas and semicolons. For more information on mobile country and network codes, go to: **Wikipedia Mobile Country Codes**.

Default Not set.

Mode Wireless Network Passpoint 802.11u Configuration

Example To set some of the MCC and MNC codes for Japan, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# 3gpp-info
 440,00;440,50
```

Related commands **show wireless network**

dot11u (wireless-network-passpoint)

Command changes Version 5.5.0-2.3: command added

additional-step-required enable (wireless-network-passpoint-dot11u)

Overview Use this command to configure an Additional Step Required for Access.

Use the **no** variant of this command to disable Additional Step Required for Access.

Syntax

```
additional-step-required enable
no additional-step-required enable
```

Default Disabled.

Mode Wireless Network Passpoint 802.11u Configuration

Usage notes Typically, access and authentication is automatic if a legacy hotspot is operated by the mobile device's Home Service Provider (SP) or if the user has previously authenticated to that hotspot. Additionally, user intervention is typically required in a roaming environment where the hotspot is not operated by the Home SP and additional steps are required to identify and authenticate with the Home SP.

Example To enable Additional Step Required for Access, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# additional-step-required enable
```

Related commands **show wireless network**

dot11u (wireless-network-passpoint)

Command changes Version 5.5.0-2.3: command added

airtime-fairness enable (wireless-ap-prof-radio)

Overview Use this command to enable **airtime-fairness** for all wireless clients regardless of speed.

Use the **no** variant of this command to disable airtime-fairness for all wireless clients.

Syntax

```
airtime-fairness enable
no airtime-fairness enable
```

Default Disabled.

Mode Wireless AP Profile Radio Configuration

Usage notes Airtime-fairness ensures that every client has equal access to air time, regardless of client capability. Client capability includes the wireless standard 802.11 mode and Radio Frequency (RF) link signal strength.

If two clients were each assigned a 10 Mbps bandwidth and sending equally sized frames then they potentially could have unequal air time if their RF link characteristics were different.

RF link characteristics are based upon the distance of the client from the Access Point (AP). A client that is closer to the AP typically operates at a higher data rate than a client farther from the AP. This is because the AP and client are deliberately designed to adapt their transmission rates in order to maintain an optimal quality of the RF link.

This behavior is normal between the AP and clients since the client devices are not expected to remain at a constant or equal distance from the AP. This could mean that one device is consuming more airtime than it is entitled to, even though that device is not consuming more than its bandwidth limit.

Note: This command is valid on TQ series devices only.

Example To enable airtime-fairness for ‘radio 2’ on ‘ap-profile100’ use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-prof 100
awplus(config-wireless-ap-prof)# ap-prof 100
awplus(config-wireless-ap-prof-radio)# radio 2
awplus(config-wireless-ap-prof-radio)# airtime-fairness enable
```

Related commands radio (wireless-ap-profile)

Command changes Version 5.4.7-2.4: command added.

anqp-domain-id (wireless-network-passpoint-hs20)

Overview Use this command to set the ANQP (Access Network Query Protocol) domain identifier.

Use the **no** variant of this command to reset the ANQP domain identifier to the default value.

Syntax

```
anqp-domain-id <0-65535>
no anqp-domain-id
```

Parameter	Description
<0-65535>	ANQP domain identifier.

Default 0

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To set the ANQP domain identifier on network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# anqp-domain-id 1
```

Related commands **show wireless network**

hs20 (wireless-network-passpoint)

Command changes Version 5.5.0-2.3: command added

anqp-element (wireless-network-passpoint-dot11u)

Overview Use this command to configure the Arbitrary Access Network Query Protocol (ANQP) element.

ANQP is a query and response protocol that defines services offered by an access point (AP), typically at a Wi-Fi hot spot.

Use the **no** variant of this command to remove a specified ANQP element entry.

Syntax

```
anqp-element info-id <0-999> payload HEX
no anqp-element info-id <0-999>
```

Parameter	Description
<0-999>	Arbitrary ANQP element configuration's unique entry number.
HEX	Arbitrary ANQP element configuration. The maximum number of characters in HEX is 100.

Default Not set.

Mode Wireless Network Passpoint 802.11u Configuration

Example To configure the ANQP element info ID to '1' and the payload HEX value to '0000', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# anqp-element
 info-id 1 payload 0000
```

Related commands **show wireless network**

dot11u (wireless-network-passpoint)

Command changes Version 5.5.0-2.3: command added

antenna (wireless-ap-prof-radio)

Overview Use the antenna command to set the antenna model for a wireless Access Point (AP).

Use the **no** variant of this command to remove the designated antenna model for a wireless AP.

Syntax

```
antenna {an2458-10dp|an5158-16dp|an5158-19dp}
no antenna
```

Parameter	Description
an2458-10dp	Antenna model AN2458-10DP
an5158-16dp	Antenna model AN5158-16DP
an5158-19dp	Antenna model AN5158-19DP

Default Not set.

Mode Wireless AP Profile Radio Configuration

Example To configure an AP radio configuration to use the antenna model AN5158-19DP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# hwtype tq single spec 11n
awplus(config-wireless-ap-prof)# band 5
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# antenna an5158-19dp
```

Related commands

radio (wireless-ap-profile)

hwtype

Command changes Version 5.4.7-2.4: command added

ap

Overview Use this command to configure an Access Point (AP).

If the AP doesn't already exist, then this command creates it.

Use the **no** variant of this command to remove an AP configuration.

Syntax

```
ap <1-65535>
```

Parameter	Description
<1-65535>	AP configuration ID number.

Default Not set.

Mode Wireless Configuration

Usage notes This command adds an AP configuration and enters the AP configuration mode.

Example To configure an AP with an ID of 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 10
```

wds radio (wireless-ap)

radio (wireless-ap-profile)

Command changes Version 5.4.7-2.4: command added.

ap-profile (wireless)

Overview Use this command to configure an AP (Access Point) profile. If the AP profile doesn't already exist, then this command creates it.

Use the **no** variant of this command to delete an AP profile.

Syntax

```
ap-profile <1-65535>
no ap-profile <1-65535>
```

Parameter	Description
<1-65535>	The AP profile ID number.

Default Not set.

Mode Wireless Configuration

Example To configure an AP profile with the ID profile number of 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
```

To remove the AP profile 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no ap-profile 10
```

radio (wireless-ap-profile)

show wireless ap-profile

Command changes Version 5.4.7-2.4: command added

ap-profile (wireless-ap)

Overview Use this command to set an Access Point (AP) Profile to an AP.

Use the **no** variant of this command to delete an AP Profile.

Syntax
```
ap-profile <1-65535>
no ap-profile
```

Parameter	Description
<1-65535>	AP Profile configuration ID number.

Default Not set.

Mode Wireless AP Configuration

Example To set AP Profile (ap-profile 100) to the AP 1configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 1
awplus(config-wireless-ap)# ap-profile 100
```

Related commands

ap

ap-profile (wireless)

show wireless ap

Command changes Version 5.4.7-2.4: command added.

association-advertisement enable

Overview Use this command to enable an Association Advertisement on the network configuration.

Use the **no** variant of this command to disable the Association Advertisement on the network configuration.

Syntax
```
association-advertisement enable
no association-advertisement enable
```

Default Disabled.

Mode Wireless Network Configuration

Example To enable the Association Advertisement for network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# association-advertisement
 enable
```

Related commands **show wireless network**

network (wireless)

Command changes Version 5.5.1-0.1: command added

atmf-application-proxy port enable

Overview Use this command to enable AMF Security mini to communicate with the wireless controller. Optionally you can also specify a port number for that communication. This is needed for AMF Security mini to control how clients of TQ series APs access the wireless network.

Use the **no** variant of this command to stop AMF Security mini from communicating with the wireless controller. This also resets the port number to the default.

After entering this command, restart the wireless controller, using the command **no enable** followed by **enable**.

Syntax

```
atmf-application-proxy port enable [<1-65535>]
no atmf-application-proxy port enable
```

Parameter	Description
<1-65535>	The port number through which AMF Security mini will communicate with the wireless controller.

Default Status: Disabled

Port number: 5443

Mode Wireless Configuration

Usage notes We recommend configuring this feature through the AMF Security mini GUI, rather than through this command.

Example To enable AMF Security mini to communicate with the wireless controller through port 5000, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# atmf-application-proxy port enable 5000
awplus(config-wireless)# no enable
awplus(config-wireless)# enable
```

Related commands **enable (wireless)**

show wireless

wireless

Command changes Version 5.5.2-2.1: command added

authentication (wireless-sec-wep)

Overview Use this command to enable or disable authentication on a wireless Access Point (AP).

Syntax

```
authentication {both|open-system|shared-key}
```

Parameter	Description
`both`	Use both types of authentication: open-system and shared-key authentication.
`open-system`	No authentication.
`shared-key`	WEP authentication.

Default Open-system.

Mode Wireless Security WEP Configuration

Usage notes For **MWS** series devices, select either the open-system or shared-key parameter. You can't select the **both** parameter.

Example To configure WEP as the security authentication mode for clients, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 10 mode wep
awplus(config-wireless-sec-wep)# authentication shared-key
```

Related commands **security (wireless)**

Command changes Version 5.4.7-2.4: command added.

auto-discovery disable

Overview Use this command to disable the automatic search for new APs in an AWC Smart Connect (AWC-SC) network.

Use the **no** variant of this command to enable the automatic search for new APs.

Syntax
```
auto-discovery disable
no auto-discovery disable
```

Default Enabled

Mode Wireless Smart Connect Profile Configuration

Usage notes Auto-discovery is a function that allows an AP that is in the factory default state to automatically become part of an AWC-SC network. This is because when a wireless AP is activated in the factory default state, its IP and MAC address are added to the AP profile and the Smart Connect profile.

Example To turn auto-discovery off for Smart Connect profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# auto-discovery disable
```

Related commands smart-connect-profile

Command changes Version 5.5.0-0.1: command added

band

Overview Use this command to assign a frequency band to a single antenna wireless AP.

Use the **no** variant of this command to set the band to the default value of 2.

Syntax

```
band {2|5}
no band
```

Parameter	Description
2	2.4GHz band
5	5GHz band

Default The default band is 2 (2.4GHz).

Mode Wireless AP Profile Configuration

Usage notes The command can only be used with single antenna APs.

Example To configure a 5GHz band for a single antenna AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# band 5
```

Related commands

ap-profile (wireless)

antenna (wireless-ap-prof-radio)

Command changes Version 5.4.7-2.4: command added

band-steering (wireless-network)

Overview Use this command to enable band steering on a wireless Access Point (AP).

Use the **no** variant of this command to disable band steering.

Syntax
```
band-steering
no band-steering
```

Default Disabled.

Mode Wireless Network Configuration

Usage notes Band Steering detects dual-band capable clients and steers them to the 5 GHz frequency. This leaves the more crowded 2.4 GHz band available for legacy clients.

This helps improve end user experience by reducing channel utilization, especially in high density environments

This command is not supported on the **MWS** series products.

Example To enable band steering, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# band-steering
```

Related commands **network (wireless)**

show wireless network

Command changes Version 5.4.7-2.4: command added.

bandwidth (wireless-ap-prof-radio)

Overview Use this command to assign a bandwidth to a radio.

Use the **no** variant of this command to revert to the default bandwidth.

Syntax

```
no bandwidth
```

Parameter	Description
20	20MHz bandwidth
40	40MHz bandwidth
80	80MHz bandwidth
160	160MHz bandwidth

Default The default bandwidth value varies according to the configured hardware and radio type.

Mode Wireless AP Profile Radio Configuration

Example To assign a 40MHz bandwidth to AP-profile 100 for Radio 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# bandwidth 40
```

bcast-key-refresh-interval (wireless-sec-osen)

Overview Use this command to set the refresh interval for the broadcast (group) key used with an OSEN security configuration.

Use the **no** variant of this command to revert to the refresh interval default value.

Syntax

```
bcast-key-refresh-interval <0-86400>
no bcast-key-refresh-interval
```

Parameter	Description
<0-86400>	The key refresh interval in seconds. The range is 0 to 86400 seconds.

Default Zero (0) is the default.

Mode Wireless Security OSEN Configuration

Usage notes OSEN is a wireless security method used with Release 2 of Hotspot 2.0 (Passpoint). OSEN is short for Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. Use the **security** command to enter OSEN security configuration mode.

Example To set a broadcast key refresh interval of 3600 for a security configuration, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode osen
awplus(config-wireless-sec-osen)# bcast-key-refresh-interval
 3600
```

Related commands **security (wireless)**

bcast-key-refresh-interval (wireless-sec-wpa-ent)

Overview Use this command to set the refresh interval for the broadcast key used in a WPA-enterprise security configuration.

Use the **no** variant of this command to set the refresh interval for the broadcast key to the default.

Syntax

```
bcast-key-refresh-interval <0-86400>
no bcast-key-refresh-interval
```

Parameter	Description
<0-86400>	The refresh interval in seconds For the **MWS series**, the broadcast key refresh rate is *<0, 30-3600>* seconds.

Default The default refresh interval is 0 seconds.

Mode Wireless Security WPA-enterprise Configuration

Example To set 3600 seconds as the broadcast key refresh interval, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# bcast-key-refresh-interval
 3600
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added

bcast-key-refresh-interval (wireless-sec-wpa-psnl)

Overview Use this command to set the refresh interval for a broadcast (group) key used in a WPA-personal security configuration.

Use the **no** variant of this command to set the refresh interval to the default value.

Syntax

```
bcast-key-refresh-interval <0-86400>
no bcast-key-refresh-interval
```

Parameter	Description
<0-86400>	The broadcast key refresh interval. For the **MWS series**, the broadcast key refresh rate is *<0, 30-3600>* seconds.

Default The default value is 0.

Mode Wireless Security WPA-personal Configuration

Example To set the broadcast key refresh interval to 3600 seconds on a WPA-personal security configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# bcast-key-refresh-interval
 3600
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added.

beacon-rssi-threshold (wireless-ap-prof-cb)

Overview Use this command to set the value of the beacon Received Signal Strength Indicator (RSSI) threshold for a wireless channel blanket configuration.

Use the **no** variant of this command to reset the beacon RSSI to the default value.

Syntax

```
beacon-rssi-threshold <0-91>
no beacon-rssi-threshold
```

Parameter	Description
<0-91>	The RSSI threshold value on Channel Blanket.

Default The default value is 30.

Mode Wireless AP Profile Channel Blanket Configuration

Example To configure a beacon RSSI threshold of 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# beacon-rssi-threshold 10
```

Related commands **channel-blanket**

Command changes Version 5.5.2-0.1: default changed to 30

Version 5.5.1-2.1: command added

bss-trans-manage enable

Overview Use this command to enable Basic Service Set (BSS) Transition Management on a wireless network configuration. The BSS consists of one redistribution point — typically an access point (WAP or AP) interconnecting all associated wireless clients.

Use the **no** variant of this command to disable BSS Transition Management on a wireless network configuration.

Syntax
```
bss-trans-manage enable
no bss-trans-manage enable
```

Default Disabled.

Mode Wireless Network Configuration

Example To configure enable BSS Transition Management, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# bss-trans-manage enable
```

Related commands **show wireless network**

network (wireless)

Command changes Version 5.5.0-2.3: command added

captive-portal

Overview Use this command to add a Captive Portal (web authentication) configuration and enter the Captive Portal configuration mode.

Captive Portal lets wireless clients authenticate themselves or agree to terms and conditions before you grant them Wi-Fi access or external web access.

Use the **no** variant of this command to remove a Captive Portal configuration.

Syntax
```
captive-portal
no captive-portal
```

Default Captive Portal is not set.

Mode Wireless Network Configuration

Example To enter the Captive Portal configuration mode of network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
```

To reset all the Captive Portal configuration settings of network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no captive-portal
```

Command changes Version 5.4.9-1.1: command added

captive-portal virtual-ip

Overview Use this command to configure the virtual IP address on Captive Portal.

Captive Portal lets wireless clients authenticate themselves or agree to terms and conditions before you grant them Wi-Fi access or external web access.

Use the **no** variant of this command to remove the virtual IP address on Captive Portal.

Syntax

```
captive-portal virtual-ip <ip-address>
no captive-portal virtual-ip
```

Parameter	Description
<ip-address>	The IPv4 address uses the format A.B.C.D

Default Not set.

Mode Wireless AP Profile Configuration

Usage notes Captive Portal uses the AP's management IP address to show an authentication page. To avoid a potential security risk, this command allows you to hide the AP management IP address by providing a virtual IP address for Captive Portal authentication.

Example To configure a virtual IP address for Captive Portal, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 5
awplus(config-wireless-ap-prof)# captive-portal virtual-ip
 1.1.1.1
```

cb-channel

Overview Use this command to designate the fixed channel for channel blanket used by each of the radios in an AP profile.

Use the **no** variant of this command to revert to the default channel setting.

Syntax

```
cb-channel radio <1-3> channel <channel-number>
no cb-channel radio <1-3>
```

Parameter	Description
<1-3>	Select the radio interface number to be a fixed channel.
<channel-number>	Fixed channel number. Select the channel from the eligible channels listed in the AP profile.

Default Not set. When the parameter is blank, an eligible channel is configured. automatically.

Mode Wireless AP Profile Channel Blanket Configuration

Example To configure cb-channel 10 to radio1 and cb-channel 40 to radio2 on AP profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof)# cb-channel radio 1 channel 10
awplus(config-wireless-ap-prof)# cb-channel radio 2 channel 40
```

Related commands **show wireless ap-profile**

Command changes Version 5.4.9-1.1: command added

cb-proxy-arp enable

Overview Use this command to enable Proxy ARP on an AP profile channel blanket configuration.

Use the **no** variant of this command to disable Proxy ARP on an AP profile channel blanket configuration.

Syntax
```
cb-proxy-arp enable
no cb-proxy-arp enable
```

Default Disabled.

Mode Wireless AP Profile Channel Blanket Configuration

Example To enable Proxy ARP for AP profile 1 channel blanket, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 1
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# cb-proxy-arp enable
```

Related commands **show wireless ap-profile**

channel-blanket

Command changes Version 5.5.1-0.1: command added

cb-proxy-arp-through enable

Overview Use this command to enable the Proxy Arp pass through feature on Channel Blanket (CB).

This feature allows ARP request packets received by the CB with unlearned IP addresses to pass through to STAs, when proxy ARP is enabled on the CB.

Use the **no** variant of this command to disable Proxy Arp pass through.

Syntax
```
cb-proxy-arp-through enable
no cb-proxy-arp-through enable
```

Default Disabled.

Mode Wireless AP Profile Channel Blanket Configuration

Example To enable Proxy ARP pass through on CB, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 20
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# cb-proxy-arp-through enable
```

To disable Proxy ARP pass through on CB, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 20
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# no cb-proxy-arp-through
 enable
```

Related commands **show wireless network**

cb-proxy-arp enable

Command changes Version 5.5.5-0.2: command added

channels (wireless-ap-prof-radio)

Overview Use this command to set the channel that a wireless Access Point (AP) uses when it is set to auto.

Use the **no** variant of this command to return the AP channel to its default.

Syntax

```
channels <1-255>
no channels
```

Parameter	Description
<1-255>	The channel number.

Default The default channel varies with each type of AP, its country-code, and outdoor settings.

Mode Wireless AP Profile Radio Configuration

Example To set the wireless AP radio channel, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# channels 10
```

Related commands

radio (wireless-ap-profile)

outdoor

country-code

Command changes Version 5.4.7-2.4: command added.

channel-blanket

Overview Use this command to enter the wireless-AP-profile-channel-blanket configuration mode. Once in this mode, you can modify the channel blanket configuration parameters for a wireless AP profile. A wireless AP profile defines the radio settings, such as band and channel selection and the control VLAN. The AP profile names the SSIDs to which it applies.

NOTE: *The channel-blanket setting can only be used with APs that support channel blanket. If this is set for other APs, you will not be able to manage those APs. See your AP's datasheet to see if it supports channel blanket.*

Use the **no** variant of this command to reset all parameters for channel blanket to default.

Syntax

```
channel-blanket
no channel-blanket
```

Default Not set

Mode Wireless AP Profile Configuration

Usage notes When the command is entered, if the "key" parameter is empty, the automatically generated value is set.

Example To enter the channel blanket configuration mode for AP profile 2, enter the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap profile 2
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)#
```

To reset all the channel blanket parameters of AP profile 2, enter the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap profile 2
awplus(config-wireless-ap-prof)# no channel-blanket
```

Related commands **show wireless ap-profile**

vap (wireless-ap-prof-radio)

Command changes Version 5.4.9-1.1: command added

channel (wireless-ap-radio)

Overview Use this command to configure a channel on an Access Point (AP). You can configure an AP to automatically select a channel or use a fixed channel.

Use the **no** variant of this command to remove any configured channels and return to the default value.

Syntax

```
channel {auto|<1-255>}
no channel
```

Parameter	Description
`auto`	The channel is automatically selected.
<1-255>	A list of fixed channels. The list is determined by the country-code.

Default The default is **auto**.

Mode Wireless AP Radio Configuration

Example To configure a fixed channel for an AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)# channel 1
```

Command changes Version 5.4.7-2.4: command added.

ciphers (wireless-sec-osen)

Overview Use this command to set which cipher suite to use with OSEN wireless security configuration.

Use the **no** variant of this command to revert to the default cipher suite.

Syntax

```
ciphers <cipher-list>
no ciphers
```

Parameter	Description
<cipher-list>	Designate the cipher suite(s) in a list format. The cipher options are either **ccmp** or **tkip** or both in any order. The combinations you can select depend on the WPA version as follows: • If the version is a combination of **wpa** and **wpa2**, the cipher suite can be either **ccmp** only or a combination of **ccmp** and **tkip**. • If the version is only **wpa2**, the cipher suite can be selected from **ccmp** only or a combination of **ccmp** and **tkip**. • If the version is only **wpa3**, only **ccmp** can be selected as the cipher suite.

Default **ccmp**

Mode Wireless Security OSEN Configuration

Usage notes OSEN is a wireless security method used with Release 2 of Hotspot 2.0 (Passpoint). OSEN is short for Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. Use the **security** command to enter OSEN security configuration mode.

Example To configure both ccmp (AES) and tkip as the cipher suite on a security configuration of OSEN, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode osen
awplus(config-wireless-sec-osen)# ciphers ccmp tkip
```

Related commands

ciphers (wireless-sec-wpa-ent)

Overview Use this command to set the cipher suite(s) used by WPA-personal security configurations. The cipher suites available are: GCMP, CCMP (AES) and TKIP.

Use the **no** variant of this command to set the default cipher suite used by WPA-personal security configurations.

Syntax

```
ciphers <cipher-list>
no ciphers
```

Parameter	Description
<cipher-list>	The cipher suite(s) to use. The list can contain: • **gcmp** • **ccmp** • **tkip**, or • both **ccmp** and **tkip** (in any order).

Default CCMP

Mode Wireless Security WPA-enterprise Configuration

Example To set both CCMP (AES) and TKIP as cipher suites on a security WPA-enterprise configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# ciphers ccma tkip
```

Related commands **security (wireless)**

Command changes Version 5.4.7-2.4: command added

ciphers (wireless-sec-wpa-psnl)

Overview Use this command to set the cipher suite(s) used by WPA-personal security configurations.The cipher suites available are: CCMP (AES) and TKIP.

Use the **no** variant of this command to set the default cipher suite used by WPA-personal security configurations.

Syntax

```
ciphers <cipher-list>
no ciphers
```

Parameter	Description
<cipher-list>	The available cipher suite(s) in list format. The list can contain either **ccmp** or **tkip** or both and can be in any order.

Default ccmp.

Mode Wireless Security WPA-personal Configuration

Usage notes For MWS series devices, a combination of versions and ciphers are supported as follows:

- versions wpa2 and ciphers ccmp
- versions wpa, wpa2, and ciphers tkip and ccmp

Example To configure WPA-personal to use both CCMP (AES) and TKIP as cipher suites in a security configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# ciphers ccmp tkip
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added.

community read-only (wireless-ap-prof-snmp)

Overview Use this command to set an SNMP read-only community name for the target AP profile. This command is valid for SNMP v1 and v2c only.

Use the **no** variant of this command to set the SNMP read-only community name back to the default (public).

Syntax

```
community read-only <community-name>
no community read-only
```

Parameter	Description
<community-name>	The community name to set. Valid characters are: - alphanumeric characters - symbols except for the following 6 symbols: “ ’ \ & < >

Default public

Mode Wireless AP Profile SNMP Configuration

Example To set the SNMP read-only community name to ‘private’, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# community read-only
 private
```

To set the SNMP trap community name back to the default (public), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp

Overview Use this command to set an SNMP trap community name for the target AP profile. This command is valid for SNMP v1 and v2c only.

Use the **no** variant of this command to set the SNMP trap community name to the default (public).

Syntax

```
community trap <community-name>
no community trap
```

Parameter	Description
<community-name>	The community name to set. Valid characters are: - alphanumeric characters - symbols except for the following 6 symbols: “ ‘ \ & < >

Default public

Mode Wireless AP Profile SNMP Configuration

Example To set the SNMP trap community name to ‘private’, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# community trap private
```

To set the SNMP trap community name back to the default (public), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no community trap
```

conn-capability protocol (wireless-network-passpoint-hs20)

Overview Use this command to specify the protocols supported by the network connection and the corresponding port numbers and whether the port is open or closed.

Use the **no** variant of this command to remove the settings for the specified protocol number.

Syntax

```
conn-capability protocol <0-255> port <0-65535> status [closed|open|unknown]
no conn-capability protocol <0-255>
```

Parameter	Description
<0-255>	Protocol number, as in the assigned protocol numbers listed at: **www.iana.org**.
<0-65535>	Port number
`closed`	Indicates the connection is in closed mode
`open`	Indicates the connection is in open mode
`unknown`	Indicates the connection status is unknown

Default Not set.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Usage notes These settings signify the capabilities of the wired network that the AP is connected to. They provide information on the connection status of the most commonly used communication protocols and ports within the hotspot.

The term ‘hs20’ is shorthand for Hotspot 2.0. Passpoint is the Wi-Fi Alliance's name for the Hotspot 2.0 program.

Example To set the connection capability on port 161 to 'closed' for protocol 17 (UDP), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# conn-capability
 protocol 17 port 161 status closed
```

Related commands **show wireless network**

hs20 (wireless-network-passpoint)

Command changes Version 5.5.0-2.3: command added

control-vlan

Overview Use this command to create a control VLAN ID for a wireless AP belonging to channel blanket.

Use the **no** variant of this command to clear an AP's designated channel blanket VLAN ID.

Syntax

```
control-vlan <vlan-id>
no control-vlan
```

Parameter	Description
<vlan-id>	The designated VLAN ID <1-4094> used on a wireless AP belonging to channel blanket.

Default Not set

Mode Wireless AP Profile Channel Blanket Configuration

Example To set the channel blanket control VLAN for AP profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# control-vlan 10
```

Related commands

Command changes Version 5.4.9-1.1: command added

country-code

Overview Use this command to set the country code for an AP-profile.

Use the **no** variant of this command to revert back to the default country code for the device's region.

Syntax

```
country code <code>
no country code
```

Parameter	Description
<code>	A two letter code representing the country. Use the command **show wireless country-code** to see the full list of country codes available.

Default The default country code is '**jp**' for Japan or '**us**' for other regions.

Mode Wireless AP Profile Configuration

Usage notes Use the command **show wireless country-code** to display a list of valid country codes.

NOTE: ap-profileap-radio

Example To set the country code to 'New Zealand' for AP-profile 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
awplus(config-wireless-ap-prof)# country-code nz
```

day (wireless-task)

Overview Use this command to set a day or range of days to run a task.

You can use the **time** command along with the **day** command to more fully set the task run time configuration.

Use the **no** variant of this command to remove the day set to run a task.

Syntax

```
day {<day> <month> <year>|<daysofweek>|every-day}
no day
```

Parameter	Description
<day>	The day set for the task. Select a number from1-31.
<month>	The month to run the task. Enter the first three letters of the month, for example Jan, Feb, Mar...
<year>	The year to run the task. Select a year between <2000-2035>.
<daysofweek>	The day or days of the week to run the task. (sunday|monday|tuesday|wednesday|thursday|friday|saturday)
every-day	Set the task to run on every day of the week.

Default Not set.

Mode Wireless Task Configuration

Example To configure task 5 to run on the 22nd of September 2017, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# day 22 Sep 2017
```

Related commands

time (wireless-task)

Command changes Version 5.4.7-2.4: command added.

deauth-req-timeout (wireless-network-passpoint-hs20)

Overview Use this command to configure the deauthentication request timeout.

Use the **no** variant of this command to revert the deauthetication timeout time to the default value.

Syntax

```
deauth-req-timeout <0-65535>
no deauth-req-timeout
```

Parameter	Description
<0-65535>	The timeout, in seconds, for client deauthentication after sending WNM notification frames. WNM notification requests allow the hotspot feature to send clients the URLs of servers that allow the client to access information about how to subscribe to the service, correct connection errors, or extend the current session.

Default 60 seconds.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To configure a deauthentication request timeout of 120 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# deauth-req-timeout 120
```

Related commands **show wireless network**

Command changes Version 5.5.0-2.3: command added

debug wireless

Overview Use this command to enable wireless debugging. Debugging filters can be based on severity level and module name.

Use the **no** variant of this command to disable all wireless debugging.

Syntax

```
debug wireless level {all|debug|dump|error|info|notice|trace|warning}
debug wireless module {all|apca|apmgr|apreq|clnmgr|cwmcore|rogue|syncscan}
no debug wireless
```

Parameter	Description	
`level`	Filters logging events by severity level and displays the output by one of the following configured options:	
	`all`	All level events
	`debug`	Debug events
	`dump`	Dump events
	`error`	Error conditions
	`info`	Information messages
	`notice`	Normal, but significant conditions
	`trace`	Trace events
	`warning`	Warning conditions
`module`	Filters logging events by module name and displays the output by one of the following configured options:	
	`all`	All module events
	`apca`	Auto power/channel assignment events
	`apmgr`	AP manager events
	`apreq`	HTTP AP request events
	`clnmgr`	Client manager events
	`cwmcore`	CWM core events
	`rogue`	Rogue events
	`syncscan`	Sync scan events

Default Disabled

Mode User Exec

Example To enable debugging of wireless with 'info' level on the 'apca' module, use the command:

```
awplus# debug wireless level info module apca
```

To disable debugging of wireless, use the command:

```
awplus# no debug wireless
```

Related commands **show debugging wireless**

Command changes Version 5.5.0-0.1: command added

description (wireless-ap)

Overview Use this command to specify a description to identify an Access Point (AP).

Use the **no** variant of this command to remove the description of an AP.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	Text to describe an AP.

Default Not set.

Mode Wireless AP Configuration

Example To specify a description for an AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 10
awplus(config-wireless-ap)# description AP10_MEETING_SPACE
```

Related commands **ap**

show wireless ap

Command changes Version 5.4.7-2.4: command added.

description (wireless-ap-prof)

Overview Use this command to give an AP profile a description.

Use the **no** variant of this command to remove the AP profile's description.

Syntax
```
description <description>
no description
```

Default Not set.

Mode Wireless AP Profile Configuration

Example To configure the description "PROF10" for an AP-profile, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
awplus(config-wireless-ap-prof)# description PROF10
```

Related commands
ap-profile (wireless)
show wireless ap-profile

Command changes Version 5.4.7-2.4: command added

description (wireless-mac-flt)

Overview Use this command to set the description of a wireless MAC filter.

Use the **no** variant of this command to remove the description.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	Text describing the wireless MAC filter.

Default No description set by default.

Mode Wireless MAC Filter Configuration

Example To set the description of MAC filter '20' to 'mywhitelist', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# description mywhitelist
```

To remove the description from MAC filter '20', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# no description
```

description (wireless-network)

Overview Use this command to set a description for the wireless network.

Use the **no** variant of this command to remove a description for a wireless network.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	Set a description for a wireless network.

Default Not set.

Mode Wireless Network Configuration

Example To set the description for a wireless network, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# description GUEST_NETWORK
```

Related commands

description (wireless-sc-prof)

Overview Use this command to configure a descriptive name for a Smart Connect profile.

Use the **no** variant of this command to remove a Smart Connect profile name.

Syntax

```
description <sc-profile-name>
no description
```

Parameter	Description
<sc-profile-name>	The descriptive name given to a Smart Connect profile.

Default Not set

Mode Wireless Smart Connect Profile Configuration

Example To set the descriptive name of SC-PROF10 for Smart Connect profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# description SC-PROF10
```

Related commands **smart-connect-profile**

description (wireless-task)

Overview Use this command to set a description for a wireless task configuration.

Use the **no** variant of this command to remove a description for a wireless task configuration.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	The description for a wireless task configuration.

Default Not set.

Mode Wireless Task Configuration

Example To set a description for the wireless task 5 configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# description PERIODIC_AWC_CALC
```

Related commands task

show wireless task

Command changes Version 5.4.7-2.4: command added.

description (wireless-trigger)

Overview Use this command to set a description for a wireless trigger.

Use the **no** variant of this command to delete the descrption for a wireless trigger.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	Text to describe the wireless trigger.

Default Not set.

Mode Wireless Trigger Configuration

Example To set a description on a wireless trigger, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-trigger 1
awplus(config-wireless-trigger)# description TRIGGER DESC 1
```

Related commands

Command changes Version 5.5.1-0.1: command added

designated-ap

Overview Use this command to designate an AP to determine the BSSID (or name) of a channel blanket profile.

BSSIDs are used to describe sections of a wireless local area network. It recognizes the AP because it has a unique physical MAC address, which creates the wireless network.

This command configures the BSSID of the designated AP to be used as the BSSID of the channel blanket.

Use the **no** variant of this command to remove a designated AP.

Syntax

```
designated-ap <1-65535>
no designated-ap
```

Parameter	Description
<1-65535>	The ID of the designated AP.

Default Not set.

Mode Wireless AP Profile Channel Blanket Configuration

Usage notes If you do not designate an AP, the AP with the lowest ID is assigned automatically.

Example To designate AP 1001 on AP profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# designated-ap 1001
```

Related commands

dgaf enable (wireless-network-passpoint-hs20)

Overview Use this command to enable Downstream Group-Addressed Forwarding (DGAF).

Use the **no** variant of this command to disable DGAF.

Syntax
```
dgaf enable
no dgaf enable
```

Default Enabled.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To disable Downstream Group-Addressed Forwarding on network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# no dgaf enable
```

Command changes Version 5.5.0-2.3: command added

domain-name (wireless-network-passpoint-dot11u)

Overview Use this command to configure one or more domain names for the entity operating the AP.

Use the **no** variant of this command to revert to the default value.

Syntax

```
domain-name <domain-name>
no domain-name
```

Parameter	Description
<domain-name>	The Domain Name(s) • Use the FQDN format, e.g. domain-name example.com • Multiple domain name entries must be separated by a comma • The length of a character in the OI-List must be less than 255 , and 10 elements or less.

Default Not set

Mode Wireless Network Passpoint 802.11u Configuration

Example To set two domain names, mydomain.com and example.net, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# domain-name
 mydomain.com,example.net
```

Related commands **show wireless network**

Command changes Version 5.5.0-2.3: command added

dot11u (wireless-network-passpoint)

Overview Use this command to add a new 802.11u configuration and enter the configuration mode.

Use the **no** variant of this command to revert to the default values.

Syntax
```
dot11u
no dot11u
```

Default Not set.

Mode Wireless Network Passpoint Configuration

Example To enter the 802.11u configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u

Command changes Version 5.5.0-2.3: command added

dtim-period

Overview Use this command to set the Delivery Traffic Indication Map (DTIM) period on the network configuration. A DTIM period value is a number that determines how often a beacon frame includes a Delivery Traffic Indication Message, and this number is included in each beacon frame.

Use the **no** variant of this command to reset the DTIM period to the default (1).

Syntax

```
dtim-period <1-5>
no dtim-period
```

Parameter	Description
<1-5>	DTIM period in seconds. Increasing this number will increase the power saving effect, but it will slow down the response.

Default 1.

Mode Wireless Network Configuration

Usage notes The DTIM is how the AP warns its clients that it is about to transmit the multicast (and broadcast) frames it queued up since the previous DTIM.

This queueing and scheduled delivery is done to allow power-conscious devices to save power by turning off their receivers for brief stretches of time, only waking up their receivers when the AP indicates is has traffic for them.

Example To set a DTIM period of 2 seconds on network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# dtim-period 2
```

Related commands **show wireless network**

network (wireless)

Command changes Version 5.5.1-0.1: command added

dup-auth-received (wireless-network)

Overview Use this command to set a wireless network to accept or ignore 'Duplicate AUTH received' messages. If the message is accepted, then connected clients are disconnected.

Use the **no** variant of this command to use the default action.

Syntax

```
dup-auth-received {disconnect|ignore}
no dup-auth-received
```

Parameter	Description
`disconnect`	Accept the disconnect connection request.
`ignore`	Ignore the disconnection request.

Default Disconnect.

Mode Wireless Network Configuration

Example To configure network 5 to ignore 'Duplicate AUTH received' messages, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 5
awplus(config-wireless-network)# dup-auth-received ignore
```

Related commands

network (wireless)

dynamic-vlan enable (wireless-sec-osen)

Overview Use this command to enable the dynamic-vlan function on wireless APs using the OSEN security mode.

Use the **no** variant of this command to disable the dynamic-vlan function.

Syntax
```
dynamic-vlan enable
no dynamic-vlan enable
```

Default Enabled.

Mode Wireless Security OSEN Configuration

Usage notes OSEN is a wireless security method used with Release 2 of Hotspot 2.0 (Passpoint) OSEN is short for Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. Use the **security** command to enter OSEN security configuration mode.

This command is not supported by MWS series APs.

Example To disable the dynamic-vlan function for security 100, use the commands:
```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 100 mode osen
awplus(config-wireless-sec-osen)# no dynamic-vlan enable
```

Related commands **show wireless security**

security (wireless)

Command changes Version 5.5.0-2.3: command added

emergency-mode

Overview Use this command to set emergency mode on a wireless network. Wireless networks in emergency mode are only active when AWC is also in emergency mode. You can use emergency mode to prevent people from being isolated from infrastructure in the event of a natural disaster such as an earthquake or typhoon.

Use the **no** variant of this command to remove the emergency mode from a wireless network.

Syntax
```
emergency-mode
no emergency-mode
```

Default Disabled.

Mode Wireless Network Configuration

Example To configure an emergency mode for network 5, use the commands:
```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 5
awplus(config-wireless-network)# emergency-mode
```

Related commands
- **emergency-mode**
- **emergency-mode usb enable**
- **emergency-mode usb key**
- **show wireless network**
- **wireless emergency-mode**
- **wireless emergency-mode usb mark key**

Command changes Version 5.5.0-0.3: command added

emergency-mode usb enable

Overview Use this command to allow AlliedWare Plus to put your wireless network into Emergency Mode by inserting a pre-prepared USB stick. Emergency mode makes your wireless network available to the public in an emergency, such as a natural disaster. This feature makes it easy to start emergency mode, because you don't have to log into the AlliedWare Plus device to do so.

Use the **no** variant of this command to stop allowing the network to enter emergency mode through a pre-prepared USB stick.

Syntax
```
emergency-mode usb enable
no emergency-mode usb enable
```

Default Disabled

Mode Wireless Configuration

Example To configure this feature, first create a suitable wireless network and reserve it for emergency mode only. To reserve the network, use the command **emergency-mode**.

Then insert an empty USB stick into the AlliedWare Plus device and use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# emergency-mode usb enable
awplus(config-wireless)# emergency-mode usb key ExampleKey
 description ExampleEmergencyUSB
awplus(config-wireless)# end
awplus# wireless emergency-mode usb mark key ExampleKey
```

The **key** parameter in the commands **emergency-mode usb key** and **wireless emergency-mode usb mark key** must match.

After this, to put the network into emergency mode, just insert the USB stick. As long as the keys on the device and the stick match, emergency mode will automatically activate. The device's port LEDs will blink to indicate it is in emergency mode.

Related commands

emergency-mode

emergency-mode usb key

show wireless

wireless emergency-mode usb mark key

Command changes Version 5.5.2-1.1: command added

emergency-mode usb key

Overview Use this command to enter a key for putting your wireless network into Emergency Mode by inserting a pre-prepared USB stick. If someone inserts a USB stick into the device, the device will look to see if the USB stick also contains this key. If it does, then the device will put the network into emergency mode.

You can enter up to 10 keys, to allow you to have multiple pre-prepared USB sticks.

Along with this command, use **wireless emergency-mode usb mark key** to prepare the USB stick and put the same key on it.

Use the **no** variant of this command to remove a key.

Syntax

```
emergency-mode usb key <key> [description <description>]
no emergency-mode usb key <key>
```

Parameter	Description
`key <key>`	The key, which can be up to 32 characters long. You can use any printable ASCII characters. If you use spaces or symbols, enclose the key in quote marks, for example “Example Key1”.
`description <description>`	An optional description of this key, up to 64 characters long. You can use any printable ASCII characters.

Default No keys exist

Mode Wireless Configuration

Example

To configure this feature, first create a suitable wireless network and reserve it for emergency mode only. To reserve the network, use the command **emergency-mode**.

Then insert an empty USB stick into the AlliedWare Plus device and use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# emergency-mode usb enable
awplus(config-wireless)# emergency-mode usb key ExampleKey
 description ExampleEmergencyUSB
awplus(config-wireless)# end
awplus# wireless emergency-mode usb mark key ExampleKey
```

The **key** parameter in the commands **emergency-mode usb key** and **wireless emergency-mode usb mark key** must match.

After this, to put the network into emergency mode, just insert the USB stick. As long as the keys on the device and the stick match, emergency mode will automatically activate. The device's port LEDs will blink to indicate it is in emergency mode.

emergency-service-reachable enable (wireless-network-passpoint-dot11u)

Overview Use this command to configure Emergency Services Reachable.

Use the **no** variant of this command to disable Emergency Services Reachable.

Syntax
```
emergency-service-reachable enable
no emergency-service-reachable enable
```

Default Disabled.

Mode Wireless Network Passpoint 802.11u Configuration

Example To enable Emergency Services Reachable, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# emergency-service-reachable enable
```

enable (wireless)

Overview Use this command to enable Access Point (AP) management by Autonomous Wave Control (AWC).

Use the **no** variant of this command to disable AP management by AWC.

Syntax
```
enable
no enable
```

Default Disabled.

Mode Wireless Configuration

Usage notes You must use the **enable** command before you configure a management address.

Example To configure AP management by AWC, using an interface with the IP address 192.168.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# enable
awplus(config-wireless)# management address 192.168.0.1
```

enable (wireless-ap-prof-snmp)

Overview Use this command to enable an SNMP configuration for the target AP profile.

Use the **no** variant of this command to disable the SNMP configuration for the target AP profile.

Syntax
```
enable
no enable
```

Default Disabled

Mode Wireless AP Profile SNMP Configuration

Example To enable SNMP, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# enable
```

To disable SNMP, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no enable

Related commands **passpoint**

Command changes Version 5.5.0-2.3: command added

enable (wireless-sec-wep)

Overview Use this command to enable a wireless WEP security configuration.

Use the **no** variant of this command to disable a wireless WEP security configuration.

Syntax
```
enable
no enable
```

Default Disabled.

Mode Wireless Security WEP Configuration

Example To enable a wireless security WEP configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10 mode wep
awplus(config-wireless-sec-wep)# enable

external-page-url

Overview Use this command to configure the external URL authentication page for Captive Portal.

To use this command, you must first specify external-page-redirect using the **mode** command.

Use the **no** variant of this command to reset the external authentication page URL.

Syntax

```
external-page-url <URL>
no external-page-url
```

Parameter	Description
<URL>	URL of the external authentication page

Default Disabled

Mode Wireless Network Captive Portal Configuration

Example To enable and set URL string 'http://www.example.com' for a Captive Portal external web authentication server on network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# external-page-url http://
www.example.com
```

Related commands

show wireless network

Command changes Version 5.5.0-1.3: command added

filter-entry

Overview Use this command to add a filter entry to a wireless MAC filter. You can optionally include a description for the filter.

Use the **no** variant of this command to remove an entry from the MAC filter list.

Syntax

```
filter-entry <mac-address> [description <description>]
no filter-entry <mac-address>
```

Parameter	Description
<mac-address>	MAC address of the filter entry in hexadecimal format HHHH.HHHH.HHHH. You can add up to 3072 MAC addresses per MAC filter, depending on your AP model.
`description`	Set an optional description for the filter entry.
<description>	Text describing the filter entry.

Default No filter entries exist

Mode Wireless MAC Filter Configuration

Usage notes If you need to add a large number of filter entries, you can use the Device GUI instead of this command. The GUI lets you upload the entries as a CSV file.

Example To add a filter entry to the MAC filter numbered 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# filter-entry
 0000.cd28.0880.1234 description PC01
```

To remove a filter entry from the MAC filter numbered 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# no filter-entry
 0000.cd28.0880.1234
```

Related commands

- **description (wireless-mac-flt)**
- **show wireless ap-profile**
- **show wireless wireless-mac-filter**
- **wireless export**
- **wireless import**
- **wireless-mac-filter (wireless)**
- **wireless-mac-filter (wireless-ap-prof)**
- **wireless-mac-filter enable**

Command changes

Version 5.5.2-1.1: maximum entries per filter increased for some APs

Version 5.4.8-2.1: command added

force-disable (wireless-ap-radio)

Overview Use this command to override and force the disabling of an Access Point (AP) radio status.

Use the **no** variant of this command to stop overrides of an AP radio status.

Syntax
```
force-disable
no force-disable
```

Default **no force-disable** (do not override the AP profile radio status).

Mode Wireless AP Radio Configuration

Example To force a disable of an AP radio status, use the following commands:
```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)# force-disable
```

Related commands **show wireless ap-profile**

radio (wireless-ap-profile)

Command changes Version 5.4.7-2.4: command added

force-power-save-disable

Overview Use this command to prevent wireless clients from changing to power saving mode. Some models of wireless client may unintentionally change to power saving mode, even if the connection between the AP and client is alive. Enabling this command prevents these clients from changing to power saving mode.

Use the **no** variant of this command to allow clients to change to power saving mode again.

Syntax
```
force-power-save-disable
no force-power-save-disable
```

Default Clients can change to power saving mode (the **no** variant of this command)

Mode Wireless AP Profile Channel Blanket Configuration

Example To prevent wireless clients from changing to power saving mode on AP profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# force-power-save-disable
```

Related commands **show wireless ap-profile**

Command changes Version 5.5.2-2.1: command added

gas-address-behavior (wireless-network-passpoint-dot11u)

Overview Use this command to set the GAS (Generic Advertisement Services) Address 3 behavior for 802.11u.

Use the **no** variant of this command to revert to the default value.

Syntax

```
gas-address-behavior <0-2>
no gas-address-behavior
```

Parameter	Description
<0-2>	GAS Address 3 behavior. • 0: P2P specification (Address3 = AP BSSID) workaround enabled by default based on GAS request Address3. • 1: IEEE 802.11 standard compliant regardless of GAS request Address3 • 2: Force non-compliant behavior (Address3 = AP BSSID for all cases)

Default 0.

Mode Wireless Network Passpoint 802.11u Configuration

Example To configure the GAS Address 3 behavior value to 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# gas-address-behavior 1
```

Related commands **show wireless network**

dot11u (wireless-network-passpoint)

Command changes Version 5.5.0-2.3: command added

gas-comeback-delay (wireless-network-passpoint-dot11u)

Overview Use this command to set the generic advertisement service (GAS) comeback-delay for 802.11u.

Use the **no** variant of this command to revert to the default value.

Syntax

```
gas-comeback-delay <0-65535>
no gas-comeback-delay <0-65535>
```

Parameter	Description
<0-65535>	GAS comeback delay Time Unit (TU) 1 TU = 1024 microseconds (approx 1 millisecond)

Default 0.

Mode Wireless Network Passpoint 802.11u Configuration

Example To configure the GAS comeback-delay value to 100, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# gas-comeback-delay 100
```

Related commands **show wireless network**

dot11u (wireless-network-passpoint)

Command changes Version 5.5.0-2.3: command added

hessid (wireless-network-passpoint-dot11u)

Overview Use this command to set the HESSID (Homogeneous Extended Service Set Identifier).

Use the **no** variant of this command to revert to the default value.

Syntax

```
hessid MAC
no hessid
```

Parameter	Description
MAC	Homogeneous ESS Identifier, in Hexidecimal notation and MAC address format: HHHH.HHHH.HHHH.HHHH

Default Not set.

Mode Wireless Network Passpoint 802.11u Configuration

Usage notes In typical Wi-Fi deployments, if two APs have different SSIDs, they are considered to be in different wireless networks.

If two APs have the same SSID, they are considered to be part of the same wireless network. But because SSIDs are not globally administered, it is possible that two APs with the same SSID are, in fact, in different wireless networks.

The homogeneous extended service set identifier (HESSID) element allows mobile devices to detect this condition. When two APs have the same SSID but from different wireless networks, the two networks have different HESSIDs

Example To set the Homogeneous ESS Identifier '02AA.BBCC.1122', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# hssid
 02AA.BBCC.1122
```

Related commands **show wireless network**

dot11u (wireless-network-passpoint)

Command changes Version 5.5.0-2.3: command added

hide-ssid (wireless-network)

Overview Use this command to hide the SSID for a selected wireless network.

Use the **no** variant of this command to stop hiding the SSID for a selected wireless network.

Syntax

```
hide ssid
no hide ssid
```

Default The default is Disabled, which means the SSID **is** included in the Access Point (AP) beacon frames. For more information, see the **Usage** section below.

Mode Wireless Network Configuration

Usage notes The SSID differentiates one wireless network from another, so all APs and all devices attempting to connect to a specific wireless network must use the same SSID to enable effective roaming.

SSIDs are included in beacon frames.

A beacon frame is one of the management frames in the IEEE 802.11 standard. Every compliant AP periodically sends beacon frames to advertise the presence of an AP in an area, its capabilities, and some configuration and security information to the client devices.

Example To hide the SSID for network 20, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# hide-ssid
```

Related commands **ssid (wireless-network)**

network (wireless)

Command changes Version 5.4.7-2.4: command added.

hs20 (wireless-network-passpoint)

Overview Use this command to add a new Hotspot 2.0 configuration and enter the configuration mode.

Use the **no** variant of this command to revert to the default.

Syntax
```
hs20
no hs20
```

Default Not set.

Mode Wireless Network Passpoint Configuration

Example To enter Hotspot 2.0 configuration mode on network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)#
```

Command changes Version 5.5.0-2.3: command added

hwtype

Overview Use this command to configure the hardware type used for a wireless AP profile.

Use the **no** variant of this command to revert the AP hardware type to the default.

Syntax

```
hwtype <modelname>
no hwtype
```

Parameter	Description
<modelname>	Set the model name. See the table below for a list of model names and associated settings.

AP modelname parameters with applicable values

AP	modelname parameter	bands supported	standard supported
TQ7613-R	at-tq7613-r	triple	11be
TQ7403 TQ7403-R	at-tq7403 at-tq7403-r	triple	11ax

TQ1402 TQm1402	at-tq1402 at-tqm1402	dual	11ac

Default No hardware type

Mode Wireless AP Profile Configuration

Usage notes This command may reset the following configuration commands for:

- antenna (AP profile)
- mode
- bandwidth
- channel

Example To configure the AP hardware type as a TQ6702 GEN2-R on AP profile 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# hwtype at-tq6702gen2-r
```

Command changes Version 5.5.5-2.1: parameters other than TQ and TQR AP model names removed

Version 5.4.9-1.1: *<modelname>* parameter added.

Version 5.4.7-2.4: command added

index

Overview Use this command to designate the key index number for WEP security.

Use the **no** variant of this command to use the default key index number for WEP security.

Syntax

```
index <1-4>
no index
```

Parameter	Description
<1-4>	The index number for the WEP security key.

Default The default key index number is set to **1**.

Mode Wireless Security WEP Configuration

Example To assign key index number 3 for a WEP security configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10 mode wep
awplus(config-wireless-sec-wep)# index 3
```

Related commands **security (wireless)**)

key (wireless-sec-wep)

Command changes Version 5.4.7-2.4: command added.

initialization-button enable

Overview Use this command to enable the initialization (reset) button on a wireless AP that uses the selected AP profile.

Use the **no** variant of this command to disable the initialization (reset) button on a wireless AP that uses the selected AP profile.

Syntax
```
initialization-button enable
no initialization-button enable
```

Default Enabled.

Mode Wireless AP Profile Configuration

Usage notes This command effects only APs which have an initialization button.

Example To enable the initialization button on APs which use **ap-profile 100**, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# initialization-button enable
```

Related commands **ap-profile (wireless)**

show wireless ap-profile

Command changes Version 5.4.7-2.4: command added.

internet-access enable (wireless-network-passpoint-dot11u)

Overview Use this command to enable Internet access. This informs the mobile device whether Internet access is available at a hotspot – which might not be the case in walled-garden environments, where the Hotspot Operator (for example, an hotel) may limit Wi-Fi access to locally available content.

Use the **no** variant of this command to disable Internet access.

Syntax
```
internet-access enable
no internet-access enable
```

Default Disabled.

Mode Wireless Network Passpoint 802.11u Configuration

Example To configure Internet access, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# internet-access enable
```

Related commands **show wireless network**

dot11u (wireless-network-passpoint)

Command changes Version 5.5.0-2.3: command added

ip-addr-type-availability (wireless-network-passpoint-dot11u)

Overview Use this command to set the IPv4 and IPv6 Address Type Availability for 802.11u.

This is information about the IP address version and type that the Hotspot Operator uses and that would be allocated and available to a mobile device after it authenticates to the network.

Use the **no** variant of this command to reset the IPv4 and IPv6 Address Type Availability to their default value.

Syntax

```
ip-addr-type-availability {no-exist|public|port-restrict|
private-nat1|private-nat2|port-private-nat1|port-private-nat2|
unknown} ipv6 {no-exist|exist|unknown}
```

```
no ip-addr-type-availability
```

Parameter	Description
`no-exist (ipv4)`	Not exist IPv4.
`public (ipv4)`	Public IPv4.
`port-restrict (ipv4)`	IPv4 with port restrictions.
`private-nat1 (ipv4)`	Private IPv4 address with Network Address Translation (NAT) once.
`private-nat2 (ipv4)`	Private IPv4 address with Network Address Translation (NAT) twice.
`port-private-nat1 (ipv4)`	Private IPv4 with port restrictions and Network Address Translation (NAT) once.
`port-private-nat2 (ipv4)`	Private IPv4 with port restrictions and Network Address Translation (NAT) twice.
`unknown (ipv4)`	Availability unknown IPv4
`no-exist (ipv6)`	Not exist IPv6
`exist (ipv6)`	Exist IPv6
`unknown (ipv6)`	Availability unknown IPv6

Default IPv4: port-private-nat1.

IPv6: no-exist

Mode Wireless Network Passpoint 802.11u Configuration

Example To configure the IPv4 Address Type Availability to public and the IPv6 to no-exist, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# ip-addr-type-availability public ipv6 no-exist
```

Related commands **show wireless network**

dot11u (wireless-network-passpoint)

Command changes Version 5.5.0-2.3: command added

ip-address (wireless-ap)

Overview Use this command to specify the IP address of a wireless Access Point (AP).

Use the **no** variant of this command to remove the IP address of the selected wireless AP.

Syntax

```
ip-address <ip-address>
no ip-address
```

Parameter	Description
<ip-address>	IPv4 address of the wireless AP.

Default Not set.

Mode Wireless AP Configuration

Example To specify an IPv4 address for a wireless AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# ip address 192.168.0.100
```

Related commands **ap**

show wireless ap

Command changes Version 5.4.7-2.4: command added.

key

Overview Use this command to designate the shared secret key used on a wireless AP belonging to channel blanket.

Use the **no** variant of this command to remove a designated key for a wireless AP belonging to channel blanket.

Syntax

```
key [encrypted] <key-string>
no key
```

Parameter	Description
`encrypted`	This parameter is displayed in show running-config output to indicate that it is displaying the password in encrypted form. You should not enter encrypted on the CLI yourself.
<key-string>	The usable key-string characters. They can be up to16 letters using ASCII Printable excluding double-quote and single-quote.

Default Not set.

Mode Wireless AP Profile Channel Blanket Configuration

Usage notes When not set, a random shared key is automatically genererated.

Example To configure AP profile100, with a channel blanket key, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# key L51nJ6Cp/A-bwXx3
```

Related commands

ap-profile (wireless-ap)

show wireless ap-profile

channel-blanket

Command changes Version 5.4.9-1.1: command added

key (wireless-sc-prof)

Overview Use this command to set the Smart Connect profile security key.

Use the **no** variant of this command to remove the security key from the Smart Connect profile.

Syntax

```
key <key-word>
no key
```

Parameter	Description
<key-word>	The WPA shared key. This is an alphanumeric string 8-64 characters long.

Default Not set

Mode Wireless Smart Connect Profile Configuration

Usage notes This command configures the WPA shared key for the Smart Connect network. If no key is set, the security key will be automatically generated.

Example To set the security key for Smart Connect profile 10 to 'sc10-secret-keyword', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# key sc10-secret-keyword
```

Related commands **smart-connect-profile**

show wireless ap-profile

Command changes Version 5.5.0-0.1: command added

key (wireless-sec-wep)

Overview Use this command to set the key-string for a WEP security configuration.

Use the **no** variant of this command to remove a key-string for a WEP security configuration.

Syntax

```
key <1-4> [encrypted] <key-string>
no key <1-4>
```

Parameter	Description
<1-4>	The key's index number. To configure the index number(s), use the **index** command.
`encrypted`	This parameter is displayed in **show running-config** output to indicate that it is displaying the password in encrypted form. You should not enter **encrypted** on the CLI yourself.
<key-string>	The usable key-string characters, which depend on the key-string type. Use the **type** command to configure the key-string character type. See the table in the usage section below for more information.

Default Not set.

Mode Wireless Security WEP Configuration

Usage notes When using the **key** command, also use the **type** command to set the key-string type to either ASCII or Hex, this will also set the character and bit number limits as follows.

Type	Number of bits	Number of characters	Case sensitive
ascii	64	5	Yes
ascii	128	13	Yes
hex	64	10	No
hex	128	26	No

Example To assign the word 'friend' as the key-string at index 3 for a WEP security configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 10 mode wep
awplus(config-wireless-sec-wep)# type ascii
awplus(config-wireless-sec-wep)# key 3 friend
```

Related commands

type (wireless-sec-wep)

length (wireless-sec-wep)

index

Command changes Version 5.4.7-2.4: command added.

key (wireless-sec-wpa-psnl)

Overview Use this command to set a string as the shared secret key on a wireless security WPA-personal configuration.

Use the **no** variant of this command to reset the shared key to the default.

Syntax

```
key [encrypted] <key-string>
no key
```

Parameter	Description
`encrypted`	This parameter is displayed in **show running-config** output to indicate that it is displaying the password in encrypted form. You should not enter **encrypted** on the CLI yourself.
<key-string>	The usable key-string characters for the configuration. You can enter 8 to 63 ASCII characters which are case-sensitive.

Default Not set.

Mode Wireless Security WPA-personal Configuration

Example To set **friend** as the shared secret key for a WPA-personal configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# key friend
```

Related commands **security (wireless)**

Command changes Version 5.4.7-2.4: command added.

l2tif enable (wireless-network-passpoint-hs20)

Overview Use this command to enable Layer 2 Traffic Inspection and Filtering (l2tif).

Use the **no** variant of this command to disable Layer 2 Traffic Inspection and Filtering.

Syntax
```
l2tif enable
no ltif enable
```

Default Disabled.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To enable Layer 2 Traffic Inspection and Filtering on network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# l2tif enable
```

Related commands **show wireless network**

hs20 (wireless-network-passpoint)

Command changes Version 5.5.0-2.3: command added

led enable

Overview Use this command to turn on the LED of a wireless Access Point (AP) using the selected AP profile.

Use the **no** variant of this command to disable the LED of a wireless AP using the selected AP profile.

Syntax
```
led enable
no led enable
```

Default Enabled.

Mode Wireless AP Profile Configuration

Example To turn off the LED of a wireless AP using AP profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# no led enable
```

Related commands **ap-profile (wireless)**

show wireless ap-profile

Command changes Version 5.4.7-2.4: command added

legacy-rates

Overview Use this command to set the legacy rates on the AP profile radio configuration.

Use the **no** variant of this command to delete any configured fixed legacy rates and return to the default.

Syntax

```
legacy-rates {all|<rates>}
no legacy-rates
```

Parameter	Description
`all`	All available rate candidates are set for the specified radio.
<rates>	Multiple usable rate candidates can be set on the specified radio, separated by commas. **For 2.4 GHz radios**: • Select from: 54, 48, 36, 24, 18, 12, 11, 9, 6, 5.5, 2,1. • If the bandwidth is 20MHz, you do not have to specify a rate. If you do not specify a rate, the device will use the lowest selected legacy rate as the basic rate. Note that the beacon frame and management frame must use this lowest rate. • If the bandwidth is 40MHz, then **1** must be specified **For 5 GHz radios**: • Select from: 54, 48, 36, 24,18,12, 9, 6. • Regardless of bandwidth, one of 6, 12, or 24 must be specified. Legacy rates do not apply to the 6 GHz radio.

Default All.

Mode Wireless AP Profile Radio Configuration

Example To set specific legacy rates on an AP profile radio configuration, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 1
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# legacy-rates
 54,48,5.5,2,1
```

Command changes

Version 5.5.4-2.3: removed requirement to specify a rate on Radio 1

Version 5.5.1-0.1: command added

length (wireless-sec-wep)

Overview Use this command to set the key length for a WEP key on a wireless security WEP configuration.

Use the **no** variant of this command to reset the key length for a WEP key to the default value.

Syntax

```
length {64|128}
no length
```

Parameter	Description
64	Set 64 bit as the key length for a WEP key
128	Set 128 bit as the key length for a WEP key

Default 128 bit.

Mode Wireless Security WEP Configuration

Example To configure 64 bit length as the key length for a WEP key on a wireless security WEP configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10 mode wep
awplus(config-wireless-sec-wep)# length 64
```

Related commands **security (wireless)**

key (wireless-sec-wep)

Command changes Version 5.4.7-2.4: command added.

log enable destination

Overview Use this command to enable the external media function storing of wireless client and neighbor AP log files.

Use the **no** variant of this command to disable the external media function storing of wireless client and neighbor AP log files.

Syntax

```
log enable destination {usb|card}
no log enable
```

Parameter	Description
`usb`	USB storage device
`card`	SD card storage device

Default Disabled, there is no destination storage device set as a default.

Mode Wireless Configuration

Example To enable the log function and configure the log store destination to USB, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log enable destination usb
```

log interval neighbor-ap

Overview Use this command to configure the interval times for storing a neighbor AP log.

Use the **no** variant of this command to revert to the default interval time of 30 minutes.

Syntax

```
log interval neighbor-ap <30-1440>
no log interval
```

Parameter	Description
<30-1440>	The interval time between storing neighbor AP logs. Enter a number in the range of 30 (min) -1440 (1 day).

Default 30 minutes

Mode Wireless Configuration

Example To configure a 60 minute interval time for storing neighbor AP logs, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log interval neighbor-ap 60
```

Related commands

log enable destination

log rotate neighbor-ap

show wireless

Command changes Version 5.4.9-2.3: command added

log rotate neighbor-ap

Overview Use this command to configure the number of rotations for storing neighbor AP log files. When the configured value is reached, the oldest log file is deleted and the latest log file is stored.

Use the **no** variant of this command to revert to the default value of 1.

Syntax

```
log rotate neighbor-ap <0-65534>
no log rotate neigbor-ap
```

Parameter	Description
<0-65534>	The number of rotations a neighbor AP log is stored for, before deleting the oldest stored file.

Default 1

Mode Wireless Configuration

Example To configure 100 generations of a neighbor's AP log files to be stored, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log rotate neighbor-ap 100
```

Related commands

log enable destination

log interval neighbor-ap

Command changes Version 5.4.9-2.3: command added

log rotate wireless-client

Overview Use this command to configure the number of rotations for storing wireless client log files.

You can determine the size of each wireless client log by using this command and the **`log size wireless-client`** command together.

For example, log size wireless-client 50, log rotate wireless-client 4 -> 50 / (4+1) = 10Kbytes.

Use the **no** variant of this command to revert to the default value of 1.

Syntax

```
log rotate wireless-client <0-255>
no log rotate wireless-client
```

Parameter	Description
<0-255>	The number of rotations for a wireless-client log. Set a number in the range 0-255.

Default The default number of rotations is 1.

Mode Wireless Configuration

Example To configure 10 generations of a wireless-client log file, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log rotate wireless-client 10
```

Related commands

log enable destination

log size wireless-client

show wireless

Command changes Version 5.4.9-2.3: command added

log size wireless-client

Overview Use this command to configure the file size used for storing wireless client logs.

You can determine the size of each wireless client log by using this command and the **`log rotate wireless-client`** commands together.

For example, log size wireless-client 50, log rotate wireless-client 4 -> 50 / (4+1) = 10Kbytes.

Use the **no** variant of this command to revert to the default log size value.

Syntax

```
log size wireless-client <50-4194304>
no log size wireless-client
```

Parameter	Description
<50-4194304>	Wireless client log size in kilobytes

Default 50 kilobytes.

Mode Wireless Configuration

Example To configure a wireless-client log size of 1Mbyte, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log size wireless-client 1000000
```

Related commands

Command changes Version 5.4.9-2.3: command added

login username (wireless-ap)

Overview Use this command to specify a username and password for a wireless Access Point (AP).

Use the **no** variant of this command to remove a username and password for a wireless AP.

Syntax

```
login username <username> password <password> [encrypted]
no login username
```

Parameter	Description
<username>	The username for the selected AP. The first character of the AP username must be a letter.
<password>	An alphanumeric string of characters used as the password for the selected AP.
`encrypted`	Means that the password that follows is encoded, not plain text. This parameter is only used in generated configuration files. In configuration files, the device prints encrypted in front of passwords to indicate that it is displaying the encoded password.

Default Not set

Mode Wireless AP Configuration

Example To set the username **manager** and password **friend** for a wireless AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# login username manager password
 friend
```

Related commands **ap**

show wireless ap

Command changes Version 5.5.4-0.1: **encrypted** parameter added

Version 5.4.7-2.4: command added.

mac-address (wireless-ap)

Overview Use this command to specify the MAC address for a wireless Access Point (AP).

Use the **no** variant of this command to remove the MAC address of the selected wireless AP.

Syntax

```
mac-address <mac-address>
no mac-address
```

Parameter	Description
<mac-address>	The MAC address of the wireless AP in hexadecimal notation with the format HHHH.HHHH.HHHH.

Default Not set.

Mode Wireless AP Configuration

Example To specify a MAC address for a wireless AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# mac-address 0000.5e00.5301
```

Related commands **ap**

show wireless ap

Command changes Version 5.4.7-2.4: command added.

mac-auth critical-mode enable

Overview Use this command to enable MAC authentication critical mode on a wireless network.

Use the **no** variant of this command to disable MAC authentication critical mode on a wireless network.

Syntax
```
mac-auth critical-mode enable
no mac-auth critical-mode enable
```

Default Disabled

Mode Wireless Network Configuration

Usage notes We recommend configuring this feature through the AMF Security mini GUI, rather than through this command.

This command is only available when the MAC authentication mode is set to AMF application proxy. To set that through the CLI, use the command **`mac-auth mode atmf-application proxy`**.

Example To enable MAC authentication critical mode on wireless network 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10
awplus(config-wireless-network)# mac-auth critical-mode enable
```

Related commands
- **mac-auth mode**
- **show wireless network**
- **wireless**

Command changes Version 5.5.2-2.1: command added

mac-auth mode

Overview Use this command to choose the MAC address authentication mode for a wireless network. You can choose to authenticate clients through RADIUS or through AMF Security mini.

Use the **no** variant of this command to reset to no MAC address authentication mode.

Syntax

```
mac-auth mode {atmf-application-proxy|radius}
no mac-auth mode
```

Parameter	Description
`atmf-application-proxy`	Use AMF Security mini to authenticate clients.
`radius`	Use RADIUS to authenticate clients.

Default No mode

Mode Wireless Network Configuration

Usage notes We recommend configuring this feature through the AMF Security mini GUI, rather than through this command.

Example To authenticate clients through AMF Security mini on network 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10
awplus(config-wireless-network)# mac-auth mode atmf-application-proxy
```

Related commands

wireless

Command changes Version 5.5.5-1.1: default changed to "no mode"

Version 5.5.4-0.1: added **mac-filter-and-radius** parameter for TQ-R series

Version 5.5.2-2.1: command added

mac-auth two-step-auth-with-cp enable

Overview Use this command to configure two-step authentication.

When enabled, STAs (stations) must pass both MAC and Captive Portal (CP) authentication before gaining access (logical **AND** condition).

Use the **no** variant of this command to disable two-step authentication. This allows STAs to pass either MAC **or** CP authentication (logical **OR** condition), rather than requiring both.

Syntax
```
mac-auth two-step-auth-with-cp enable
no mac-auth two-step-auth-with-cp enable
```

Default Enabled.

Mode Wireless Network Configuration

Example To enable two-step authentication on network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# mac-auth two-step-auth-with-cp
 enable
```

Related commands **show wireless network**

mac-auth mode

Command changes Version 5.5.5-0.1: command added

mac-auth password

Overview Use this command to change the password for MAC-based authentication.

Use the **no** variant of this command to return the password to its default.

Syntax

```
mac-auth password <password>
no mac-auth password
```

Parameter	Description
<password>	The new password. Passwords can be up to 64 characters in length and can contain any printable characters except ?, " (double quotes), and spaces.

Default By default the password is the MAC address of the supplicant.

Mode Wireless Network Configuration

Example To set the password for MAC authentication to be 'SECRET', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# mac-auth password SECRET
```

To reset the password for MAC authentication to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no mac-auth password
```

Related commands

enable (wireless-network-cp)

network (wireless)

mac-auth radius auth group (wireless-network)

mac-auth username

Command changes Version 5.4.9-2.1: command added

mac-auth radius auth group (wireless-network)

Overview Use this command to enable MAC authentication of clients with a RADIUS group in a wireless network.

Use the **no** variant of this command to disable MAC authentication with a RADIUS group.

Syntax

```
mac-auth radius auth group {radius|<group-name>}
no mac-auth radius auth group
```

Parameter	Description
`radius`	Use a RADIUS group, which means **all** RADIUS servers.
<group-name>	The RADIUS server group.

Default Not set.

Mode Wireless Network.

Usage notes This command enables MAC authentication and designates a RADIUS server group to authenticate clients on a wireless network. RADIUS server groups are defined using the **aaa group server** command. RADIUS server groups can consist of multiple server hosts, but this command only uses two servers.

Example To enable MAC authentication with a RADIUS server group, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10
awplus(config-wireless-network)# mac-auth radius auth group
 radius
```

Related commands network (wireless)

Command changes Version 5.4.7-2.4: command added.

mac-auth username

Overview Use this command to set the format of the MAC address in the username and password field when a request for MAC-based authorization is sent to a RADIUS server.

Use the **no** variant of this command to reset the format to the default of hyphen and lower-case.

Syntax

```
mac-auth username {hyphen|colon|unformatted} {lower-case|upper-case}
no mac-auth username
```

Parameter	Description
hyphen	The MAC address includes hyphens, e.g. xx-xx-xx-xx-xx-xx.
colon	The MAC address includes colons, e.g. xx:xx:xx:xx:xx:xx.
unformatted	The MAC address does not include hyphens or colons, e.g. xxxxxxxxxxxx.
lower-case	The MAC address uses lower-case characters (a-f).
upper-case	The MAC address uses upper-case characters (A-F).

Default Default format is hyphen lower-case.

Mode Wireless Network Configuration

Example To configure the format of the MAC address in the username and password field to be colon and upper-case, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# mac-auth username colon upper-case
```

To reset the format of the MAC address in the username and password field to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no mac-auth username
```

Related commands

Command changes

Version 5.4.9-2.1: command added

management address

Overview Use this command to configure a management address on the router for transmitting Autonomous Wave Control (AWC) packets to Access Points (APs). The management address must already exist on a device interface.

Use the **no** variant of this command to turn off AP management by AWC on the management address.

Syntax

```
managment address <ipv4-addr>
no management address
```

Parameter	Description
<ipv4-addr>	Set the IPv4 interface address used for AP management by AWC.
no	Unset the IPv4 management address used for AP management by AWC.

Default Not enabled.

Mode Wireless Configuration

Example To configure an AP management interface address, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# management address 192.168.0.1
```

To remove an AP management interface address, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no management address
```

Related commands enable (wireless)

Command changes Version 5.4.7-2.4: command added.

management-frame-protection enable (wireless-sec-osen)

Overview Use this command to enable management frame protection (MFP) for wireless Access Points (APs) using the OSEN security mode.

MFP provides security for management messages passed between APs and client stations. MFP checks management messages for potential security issues such as rogue devices and denial-of-service attacks.

Use the **no** variant of this command to disable MFP.

Syntax

```
management-frame-protection enable [type {capable|required}]
no management-frame-protection enable
```

Parameter	Description
`type`	The type of protection, select **capable** or **required**. If protection **type** is omitted, then **capable** is the default protection type.
`capable`	Mixed operation. Allows legacy devices that do not support 802.11w to associate while also allowing devices that support 802.11w to use the 802.11w features.
`required`	Prevents clients that do not support 802.11w from associating with the SSID.

Default Enabled.

Mode Wireless Security OSEN Configuration

Usage notes Select the protection **type** based on the WPA version:

If the WPA version is:

- a combination of **wpa** and **wpa2**, then protection is disabled
- only **wpa2**, then the protection type can be either **capable**, **required**, or **disabled**
- only **wpa3**, then the protection type is **required**

Example To enable management frame protection for clients that do not support 802.11w, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode osen
awplus(config-wireless-sec-osen)# management-frame-protection
 enable type required
```

To disable management frame protection, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode osen
awplus(config-wireless-sec-osen)# no management-frame-protection
 enable
```

Related commands

Command changes Version 5.5.0-2.3: command added

management-frame-protection enable (wireless-sec-wpa-ent)

Overview Use this command to enable management frame protection (MFP) in a WPA-enterprise configuration.

MFP provides security for management messages passed between wireless Access Points (APs) and client stations. MFP checks management messages for potential security issues such as rogue devices and denial-of-service attacks.

Use the **no** variant of this command to disable MFP.

Syntax

```
management-frame-protection enable [type{capable|required}]
no management-frame-protection enable
```

Parameter	Description
`type`	The type of protection, select **capable** or **required**. If protection **type** is omitted, then **capable** is the default protection type.
`capable`	Mixed operation. Allows legacy devices that do not support 802.11w to associate while also allowing devices that support 802.11w to use the 802.11w features.
`required`	Prevents clients that do not support 802.11w from associating with the SSID.

Default Enabled.

Mode Wireless Security WPA-enterprise Configuration

Usage notes Select the protection **type** based on the WPA version:

If the WPA version is:

- a combination of **wpa** and **wpa2**, then protection is disabled
- only **wpa2**, then the protection type can be either **capable**, **required**, or **disabled**
- only **wpa3**, then the protection type is **required**

Example To **disable** MFP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-enterprise
awplus(config-wireless-sec-wpa-psnl)# no management-frame-
protection enable
```

Related commands

Command changes Version 5.4.7-2.4: command added.

Version 5.5.0-2.3: parameter **type** added

management-frame-protection enable (wireless-sec-wpa-psnl)

Overview Use this command to enable Management Frame Protection (MFP). MFP provides security for management messages passed between wireless Access Points (APs) and client stations. MFP checks management messages for potential security issues such as rogue devices and denial-of-service attacks.

This parameter will be ignored when the version list includes **wpa3** as WPA3 requires that MFP is enabled, see **versions (wireless-sec-wpa-psnl)**.

Use the **no** variant of this command to disable MFP.

Syntax

```
management-frame-protection enable[type{capable|required}]
no management-frame-protection enable
```

Parameter	Description
`type`	The type of protection, select **capable** or **required**. If protection **type** is omitted, then **capable** is the default protection type.
`capable`	Mixed operation. Allows legacy devices that do not support 802.11w to associate while also allowing devices that support 802.11w to use the 802.11w features.
`required`	Prevents clients that do not support 802.11w from associating with the SSID.

Default Enabled.

Mode Wireless Security WPA-personal Configuration

Usage notes Select the protection **type** based on the WPA version:

If the WPA version is:

- a combination of **wpa** and **wpa2**, then protection is disabled
- only **wpa2**, then the protection type can be either **capable**, **required**, or **disabled**
- only **wpa3**, then the protection type is **required**

Example To disable MFP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 100 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# no management-frame-
protection enable
```

max-clients

Overview Use this command to set the number of clients able to simultaneously connect to a wireless Access Point (AP).

Use the **no** variant of this command to return the number of clients able to connect to the default value.

Syntax

```
max-clients <0-200>
no max-clients
```

Parameter	Description
<0-200>	The number of clients able to connect to the wireless AP. Configuring the **number 0** will disable all clients from connecting to the selected AP. For the **MWS** series, the range is: *<0 -127>* with a default of 127.

Default 200.

Mode Wireless AP Profile Radio Configuration

Example To set the maximum number of simultaneous clients that can connect to a wireless AP to 128, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# enable
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# max-clients 128
```

Related commands

Command changes Version 5.4.7-2.4: command added.

mode (wireless-ap-prof-radio)

Overview Use this command to set the **wireless standard** and **bandwidth** mode used by the Access Points (APs) in a secure wireless security configuration. The AP type or model determines which mode to select.

Use the **no** variant of this command to set the mode to the default values specified for an AP type.

Syntax

```
mode {a|bg|a-n|bg-n|n-only-a|n-only-g|a-n-ac|n-ac|bg-n-ax|a-n-ac-ax|ax}
no mode
```

Parameter	Standard	Description
a	802.11a	Bandwidth 54Mbps - 5GHz
bg	802.11bg	Bandwidths 11 and 54Mbps- 2.4GHz.
a-n	802.11a/n	Bandwidths 54 and 300 Mbps - 2.4GHz.
bg-n	802.11b/g/n	Bandwidths 11, 54, and 300 Mbps - 2.4GHz
n-only-a	802.11n	Bandwidth 300 Mbps using the 5GHz bandwidth
n-only-g	802.11n	Bandwidth 300 Mbps using the 2.4GHz bandwidth
a-n-ac	802.11a/n/ac	Dual-band: supporting simultaneous connections on both the 2.4 GHz and 5 GHz Wi-Fi bands.802.11ac offers backward compatibility to 802.11b/g/n and bandwidth rated up to 1300 Mbps on the 5 GHz band plus up to 450 Mbps on 2.4 GHz.
n-ac	802.11n/ac	Dual-band: Bandwidth 54, and 300Mbps using both the 2.4 and 5GHz frequencies.
bg-n-ax	802.11b/n/ax	2.4GHz
a-n-ac-ax	802.11b/n/ax	5GHz
ax	802.11ax	6GHz

Default The default values change with each antenna type and AP.

Mode Wireless AP Profile Radio Configuration

Example To configure the wireless mode **a-n-ac** for AP profile 100, radio 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# mode a-n-ac
```

Command changes Version 5.4.7-2.4: command added.

mode (wireless-network-cp)

Overview Use this command to set the Captive Portal (web authentication) mode.

Captive Portal lets wireless clients authenticate themselves or agree to terms and conditions before you grant them Wi-Fi access or external web access.

Use the **no** variant of this command to reset the Captive Portal mode to default.

Syntax

```
mode {click-through|radius|external-page-redirect}
no mode
```

Parameter	Description
`radius`	The user name and password entered from the browser screen are sent to the RADIUS server and a network connection is permitted after successful authentication.
`click-through`	This method asks users to agree to the terms of use (click-through agreement) before allowing them to connect to the wireless network.
`external-page-redirect`	Redirect the authentication page to a user configured URL such as a third party Captive Portal vendor page.

Default click-through

Mode Wireless Network Captive Portal Configuration

Example To set the Captive Portal authentication mode as RADIUS, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# mode radius
```

nai-realm (wireless-network-passpoint-dot11u)

Overview Use this command to set the NAI (Network Access Identifier) Realm information.

Use the **no** variant of this command to remove a specified NAI Realm entry.

Syntax

```
nai-realm <realm-number> realm-name <realm-name> eap-method
 <eap-method>
no nai-realm <realm-number>
```

Parameter	Description
<realm-number>	NAI Realm information's unique entry number in the range <1-10>
<realm-name>	NAI Realm name: • The NAI Realm Name in FQDN (Fully Qualified Domain Name) format. • Multiple NAI Realm Names must be separated by a comma. • The maximum number of characters allowed including commas is 100.
<eap-method>	Designated EAP method(s) in a list format. The list can use either **eap-tls** or **eap-ttls** or **eap-sim** or two of these three in any order.

Default Not set.

Mode Wireless Network Passpoint 802.11u Configuration

Usage notes A network access identifer (NAI) is a standardized (RFC 4282) format for identifying users requesting access to a network (e.g.user@realm.com). Thus, an NAI Realm identifes the proper authentication server or domain for the user's authentication exchange.

Example To configure an NAI Realm Name and EAP method(s), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# nai-realm 2

neighbor-ap-detection enable

Overview Use this command to enable Neighbor AP Detection on the AP profile radio configuration.

Use the **no** variant of this command to disable Neighbor AP Detection for an AP profile radio configuration.

Syntax
```
neighbor-ap-detection enable
no neighbor-ap-detection enable
```

Default Enable.

Mode Wireless AP Profile Radio Configuration

Example To disable Neighbor AP Detection for APs using AP profile 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 1
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# no neighbor-ap-detection

network-auth-type (wireless-network-passpoint-dot11u)

Overview Use this command to set the network authentication type.

Use the **no** variant of this command to remove the specified network authentication type.

Syntax

```
network-auth-type {online-enrollment|terms-and-conditions|
redirect-http-https|
redirect-dns} [redirect-url <url>]
```

```
no network-auth-type {online-enrollment|terms-and-conditions|
redirect-http-https|
redirect-dns}
```

Parameter	Description
`online-enrollment`	Authentication type as online enrollment.
`terms-and-conditions`	Authentication type as terms and conditions.
`redirect-http-https`	Redirect using HTTP/HTTPS.
`redirect-dns`	Redirect using DNS.
`redirect url <url>`	Redirect using URL. The URL is an ASCII string of up to 128 characters other then the following characters. {, }, |, \, ^, [,], ` Refer to RFC-2396

Default Not set.

Mode Wireless Network Passpoint 802.11u Configuration

Example To set the network authentication type as online-enrollment with a redirect URL, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# network-auth-type online-enrollment redirect-url example.com
```

To delete the network authentication type online-enrollment, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# no network-auth-type online-enrollment
```

Related commands **show wireless network**

Command changes Version 5.5.0-2.3: command added

network-type (wireless-network-passpoint-dot11u)

Overview Use this command to select the access network type.

Use the **no** variant of this command to revert to the default access network type.

Syntax

```
network-type {private|guest-private|chargeable-public| free-public|personal-device|emergency|test|wildcard}
no network-type
```

Parameter	Description
`private`	Private network
`guest-private`	Private network with guest access
`chargeable-public`	Chargeable public network
`free-public`	Free public network
`personal-device`	Personal device network
`emergency`	Emergency service only network
`test`	Test or experimental network
`wildcard`	Wildcard

Default Private.

Mode Wireless Network Passpoint 802.11u Configuration

Example To enter the 802.11u configuration mode and set the network access type to free-public, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# network-type
 free-public
```

Version 5.5.0-2.3: command added

network (wireless)

Overview Use this command to configure a wireless network.

If the network doesn't exist, then this command creates it.

Use the **no** variant of this command to remove a wireless network.

Syntax

```
network <1-65535>
```

Parameter	Description
<1-65535>	The network ID number

Default Not set.

Mode Wireless Configuration

Usage notes This commands adds a network configuration and enters the network configuration mode.

Example To configure a wireless network with an ID of 20, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
```

Command changes Version 5.4.7-2.4: command added.

ntp designated-server

Overview Use this command to designate the NTP server that a wireless Access point (AP) refers to.

Use the **no** variant of this command to remove the configured IP address or host-name of the NTP server.

Syntax

```
ntp designated-server {ip <ip-address>|host <host-name>}
no ntp designated-server
```

Parameter	Description
<ip-address>	Specify the IP address of the NTP server, entered in the form A.B.C.D for an IPv4 address.
<host-name>	Specify the host-name for the NTP server

Default Disabled.

Mode Wireless AP Profile Configuration

Usage notes This command sets the NTP server that a wireless AP refers to. If the NTP server is disabled, then the AP will synchronize its time with the AWC router.

This is because the AP can not hold current time after a reboot because it does not have a real-time clock.

Therefore, the NTP master must be configured on the AWC router.

Example To configure an NTP server with an IP address of 192.168.0.254 for ap-profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# ntp designated-server
 192.168.0.154
```

Related commands

Command changes Version 5.4.7-2.4: command added

ntp designated-server enable

Overview Use this command to configure NTP on a wireless Access Point (AP).

Use the **no** variant of this command to disable the NTP feature on an AP.

Syntax
```
ntp designated-server enable
no ntp designated-server enable
```

Default Enabled.

Mode Wireless AP Profile Configuration

Example To disable NTP for AP-profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# no ntp designated-server enable
```

Related commands **ntp designated-server**

Command changes Version 5.4.7-2.4: command added.

ntp designated-server period

Overview Use this command to set the time adjustment period for an NTP server. This is the time adjustment period for a wireless AP using the selected AP profile.

Use the **no** variant of this command to reset the time adjustment period to the default of 10 minutes.

Syntax

```
ntp designated-server period <1-9999>
no ntp designated-server period
```

Parameter	Description
<1-9999>	The time adjustment period for the NTP server in minutes.

Default 10 minutes.

Mode Wireless AP Profile Configuration

Example To configure 30 minutes as the NTP server time adjustment period for ap-profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# ntp designated-server
 192.168.0.254
awplus(config-wireless-ap-prof)# ntp designated-server period 30
```

Related commands

Command changes Version 5.4.7-2.4: command added.

operating-class (wireless-network-passpoint-hs20)

Overview Use this command to set the Operating Class for Hotspot 2.0.

Use the **no** variant of this command to revert to the default value.

Syntax

```
operating-class <HEX-value>
no operating-class
```

Parameter	Description
<HEX-value>	Operating Class Indication value in HEX. Refer to Table E-4 of IEEE Std 802.11-2012 Annex E

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To set an Operating Class Indication value of 51, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# operating-class
 51
```

Related commands **show wireless network**

operator (wireless-network-passpoint-hs20)

Overview Use this command to configure the operator friendly name, unique entry number, and language code of a Hotspot 2.0 entry.

Use the **no** variant of this command to remove the configuration details of a Hotspot 2.0 entry.

Syntax

```
operator <operator-id> lang <language-code> friendly-name
 <friendly-name>
no operator <operator-id>
```

Parameter	Description
<operator-id>	The unique operator entry number. Select from the range 1-10.
<language-code>	The language code. You can use only 2 or 3 characters as specified in ISO-639. For example: English is 'eng', Japanese is 'jpn'.
<friendly-name>	The text field used to identify the Hotspot venue operator. You can use up to 252 octets of special characters (utf-8 encode). For example: "Allied Bld.5th floor".

Default Not set

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To configure the language code and operator friendly name on Operator ID 2, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# operator 2 lang
 eng friendly-name Allied-Telesis
```

osu-providers friendly-name lang name

Overview Use this command to set the OSU Providers Friendly Name. This information is required with Passpoint Hotspot2.0 configurations.

Use the **no** variant of this command to remove the specified OSU Providers Friendly Name.

Syntax

```
osu-providers friendly-name lang <language-code> name <friendly-name>
```

```
no osu-providers friendly-name lang <language-code> name
 <friendly-name>
```

Parameter	Description
<language-code>	The language code. You can use only 2 or 3 characters as specified in ISO-639. For example: English is 'eng', Japanese is 'jpn'.
<friendly-name>	The text field used to identify the OSU operator. You can use up to 252 octets of special characters (utf-8 encode). For example: "Allied Bld.5th floor".

Default None.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To configure the OSU Provider's Friendly Name, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# osu-providers
 friendly-name lang eng name Example operator
```

osu-providers icon lang file

osu-providers server-uri

Command changes

Version 5.5.2-0.1: command added

osu-providers icon lang file

Overview Use this command to set the Online Sign-up (OSU) provider icon for a Hotspot2.0 configuration.

When OSU services are available, a list of the OSU providers that are reachable from the hotspot are presented to the client. The list is typically displayed as an icon, title, and description, for each provider. The icon is actually embedded within the certificate issued to the OSU server, thus ensuring that clients don't connect to 'rogue' provisioning systems.

Use the **no** variant of this command to remove an OSU provider icon.

Syntax

```
osu-providers icon lang <language-code> file <file-name>
no osu-providers icon lang <language-code> file <file-name>
```

Parameter	Description
<language-code>	The language code. You can use only 2 or 3 characters as specified in ISO-639. For example: English is 'eng', Japanese is 'jpn'.
<file-name>	The icon's file name: Range: <= 255 characters Format: ASCII printable string without the following characters:\/:*?"<>| Extensions: **.png** only. Size: < 64K Byte.

Default N/A.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To set the OSU provider icon, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# osu-providers
 icon lang eng file TestIcon.png
```

To copy the OSU Provider icon from USB to flash, use the command:

```
awplus# copy usb:/TestIcon.png flash:/gui-userdata/osu-icon/
```

To check the OSU Provider icon file, use the command:

```
awplus# dir flash:/gui-userdata/osu-icon/
```

Command changes Version 5.5.2-0.1: command added

osu-providers method-list

Overview Use this command to set the list of protocols (methods) that OSU Providers use to communicate between mobile devices.

Use the **no** variant of this command to reset the OSU Providers method list.

Syntax

```
osu-providers method-list oma-dm
osu-providers method-list soap-xml-spp
osu-providers method-list oma-dm soap-xml-spp
osu-providers method-list soap-xml-spp oma-dm
no osu-providers method-list
```

Parameter	Description
`oma-dm`	Provisioning using Open Mobile Alliance (OMA) Device Management (DM)
`soap-xml-spp`	Provisioning using Subscription Provisioning Protocol based on Simple Object Access Protocol XML.

Default Not set.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Usage notes The list includes the OMA-DM and SOAP-XML SPP protocols. You can configure the list priority. For example, **oma-dm soap-xml-spp** indicates the method OMA-DM has a higher priority than SOAP-XML-SPP.

Example To set the OSU Providers method list to OMA-DM and SOAP-XML SPP, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# osu-providers
 method-list oma-dm soap-xml-spp
```

Version 5.5.2-0.1: command added

osu-providers nai

Overview Use this command to configure the OSU Providers NAI (Network Access Indentifier) on a Hotspot2.0 configuration.

Use the **no** variant of this command to remove a specified NAI Realm entry.

Syntax

```
osu-providers nai <realm-name>
no osu-providers nai <realm-name>
```

Parameter	Description
<realm-name>	NAI Realm name: • The NAI Realm Name in FQDN (Fully Qualified Domain Name) format, as described in RFC4282, Section 2.8. For example, realm@example.com • Range: <253 octets

Default Not set.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To configure the OSU Provider NAI, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# osu-providers
 nai realm@example.com

osu-providers server-uri

Overview Use this command to configure the OSU Providers Server URI (Uniform Resource Identifier). You will need to set this on Passpoint Hotspot2.0 configurations.

Use the **no** variant of this command to reset the OSU Providers Server URI.

Syntax

```
osu-providers server-uri <uri>
no osu-providers server-uri
```

Parameter	Description
<uri>	The OSU Providers Server URI. Range: <= 253 characters, Format: ASCII printable characters.

Default Not set.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To configure the OSU Provider's Server URI, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20

Command changes Version 5.5.2-0.1: command added

osu-providers service-desc lang desc

Overview Use this command to set the OSU Providers Service Description. This information is required with Passpoint Hotspot2.0 configurations.

Use the **no** variant of this command to remove an OSU Providers Service Description.

Syntax

```
osu-providers service-desc lang <language-code> desc <service-name>
```

```
no osu-providers service-desc lang <language-code> desc
 <service-name>
```

Parameter	Description
<language-code>	The language code. You can use only 2 or 3 characters as specified in ISO-639. For example: English is 'eng', Japanese is 'jpn'.
<service-name>	The text field used to identify the OSU Providers Service. You can use up to 252 octets of special characters (utf-8 encode).

Default Not set.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To configure the OSU Provider's Service Description, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20

Command changes

Version 5.5.2-0.1: command added

osu ssid

Overview Use this command to set the Online-signup (OSU) SSID that wireless clients will use with a Hotspot2.0 configuration.

Use the **no** variant of this command to reset the OSU Status configuration.

Syntax

```
osu ssid <ssid-value>
no osu ssid
```

Parameter	Description
<ssid-value>	The OSU SSID for the Hotspot2.0 configuration. Enter a string up to 32 characters in length. If the name contains spaces then you must enclose it in "quotation marks". For example, "test ssid" requires quotes but test-ssid does not.

Default Not set.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Usage notes The Passpoint OSU options allow you to register a mobile device with a service provider and choose a plan to gain network access. When you sign up, your device will send you user credentials to connect to the network.

Example To set an OSU SSID named 'test-ssid', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# osu ssid test-ssid
```

To set an OSU SSID 'test ssid' (which contains a space), include double-quotes around the SSID, as shown in the following command:

```
awplus(config-wireless-network-passpoint-hs20)# osu ssid "test ssid"
```

Related commands

Command changes

Version 5.5.2-0.1: command added

osu status enable

Overview Use this command to enable OSU (Online Sign-up). OSU is an optional setting included with Passpoint configuration on a wireless network. OSU allows you to register a mobile device with a service provider and choose a plan to gain network access. When you sign up, your device will send you user credentials to connect to the network.

Use the **no** variant of this command to disable OSU.

Syntax
```
osu status enable
no osu status enable
```

Default Disabled.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To enable OSU, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# osu status
 enable
```

Command changes Version 5.5.2-0.1: command added

outdoor

Overview Use this command to designate that a wireless AP is located outdoors.

Use the **no** variant of this command to designate when a wireless AP is not located outdoors.

Syntax
```
outdoor
no outdoor
```

Default No outdoor.

Mode Wireless AP Profile Configuration

Usage notes This command indicates whether the wireless AP is located outdoors, and selects the mode and channel that corresponds to this. To configure a channel number, use the **channel** command in **wireless-ap-prof-radio** mode. If you configure an invalid channel number, an error message displays the valid channels that you may select in your region.

The command is ignored when the AP is already configured using the **hwtype** command.

Example To configure an AP to be located outdoors, use the following commands:
```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# outdoor
```

Related commands

Command changes Version 5.4.7-2.4: command added

page-proxy-url

Overview Use this command in Captive Portal mode to set the location of the custom page to display for web authentication. This page will be displayed instead of the wireless access point's built-in authentication or click-through page.

Use the **no** variant of this command to remove the URL pointing to the custom web authentication page.

Syntax

```
page-proxy-url <URL>
no page-proxy-url
```

Parameter	Description
<URL>	URL of external web server (hostname or dotted IP notation).

Default No custom page is set by default.

Mode Wireless Network Captive Portal Configuration

Example To enable and set the web authentication proxy page, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# page-proxy-url http://
www.mydomain.com/login_page
```

passpoint

Overview Use this command to enter the passpoint configuration mode.

Use the **no** variant of this command to revert to the default setting.

Syntax
```
passpoint
no passpoint
```

Default Not set.

Mode Wireless Network Configuration

Example To enter passpoint configuration mode, use the commands:
```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)#
```

peer (wireless-wds)

Overview Use this command to add a pair of wireless Access Points (APs) to a WDS peer list.

Use the **no** variant of this command to remove a pair of wireless APs from a WDS peer list.

Syntax

```
peer ap <1-65535> radio <1-3> {ap <1-65535>|mac <mac-addr>}
 radio <1-3>
no peer
```

Parameter	Description
ap	Signifies that the first AP identifier follows.
<1-65535>	The first AP identifier.
radio	Select the radio interface of the first AP.
<1-3>	Designate the radio interface for the first AP.
ap	Signifies that the second AP identifier follows.
<1-65535>	The second AP identifier.
mac	Signifies that the MAC address of the second AP follows.
<mac-addr>	The MAC address of the second AP. Enter the address in the format <*HHHH.HHHH.HHHH*> where *H* is a hexadecimal number.
radio	Select the radio interface of the second AP.
<1-3>	The radio interface for the second AP.

Default There are no APs configured in a WDS peer list by default.

Mode Wireless WDS Configuration

Example To add a pair of wireless APs to a WDS peer list, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wds 10
awplus(config-wireless-wds)# peer ap 10 radio 1 ap 20 radio 1
```

Command changes

Version 5.4.7-2.4: command added.

permit host (wireless-ap-prof-snmp)

Overview Use this command to set the SNMP permit host for the target AP profile. This command is valid for SNMP v1 and v2c only.

Use the **no** variant of this command to remove the SNMP permit host from the AP profile.

Syntax

```
permit host <host-name>
no permit host
```

Parameter	Description
<host-name>	Respond only to SNMP requests from the specified host name. For example FQDN, IP address, or subnet mask (manager.your.domain.com, 10.10.1.37, 192.168.1.1/24.

Default Not set

Mode Wireless AP Profile SNMP Configuration

Example To set the SNMP permit host to '192.168.1.1', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# permit host 192.168.1.1
```

To remove the SNMP permit host '192.168.1.1', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no permit host
```

Related commands

port (wireless-ap-prof-snmp)

Overview Use this command to set the SNMP listening port number for the target AP profile.

Use the **no** variant of this command to set the SNMP listening port back to the default (161).

Syntax

```
port <1-65535>
no port
```

Parameter	Description
<1-65535>	The SNMP listening port number to set.

Default 161

Mode Wireless AP Profile SNMP Configuration

Example To set the SNMP listening port to 166, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# port 166
```

To set the SNMP listening port back to the defautl (161), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no port
```

Related commands

power (wireless-ap-radio)

Overview Use this command to set the power level for client devices on a wireless Access Point (AP).

Use the **no** variant of this command to return the power level to its default value.

Syntax

```
power <1-100>
no power
```

Parameter	Description
<1-100>	The percentage power level value.

Default A power level of 100% is the default.

Mode Wireless AP Radio Configuration

Example To set a power level of 30% for radio 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)# power 30
```

Related commands **show wireless ap**

radio (wireless-ap)

Command changes Version 5.4.7-2.4: command added

pre-authentication enable (wireless-sec-osen)

Overview Use this command to allow wireless Access Points (APs) that have WPA2 clients to share the pre-authentication packets from the WPA2 clients with other APs.

When enabled, this speeds up authentication for roaming clients who connect to multiple APs.

Use the **no** variant of this command to disable pre-authentiction

Syntax
```
pre-authentication enable
no pre-authentication enable
```

Default Enabled.

Mode Wireless Security OSEN Configuration

Usage notes OSEN is a wireless security method used with Release 2 of Hotspot 2.0 (Passpoint) OSEN is short for Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. Use the **security** command to enter OSEN security configuration mode.

This command is not supported by WPA clients.

Example To disable pre-authentication for an OSEN security configuration, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode osen
awplus(config-wireless-sec-osen)# no pre-authentication enable
```

Related commands **security (wireless)**

show wireless security

Command changes Version 5.5.0-2.3: command added

pre-authentication enable (wireless-sec-wpa-ent)

Overview Use this command to enable WPA-enterprise pre-authentication for Access Points (APs) that have WPA2 clients.

Use the **no** variant of this command to disable WPA-enterprise pre-authentication.

Syntax
```
pre-authentication enable
no pre-authentication enable
```

Default Enabled.

Mode Wireless Security WPA-enterprise Configuration

Usage notes Enable this option if the AP has WPA2 clients and you want the AP to share the pre-authentication packets from the clients with other access points. If it is enabled, this can speed up authentication for roaming clients who connect to multiple access points. This option does not apply to WPA clients.

The MWS series of devices do not support pre-authentication, therefore, you should **disable** this command on these devices.

Example To disable pre-authentication on a WPA-enterprise configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# no pre-authentication
 enable
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added

proxy-arp enable

Overview Use this command to enable proxy ARP on the wireless network. When Downstream Group-Addressed Forwarding (DGAF) is disabled, AlliedWare Plus enables Proxy ARP on the Access Points.

Use the **no** variant of this command to disable proxy ARP.

Syntax
```
proxy-arp enable
no proxy-arp enable
```

Default Disabled.

Mode Wireless Network Configuration

Example To enable Proxy ARP, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# proxy-arp enable
```

Related commands
show wireless network
network (wireless)
dgaf enable (wireless-network-passpoint-hs20)

Command changes Version 5.5.0-2.3: command added

proxy-arp-through enable

Overview Use this command to enable the Proxy Arp pass through feature.

This feature allows ARP packets from unknown addresses to pass through to STAs, when proxy ARP is enabled on the AP, rather than dropping them. This speeds up IP resolution for stations such as IP phones.

Use the **no** variant of this command to disable Proxy Arp pass through.

Syntax
```
proxy-arp-through enable
no proxy-arp-through enable
```

Default Disabled.

Mode Wireless Network Configuration

Example To enable Proxy ARP pass through, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# proxy-arp-through enable
```

Related commands **show wireless network**

proxy-arp enable

Command changes Version 5.5.5-0.2: command added

qos-map-set (wireless-network-passpoint-dot11u)

Overview Use this command to set the QoS map set for 802.11u.

Use the **no** variant of this command to revert to the default value.

Syntax

```
qos-map-set <qos-map>
no qos-map-set
```

Parameter	Description
<qos-map>	QoS map configuration. • The QoS map is a comma delimited list of decimal values in the range 0-63 or 255. • The maximum number of elements in the list is 29. (21 DSCP Exception + 8 User Priority). Refer to: IEEE Std 802.11-2012, 8.4.2.97. • Total length of QOSMAP < 190. Format: [<DSCP Exceptions[DSCP,UP]>,]<UP 0 range[low,high]>,...<UP 7 range[low,high]>

Default 0

Mode Wireless Network Passpoint 802.11u Configuration

Example To configure two DSCP exceptions (53,2 and 22,6), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# qos-map-set
 53,2,22,6,8,15,0,7,255,16,31,32,39,255,255,40,47,255,255
```

radio (wireless-ap)

Overview Use this command to enter **wireless-ap-radio** configuration mode.

Syntax

```
radio <1-3>
```

Parameter	Description
<1-3>	The radio interface.

Mode Wireless AP Configuration

Example To enter the AP Radio configuration mode, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)#
```

radio (wireless-ap-profile)

Overview Use this command to enter AP profile radio configuration mode. Once in this mode, you can create and modify the radio configuration parameters for an AP profile.

Syntax

```
radio <1-3>
```

Parameter	Description
<1-3>	The radio interface within the AP profile.

Mode Wireless AP Profile Configuration

Example To enter the AP profile radio configuration mode for radio 1, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)#
```

radius accounting enable

Overview Use this command to configure RADIUS accounting on Captive Portal with external RADIUS.

Use the **no** variant of this command to disable RADIUS accounting on Captive Portal.

Syntax
```
radius accounting enable
no radius accounting enable
```

Default Disabled.

Mode Wireless Network Captive Portal Configuration

Usage notes The server settings used by Captive Portal RADIUS accounting are those configured by the **radius auth group** command. The port number used is the same one set on the primary server by the command **radius-server host**.

Example To configure RADIUS accounting on Captive Portal for network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# radius accounting enable
```

Related commands **radius accounting enable**

radius auth group (wireless-network-cp)

Command changes Version 5.5.0-1.3: command added

radius auth group (wireless-network-cp)

Overview Use this command to set the RADIUS server/s that wireless APs use for Captive Portal (web authentication).

Use the **no** variant of this command to remove the RADIUS server/s used for authentication.

Syntax

```
radius auth group {radius|<groupname>}
no radius auth group {radius|<groupname>}
```

Parameter	Description
`radius`	Use a RADIUS server registered with the **radius-server host** command.
<groupname>	Use a RADIUS server that belongs to the specified server group. Use a server group created with the **aaa group server** radius command.

Default No RADIUS server set by default.

Mode Wireless Network Captive Portal Configuration

Example To use the RADIUS group 'my_rad' for Captive Portal authentication, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# mode radius
awplus(config-wireless-network-cp)# radius auth group my_rad
```

Related commands

- **aaa group server**
- **captive-portal**
- **enable (wireless-network-cp)**
- **mac-auth password**
- **mac-auth username**
- **page-proxy-url**
- **radius-server host**
- **redirect-url**
- **session-keep**
- **mode (wireless-network-cp)**

Command changes

Version 5.4.9-1.1: command added

radius authentication group (wireless-sec-osen)

Overview Use this command to assign a RADIUS server group for authenticating wireless AP clients using the OSEN security mode.

Use the **no** variant of this command to revert to the default RADIUS server group.

Syntax

```
radius auth group {radius|<group-name>}
no radius auth group
```

Parameter	Description
`radius`	Use RADIUS servers.
<group-name>	Use the RADIUS server group

Default RADIUS.

Mode Wireless Security OSEN Configuration

Usage notes The RADIUS server group is configured with the **aaa group server** command.

The group name **radius** is predefined, which includes all RADIUS servers configured by the **radius-server host** command. However, this command, (**radius authentication group**) uses only the first two configured servers.

Example To configure the RADIUS authentication group to authenticate APs using the OSEN security mode, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode osen
awplus(config-wireless-sec-osen)# radius authentication group
 radius
```

Related commands

security (wireless)

Command changes Version 5.5.0-2.3: command added

radius auth group (wireless-sec-wpa-ent)

Overview Use this command to set the RADIUS server group used to authenticate clients in a wireless WPA-enterprise.

Use the **no** variant of this command to set the RADIUS server group to the default.

Syntax

```
radius auth group {radius|<group-name>}
no radius auth group
```

Parameter	Description
`radius`	Use all RADIUS servers.
<group-name>	Server group name

Default RADIUS (all RADIUS servers).

Mode Wireless Security WPA-enterprise Configuration

Example To set **radius**, which means all RADIUS servers, to authenticate a wireless WPA-enterprise, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# radius auth group radius
```

Related commands **security (wireless)**

Command changes Version 5.4.7-2.4: command added

redirect-url

Overview Use this command to enable the redirect-url feature. After successful authentication this feature redirects the web browser to the URL specified in the command. If both **session-keep** and **redirect-url** are enabled, session-keep takes precedence.

Use the **no** variant of this command to disable the redirect-url feature.

Syntax

```
redirect-url <URL>
no redirect-url
```

Parameter	Description
<URL>	URL of page to redirect the user to (hostname or dotted IP notation).

Default Not set by default.

Mode Wireless Network Captive Portal Configuration

Example To enable and set the redirect-url for Captive Portal authentication on network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# redirect-url http://
www.mydomain.com/welcome
```

Command changes Version 5.4.9-1.1: command added

rogue-ap-detection enable (wireless)

Overview Use this command to enable rogue application detection.

Use the **no** variant of this command to disable rogue application detection.

Syntax
```
rogue-ap-detection enable
no rogue-ap-detection enable
```

Default Disabled.

Mode Wireless Configuration

Example To enable rogue application detection, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# rogue-ap-detection enable
```

Related commands **show wireless**

Command changes Version 5.4.7-2.4 command added.

roaming-oi (wireless-network-passpoint-dot11u)

Overview Use this command to set the Roaming Consortium List. A Roaming Consortium List contains multiple Organisation Identifiers (OIs) whose security credentials can be used to connect to a network.

Use the **no** variant of this command to revert to the default value.

Syntax

```
roaming-oi <oi-list>
no roaming-oi
```

Parameter	Description
<oi-list>	Roaming Consortium List. • You can have multiple OIs in a list • Each OI is between 3 and 15 octets and is configured as a headecimal string. • Separate OIs with a comma. • The maximum number of OIs is 15. • The length of a character in the OI-List must be less than 465 including commas.

Default None

Mode Wireless Network Passpoint 802.11u Configuration

Usage notes The Roaming Consortium Element tell a mobile device which roaming consortiums or service providers are available through an AP.

Example To set a Roaming Consortium List containing two OIs, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# roaming-oi
 021122,2233445566
```

Related commands **show wireless network**

dot11u (wireless-network-passpoint)

Command changes Version 5.5.0-2.1: command added.

sc-profile

Overview Use this command to add a Smart Connect profile configuration and enter the Smart Connect profile configuration mode.

Use the **no** variant of this command to remove a Smart Connect profile configuration.

Syntax
```
sc-profile <1-65535>
no sc-profile
```

Parameter	Description
<1-65535>	The Smart Connect profile ID.

Default Not set

Mode Wireless AP Profile Configuration

Example To add Smart Connect profile 1 to AP profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
awplus(config-wireless-ap-prof)# sc-profile 1
```

Related commands
smart-connect-profile
show wireless ap-profile
show wireless network

Command changes Version 5.5.0-0.1: command added

sc-channel

Overview Use this command to set a fixed radio channel for an access point (AP) using Smart Connect.

Use the **no** variant of this command to delete this setting.

Syntax

```
sc-channel radio <1-3> channel {<channel-number>|auto}
no sc-channel
```

Parameter	Description
<1-3>	Select the radio channel fixed for AWC-SC use
<channel-number>	Select the radio channel that is defined in the AP profile
auto	The radio channel is automatically selected

Default Not set.

Mode Wireless Smart Connect Profile Configuration

Example To automatically configure the Smart Connect channel with AP profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# sc-channel radio 2 channel auto
```

Related commands

security (wireless)

Overview Use this command to configure a wireless security instance and enter a configuration mode. If the instance doesn't already exist, then this command creates it.

Use the **no** variant of this command to remove a wireless security instance.

Syntax

```
security <1-65535> mode {osen|wep|wpa-personal|wpa-enterprise}
no security <1-65535>
```

Parameter	Description
<1-65535>	Wireless security instance identification number
`mode`	Security mode
`osen`	Security mode OSEN. This assigns the configuration identifier to **config-wireless-sec-osen** mode and enters the mode.
`wep`	Security mode WEP. This assigns the configuration identifier to **config-wireless-sec-wep** mode and enters the mode.
`wpa-personal`	Security mode WPA-Personal. This assigns the configuration identifier to **config-wireless-sec-wpa-psnl** mode and enters the mode.
`wpa-enterprise`	Security mode WPA-Enterprise. This assigns the configuration identifier to **config-wireless-sec-wpa-ent** mode and enters the mode.

Default Not set.

Mode Wireless Configuration

Usage notes You create a wireless security instance by designating a security instance ID and selecting a security mode. The types of security modes are:

- OSEN
- WEP
- WPA-Personal
- WPA-Enterprise

Example To configure and enter the wireless security mode for WPA-Personal, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 10 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)#
```

Command changes Version 5.4.7-2.4: command added

Version 5.5.0-2.3: **osen** parameter added

security (wireless-network)

Overview Use this command to designate a security configuration identifier for a wireless security configuration.

Use the **no** variant of this command to remove a security configuration identifier.

Syntax

```
security <1-65535>
no security
```

Parameter	Description
<1-65535>	The wireless security configuration identifier.

Default Not set.

Mode Wireless Network Configuration

Example To assign a security configuration identifier of 10 to wireless network 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 2
awplus(config-wireless-network)# security 10
```

Related commands **network (wireless)**

show wireless network

Command changes Version 5.4.7-2.4: command added.

security (wireless-wds)

Overview Use this command to set a wireless security configuration identifier to the WDS configuration mode.

Use the **no** variant of this command to remove the WDS security configuration identifier.

Syntax

```
security <1-65535>
no security
```

Parameter	Description
<1-65535>	The wireless security configuration identifier.

Default Not set.

Mode Wireless WDS Configuration

Example To designate the wireless security configuration identifier to the WDS configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wds 10
awplus(config-wireless-wds)# security 2
```

Related commands **wds**

show wireless wds

Command changes Version 5.4.7-2.4: command added

service wireless

Overview Use this command to enable wireless services.

Use the **no** version of the command to disable unused wireless services.

Syntax
```
service wireless
no service wireless
```

Default Enabled

Mode Global Configuration

Usage notes On devices that support the wireless manage feature, sometimes it may be desirable to disable unused services, in order to reduce memory use. Disabling the wireless services will only take effect after you save the configuration and restart the device.

Example To disable the wireless service, use the commands:

```
awplus# configure terminal
awplus(config)# no service wireless
```

Output The following shows typical output.

Example output from `no service wireless`

```
awplus(config)#no service wireless
% Save the config and restart the device for this change to take
 effect
```

Command changes Version 5.5.0-0.1: command added

session-keep

Overview Use this command to enable the session-keep feature. After successful authentication this feature redirects the web browser back to the originally requested URL. If both **session-keep** and **redirect-url** are enabled, session-keep takes precedence.

Use the **no** variant of this command to disable the session-keep feature.

Syntax
```
session-keep
no session-keep
```

Default Not set by default.

Mode Wireless Network Captive Portal Configuration

Example To configure session-keep for Captive Portal authentication on network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# session-keep
```

Related commands

mac-auth password

mac-auth username

page-proxy-url

radius auth group (wireless-network-cp)

redirect-url

Command changes Version 5.4.9-1.1: command added

session-key-refresh-action

Overview Use this command to set the action after the interval has expired for the session key used in a WPA-enterprise security configuration.

Use the **no** variant of this command to revert to the default action.

Syntax

```
session-key-refresh-action {reauthentication|disconnection}
no session-key-refresh-action
```

Parameter	Description
`reauthentication`	The client will be asked to re-authenticate after the session expires.
`disconnection`	The client will be disconnected when the session expires.

Default Reauthentication.

Mode Wireless Security WPA-enterprise Configuration

Usage notes This command will not work if the **`session-key-refresh-interval`** command is set to a non-zero value.

Example For a WPA-enterprise configuration, to set disconnect as the action after the expire session-key refresh interval, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 100 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# session-key-refresh-action
 disconnection
```

Related commands **show wireless security**

session-key-refresh-interval

Command changes Version 5.5.1-2.1: command added

session-key-refresh-interval

Overview Use this command to set the refresh interval for the session key used in a WPA-enterprise security configuration.

Use the **no** variant of this command to set the refresh interval to the default.

Syntax

```
session-key-refresh-interval <0-86400>
no session-refresh-key-interval
```

Parameter	Description
<0-86400>	The refresh interval in seconds.

Default The default refresh interval is 0 seconds.

Mode Wireless Security WPA-enterprise Configuration

Usage notes This command is for TQ series devices only.

Example To set 7200 seconds as the session key refresh rate, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wep-ent)# session-key-refresh-
interval 7200
```

Related commands **security (wireless)**

session-timeout-interval (wireless network-cp)

Command changes Version 5.4.7-2.4: command added

session-timeout-action (wireless network-cp)

Overview Use this command to limit the connection time for clients on a Captive Portal session. When the session times-out, the client will either be presented with the authentication page or be disconnected.

Use the **no** variant of this command to revert to the default action.

Syntax

```
session-timeout-action {reauthentication|disconnection}
no session-timeout-action
```

Parameter	Description
`reauthentication`	The client must re-authenticate before continuing to use the Captive Portal session.
`disconnection`	The client will be disconnected when the Captive Portal session expires. The client can decide whether or not to go through the process of re-authentication.

Default Reauthentication.

Mode Wireless Network Captive Portal Configuration

Usage notes This command will not work if the **`session-timeout-interval`** command is set to a non-zero value.

Example To disconnect an AP after its Captive Portal session has expired, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 100
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# session-timeout-action
 disconnection
```

Related commands **show wireless network**

session-timeout-interval (wireless network-cp)

Command changes Version 5.5.1-2.1: command added

session-timeout-interval (wireless network-cp)

Overview Use this command to set the session-timeout-interval for authenticated clients in a Captive Portal configuration.

Use the **no** variant of this command to revert to the default session-timeout-interval value.

Syntax

```
session-timeout-interval <0-86400>
no session-timeout-interval
```

Parameter	Description
<0-86400>	The session-timeout-interval value in seconds. To disable the timeout function, set a value of '0' seconds.

Default 3600 seconds.

Mode Wireless Network Captive Portal Configuration

Example To configure a session-timeout-interval of 1800 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 100
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# session-timeout-interval
 1800
```

Related commands

Command changes Version 5.5.1-2.1: command added

show debugging wireless

Overview Use this command to see what debugging is turned on for wireless management.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Syntax
```
show debugging wireless
```

Mode User Exec and Privileged Exec

Example
```
awplus# show debugging wireless
```

Output The following shows typical output.

Example output from the `show debugging wireless` command

```
awplus#show debugging wireless
 Wireless debugging is on
 Wireless all modules debugging is on
 Wireless warning level debugging is on
```

Related commands **show wireless**

show wireless

Overview Use this command to show the overall wireless status information.

Syntax
```
show wireless
```

Mode Privileged Exec

Example To show the overall wireless status on a device, use the command:
```
awplus# show wireless
```

Output
```
awplus> show wireless
Wireless Controller Mode ........ Enable
Management IP Address ........... 192.168.8.30
Rogue AP Detection .............. Enable
Neighbor Managed AP Detection ... Enable
Emergency Mode .................. Activate
 Activated User ................. Emergency USB by Example Key1
 Activated Time ................. 2022-04-27 12:11:36
Emergency USB trigger ........... Enable
 Trigger Key1 ................... Example Key1
  Description ................... ABC School USB1
 Trigger Key2 ................... Example Key2
  Description ................... ABC School USB2
Log ............................. Disable
Log Destination ................. USB
Log Size Wireless Client ........ 50
Log Rotate Wireless Client ...... 1
Log Rotate neighbor AP .......... 1
Log Interval neighbor AP ........ 30

Command changes Version 5.4.7-2.4: command added.

show wireless ap

Overview Use this command to display the configuration and status of wireless Access Points (APs).

Syntax

```
show wireless ap {<ap-id-range>|all} [brief|status|detail]
```

Parameter	Description
<ap-id-range>	Display the configuration and status for a selected AP or range of APs, <1-65535>.
`all`	Display the configuration and status of APs.
`brief`	Display the brief configuration details of APs.
`status`	Display the status of APs.
`detail`	Display the detailed status and device information of APs.

Mode Privileged Exec

Example To display the status and configuration of wireless APs, use the following command:

```
awplus# show wireless ap
```

Output The following shows typical output.

Example output from `show wireless ap`

```
awplus#show wireless ap
AP ID 1:

show wireless ap capability

Overview Use this command to display the configured specifications of a supported wireless Access Point (AP).

Syntax

```
show wireless ap capability
show wireless ap capability hwtype <modelname>
show wireless ap capability hwtype {tq|mws} [single|dual|triple]
 [spec {11ac|11ax||11n}] [radio {1|2|3}] [country <country-
code>]
```

Parameter	Description
`hwtype`	To specify the display of a hardware type. When omitted, all hardware types will be displayed.
<modelname>	The model name of the wireless AP capabilities to be displayed. See **hwtype** for a full list of model names.
`tq`	Display hardware type AT-TQ series only.
`mws`	Display hardware type AT-MWS series only.
`single`	Display information for only APs with a single radio.
`dual`	Display information for only APs with dual radios.
`triple`	Display information for only APs with triple radios.
`spec`	To specify the display of an IEEE wireless networking standard mode. When omitted, all modes are displayed.
`11ac`	Display information for the 802.11ac mode only.
`11ax`	Display information for the 802.11ax mode only.
`11n`	Display information for the 802.11n mode only.
`radio`	To specify a radio bandwidth. When omitted, all radio bandwidths are displayed.
`1`	Display information for radio 1 (bandwidth 2.4GHz only).
`2`	Display information for radio 2 (bandwidth 5GHz only).
`3`	Display information for radio 3.
`country`	To specify the display for a country. When omitted, the default country will be displayed.
<country-code>	Display the specified country code. The default country code is ‘jp’ for Japan or ‘us’ for other regions.

Mode User Exec and Privileged Exec

Output The following shows typical output.

Example output from `show wireless ap capability`

```
awplus#show wireless ap capability

Version 5.4.9-1.1: *<modelname>* parameter added.

show wireless ap clients

Overview Use this command to display information about the clients on an AP or APs that this device is managing through the Wireless Controller.

If no parameters are specified, then all clients on all APs are displayed.

Syntax `show wireless ap [<ap-id-range>|all] clients [radio <1-3>]`

Parameter	Description
`<ap-id-range>`	Display information for the selected AP, or a range of APs, from 1 to 65535.
`all`	Display all APs' clients.
`<`	Radio interface number.

Mode User Exec and Privileged Exec

Example To display the clients for all APs, use the following command:

```
awplus# show wireless ap clients
```

Output The following shows typical output.

Example output from `show wireless ap clients`

```
awplus#show wireless ap clients
-------------------------------------------------------------------------------

```

Related commands radio (wireless-ap)

Command changes Version 5.4.7-2.4: command added

show wireless ap neighbors

Overview Use this command to display the neighboring wireless Access Points (APs) connected to a radio or range of radios. If no parameters are specified, then all configurations are displayed.

Syntax

```
show wireless ap [<ap-id-range>|all] neighbors [radio <1-3>]
```

Parameter	Description
<ap-id-range>	Show the radio and wireless neighbors associated with an AP or range of APs. To select a range, use the range format <1-65535>.
`all`	Display the radio and neighbors for all APs.
`<`	Radio interface number.

Mode User Exec and Privileged Exec

Example To display wireless AP neighbors, use the following command:

```
awplus# show wireless ap neighbors
```

Output The following shows typical output.

Example output from `show wireless ap neighbors`

```
awplus#show wireless ap neighbors
BSSID          ESSID                     R Ch  Sig AP    Detected

show wireless ap power-channel

Overview Use this command to display the currently configured status of an Access Point (AP) power-channel. If the command parameters are omitted, then the status for all APs will display.

Syntax

```
show wireless ap [<ap-id-range>|all] power-channel
```

Parameter	Description
<ap-id-range>	Display the current power-channel status for a selected AP or range of APs in the format <1-65535>
`all`	Display the current power-channel status for all APs.

Mode User Exec and Privileged Exec

Example To display the currently configured power-channel status for APs, use the command:

```
awplus# show wireless ap power-channel
```

Output The following shows typical output.

Example output from `show wireless ap power-channel`

```
awplus#show wireless ap power-channel
AP    MAC address    Radio1         Radio2

Command changes Version 5.4.7-2.4: command added.

show wireless ap-profile

Overview Use this command to display the AP-profile configuration for a wireless network.

Syntax `show wireless ap-profile [<ap-profile-id-range>|all] [brief]`

Parameter	Description
<ap-profile-id-range>	Displays the AP-profile information for an ID range. The ID range is <1-65535>.
`all`	Displays all AP-profile configurations.
`brief`	Displays a brief summary of AP-profile configurations.

Mode User Exec and Privileged Exec

Output The following shows typical output.

Example output from `show wireless ap-profile brief`

```
awplus#show wireless ap-profile brief

Command changes

Version 5.4.7-2.4: command added

show wireless auto-config

Overview Use this command to display operational status for automatically configured wireless networks, profiles and APs.

Syntax
```
show wireless auto-config
```

Mode Privileged Exec

Example To display current information about an automatic configuration session, use the command:

```
awplus# show wireless auto-config
```

Output The following shows typical output.

Example output from `show wireless auto-config`

```
awplus#show wireless auto-config
Last Time executed: 2018-2-26 13:05:26
Last Time updated: 2018-2-26 13:07:33
AP-Profile: 10
Country-code: Not set
Status: Creating configuration

IP Address       MAC Address     Hwtype          AP    Prof   Status
---------------- --------------- --------------- ----- ------ --------
192.168.120.117  0067.5ebb.92c4  tq-single-11n   -     -      NoMatch
192.168.120.113  0067.5e00.5301  tq-dual-11ac    -     -      Collected

192.168.120.115  0067.5eac.606f  tq-dual-11ac    -     -      Awaiting
```

Parameters in the output from `command name`

Parameter	Description
`Last Time executed`	The time that the wireless automatic configuration was last executed.
`Last Time updated`	The time that any AP status was last updated.
`auto-config Time-out`	The time that an automatic configuration session timed out. If the wireless controller completed a session before timing out, then it will show this time.
`AP-Profile`	Specified AP Profile ID for new configurations, or new profile ID of an automatically created one.
`Country-code`	This is a specified two letter code representing the country for the AP profile. If no country is specified then it appears as “Not set”.
`Status`	**Initialized:** Wireless automatic discovery of AP list started. **In Progress:** Discovery AP list achieved, now collecting data and creating configuration. **IP Modifying:** Modifying IP address after creating another configuration (this status is brief in time). **Completed:** All configuration is finished successfully. **Aborted:** Automatic configuration process was stopped using the command **`wireless auto-config abort`**. **Failed:**

Parameter	Description
	Wireless automatic configuration failed, for example “Failed to set profile to discovered AP”.
`IP Address`	Discovered wireless access point IP address.
`MAC Address`	Discovered wireless access point MAC address.
`Hwtype`	Discovered wireless access point hardware type.
`AP`	AP configuration for discovered wireless access points.
`Prof`	AP profile that attach to discovered wireless access points.
`Status`	Discovered wireless access points status: **Awaiting:** Waiting for completion of collecting the data. **Modify:** AP MAC address already exists. It will modify the IP address. **Skip:** Already configured AP MAC address and IP address, so will do nothing. **Done:** Successful retrieval of hardware type (model name) and configuration created. **NoMatch:** hardware type of specified AP profile did not match. **NoResp:** Centralized Wireless Manager (CWM) Agent(AP) did not respond. **Failed:** Failed to create configuration, for example “failed to create network %d”.

Command changes

Version 5.4.8-1.1: command added

show wireless captive-portal network walled-garden

Overview Use this command to display wireless network walled garden entries for Captive Portal.

Syntax

```
show wireless captive-portal {<network-ID>|all} walled-garden
```

Parameter	Description
<network-ID>	Display output for the specified wireless network ID or range of network IDs, valid network IDs are <1- 65535>.
`all`	Display all wireless network walled garden entries.

Mode Privileged Exec

Example To display the walled garden entries for Captive Portal on network 5, use the commands:

```
awplus# show wireless captive-portal network 5 walled-garden
```

Output The following shows typical output.

Example output from `show wireless captive-portal network 5 walled-garden`

```
awplus#show wireless captive-portal network 5 walled-garden
WALLED GARDEN LIST FOR NETWORK ID 5:
 Entries ..................... 3
    Walled Garden
    ------------------------------
    example.com
    1.1.1.1
    1.1.1.0/24
```

Related commands **captive-portal virtual-ip**

Command changes Version 5.5.0-1.3: command added

show wireless channel-blanket ap status

Overview Use this command to display the channel blanket status for a single or range of wireless APs. An AP whose AP ID is displayed as "-" is an AP that is not part of an AWC Lite configuration. If an AP ID (or range) is not selected, then the status of all APs will be displayed.

Syntax

```
show wireless channel-blanket ap {<ap-idrange> | all} status
```

Parameter	Description
<ap-idrange>	The AP ID, or range of IDs <1-65535>
`all`	Display the channel blanket status of all APs

Mode Privileged Exec

Example To display the wireless channel blanket status for AP 100, use the command:

```
awplus# show wireless channel-blanket ap 100 status
```

Output The following shows typical output.

Example output from `show wireless channel-blanket ap status`

```
awplus#show wireless channel-blanket ap 100 status
 AP: 100
 Last Update Time: 2018-10-04 01:33:33
 Number of CB member: 5
  AP    MAC Address
  ----- ----------------
  11    001a.eb12.3456
  12    001a.eb12.3457
  13    001a.eb12.3458
  14    001a.eb12.3459
  -     001a.eb12.3460
```

Related commands **ap**

channel-blanket

Command changes Version 5.4.9-1.1: command added

show wireless channel-blanket ap-profile status

Overview Use this command to display the channel blanket status of AP profiles. The command displays the number of channel blanket APs configured and visible from each AP to which the profile is assigned. An AP whose member is displayed as "-" is an AP that is not part of the channel blanket. If an AP Profile (or range) is not selected, then all APs profiles will be displayed.

Syntax

```
show wireless channel-blanket ap-profile {<profile-id> | all}
 status
```

Parameter	Description
<profile-id>	The AP Profile ID, or range of IDs <1-65535>.
`all`	Display the status of all APs in the AP profile.

Mode Privileged Exec

Example To display the wireless channel blanket status for APs belonging to AP profile 100, use the following command:

```
awplus# show wireless channel-blanket ap-profile 100 status
```

Output The following shows typical output.

Example output from `show wireless channel-blanket ap-profile`

```
awplus#show wireless channel-blanket ap-profile 100 status
AP Profile: 100
 AP    Member TimeStamp
 ----- ------ -------------------
 11    4      2018-10-04 01:33:33
 12    4      2018-10-04 01:33:29

Command changes Version 5.4.9-1.1: command added

show wireless country-code

Overview Use this command to display a list of country codes that an Access Point (AP) can use in a wireless configuration.

Syntax
```
show wireless county-code
```

Mode User Exec and Privileged Exec

Example To display a list of country codes, use the command:
```
awplus# show wireless country-code
```

Output The following shows typical output.

Example output from `show wireless country-code`

```
awplus#show wireless country-code
Code  Country
----  -------------------------------
AD    Andorra
AE    United Arab Emirates
AF    Afghanistan
AG    Antigua and Barbuda
AI    Anguilla
AL    Albania
AM    Armenia
AN    Netherlands Antilles
AO    Angola
AR    Argentina
AS    American Somoa
AT    Austria
AU    Australia
AW    Aruba
AZ    Azerbaijan
......
```

Related commands **show wireless ap capability country-code**

Command changes Version 5.4.7-2.4: command added.

show wireless network

Overview Use this command to display a wireless network configuration.

If you use the **brief** parameter, a summary of the configuration will be displayed, otherwise a detailed version is displayed.

Syntax `show wireless network [<network-id-range>|all] [brief]`

Parameter	Description
<network-id-range>	Display the network configuration for a selected wireless network ID or network ID range <1-65535>.
`all`	Display the configuration for all wireless networks.
`brief`	Display a brief summary of the wireless network configuration.

Mode User Exec

Example To display the brief wireless network configuration, use the command:

```
awplus# show wireless network brief
```

Output The following shows typical output.

Example output from `show wireless network brief`

```
awplus#show wireless network brief
ID    VLAN  SSID              H E  Sec ID MAC-Auth Web-Auth
----- ----  ----------------  ----- ----- -------- --------

Command changes

Version 5.4.7-2.4: command added.

show wireless power-channel calculate

Overview Use this command to display the result of the optimal power per channel as calculated by Autonomous Wave Control (AWC).

Note: To see the currently assigned power per channel, use the command **show wireless ap power-channel**.

Syntax
```
show wireless power-channel calculate
```

Mode Privileged Exec

Example To display the optimal power for each channel as calculated by AWC, use the following command:

```
awplus# show wireless power-channel calculate
```

Output The following shows typical output.

Example output from `show wireless power-channel calculate`

```
awplus#show wireless power-channel calculate

show wireless sc-profile

Overview Use this command to display the Smart Connect profile configuration.

Syntax `show wireless sc-profile [<sc-profile-range>|all] [brief]`

Parameter	Description
<sc-profile-range>	The Smart Connect profile ID or IDs to display. Select from the range 1-65535
`all`	Display all Smart Connect profiles
`brief`	Display a brief summary of the Smart Connect profile configuration

Mode Privileged Exec

Example To display all the Smart Connect profile information, use the command:

```
awplus# show wireless sc-profile all
```

Output The following shows typical output.

Example output from `show wireless sc-profile all`

```
awplus#show wireless sc-profile all
SC-PROFILE ID 1:
 Description ................... SC PROFILE 01

show wireless security

Overview Use this command to display the wireless security configuration.

Syntax

```
show wireless security [<security-id-range>|all] [brief|detail]
```

Parameter	Description
<security-id-range>	Display the security configuration for a specified ID range. Specify the ID range using the format <1-65535>
`all`	Display all wireless security configurations.
`brief`	Display a brief summary of the security configuration.
`detail`	Display detailed information about the security configuration, including any security keys.

Mode Privileged Exec

Examples To display a brief summary of the wireless security configuration, use the following command:

```
awplus# show wireless security brief
```

To display a longer summary of the wireless security configuration, use the following command:

```
awplus# show wireless security
```

To display a detailed wireless security configuration, use the following command:

```
awplus# show wireless security detail
```

Output The following shows typical output.

Example output from `show wireless security brief`

```
awplus# show wireless security brief

Command changes Version 5.5.3-1.1: Keys moved to output of **detail** parameter.

Version 5.4.7-2.4: command added.

show wireless smart-connect ap

Overview Use this command to display AP connection status for Smart Connect.

Syntax

```
show wireless smart-connect ap [<sc-ap-range>|all] status
```

Parameter	Description
<sc-ap-range>	Display the connection status for a single Smart Connect AP or range of APs. Select from ID range 1-65535.
`all`	Display the connection status for all Smart Connect APs.

Mode Privileged Exec

Output The following shows typical output.

Example output from `show wireless smart-connect ap all status`

```
awplus#show wireless smart-connect ap all status
SC-PROFILE ID: 1
Last Update Time: 2019-12-12 11:14:35
Number of Smart Connect member: 1
AP    MAC Address         VAP Rx  VAP Tx  STA Rx  STA Tx (KB/sec)
----- ------------------- ------- ------- ------- -------
    1 * 0000.5e00.5301        1.3     2.2     0.0     0.0
    2 |- 0000.5e00.5302       0.0     0.0     0.5     0.7
    3 |- 0000.5e00.5303       0.0     0.0     0.5     0.6
```

Related commands **smart-connect-profile**

sc-profile

Command changes Version 5.5.0-0.1: command added

show wireless task

Overview Use this command to display the tasks associated with Autonomous Wave Control (AWC).

Syntax

```
show wireless task [<task-id-range>] [brief|status]
```

Parameter	Description
<task-id-range>	Display the task information for a specific task ID or ID range.
`brief`	Display the task information in summary format.
`status`	Display the task status information. For example the date and time that the task will be performed next.

Mode User Exec and Privileged Exec

Usage notes An AWC task is a periodic or scheduled action to be taken, such as applying a configuration to an Access Point (AP) on a specified date, or calculating optimal AP power-channel usage and applying the results to all APs. See the **task** command for more details.

Example To display the configured AWC tasks in detail, use the command:

```
awplus# show wireless task
```

Output The following shows typical output.

Example output from `show wireless task`

```
awplus# show wireless task
Task ID 1: Enable
 Description ................... task1
 Time ........................... 10:00
 Day ............................ Sun,Wed,Sat
 Type ........................... Download
  AP ............................ 2-5

show wireless wds

Overview Use this command to display the configuration of a Wireless Distribution System (WDS) with Autonomous Wave Control. A WDS enables the wireless interconnection of Access Points (APs) or Peers in an IEEE802.11 network.

Syntax

```
show wireless wds [<wds-id-range>][brief]
```

Parameter	Description
<wds-id-range>	Display the configured information for a specified ID or a range of IDs. To display a range of WDS IDs, use the format <1-65535>.
`brief`	Display a brief summary of the WDS configuration.

Mode User Exec and Privileged Exec

Example To display the full detail of a WDS configuration for a wireless network, use the following command:

```
awplus# show wireless wds
```

Output The following shows typical output.

Example output from `show wireless wds`

```
awplus#show wireless wds
WDS ID 1: Enable
 Peer 1st AP ..................... 10
      2nd AP ..................... 11
 Security ....................... 100

WDS ID 2: Enable
 Peer AP1 ....................... 20
      AP2 ....................... abcd.1234.6789
 Security ....................... 100

WDS ID 3: Disable
Peer AP1 ....................... 30
     AP2 ....................... 16
Security ....................... 200
```

Example output from `show wireless wds brief`

```
awplus# show wireless wds brief
ID    Status  Peer 1st AP    Peer 2nd AP    Security
----- ------- -------------- -------------- --------
1     Enable  10             11             100
2     Enable  20             abcd.1234.6789 100
3     Disable 30             16             200
```

Command changes

Version 5.4.7-2.4 command added.

show wireless wireless-mac-filter

Overview Use this command to display the wireless MAC filter configuration for Autonomous Wave Control.

Syntax

```
show wireless wireless-mac-filter [<mac-filter-range>|all]
 [brief]
```

Parameter	Description
<mac-filter-range>	<1-65535>Display the information for a specified ID or range of IDs.
`all`	Display the information for all MAC filters.
`brief`	Display a brief summary of the information

Mode Privileged Exec

Output The following shows typical output.

Example output from `show wireless-mac-filter`

```
awplus#show wireless wireless-mac-filter

WIRELESS MAC FILTER ID 100:
  Description ................... Floor 1
  Rule........................... deny
  Entries ....................... 3
  Entries ....................... 2
    MAC address    Description
    -------------- ---------------
    1234.5678.abcd PC lab 1
    0987.6543.abcd guest
    abcd.9876.5432

show wireless wireless-trigger

Overview Use this command to display the wireless trigger status on a wireless network.

Syntax

```
show wireless wireless-trigger [all|<trigger-id>]
```

Parameter	Description
<trigger-id>	Select an ID number between 1-8. You can also select a range of IDs using a comma separated list.

Default All

Mode Privileged Exec and User Exec

Example To display the status for all wireless triggers, use the commands:

```
awplus# show wireless wireless-trigger
```

Output The following shows typical output.

Example output from `show wireless wireless-trigger`

```
awplus> show wireless wireless-trigger
Wireless Trigger ID 1:
 Description ................... Trigger 1
 Status ........................ Inactive
Wireless Trigger ID 2:
 Description ................... Trigger 2
 Status ........................ Active
  Activated User ............... Admin
  Activated Time ............... 2020-12-28 12:11:34
```

single-channel-scan enable

Overview Use this command to allow single channel scanning on the AP profile radio configuration.

Use the **no** variant of this command to disable single channel scanning for APs of a specified AP profile.

Syntax
```
single-channel-scan enable
no single-channel-scan enable
```

Default Disabled.

Mode Wireless AP Profile Configuration

Example To enable single channel scan for APs of a specified AP profile, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile local
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# enable
awplus(config-wireless-ap-prof-radio)# neighbor-ap-detection
 enable
awplus(config-wireless-ap-prof-radio)# single-channel-scan
 enable
```

To disable single channel scan for APs of a specified AP profile, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile local
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# no single-channel-scan
 enable
```

Related commands
show wireless ap profile

Command changes Version 5.5.5-0.1: command added

single-channel-scan duration

Overview Use this command to set the duration for a single channel Radio Frequency Scan (RFScan).

This value is used in AP-Profile configuration

Use the **no** variant of this command to reset the duration of a single channel RFScan to the default value.

Syntax

```
single-channel-scan duration <10-2000>
no single-channel-scan duration
```

Parameter	Description
<10-2000>	The scan duration in milliseconds.

Default The default scan duration is 50 milliseconds.

Mode Wireless AP Profile Radio Configuration

Example To set the duration of a single RFScan to 120 milliseconds on Radio 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile local
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# single-channel-scan
 duration 120
```

To reset the duration of a single RFScan to the default value on Radio 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile local
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# no single-channel-scan
 duration
```

Related commands **show wireless ap-profile**

single-channel-scan keep-data-time

Command changes Version 5.5.5-0.2: command added

single-channel-scan interval

Overview Use this command to set the interval time for a single channel Radio Frequency Scan (RFScan).

This value is used in AP-Profile configuration

Use the **no** variant of this command to reset the interval time of a single channel RFScan to the default value.

Syntax

```
single-channel-scan interval <30-120>
no single-channel-scan interval
```

Parameter	Description
<30-120>	The scan interval time in seconds.

Default The default scan duration is 60 seconds.

Mode Wireless AP Profile Radio Configuration

Example To set the interval time of a single RFScan to 120 milliseconds on Radio 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile local
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# single-channel-scan
 interval 80
```

To reset the interval time of a single RFScan to the default value on Radio 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile local
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# no single-channel-scan
 interval
```

Related commands

single-channel-scan keep-data-time

single-channel-scan duration

Command changes Version 5.5.5-0.2: command added

single-channel-scan keep-data-time

Overview Use this command to set the retention time for data obtained from a single channel Radio Frequency Scan (RFScan).

Use the **no** variant of this command to set the retention time to the default.

This value is used in AP-Profile configuration

Syntax

```
single-channel-scan keep-data-time <1800-7200>
no single-channel-scan keep-data-time
```

Parameter	Description
<1800-7200>	The retention time to keep the RFScan result in seconds.

Default The default time to keep the RFScan result is 3600 seconds.

Mode Wireless AP Profile Radio Configuration

Example To set the time to keep information of a single RFScan result to 4200 seconds on Radio 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile local
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# single-channel-scan keep-data-time 4200
```

To reset the time to keep information of a single RFScan result to the default value on Radio 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile local
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# no single-channel-scan keep-data-time
```

Related commands **show wireless ap-profile**

Command changes Version 5.5.5-0.2: command added

smart-connect-profile

Overview Use this command to create a Smart Connect profile and enter the Smart Connect profile configuration mode.

Use the **no** variant of this command to delete a Smart Connect profile from the wireless configuration.

Syntax

```
smart-connect-profile <1-65535>
no smart-connect-profile <1-65535>
```

Parameter	Description
<1-65535>	The Smart Connect profile ID

Default Not set

Mode Wireless Configuration

Example To configure Smart Connect profile 10 and enter the Smart Connect profile configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)#
```

To delete Smart Connect profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no smart-connect-profile 10
```

snmp (wireless-ap-prof)

Overview Use this command to enter SNMP configuration mode so you can add an SNMP configuration.

Use the **no** variant of this command to reset the SNMP parameters back to the default (not set).

Syntax
```
snmp
no snmp
```

Default Not set

Mode Wireless AP Profile Configuration

Example To enter the SNMP configuration mode of AP profile 2, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)#
```

To disable SNMP, use the commands:

```
awplus# configure terminal

Command changes Version 5.5.0-2.1: command added

ssid (wireless-network)

Overview Use this command to configure the SSID (Service Set Identifier) for the wireless network.

Syntax

```
ssid <value>
```

Parameter	Description
<value>	The unique alphanumeric description or name of the SSID. The maximum character length is 32.

Default Default- {NETWORKID}.

Except for the default Guest Network, the default SSID for each network is 'Default-' followed by the unique Network ID.

Mode Wireless Network Configuration

Usage notes A network must be configured with an SSID of one or more alphanumeric characters. The SSID can be modified, but cannot be deleted.

Example To configure a SSID name for a wireless network, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# ssid GUEST_NETWORK_1
```

Related commands **network (wireless)**

show wireless network

Command changes Version 5.4.7-2.4: command added.

ssid (wireless-sc-prof)

Overview Use this command to set the SSID used for wireless communication between APs in a Smart Connect network.

Use the **no** variant of this command to remove the SSID from a Smart Connect profile.

Syntax

```
ssid <ssid-value>
no ssid
```

Parameter	Description
<ssid-value>	The SSID for the Smart Connect network. Enter a string up to 32 characters in length.

Default Not set

Mode Wireless Smart Connect Profile Configuration

Example To set the SSID ID of 10 used for wireless communication between APs in Smart Connect network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 20
awplus(config-wireless-sc-prof)# ssid SC-NETWORK-10
```

Related commands

station-isolation enable

Overview Use this command to enable to the station-isolation option on channel blanket for a wireless AP profile. When station-isolation is enabled, the AP blocks communication between wireless clients on the same virtual access point (VAP). The AP still allows data traffic between its wireless clients and wired devices on the network.

Use the **no** variant of this command to disable the station-isolation option.

Syntax
```
station-isolation enable
no station-isolation enable
```

Default Disabled.

Mode Wireless AP Profile Channel Blanket Configuration

Example To enable station-isolation for channel blanket on AP profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# station-isolation enable
```

Related commands
ap-profile (wireless-ap)
show wireless ap-profile
channel-blanket

Command changes Version 5.4.9-1.1: command added

station-isolation enable (wireless-ap-prof-radio)

Overview Use this command to enable the **station-isolation** option. This option designates whether to allow communication between wireless clients which are connected to the same Virtual Access Point (VAP).

Use the **no** variant of this command to disable the station-isolation option on a selected VAP.

Syntax

```
station-isolation enable
no station-isolation enable
```

Parameter	Description
`enable`	Enable the station-isolation option.

Default Disabled.

Mode Wireless AP Profile Radio Configuration

Example To enable the station-isolation option for **radio 2** on **ap-profile 100**, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# station-isolation enable
```

Related commands

task

Overview Use this command to configure an Autonomous Wave Control (AWC) task.

If the task doesn't exist, then this command creates it.

Use the **no** variant of this command to remove the task.

Syntax

```
task <1-65535>
no task <1-65535>
```

Parameter	Description
<1-65535>	Task ID number

Default Not set.

Mode Wireless Configuration

Usage notes A task is a configuration for a periodic or scheduled action to be taken. For example, the task may be to run a configuration, start an AWC calculation, or download AP firmware. Use commands such as **description**, **time**, and **day** to configure the task actions.

Example To add a task with an ID of 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 10
```

To remove task ID 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no task 10
```

time (wireless-task)

Overview Use this command to set a time to run a task using the 24-hour format.

You can use the **day** command along with the **time** command to more fully set the task run time configuration.

Use the **no** variant of this command to remove the time set to run a task.

Syntax

```
time <HH:MM>
no time
```

Parameter	Description
<HH:MM>	The time set to run a task in 24-hour time format.

Default Not set.

Mode Wireless Task Configuration

Example To set task 5 to run at 11:15 pm, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# time 23:15
```

Related commands

trap host (wireless-ap-prof-snmp)

Overview Use this command to add an SNMP trap host to the entry for the target AP Profile.

Use the **no** variant of this command to remove the specified SNMP trap host from the entry.

Syntax

```
trap host <host-name>
no trap host <host-name>
```

Parameter	Description
<host-name>	The host that sends the SNMP trap. Specify the host name (FQDN) or IP address. For example manager.your.domain.com, 10.10.1.37.

Default The entry is empty.

Mode Wireless AP Profile SNMP Configuration

Usage notes The maximum number of registrations is 3 entries.

Example To add the SNMP trap host 192.168.1.1 to the entry, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# trap host 192.168.1.1
```

To remove the SNMP trap host 192.168.1.1 from the entry, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no trap host 192.168.1.1
```

Related commands

type (wireless-sec-wep)

Overview Use this command to assign the key-string type for a wireless security WEP configuration.

Use the **no** variant of this command to reset the assigned WEP key-string type to the default.

Syntax

```
type {ascii|hex}
no type
```

Parameter	Description
ascii	Use ASCII as the type for the WEP key
hex	Use Hex as the type for the WEP key

Default Hex.

Mode Wireless Security WEP Configuration

Example To configure ASCII as the key-string type for WEP for a wireless security WEP configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10 mode wep
awplus(config-wireless-sec-wep)# type ascii
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added.

type ap-configuration apply ap

Overview Use this command to apply a task configuration type to a selected wireless Access Point (AP) or range of wireless APs.

Syntax

```
type ap-configuration apply ap {all|<ap-id-range>}
```

Parameter	Description
`all`	Apply the configuration to all APs.
<ap-id-range>	Apply the configuration to a selected range of APs.

Default Not set.

Mode Wireless Task Configuration

Example To assign task 5 configuration to wireless AP ranges: 5-9 and 15-19, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# type ap-configuration apply ap
 5-9,15-19

ap

type download ap (wireless-task)

Command changes Version 5.4.7-2.4: command added.

type download ap (wireless-task)

Overview Use this command to download and update wireless Access Point (AP) firmware. The firmware must be stored on an HTTP server.

Syntax

```
type download ap {all|<ap-id-range>} url <URL> [username <user-name> password <password> [encrypted]]
```

Parameter	Description
`all`	Run the task on all managed APs.
<ap-id-range>	Run the task on the selected identifier.
<URL>	The URL where the firmware is stored and can be downloaded from.
<user-name>	The username requiring authentication and access to the URL.
<password>	The password requiring authentication and access to the URL.
`encrypted`	Means that the password that follows is encoded, not plain text. This parameter is only used in generated configuration files. In configuration files, the device prints encrypted in front of passwords to indicate that it is displaying the encoded password.

Mode Wireless Task Configuration

Example To set a task to download new firmware from the IP address192.168.0.1 to a wireless AP which is assigned '7' as its identifier, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# type download ap 7 url
 http://192.168.0.1/AT-TQ4600-4.0.3.b02.img
```

Related commands

ap

type ap-configuration apply ap

type power-channel ap all

Command changes

Version 5.5.4-0.1: **encrypted** parameter added

Version 5.4.7-2.4: command added.

type power-channel ap all

Overview Use this command to calculate the power usage on wireless Access Point (AP) channels and apply the results manually or automatically.

Syntax

```
type power-channel ap all {calculate|apply|calculate-and-apply}
```

Parameter	Description
`calculate`	Run the AWC power calculation on all APs.
`apply`	Apply the latest AWC power calculation results to all APs.
`calculate-and-apply`	Run the AWC power calculation and apply the results to all APs.

Default Not set.

Mode Wireless Task Configuration

Usage notes This command allows you to monitor how APs are being utilized at various times and adjust AP power levels if required.

Example To calculate all AP power-channel usage and apply the results to all APs, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# type power-channel ap all
 calculate-and-apply
```

Related commands

Command changes Version 5.4.7-2.4: command added.

unauth-emergency-service-access enable (wireless-network-passpoint-dot11u)

Overview Use this command to configure unauthenticated access to emergency services. This makes emergency services available to any user, with or without a valid authentication credential.

Use the **no** variant of this command to disable unauthenticated access to emergency services.

Syntax
```
unauth-emergency-service-access enable
no unauth-emergency-service-access enable
```

Default Disabled.

Mode Wireless Network Passpoint 802.11u Configuration

Example To configure unauthenticated access to emergency services, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# unauth-emergency-service-access enable
```

Related commands **show wireless network**

dot11u (wireless-network-passpoint)

Command changes Version 5.5.0-2.3: command added

username (wireless-ap-prof-snmp)

Overview Use this command to set an SNMP version v3 username and password for the target AP profile. This command is valid for SNMP version v3 only.

Use the **no** variant of this command to remove an SNMP username and password.

Syntax

```
username <username> password [encrypted] <password>
no username
```

Parameter	Description
<username>	The user name that is used for user authentication and encryption. Enter up to 12 alphanumeric characters. The user name cannot begin with a number.
`encrypted`	Indicates that the following password is in its encrypted form. Its primary purpose is to use to store the shared key to startup-configuration. You should not use it when entering the command manually.
<password>	The password is used for encryption. Enter from 8 to 32 characters. Valid characters are: - alphanumeric characters - symbols except for the following 8 symbols: " $ & ' * : < >

Default Not set

Mode Wireless AP Profile SNMP Configuration

Example To set the SNMP username to 'manager' and the password to 'friend001', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# username manager password
 friend001
```

To remove the SNMP username and password, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof)# no username
```

Version 5.5.0-2.1: command added

vap (wireless-ap-prof-radio)

Overview Use this command to assign a network configuration ID to a Virtual Access Point (VAP) on a radio.

Use the **no** variant of this command to remove the network configuration for a VAP.

Syntax

```
vap <0-15> network <1-65535> [channel-blanket]
no vap <0-15>
```

Parameter	Description
<0-15>	VAP identification number
`network`	Designate the relevant network configuration identification for the selected VAP.
<1-65535>	Network configuration of the designated VAP
`channel-blanket`	Set the VAP to channel blanket mode

Mode Wireless AP Profile Radio Configuration

Usage notes The number of VAPs available depends on the access point model. See the AP's datasheet for details.

vap0 is the only VAP identification number valid on the **MWS series**.

Example To associate an AP with network (ID 2) to VAP 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# vap 2 network 2
```

Related commands

radio (wireless-ap-profile)

network (wireless)

Command changes Version 5.4.7-2.4: command added.

venue group (wireless-network-passpoint-dot11u)

Overview Use this command to designate the venue group used in a Passpoint 802.11u wireless configuration.

Use the **no** variant of this command to reset a venue group.

Syntax
```
venue group <0-255>
no venue group
```

Parameter	Description
<0-255>	The venue group code. See IEEE 802.11-2016, Table 9-61 page 756.

Default 7

Mode Wireless Network Passpoint 802.11u Configuration

Example To set a venue group, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# venue group 2
```

Related commands **show wireless network**

venue type (wireless-network-passpoint-dot11u)

Command changes Version 5.5.1-1.1: command added.

venue name (wireless-network-passpoint-dot11u)

Overview Use this command to designate the venue name and language code used in a Passpoint 802.11u wireless configuration.

Use the **no** variant of this command to remove a venue name.

Syntax

```
venue name <1-10> lang <lang-code> name <venue-name>
no venue name <1-10>
```

Parameter	Description
<1-10>	The venue name identifier number. If the specified identifier number does not exist, then a new one will be created. If it does exist, the language code and venue name will be overwritten.
<lang-code>	The language code. The code is 2 or 3 characters as specified in ISO-639. For example, 'eng' , 'jpn'
<venue-name>	The venue name. • You can enter up to 10 separate entries • The maximum number of characters is 252.

Default No name is set

Mode Wireless Network Passpoint 802.11u Configuration

Example To set a venue name, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# venue name 1
 lang eng name Allied Telesis Ltd
```

Related commands **show wireless network**

Command changes Version 5.5.1-1.1: command added.

venue type (wireless-network-passpoint-dot11u)

Overview Use this command to designate the venue type used in a Passpoint 802.11u wireless configuration.

Use the **no** variant of this command to reset a venue type.

Syntax
```
venue type <0-255>
no venue type
```

Parameter	Description
<0-255>	The venue type code. See IEEE 802.11-2016, Table 9-62 page 756-759.

Default 1

Mode Wireless Network Passpoint 802.11u Configuration

Example To set a venue type, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# venue type 2
```

Related commands **show wireless network**

venue group (wireless-network-passpoint-dot11u)

Command changes Version 5.5.1-1.1: command added.

version (wireless-ap-prof-snmp)

Overview Use this command to set the SNMP agent version for the target AP profile.

Use the **no** variant of this command to set it back to the default (v1 and v2c).

Syntax

```
version {v1v2c|v3}
no version
```

Parameter	Description
v1v2c	Set when the SNMP agent version is at v1 or v2c.
v3	Set when the SNMP agent version is v3.

Default v1v2c

Mode Wireless AP Profile SNMP Configuration

Example To set the SNMP version as v3, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# version v3
```

To set the SNMP listening port back to the default (v1v2c), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no version
```

versions (wireless-sec-osen)

Overview Use this command to set which Wi-Fi Protected Access (WPA) version to use with OSEN wireless security configuration. OSEN is Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. It is used with Release 2 of Hotspot 2.0 (Passpoint).

Use the **no** variant of this command to revert to the default setting (WPA2).

Syntax

```
versions <version-list>
no versions
```

Parameter	Description
<version-list>	The supported WPA version(s) list. The list can use either **wpa** or **wpa2** or **wpa3**, or two of these three, or all in any order. OSEN only allows the following combinations: • two combinations of **wpa** and **wpa2** • **wpa** only • **wpa3** only

Default WPA2.

Mode Wireless Security OSEN Configuration

Usage notes OSEN is a wireless security method used with Release 2 of Hotspot 2.0 (Passpoint) OSEN is short for Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. Use the **security** command to enter OSEN security configuration mode.

Example To set both WPA and WPA2 as WPA versions on a security configuration of OSEN, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode osen
awplus(config-wireless-sec-osen)# versions wpa wpa2
```

Related commands show wireless security

Command changes Version 5.5.0-2.3: command added

versions (wireless-sec-wpa-ent)

Overview Use this command to set the WPA version used for a WPA-enterprise wireless security configuration.

Use the **no** variant of this command to reset the designated version to the default.

Syntax

```
versions <version-list>
no versions
```

Parameter	Description
<version-list>	The version list. You can use either **wpa**, **wpa2**, **wpa3**, or any combination of the three in any order.

Default wpa2.

Mode Wireless Security WPA-enterprise Configuration

Usage notes For MWS series devices, a combination of versions and ciphers are supported as follows:

- versions WPA2 and ciphers CCMP
- versions WPA, WPA2, and ciphers TKIP and CCMP

WPA3 is only supported on TS5403 series devices.

Example To configure both WPA and WPA2 as WPA versions on a security configuration for WPA-enterprise, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# versions wpa wpa2
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added.

Version 5.4.9-1.1: **wpa3** parameter added.

versions (wireless-sec-wpa-psnl)

Overview Use this command to set the WPA version used for a WPA-personal wireless security configuration.

Use the **no** variant of this command to reset the designated version to the default.

Syntax

```
versions <version-list>
no versions
```

Parameter	Description
<version-list>	The version list. You can use either **wpa**, **wpa2**, **wpa3**, or any combination of the three in any order.

Default wpa2.

Mode Wireless Security WPA-personal Configuration

Usage notes For MWS series devices, a combination of versions and ciphers are supported as follows:

- versions WPA2 and ciphers CCMP
- versions WPA, WPA2, and ciphers TKIP and CCMP

WPA3 is only supported on TS5403 series devices.

Example To configure both WPA and WPA2 as WPA versions on a security configuration for WPA-personal, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# versions wpa wpa2
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added.

Version 5.4.9-1.1: **wpa3** parameter added.

vlan (wireless-network)

Overview Use this command to configure the wireless VLAN that clients belong to.

Use the **no** variant of this command to reset the wireless VLAN to the default.

Syntax
```
vlan <1-4094>
no vlan
```

Parameter	Description
<1-4094>	VLAN ID number.

Default VLAN1.

Mode Wireless Network Configuration

Example To configure a VLAN ID, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# vlan 100
```

To restore VLAN 20 to its default value, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no vlan
```

Related commands **network (wireless)**

Command changes Version 5.4.7-2.4: command added

walled-garden-dns-proxy enable

Overview Use this command to enable DNS proxy for a walled garden.

Use the **no** variant of this command to disable DNS proxy for a walled garden.

A 'walled garden' is often used in public Wi-Fi networks, such as those in airports, hotels, or cafes, to provide users with access to specific resources (such as a login page or certain informational websites) while preventing unrestricted access to the entire Internet.

The DNS proxy server intercepts DNS queries made by users' devices and redirects them to specific IP addresses associated with the allowed websites or services within the walled garden.

Syntax
```
walled-garden-dns-proxy enable
no walled-garden-dns-proxy enable
```

Default Disabled.

Mode Wireless Network Captive Portal Configuration

Example To enable DNS proxy for a walled garden, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# walled-garden-dns-proxy
 enable
```

Related commands **show wireless network**

walled-garden entry

Command changes Version 5.5.3-2.1: command added

walled-garden entry

Overview Use this command to configure a walled garden for Captive Portal.

On the Internet, a walled garden typically controls a user's access to web content and services. The walled garden directs the user's navigation within particular areas to allow access to a selection of websites or prevent access to other websites.

A common example could be a hotel environment where unauthenticated users are allowed to navigate to a designated login page (for example, a hotel website) and all its contents.

Use the **no** variant of this command to remove a walled garden on a wireless network that's configured with a Captive Portal.

Syntax

```
walled-garden entry {<ip-addr>|<ip-addr/mask>|<fqdn>}
no walled-garden entry {<ip-addr>|<ip-addr/mask>|<fqdn>}
```

Parameter	Description
<ip-addr>	IPv4 address format, e.g. 1.1.1.1
<ip-addr/mask>	IPv4 address format with subnet mask, e.g. 1.1.1.0/24
<fqdn>	FDQN format. Sequence of {LETTER/DIGIT/HYPHEN}.{LETTER/DIGIT/HYPHEN}...while each dotted part of the name (aa or bb or cc in this example) MUST NOT end with HYPHEN and the first character MUST be a LETTER or a DIGIT. And each dotted part (aa or bb or cc in this example) must be 63 characters or less, e.g. example.com or www.example.com You can use a wildcard, e.g.*.com, example.*

Default Not set

Mode Wireless Network Captive Portal Configuration

Example To add a new entry to a walled garden list on Captive Portal for network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# walled-garden entry
 example.com
```

Version 5.5.0-1.3: command added

wan-metrics downlink-load (wireless-network-passpoint-hs20)

Overview Use this command to set the wan-metrics downlink-load for Hotspot 2.0.

Use the **no** variant of this command to revert to the default value.

Syntax

```
wan-metrics downlink-load <0-255>
no wan-metrics downlink-load
```

Parameter	Description
<0-255>	WAN Metrics Down Link Load value Calculation formula: WAN line load factor (%) /100*255 For example: 75% -> 75/100*255=191

Default 80.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To set a WAN Metrics Down Link Load of 191, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# wan-metrics
 downlink-load 191
```

Related commands **show wireless network**

Command changes Version 5.5.0-2.3: command added

wan-metrics downlink-speed (wireless-network-passpoint-hs20)

Overview Use this command to set the wan-metrics downlink-speed for Hotspot 2.0.

Use the **no** variant of this command to revert to the default value.

Syntax

```
wan-metrics downlink-speed <1-4294967295>
no wan-metrics downlink-speed
```

Parameter	Description
<1-4294967295>	WAN Metrics Down Link Speed (kbps)

Default 8000.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To set a WAN Metrics Down Link Speed of 191 kbps, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# wan-metrics
 downlink-speed 191
```

Command changes Version 5.5.0-2.3: command added

wan-metrics info (wireless-network-passpoint-hs20)

Overview Use this command to configure the WAN Metrics Link Status information for Hotspot 2.0.

Use the **no** variant of this command to revert to the default value.

Syntax

```
wan-metrics info <HEX-value>
no wan-metrics info
```

Parameter	Description
<HEX-value>	A one or two digit hexadecimal number.
	Calculation formula: • (At Capacity << 3) | (Symmetric Link << 2) | (Link Status & 0x3) Bit placement: • Bit[3]: At Capacity • Bit[2]: Symmetric Link • Bit[1:0]: Link Status **At Capacity**: Set to 1 to notify you that the line capacity on the WAN side has reached the upper limit. **Symmetric Link**: Set to 1 to notify you that Uplink/ Downlink speed are the same value. **Link Status**: Configure as shown below: • 1 (0b01) : Link up • 2 (0b10) : Link down • 3 (0b11) : Link in test state

Default 01

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To set the WAN Metrics Link Status information, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# wan-metrics info
 01
```

wan-metrics load-measure-duration (wireless-network-passpoint-hs20)

Overview Use this command to set the wan-metrics load measure-duration for Hotspot 2.0.

Use the **no** variant of this command to revert to the default value.

Syntax

```
wan-metrics load-measure-duration <0-65535>
no wan-metrics load-measure-duration
```

Parameter	Description
<0-65535>	WAN Metrics Load Measure Duration value Calculation formula: Measurement interval (seconds)*10 For example: 2 second interval -> 2*10=20

Default 3000.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To set a WAN Metrics Load Measure Duration value of 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20

Use the **no** variant of this command to revert to the default value.

Syntax

```
wan-metrics uplink-load <0-255>
no wan-metrics uplink-load
```

Parameter	Description
<0-255>	WAN Metrics Up Link Load value Calculation formula: WAN line load factor (%) /100*255 For example: 75% -> 75/100*255=191

Default 240.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To set a WAN Metrics Up Link Load of 191, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint

Use the **no** variant of this command to revert to the default value.

Syntax

```
wan-metrics uplink-speed <1-4294967295>
no wan-metrics uplink-speed
```

Parameter	Description
<1-4294967295>	WAN Metrics Up Link Speed (kbps)

Default 1000.

Mode Wireless Network Passpoint Hotspot 2.0 Configuration

Example To set a WAN Metrics Up Link Speed of 10000 kbps, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint

wds

Overview Use this command to add a Wireless Distribution System (WDS) configuration.

Use the **no** variant of this command to remove a WDS configuration.

Syntax

```
wds <1-65535>
```

Parameter	Description
<1-65535>	WDS configuration ID number.

Default Not set.

Mode Wireless Configuration

Usage notes This command adds a WDS configuration and enters the configuration mode.

Example To add a WDS configuration for AWC, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wds 10
```

To remove a WDS configuration for AWC, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no wds 10
```

Use the **no** variant of this command to remove a wireless radio interface.

Syntax

```
wds radio <1-3>
no wds radio
```

Parameter	Description
<1-3>	Designate a radio interface for the WDS connection.

Default Not set.

Mode Wireless AP Configuration

Example To configure 'radio 2' as the radio interface for a WDS connection, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# wds radio 2
```

web-auth radius auth group

Overview Use this command to enable Web authentication of clients with a RADIUS group in a wireless network.

Use the **no** variant of this command to disable Web authentication with a RADIUS group.

Syntax

```
web-auth radius auth group {radius|<group-name>}
no web-auth radius auth group
```

Parameter	Description
`radius`	Use a RADIUS group, which means **all** RADIUS servers.
<group-name>	The RADIUS server group.

Default Not set.

Mode Wireless Network.

Usage notes This command enables Web authentication and designates a RADIUS server group to authenticate clients on a wireless network. RADIUS server groups are defined using the **aaa group server** command. RADIUS server groups can consist of multiple server hosts, but this command only uses two servers.

Example To enable Web authentication with a RADIUS server group, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10
awplus(config-wireless-network)# web-auth radius auth group
 radius
```

Related commands **aaa group server**

network (wireless)

Command changes Version 5.4.7-2.4: command added.

wireless

Overview Use this command to enter wireless configuration mode.

Use the **no** variant of this command to remove all wireless configuration.

Syntax
```
wireless
no wireless
```

Mode Global Configuration

Example To enter wireless configuration mode, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)#
```

Toremove all wireless configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# no wireless
```

Related commands **show wireless ap-profile**

show wireless network

Command changes Version 5.4.7-2.4: command added.

wireless ap-configuration apply ap

Overview Use this command to apply a configuration to a single Access point (AP) or a range of APs. The configuration must exist before you use this command.

Syntax

```
wireless ap-configuration apply ap {all|<ap-idrange>}
```

Parameter	Description
`all`	Apply the configuration to all APs.
<ap-idrange>	Apply the configuration to a range of APs. The range format is 1-65535.

Mode Privileged Exec

Example To apply a configuration to the AP range 1-10, use the command:

```
awplus# configure terminal
awplus(config)# wireless ap-configuration apply 1-10
```

To apply a configuration to all APs, use the command:

```
awplus# wireless ap-configuration apply ap all
```

Related commands ap

Command changes Version 5.4.7-2.4: command added.

wireless ap-configuration pull ap

Overview Use this command to fetch the current running wireless configuration from the CWM Agent and update the device's running configuration.

Syntax
```
wireless ap-configuration pull ap {all|<ap-idrange>} [clean-up]
```

Parameter	Description
`all`	Apply the created configuration to all wireless APs.
<ap-idrange>	Apply the created configuration to designated wireless APs or range of APs.
`clean-up`	Clean up configurations that are not used after pulling. This prevents the configuration files from becoming too large. Target configurations include: Network, Security, RADIUS Server Group, and Wireless MAC Filter.

Mode Privileged Exec

Example To pull the configurations from a range of APs 1-10, use the commands:

```
awplus> enable
awplus# wireless ap-configuration pull ap 1-10
```

To pull the configurations from all APs, use the commands:

```
awplus> enable
awplus# wireless ap-configuration pull ap all
```

Related commands ap

Command changes Version 5.5.5-1.1: command added

wireless auto-config

Overview Use this command to start an automatic discovery and configuration of wireless APs using Autonomous Wave Control (AWC).

Syntax

```
wireless auto-config create-new [country-code <code>]
wireless auto-config ap-profile <1-65535>
wireless auto-config abort
```

Parameter	Description
`ap-profile`	This parameter selects an existing profile to use for configuring the newly discovered APs.
<1-65535>	Profile ID number from the range 1 to 65535.
`create-new`	This parameter automatically creates a new profile based on the AP's model name.
`country-code`	Optional parameter, if specified the new profiles will have the country code set.
<code>	A two letter code representing the country. Use the command **show wireless country-code** to see the full list of country codes available.
`abort`	This parameter stops the automatic discovery process.

Mode Privileged Exec

Usage notes AP configuration is created for discovered APs including their IP addresses and MAC addresses. The AP profile is created automatically based on the model name. The network and security is created using defined default values.

Use the **abort** parameter to stop the automatic discovery process from continuing.

Examples To start an automatic discovery and configuration of a wireless network and apply the profile ID "1", use the command:

```
awplus# wireless auto-config ap-profile 1
```

To start an automatic discovery and configuration of a wireless network with a new AP profile, use the command:

```
awplus# wireless auto-config create-new
```

To stop an automatic discovery configuration, use the command:

```
awplus# wireless auto-config abort
```

Related commands **show wireless auto-config**

Command changes Version 5.4.8-1.1: command added

wireless channel-blanket ap-profile bssid-renew

Overview Use this command to renew the BSSID assigned to the channel blanket for the specified AP-profile(s).

Syntax
```
wireless channel-blanket ap-profile {<ap-profile-id-range>|all}
 bssid-renew
```

Parameter	Description
<ap-profile-id-range>	Renew the BSSID of the channel blanket for a specific AP-profile or range of AP-profiles <1-65535>.
`all`	Renew the BSSID of the channel blanket for all AP-profiles.

Default Not set

Mode Privileged Exec

Example To renew the channel blanket BSSID for AP-profile 1 and 2, use the commands:

```
awplus# wireless channel-blanket ap-profile 1,2 bssid-renew
```

Related commands **show wireless ap-profile**

vap (wireless-ap-prof-radio)

Command changes Version 5.5.1-0.1: command added

wireless download ap url

Overview Use this command to download Access Point (AP) firmware from a URL.

Syntax
```
wireless download ap {all|<aprange>} url [username <user-name>
 password <password>]
```

Parameter	Descript
`all`	All APs.
<aprange>	A range of APs *<1-65535>*
`username` *<user-name>*	The login username. The username can contain: • up to 255 characters. • any printable ASCII characters (ASCII 32-126) • special characters: backslash, double-quote or space, but they should be escaped with a backslash.
`password` *<password>*	Passwords can be up to 64 characters in length and can contain printable characters, except: • ? • “(double quotes) • space

Default Not set.

Mode Privileged Exec

NOTE: *AWC supports the following firmware version:*

- *TW series: v4.0.5B02*
- *MWS2533AP: v2.2.1, v2.2.3*
- *MWS600AP/MWS1750AP: v2.2.3*

Example To download new firmware to all APs from the URL 192.168.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless download ap all url
 http://192.168.0.1/AT-TQ4600-4.0.3.n.b02.img
```

Related commands **show wireless ap**

Command changes Version 5.4.7-2.4: command added.

wireless emergency-mode

Overview Use this command to activate or deactivate AWC emergency mode. Wireless networks that have been flagged for emergency-mode are activated or deactivated when this command is configured.

Syntax
```
wireless emergency-mode {activate|deactivate}
```

Default Deactivated

Mode Privileged Exec

Example To activate the emergency mode in AWC, use the command:
```
awplus# wireless emergency-mode activate
```

Related commands **emergency-mode**

show wireless

Command changes Version 5.5.0-0.3: command added

wireless emergency-mode usb mark key

Overview Use this command to prepare a USB stick for putting your wireless network into Emergency Mode and add a key to that stick. If someone inserts that USB stick into the device, AlliedWare Plus will check whether the device also contains this key. If it does, then the device will put the network into emergency mode.

Along with this command, use **emergency-mode usb key** to add the same key to the device.

Syntax

```
wireless emergency-mode usb mark key <key>
wireless emergency-mode usb unmark
```

Parameter	Description
`key <key>`	The key, which can be up to 32 characters long. You can use any printable ASCII characters. If you use spaces or symbols, enclose the key in quote marks, for example “Example Key1”.
`mark`	Prepare the USB stick for emergency mode use.
`unmark`	Remove the emergency mode configuration and key from the USB stick.

Default No USB sticks are configured.

Mode Privileged Exec

Example

To configure this feature, first create a suitable wireless network and reserve it for emergency mode only. To reserve the network, use the command **emergency-mode**.

Then insert an empty USB stick into the AlliedWare Plus device and use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# emergency-mode usb enable
awplus(config-wireless)# emergency-mode usb key ExampleKey
 description ExampleEmergencyUSB
awplus(config-wireless)# end
awplus# wireless emergency-mode usb mark key ExampleKey
```

The **key** parameter in the commands **emergency-mode usb key** and **wireless emergency-mode usb mark key** must match.

After this, to put the network into emergency mode, just insert the USB stick. As long as the keys on the device and the stick match, emergency mode will automatically activate. The device's port LEDs will blink to indicate it is in emergency mode.

Related commands

Command changes

Version 5.5.2-1.1: command added

wireless export

Overview Use this command to export MAC filter entries to a CSV file. If the specified file does not exist, it will be created. If the file does exist then it will be overwritten with the new data.

Syntax

```
wireless export wireless-mac-filter <mac-filter-id> <url>
```

Parameter	Description
<mac-filter-id>	<1-65535>The ID of the MAC filter to export.
<url>	Path and filename of the export file.

Mode Privileged Exec

Example To export MAC filter '20' to a CSV file named 'whitelist.csv', use the following command:

```
awplus# wireless export wireless-mac-filter 20 flash://
whitelist.csv
```

Sample export file:

```
"00:1a:eb:12:34:56","client1"
"00:1a:eb:12:34:57","client2"
"00:1a:eb:12:34:58","client3"
"00:1a:eb:12:34:59","client4"
"00:1a:eb:12:34:5a","client5"
```

Command changes Version 5.4.8-2.1: command added

wireless get-tech abort

Overview Use this command to stop getting technical support files from managed APs.

Syntax
```
wireless get-tech abort
```

Mode Privileged Exec

Usage notes This command aborts **all** technical-support files executed by the commands: **`wireless get-tech ap`**, **`wireless get-tech ap-profile`** and **`wireless get-tech sc-profile`**. You cannot limit it to an AP or profile.

Example To abort all technical support files, use the command:
```
awplus# wireless get-tech abort
```

Output The following shows typical output.

Example output from `show wireless ap 1 status` before and after issuing the command `wireless get-tech abort`. You can see the operation 'rupt' state changes from 'E' (Executing) to 'F' (Failed).

```
awplus#wireless get-tech ap 1 url flash://tech/
awplus#
awplus#show wireless ap 1 status
ID    Model           FW ver     Manage rupt Config   c Clnt  Uptime
----- --------------- ---------- ---------- ---------- ---- ---------------
    1 AT-TQ5403       6.0.2-0.1  Managd ---E Succeed  -    0  850051
awplus#
awplus#wireless get-tech abort
awplus#
awplus#show wireless ap 1 status
ID    Model           FW ver     Manage rupt Config   c Clnt  Uptime
----- --------------- ---------- ---------- ---------- ---- ---------------
    1 AT-TQ5403       6.0.2-0.1  Managd ---F Succeed  -    0  850051
```

Command changes Version 5.5.2-0.1: command added

wireless get-tech ap

Overview Use this command to get technical support files from managed wireless APs.

Syntax

```
wireless get-tech ap {<1-65535>|all} url <url>
```

Parameter	Description
<1-65535>	The Access Point ID or range of IDs.
all	Get technical support files for all AP IDs.
<url>	The destination directory to store the technical support files. You can use flash, USB, or card prefixes. If no destination URL is set, then flash is used.

Mode Privileged Exec

Example To get the technical support files for all APs, and store those files to the 'tech' directory on flash, use the commands:

```
awplus# wireless get-tech ap all url flash:/tech/
```

Related commands

show wireless ap

wireless get-tech sc-profile

wireless get-tech ap-profile

wireless get-tech abort

Command changes Version 5.5.2-0.1: command added

wireless get-tech ap-profile

Overview Use this command to get technical support files from all managed wireless APs that use the specified AP Profile ID.

Syntax

```
wireless get-tech ap-profile {<1-65535>|all} url <url>
```

Parameter	Description
<1-65535>	The AP Profile ID.
all	Get technical support files for managed APs for all Access Point Profile IDs.
<url>	The destination directory to store the technical support files. You can use flash, USB, or card prefixes. If no destination URL is set, then flash is used.

Mode Privileged Exec

Example To get the technical support files for APs in use for all Access Point Profile IDs, and store those files to the 'tech' directory on flash, use the commands:

```
awplus# wireless get-tech sc-profile all url flash:/tech/
```

Related commands

show wireless ap

Command changes Version 5.5.2-0.1: command added

wireless get-tech sc-profile

Overview Use this command to get technical support files from all managed wireless APs that use the specified Smart Connect (SC) Profile ID.

Syntax

```
wireless get-tech sc-profile {<1-65535>|all} url <url>
```

Parameter	Description
<1-65535>	The Smart Connect Profile ID.
all	Get technical support files for all Smart Connect Profile IDs.
<url>	The destination directory to store the technical support files. You can use flash, USB, or card prefixes. If no destination URL is set, then flash is used.

Mode Privileged Exec

Example To get the technical support files for APs in use for all Smart Connect Profiles, and store those files to the 'tech' directory on flash, use the commands:

```
awplus# wireless get-tech sc-profile all url flash:/tech/
```

wireless import

Overview Use this command to import MAC filter entries from a CSV file. The imported entries can either replace or be appended to the existing entries.

Syntax

```
wireless import <url> wireless-mac-filter <mac-filter-id> {add|replace}
```

Parameter	Description
<url>	Path and filename of the import file.
<mac-filter-id>	<1-65535> The ID of the MAC filter to import the entries to.
add	Add the filter entries to the specified MAC filter
replace	Overwrite the existing MAC filter with the imported entries.

Mode Privileged Exec

Example To add MAC filter entries from the file 'whitelist.csv' to MAC filter '20', use the following command:

```
awplus# wireless import flash://whitelist.csv wireless-mac-filter 20 add
```

Sample import file:

```
"00:1a:eb:12:34:56","client1"
"00:1a:eb:12:34:57","client2"
"00:1a:eb:12:34:58","client3"

wireless power-channel ap all

Overview This command activates AWC to calculate the optimal power-channel levels for all the Access Points (APs) in a wireless network. You can use this command to calculate and apply the latest AWC calculation results to the APs automatically or you can choose to apply them manually.

Syntax

```
wireless power-channel ap all {calculate|apply|calculate-and-apply}
```

Parameter	Description
`calculate`	Use AWC to calculate the optimal power-channel levels for all APs.
`apply`	Apply the latest AWC optimal power-channel level results to all APs.
`calculate-and-apply`	Use AWC to calculate the optimal power-channel levels for all APs, and apply the results to the APs.

Default Not set.

Mode Privileged Exec

Example To activate AWC to calculate the optimal power-channel levels for all APs, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless power-channel ap all calculate
```

To apply the latest optimal power-channel results manually to all APs, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless power-channel ap all apply
```

To activate AWC to calculate the optimal power-channel levels for all APs and then automatically apply the results to the APs, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless power-channel ap all calculate-and-apply
```

Related commands **show wireless ap power-channel**

Command changes Version 5.4.7-2.4: command added.

wireless reset ap

Overview Use this command to reset the current configuration applied to a wireless Access Point (AP).

Syntax

```
wireless reset ap {all|<aprange>}
```

Parameter	Description
<aprange>	Reset the range of APs in the format *<1-65535>*
`all`	Reset all APs.

Mode Privileged Exec

Example To reset the configuration for wireless APs in the range 1-10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless reset ap 1-10
```

To reset the configuration for all wireless APs, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless reset ap all
```

Related commands **ap**

Command changes Version 5.4.7-2.4: command added.

wireless-mac-filter (wireless)

Overview Use this command to configure a wireless MAC filter. If the filter does not already exist it will be created when you issue this command.

Use the **no** variant of this command to remove a wireless MAC filter.

Syntax
```
wireless-mac-filter <mac-filter-id>
no wireless-mac-filter <mac-filter-id>
```

Parameter	Description
<mac-filter-id>	The ID of the MAC filter, in the range 1 to 65535.

Default No MAC filters are set by default.

Mode Wireless Configuration

Example To add a MAC filter with ID '20' and enter configuration mode for that filter, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)#
```

To remove a MAC filter with ID '20', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no wireless-mac-filter 20
```

Related commands

Command changes Version 5.4.8-2.1: command added

wireless-mac-filter (wireless-ap-prof)

Overview Use this command to assign a MAC filter to a wireless AP profile. You can configure the filter as a 'whitelist' or a 'blacklist'. An AP profile can only have one MAC filter assigned to it.

Use the **no** variant of this command to remove a MAC filter from an AP profile.

Syntax

```
wireless-mac-filter {permit|deny} <mac-filter-id>
no wireless-mac-filter
```

Parameter	Description
`permit`	Set the MAC filter as a whitelist.
`deny`	Set the MAC filter as a blacklist.
<mac-filter-id>	The ID of the MAC filter to assign to the AP profile, in the range 1 to 65535.

Default No MAC filter assigned by default.

Mode Wireless AP Profile Configuration

Example To assign the MAC filter '20' as a whitelist to wireless AP profile '1', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 1
awplus(config-wireless-ap-prof)# wireless-mac-filter permit 20
```

To remove a MAC filter from wireless AP profile '1', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 1
awplus(config-wireless-ap-prof)# no wireless-mac-filter
```

Command changes

Version 5.4.8-2.1: command added

wireless-mac-filter enable

Overview Use this command to enable the MAC filter on a Virtual Access Point (VAP). It will enable the MAC filter based on the filter entry set in the AP profile.

Use the **no** variant of this command to disable the AMC filter on a VAP.

Syntax
```
wireless-mac-filter enable
no wireless-mac-filter enable
```

Default Disabled by default.

Mode Wireless Network Configuration

Example To enable wireless MAC filter on APs that use network 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 100
awplus(config-wireless-network)# wireless-mac-filter enable
```

To disable wireless MAC filter on APs that use network 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 100
awplus(config-wireless-network)# no wireless-mac-filter enable
```

Command changes Version 5.4.8-2.1: command added

wireless wireless-trigger

Overview Use this command to activate or deactivate a wireless-trigger. You can set an action for a specific trigger ID, range of IDs, or all wireless-trigger IDs.

Syntax

```
wireless wireless-trigger [all|<trigger-id>] activate
wireless wireless-trigger [all|<trigger-id>] deactivate
```

Parameter	Description
`all`	Action all wireless-triggers.
<trigger-id>	The trigger ID. This can be a number in the range of 1-8. You can also specify multiple trigger IDs using a comma separated list.
`activate`	Activate wireless-trigger.
`deactivate`	Deactivate wireless-trigger.

Default Not set.

Mode Privileged Exec

Example To activate wireless-trigger 1, use the command:

```
awplus# wireless wireless-trigger 1 activate
```

To deactivate all wireless-triggers, use the command:

```
awplus# wireless wireless-trigger all deactivate
```

Related commands

Command changes Version 5.5.1-0.1: command added

wireless-trigger

Overview Use this command to add a wireless trigger and enter the wireless-trigger configuration mode.

Use the **no** variant of this command to delete a specific wireless-trigger ID configuration.

Syntax
```
wireless-trigger <trigger-id>
no wireless-trigger <trigger-id>
```

Parameter	Description
<trigger-id>	Enter an ID number in the range 1-8.

Default Not set

Mode Wireless Configuration

Example To add a wireless trigger and enter the wireless-trigger configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-trigger 1
awplus(config-wireless-trigger)#
```

To delete a wireless trigger, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no wireless-trigger 1
```

Related commands

wireless-trigger-id

Overview Use this command to mark a network for a wireless-trigger.

Use the **no** variant of this command to unmark a wireless trigger on a network.

Syntax

```
wireless-trigger-id <trigger-id>
no wireless-trigger-id <trigger-id>
```

Parameter	Description
<trigger-id>	Trigger ID, a numerical value in the range 1-8. The trigger must already exist.

Default Not set.

Mode Wireless Network Configuration

Example To mark a wireless trigger in network 5, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 5
awplus(config-wireless-network)# wireless-trigger-id 1
```

Introduction

Overview This chapter provides an alphabetical reference of commands used to configure Device Discovery using STOAT (Standardized Topology Organizer and Transport).

Using LLDP and DHCP Snooping, STOAT can discover and gather information about devices in the local network. These devices may include IP cameras, IP phones, PCs, laptops, Wi-fi access points, printers, and so on.

Vista Manager EX merges the data from STOAT and existing discovery methods such as AMF, and AMF Plus Device Discovery, to provide a single, accurate and more complete view of the network.

For more information, see the **Device Discovery using STOAT Feature Overview and Configuration Guide**.

clear stoat collector session counters

Overview Use this command to clear the STOAT transport session counters.

Syntax

```
clear stoat collector session counters [<1-4294967295>]
```

Parameter	Description
<1-4294967295>	Session ID

Mode Privileged Exec

Example To clear all STOAT transport session counters, use the command:

```
awplus# clear stoat collector session counters
```

To clear a specific STOAT transport session counter, use the command:

```
awplus# clear stoat collector session counters 234234234
```

Related commands

Command changes Version 5.5.3-1.1: command added

description (stoat-dest)

Overview Use this command to add an informative description to a STOAT destination.

Use the **no** variant of this command to remove a description from a STOAT destination.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	A word or phrase that uniquely identifies this STOAT destination or its purpose. Valid characters are any printable character and spaces, up to a maximum of 40 characters.

Default Not set.

Mode STOAT Destination Configuration

Example To add the description 'chc-collector-1' to a STOAT destination with IP address 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# description chc-collector-1
```

To remove the description from a STOAT destination with IP address 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# no description
```

Related commands stoat destination

Command changes Version 5.5.3-1.1: command added

key (stoat-dest)

Overview Use this command to configure a key to use with a STOAT destination. The key allows the STOAT collector to authenticate this device as a valid source. The destination will not attempt to connect if no key is set.

A matching key must be configured on the STOAT collector device.

Use the **no** variant of this command to remove a key for a STOAT destination.

Syntax

```
key [8] <key-string>
no key
```

Parameter	Description
8	Specifies that you are entering a password as a string that has already been encrypted instead of entering a plain text password.The running config displays the new password as an encrypted string even if password encryption is turned off.
<key-string>	Shared key string applied, a value in the range 8 to 80 characters.

Default Not set.

Mode STOAT Destination Configuration

Example To configure the key 'verysecret' for STOAT destination 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# key verysecret
```

To remove the key for STOAT destination 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# no key
```

Related commands **stoat collector key**

stoat destination

Command changes Version 5.5.3-1.1: command added

name-check (stoat-dest)

Overview Use this command to enable or disable certificate name checking for the server certificate received from the STOAT collector.

Use the **no** variant of this command to disable name checking for the server certificate received from the STOAT collector.

Syntax

```
name-check
no name-check
```

Default Disabled.

Mode STOAT Destination Configuration

Usage notes If enabled, the received server certificate must contain the address configured for this STOAT destination . This setting only takes effect if the STOAT destination has been configured with a trustpoint.

Example To enable name-check for STOAT destination 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-destination)# name-check
```

To disable name-check for STOAT destination 192.0.2.6, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-destination)# no name-check
```

Related commands **service stoat**

Command changes Version 5.5.3-1.1: command added

service stoat

Overview Use this command to enable or disable Standardized Topology Organizer and Transport (STOAT) functionality on a device. Once enabled, the device will accept STOAT collector and STOAT source configuration.

Use the **no** variant of this command to disable STOAT functionality on a device.

Syntax
```
service stoat
no service stoat
```

Default Disabled.

Mode Global Configuration

Example To enable STOAT functionality on a device, use the commands:
```
awplus# configure terminal
awplus(config)# service stoat
```
To disable STOAT functionality on a device, use the commands:
```
awplus# configure terminal
awplus(config)# no service stoat
```

show stoat collector

Command changes Version 5.5.3-1.1: command added

show stoat collector

Overview Use this command to see the operational status of the STOAT collector.

Syntax

```
show stoat collector [sessions|keys]
```

Parameter	Description
`sessions`	Active session information
`keys`	Authentication key information

Mode Privileged Exec

Example To show the STOAT collector status information, use the command:

```
awplus# show stoat collector
```

To show the STOAT collector active session information, use the command:

```
awplus# show stoat collector sessions
```

To show the STOAT collector authentication key information, use the command:

```
awplus# show stoat collector keys
```

Output

Example output from `show stoat collector`

```
awplus#show stoat collector
STOAT    Collector Information:
------------------------------
Status        : Enabled
Expiry-period : 60 seconds
Trustpoint    : default-selfsigned
```

Example output from `show stoat collector sessions`

```
awplus#show stoat collector sessions

STOAT Collector Session Information:
------------------------------------
Sessions created                       : 2
Sessions expired                       : 0
Sessions failed                        : 0
Sessions failed sync authentication    : 0
Sessions failed update                 : 0
Sessions failed update authentication  : 0

Session ID                             : 3F4B5C27
 Source Name                           : alice
 State                                 : Active
 Counters
  Update success                       : 0
  Update authentication failure        : 0
  Update failure                       : 0
  RX payload bytes                     : 11
  RX payload apteryx set failure       : 0

show stoat destinations

Overview Use this command to see the operational status of the configured STOAT destinations.

Syntax

```
show stoat destinations [detail]
```

Parameter	Description
`detail`	Show detailed information

Mode Privileged Exec

Example To show summary information about STOAT destinations, use the command:

```
awplus# show stoat destinations
```

To show detailed information about STOAT destinations, use the command:

```
awplus# show stoat destinations detail
```

Output The following shows typical output.

Example output from `show stoat destinations`

```
awplus#show stoat destinations
STOAT Destination Summary Information:
--------------------------------------|
Address      : 192.168.0.12
 State       : Hold

Address      : 192.168.0.2
 State       : Active
```

Example output from `show stoat destinations detail`

```
awplus#show stoat destinations detail

STOAT Destination Summary Information:
--------------------------------------|
Address                             : 192.168.0.12
 State                              : Hold
 Session ID                         : 0
 Expiry-period                      : 0 seconds
 Counters:
  Sync OK                           : 0
  Sync failed - unreachable         : 6612
  Sync failed - authentication      : 0
  Sync failed - bad response        : 0
  Update OK                         : 0
  Update failed - unreachable       : 0
  Update failed - authentication    : 0
  Update failed - unknown session   : 0
  RX bytes                          : 0

```

Related commands **stoat destination**

shutdown (stoat-dest)

Command changes Version 5.5.3-1.1: command added

shutdown (stoat-dest)

Overview Use this command to disable a STOAT destination.

Use the **no** variant of this command to enable a STOAT destination.

Syntax
```
shutdown
no shutdown
```

Default Enabled (no shutdown)

Mode STOAT Destination Configuration

Example To enable the STOAT destination 192.0.2.6, use the commands:
```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# no shutdown
```

Related commands **stoat destination**

show stoat destinations

Command changes Version 5.5.3-1.1: command added

stoat collector enable

Overview Use this command to start or stop the Standardized Topology Organizer and Transport (STOAT) collector functionality on a device.

Note: The device must be able to receive requests from STOAT sources before this command is used. To enable a device to receive requests from STOAT, use the **service stoat** command.

Use the **no** variant of this command to stop the STOAT collector functionality on a device.

Syntax

```
stoat collector enable
no stoat collector enable
```

Default Disabled.

Mode Global Configuration

Usage notes The STOAT feature is responsible for discovering devices and network topology, organizing that information into a standardized format, and transporting it to a central location for use. AMF uses STOAT data to allow non-AMF devices and their links to be displayed in the AMF topology map.

There are two types of STOAT device:

- **Collector** - receives and aggregates topology data
- **Source** - sends data to a collector. The data contains information that it knows about itself and has learned through discovery protocols

Example To start the STOAT collector, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector enable
```

To stop the STOAT collector, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat collector enable
```

Related commands

stoat collector expiry-period

stoat collector key

Command changes Version 5.5.3-1.1: command added.

stoat collector expiry-period

Overview Use this command to modify the session expiry-period for all of the STOAT collector's sessions.

Use the **no** variant of this command to revert to the default expiry-period of 60 seconds.

Syntax

```
stoat collector expiry-period <10-300>
no stoat collector expiry-period
```

Parameter	Description
<10-300>	Expiry-period in seconds (default: 60)

Default 60 seconds.

Mode Global Configuration

Example To configure an expiry-period of 15 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector expiry-period 15
```

To revert the expiry-period to its default of 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat collector expiry-period
```

Related commands

Command changes Version 5.5.3-1.1: command added

stoat collector key

Overview Use this command to configure the authentication key used by the STOAT collector.

Use the **no** variant of this command to remove a STOAT authentication key.

Syntax

```
stoat collector key [8]{auth-key|generate} [description
 <description>]
no stoat collector key [8]{auth-key|generate} [description
 <description>]
```

Parameter	Description
8	Specifies a key in encrypted format instead of plain text.
auth-key	Authentication key
generate	Let STOAT generate a key
description	Add a useful description
<description>	The useful description text

Default Not set.

Mode Global Configuration

Example To configure a plain-text key 'secret-key' with no description, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector key secret-key
```

To configure a plain-text key 'secret-key' with a description, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector key secret-key description 'this
 is my secret key'
```

To **generate** a key with a description, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector key generate description 'my
 generated key'
```

To configure an encrypted key with a description, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector key 8
 CFWzNguaqyoPDqYoCBGzff07CfQZOJ-eJO0JslXON3E= description 'my
 encrypted key'
```

To remove a configured encrypted key, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat collector key 8
 CFWzNguaqyoPDqYoCBGzff07CfQZOJ-eJO0JslXON3E=
```

Output The following shows typical output.

Example output from `stoat collector key generate`

```
awplus(config)# stoat collector key generate

NttWCIS0KsyQ1-1_98qi4HcVdMRykeaE8IKfPe1Xv9o
```

Related commands

Command changes Version 5.5.3-1.1: command added

stoat collector trustpoint

Overview Use this command to add a crypto PKI trustpoint containing a server certificate and a key to the STOAT collector. This enables secure HTTPS API communication between the STOAT collector and STOAT source.

Use the **no** variant of this command to remove a configured PKI trustpoint from a STOAT collector.

Syntax

```
stoat collector trustpoint <trustpoint-name>
no stoat collector trustpoint
```

Parameter	Description
<trustpoint-name>	PKI trustpoint name.

Mode Global Configuration

Example To add an existing PKI trustpoint called ‘chc’ to the STOAT collector, use the commands:

```
awplus# configure terminal
awplus(config)# stoat collector trustpoint chc
```

To remove a configured PKI trustpoint from the STOAT collector, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat collector trustpoint
```

Related commands

Command changes Version 5.5.3-1.1: command added

stoat destination

Overview Use this command to configure a remote STOAT collector destination.

Use the **no** variant of this command to remove a STOAT collector destination.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
stoat destination {<ip-address>|<host-name>|<ipv6-address>} [vrf
 <vrf-name>]
no stoat destination {<ip-address>|<host-name>|<ipv6-address>}
 [vrf <vrf-name>]
```

Parameter	Description
<ip-address>	The IPv4 address, using the format A.B.C.D.
<host-name>	The host name specified in FQDN (Fully Qualified Domain Name). For example, manager.your.domain.com.
<ip6-address>	The IPv6 address, using the format X:X::X:X.
`vrf`	Specify a VRF instance.
<vrf-name>	The name of the specific VRF instance.

Default Not set.

Mode Global Configuration

Example

To configure a remote STOAT collector at IP address 10.0.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 10.0.0.1
```

To remove a remote STOAT collector at IP address 10.0.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat destination 10.0.0.1
```

To configure a remote STOAT collector at IP address 10.0.0.1 on VRF red, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 10.0.0.1 vrf red
```

To configure a remote STOAT collector at stoat.com, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination stoat.com
```

To remove a remote STOAT collector at stoat.com, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat destination stoat.com
```

To configure a remote STOAT collector at 2001:db8 : :1, use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 2001:db8::1
```

To remove a remote STOAT collector at 2001:db8 : :1, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat destination 2001:db8::1
```

Related commands

stoat discovery

Command changes

Version 5.5.3-1.1: command added

stoat discovery

Overview Use this command to enable a device to import Standardized Topology Organizer and Transport (STOAT) discovery information learned by a given protocol. This command allows the device to act as a STOAT collector. STOAT collectors receive and aggregate topology data used in the AMF topology map.

Use the **no** variant of this command to disable the import of STOAT discovery information learned by a given protocol.

Syntax

```
stoat discovery dhcp-snooping
stoat discovery dot1x
stoat discovery lldp
stoat discovery wireless
no stoat discovery dhcp-snooping
no stoat discovery dot1x
no stoat discovery lldp
no stoat discovery wireless
```

Parameter	Description
`dhcp-snooping`	Import information learned through the DHCP Snooping protocol.
`lldp`	Import information learned through the LLDP protocol.
`dot1x`	Import information learned through 802.1X and Port authentication
`wireless`	Import information learned by Wireless Manager

Default Disabled.

Mode Global Configuration

Example To enable a device to import information learned by the DHCP Snooping protocol, use the commands:

```
awplus# configure terminal
awplus(config)# stoat discovery dhcp-snooping
```

To disable a device from importing information learned by the DHCP Snooping protocol, use the commands:

```
awplus# configure terminal
awplus(config)# no stoat discovery dhcp-snooping
```

Related commands

ip dhcp snooping

lldp run

stoat destination

Command changes

Version 5.5.3-2.1: **dot1x** and **wireless** parameters added

trustpoint (stoat-dest)

Overview Use this command to specify the trustpoint to use when authenticating the STOAT collector. If no trustpoint is specified, the STOAT collector will be implicitly trusted without authentication.

Use the **no** variant of this command to stop the use of trustpoints with a specified STOAT destination.

Syntax

```
trustpoint <trustpoint-name>
no trustpoint
```

Parameter	Description
<trustpoint-name>	Name of the trustpoint.

Default Not set.

Mode STOAT Destination Configuration

Example To configure the STOAT destination 192.0.2.6 to use trustpoint 'chc', use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# trustpoint chc
```

To stop the use of trustpoints with STOAT destination 192.0.2.6 use the commands:

```
awplus# configure terminal
awplus(config)# stoat destination 192.0.2.6
awplus(config-stoat-dest)# no trustpoint
```

Related commands

stoat collector trustpoint

name-check (stoat-dest)

Command changes Version 5.5.3-1.1: command added

unique-id

Overview Use this command to generate a new unique ID for a device. This ID is used to uniquely identify a device in the STOAT topology.

Some circumstances may require you to generate a new unique ID, for example after recovering a device from an AMF provisioned backup.

Syntax
```
unique-id
```

Mode Privileged Exec

Example To generate a new unique ID for a STOAT device, use the command:

```
awplus# unique-id
```

- **snmp-discovery snmp-version** on page 4226
- **snmp-discovery user** on page 4227

Introduction

Overview This chapter provides an alphabetical reference of commands used to configure Device Discovery using SNMP.

SNMP Device Discovery is available from the AlliedWare Plus CLI and is also available from Vista Manager mini. This feature provides information that allows the CLI to display third party vendor device data in real time.

For more information, see the **Device Discovery and Monitoring using SNMP Feature Overview and Configuration Guide**.

clear snmp-discovery

Overview Use this command to remove information learned by the SNMP Discovery process.

Syntax

```
clear snmp-discovery ip [<ipv4-address>]
clear snmp-discovery nodes [<ipv4-address>]
```

Parameter	Description
`ip`	Internet Protocol (IP)
<ipv4-address>	IPv4 network address for the discovered device, for example 192.168.3.1
`nodes`	Node information
<ipv4-address>	IPv4 network address for the discovered nodes, for example 192.168.3.1

Default No information is cleared.

Mode Privileged Exec

Examples To remove all SNMP discovered devices, use the command:

```
node1# clear snmp-discovery nodes
```

To remove a particular SNMP discovered device, use the command:

```
node1# clear snmp-discovery nodes 192.168.3.1
```

To remove all entries from SNMP Discovery's database of devices discovered by ARP, use the command:

```
node1# clear snmp-discovery ip
```

To remove a particular entry from SNMP Discovery's database of devices discovered by ARP, use the command:

```
node1# clear snmp-discovery ip 192.168.3.1
```

Related commands **show snmp-discovery**

Command changes Version 5.5.0-0.3: command added

service snmp-discovery

Overview Use this command to enable SNMP Discovery to discover devices on an AMF network.

Use the **no** variant of this command to disable SNMP Discovery.

Syntax
```
service snmp-discovery
no service snmp-discovery
```

Default Disabled

Mode Global Configuration

Usage notes The server starts a process which detects IP addresses reachable on a network. An SNMP 'get' request is performed on these IP addresses to detect device information. The SNMP name, SNMP description, SNMP location, and SNMP serial number are obtained if they are available.

SNMP Discovery will not run if there are no Layer 3 IP interfaces configured.

Example To start the discovery service on the AMF node, use the commands:
```
awplus# configure terminal
awplus(config)# service snmp-discovery
```

Related commands

Command changes Version 5.5.0-0.3: command added

show running-config snmp-discovery

Overview Use this command to display the running configuration for SNMP Discovery.

Syntax
```
show running-config snmp-discovery
```

Mode Privileged Exec

Example To display the running configuration for SNMP Discovery, use the command:

```
awplus# show running-config snmp-discovery
```

Output The following shows typical output.

Example output from `show running-config snmp-discovery`

```
node1#show running-config snmp-discovery
service snmp-discovery
snmp-discovery community accounting
snmp-discovery user tim encrypted auth md5 U2FsdGVkX1/

+ZvSzUUviRt9ZdsFwtB6HU12lU=
snmp-discovery permit ip 192.168.3.2
snmp-discovery permit ip 192.168.3.6
snmp-discovery deny ip 192.168.3.5
```

Related commands **show snmp-discovery**

Command changes Version 5.5.0-0.3: command added

show snmp-discovery

Overview Use this command to show information about the SNMP Discovery process.

Syntax

```
show snmp-discovery [detail|ip|nodes]
```

Parameter	Description
`detail`	SNMP Discovery node detail
`ip`	SNMP Discovery IP addresses
`nodes`	SNMP Discovery node information

Mode User Exec

Examples To display information about the SNMP Discovery status, use the command:

```
awplus# show snmp-discovery
```

To display information about the SNMP Discovery IPv4 addresses learned, use the command:

```
awplus# show snmp-discovery ip
```

To display information about the SNMP Discovery nodes learned, use the command:

```
awplus# show snmp-discovery nodes
```

To display information about the SNMP Discovery in greater detail, use the command:

```
awplus# show snmp-discovery detail
```

Output The following shows typical output.

Example output from `show snmp-discovery`

```
awplus#show snmp-discovery

SNMP Discovery information:

SNMP Discovery                : Enabled
SNMP Polling interval         : 300
ARP Polling interval          : 60
SNMP Discovery version        : v2c
SNMPv2 Discovery Community    : accounting
```

Example output from `show snmp-discovery ip`

```
node1#show snmp-discovery ip
SNMP Discovery Devices:

IP Address       MAC Address     Type     State         Last Seen Time
-------------------------------------------------------------------------
172.18.100.10    -               Permit   -             -

snmp-discovery permit

snmp-discovery snmp-polling-interval

Command changes

Version 5.5.0-0.3: command added

snmp-discovery arp-polling-interval

Overview Use this command to configure the SNMP ARP polling interval.

Use the **no** variant of this command to set the SNMP ARP polling interval back to the default (60 seconds).

Syntax

```
snmp-discovery arp-polling-interval <1-3600>
no snmp-discovery arp-polling-interval
```

Parameter	Description
<1-3600>	The polling number in seconds to interval in the range from 1 to 3600.

Default ARP requests are sent out every 60 seconds

Mode Global Configuration

Usage notes SNMP Discovery first uses ARP to discover subnets that are reachable from the AMF node. This polling happens every 60 seconds by default. Use this command to change the polling interval.

Examples To configure the SNMP Discovery ARP polling interval to 120 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery arp-polling-interval 120
```

To set the SNMP Discovery ARP polling interval back to the default (60 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery arp-polling-interval
```

Related commands **service snmp-discovery**

show snmp-discovery

Command changes Version 5.5.0-0.3: command added

snmp-discovery community

Overview Use this command to create an SNMP community in read-only mode for SNMPv1 and v2c only.

Use the **no** variant of this command to remove an SNMP community.

Syntax

```
snmp-discovery community <community-name>
```

Parameter	Description
<community-name>	The name of the community that can be up to 20 characters long and is case sensitive.

Default The SNMP Discovery community name is 'public' by default

Mode Global Configuration

Usage notes This command creates an SNMP community in read-only mode. The community allows access to all MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used for SNMPv3.

Examples To configure an SNMP community named 'accounting', use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery community accounting
```

To set the SNMP community name back to the default (public), use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery community
```

Related commands **service snmp-discovery**

show snmp-discovery

Command changes Version 5.5.0-0.3: command added

snmp-discovery deny

Overview Use this command to prevent ARP requests from being sent. When an interface or IPv4 address is denied, it means an ARP request and SNMP 'get' request will never be sent to that device when the command **service snmp-discovery** is enabled.

Use the **no** variant of this command to remove the configuration.

Syntax

```
snmp-discovery deny interface <interface-range>
snmp-discovery deny ip <ipv4-address>
no snmp-discovery deny interface <interface-range>
no snmp-discovery deny ip <ipv4-address>
```

Parameter	Description
`interface`	Interfaces to deny
<interface-name>	Interface name, for example VLAN2
`ip`	IP address
<ipv4-address>	IPv4 address to deny

Default AMF and stacking management VLANs are denied

Mode Global Configuration

Examples To configure a deny interface command for VLAN2, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery deny interface vlan2
```

To stop interface VLAN2 from being denied, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery deny interface vlan2
```

To configure a deny IP command for IP address 192.168.3.2, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery deny ip 192.168.3.2
```

To stop IP address 192.168.3.2 from being denied, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery deny ip 192.168.3.2
```

Output The following shows typical output.

Example output from `show snmp-discovery ip`

```
awplus#show snmp-discovery ip
SNMP Discovery Devices:

IP Address       MAC Address     Type     State         Last Seen Time
-------------------------------------------------------------------------
192.168.3.2      -               Deny     -             -
1.2.3.6          -               Permit   -             30 Jul, 2020 06:30:55
1.2.3.4          -               Permit   -             31 Jul, 2020 05:49:04
192.168.2.2      3863.bb5c.b900  Dynamic  Up            -
```

Related commands **service snmp-discovery**

show snmp-discovery

Command changes Version 5.5.0-0.3: command added

snmp-discovery permit

Overview Use this command if you want to allow SNMP Discovery to do requests on interfaces with greater than 256 members. You can permit a specific IP address.

Syntax

```
snmp-discovery permit ip <ipv4-address>
no snmp-discovery permit ip <ipv4-address>
```

Parameter	Description
ip	Internet Protocol (IP)
<ipv4-address>	IPv4 network address

Default All IPv4 interfaces with 256 members or less are included in SNMP Discovery.

Mode Global Configuration

Examples To configure a permit IP command for the address 192.168.3.2, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery permit ip 192.168.3.2
```

To remove the permit configuration for the address 192.168.3.2, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery permit ip 192.168.3.2
```

Output

```
awplus#show snmp-discovery ip
SNMP Discovery Devices:

IP Address       MAC Address     Type     State         Last Seen Time
-------------------------------------------------------------------------
1.2.3.5          -               Deny     -             -
1.2.3.6          -               Permit   -             Jul 27, 2020 03:33:39
1.2.3.4          -               Permit   -             Jul 28, 2020 04:25:05
192.168.2.2      3863.bb5c.b900  Dynamic  Up            -
192.168.3.2      4263.cc3c.b500  permit   Up            -
```

Related commands **service snmp-discovery**

show snmp-discovery

Command changes Version 5.5.0-0.3: command added

snmp-discovery snmp-polling-interval

Overview Use this command to change the SNMP request polling interval (in seconds).

Use the **no** variant of this command to set the SNMP request polling interval back to the default (300 seconds).

Syntax

```
snmp-discovery snmp-polling-interval <60-3600>
no snmp-discovery snmp-polling-interval
```

Parameter	Description
<60-3600>	The number of seconds for the SNMP polling interval. From the range 60 to 3600.

Default 300 seconds (5 minutes)

Mode Global Configuration

Usage notes ARP polling and SNMP Discovery uses SNMP 'get' requests to poll the devices discovered by the ARP polling. This polling happens every 300 seconds (5 minutes) by default.

SNMP polling is enabled when **`service snmp-discovery`** is enabled.

Examples To configure the SNMP discovery polling interval to 120 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery snmp-polling-interval 120
```

To set the SNMP discovery polling interval back to the default (300 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery snmp-polling-interval
```

Related commands **service snmp-discovery**

show snmp-discovery

Command changes Version 5.5.0-0.3: command added

snmp-discovery snmp-version

Overview Use this command to set the SNMP version that you are using.

Use the **no** variant of this command to set the SNMP version back to the default (v2c).

Syntax

```
snmp-discovery snmp-version {v1|v2c|v3}
no snmp-discovery snmp-version
```

Parameter	Description
v1	Enter the SNMP version number you are using
v2c	If you are using SNMP version v2c, set the community name with the command **snmp-discovery community**
v3	If you are using SNMP version v3, set the security with the command **snmp-discovery user**

Default SNMP version v2c

Mode Global Configuration

Usage notes This command defaults to SNMP version v2c and creates an SNMP community in read-only mode. The community allows access to all the MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used when operating SNMPv3.

If using SNMPv3, you can choose the security level and then the authentication protocol and privacy protocol.

Examples To configure SNMP Discovery to use SNMP version 3, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery snmp-version v3
```

To set the SNMP Discovery SNMP version back to the default (v2c), use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery snmp-version
```

Related commands service snmp-discovery

Command changes Version 5.5.0-0.3: command added

snmp-discovery user

Overview Use this command to create a user for SNMPv3 'get' requests only.

Use the **no** variant of this command to remove an SNMPv3 user.

Syntax

```
snmp-discovery user <user-name> [encrypted] [auth {md5|sha}
 <auth-password>] [priv {des|aes} <privacy-password>]
no snmp-discovery user <user-name>
```

Parameter	Description
<user-name>	The user name is a string up to 20 characters long and is case sensitive. For example, 'Rodger'.
`encrypted`	Use the encrypted parameter when you want to enter encrypted passwords.
`auth`	Authentication protocol that can be either MD5 or SHA.
`md5`	MD5 Message Digest Algorithms.
`sha`	SHA Secure Hash Algorithm.
<auth-password>	Authentication password that is a string from 8 to 20 characters and is case sensitive.
`priv`	Privacy protocol that can be either DES or AES.
`des`	DES Data Encryption Standard.
`aes`	AES Advanced Encryption Standards.
<privacy-password>	Privacy password is a string from 8 to 20 characters and is case sensitive.

Default No user is configured

Mode Global Configuration

Usage notes

Additionally, this command provides the option of selecting an authentication protocol and (where appropriate) an associated password. Similarly, options are offered for selecting a privacy protocol and password.

The authentication method must match what is used on the devices being configured.

Use the **encrypted** parameter when you want to enter already encrypted passwords in encrypted form as displayed in the running and startup configurations stored on the switch.

User passwords are entered using plain text without the **encrypted** parameter and are encrypted according to the authentication and privacy protocols selected.

User passwords are viewed as encrypted passwords in running and startup configurations shown from the **show running-config** and **show startup-config** commands. Copy and paste encrypted passwords from the running configuration or startup configuration to avoid entry errors.

Examples

To add SNMP Discovery user ‘authuser’ with authentication protocol ‘md5’, authentication password ‘authpass’ privacy protocol ‘des’ and privacy password privpass, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery user authuser auth md5 Authpass
 priv des Privpass
```

To enter existing SNMP user ‘authuser’ with existing passwords with authentication protocol ‘md5’ plus the encrypted authentication password ‘0x1c74b9c22118291b0ce0cd883f8dab6b74’, privacy protocol ‘des’ plus the encrypted privacy password ‘0x0e0133db5453ebd03822b004eeacb6608f’, use the following commands:

NOTE: *Note Copy and paste the encrypted passwords from the running-config or the startup-config displayed, using the show running-config and show startup-config commands respectively, into the command line to avoid key stroke errors issuing this command.*

```
awplus# configure terminal
awplus(config)# snmp-discovery user authuser encrypted
 auth md50x1c74b9c22118291b0ce0cd883f8dab6b74 priv des
 0x0e0133db5453ebd03822b004eeacb6608f
```

To delete SNMP user ‘authuser’, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery user authuser
```

Output The following shows typical output.

Example output from `show snmp-discovery`

```
awplus#show snmp-discovery
SNMP Discovery information:

SNMP Discovery                : Enabled
SNMP Polling interval         : 300
ARP Polling interval          : 60
SNMP Discovery version        : v3

SNMPv2 Discovery Community    : accounting
SNMPv3 Discovery User         : authuser
User Encrypted auth           : md5
User Encrypted password       : 0x1c74b9c22118291b0ce0cd883f8dab6b74
User Privilege                : des
User Privilege password       : 0x0e0133db5453ebd03822b004eeacb6608f
```

Introduction

Overview This chapter provides an alphabetical reference for commands used to configure DHCP.

For more information, see the **DHCP Feature Overview and Configuration Guide**.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

bootfile

Overview This command sets the boot filename for a DHCP server pool. This is the name of the boot file that the client should use in its bootstrap process. It may need to include a path.

The **no** variant of this command removes the boot filename from a DHCP server pool.

Syntax

```
bootfile <filename>
no bootfile
```

Parameter	Description
<filename>	The boot file name.

Mode DHCP Configuration

Example To configure the boot filename for a pool P2, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# bootfile boot/main_boot.bt
```

clear ip dhcp binding

Overview This command clears either a specific lease binding or the lease bindings specified by the command or DHCP server. The command will only take effect on dynamically allocated bindings, not statically configured bindings.

Syntax
```
clear ip dhcp binding {ip <ip-address>|mac <mac-address>|all|
pool <pool-name>|range <low-ip-address> <high-ip-address>}
```

Syntax (VRF-lite)
```
clear ip dhcp binding [vrf <name>|global] {ip <ip-address>|
mac <mac-address>|all|pool <pool-name>|range <low-ip-address>
 <high-ip-address>}
```

Parameter	Description
`vrf`	Display the output for a VRF instance
<name>	The name of the specific VRF instance.
`global`	Display the output for the Global VRF instance
`ip` *<ip-address>*	IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D.
`mac` *<mac-address>*	MAC address of the DHCP client, in hexadecimal notation in the format HHHH.HHHH.HHHH.
`all`	All DHCP bindings.
`pool` *<pool-name>*	Description used to identify DHCP server address pool. Valid characters are any printable character. If the name contains spaces then you must enclose these in “quotation marks”.
`range` *<low-ip-address>* *<high-ip-address>*	IPv4 address range for DHCP clients, in dotted decimal notation. The first IP address is the low end of the range, the second IP address is the high end of the range.

Mode User Exec and Privileged Exec

Usage

A specific binding may be deleted by **ip** address or **mac** address, or several bindings may be deleted at once using **all**, **pool** or **range**.

Note that if you specify to clear the **ip** or **mac** address of what is actually a static DHCP binding, an error message is displayed. If **all**, **pool** or **range** are specified and one or more static DHCP bindings exist within those addresses, any dynamic entries within those addresses are cleared but any static entries are not cleared.

Examples

To clear the specific IP address binding 192.168.1.1, use the command:

```
awplus# clear ip dhcp binding ip 192.168.1.1
```

To clear all dynamic DHCP entries, use the command:

```
awplus# clear ip dhcp binding all
```

Example (VRF-lite)

To clear all dynamic binding from VRF red instance, use the command:

```
awplus# clear ip dhcp binding vrf red all
```

Related commands

show ip dhcp binding

default-router

Overview This command adds a default router to the DHCP address pool you are configuring. You can use this command multiple times to create a list of default routers on the client's subnet. This sets the router details using the pre-defined option 3. Note that if you add a user-defined option 3 using the **option** command, then you will override any settings created with this command.

The **no** variant of this command removes either the specified default router, or all default routers from the DHCP pool.

Syntax

```
default-router <ip-address>
no default-router [<ip-address>]
```

Parameter	Description
<ip-address>	IPv4 address of the default router, in dotted decimal notation.

Mode DHCP Configuration

Examples To add a router with an IP address 192.168.1.2 to the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# default-router 192.168.1.2
```

To remove a router with an IP address 192.168.1.2 to the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no default-router 192.168.1.2
```

To remove all routers from the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no default-router
```

dns-server

Overview This command adds a Domain Name System (DNS) server to the DHCP address pool you are configuring. You can use this command multiple times to create a list of DNS name servers available to the client. This sets the DNS server details using the pre-defined option 6.

Note that if you add a user-defined option 6 using the **option**, then you will override any settings created with this command.

The **no** variant of this command removes either the specified DNS server, or all DNS servers from the DHCP pool.

Syntax

```
dns-server <ip-address>
no dns-server [<ip-address>]
```

Parameter	Description
<ip-address>	IPv4 address of the DNS server, in dotted decimal notation.

Mode DHCP Configuration

Examples To add the DNS server with the assigned IP address 192.168.1.1 to the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# dns-server 192.168.1.1
```

To remove the DNS server with the assigned IP address 192.168.1.1 from the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no dns-server 192.168.1.1
```

To remove all DNS servers from the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no dns-server
```

Related commands

option

service dhcp-server

show ip dhcp pool

subnet-mask

domain-name

Overview This command adds a domain name to the DHCP address pool you are configuring. Use this command to specify the domain name that a client should use when resolving host names using the Domain Name System. This sets the domain name details using the pre-defined option 15.

Note that if you add a user-defined option 15 using the **option**, then you will override any settings created with this command.

The **no** variant of this command removes the domain name from the address pool.

Syntax

```
domain-name <domain-name>
no domain-name
```

Parameter	Description
<domain-name>	The domain name you wish to assign the DHCP pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”.

Mode DHCP Configuration

Examples To add the domain name Nerv_Office to DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# domain-name Nerv_Office
```

To remove the domain name Nerv_Office from DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no domain-name Nerv_Office
```

Related commands

subnet-mask

host (DHCP)

Overview This command adds a static host address to the DHCP address pool you are configuring. The client with the matching MAC address is permanently assigned this IP address. No other clients can request it.

The **no** variant of this command removes the specified host address from the DHCP pool. Use the **no host all** command to remove all static host addresses from the DHCP pool.

Syntax

```
host <ip-address> <mac-address>
no host <ip-address>
no host all
```

Parameter	Description
<ip-address>	IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D
<mac-address>	MAC address of the DHCP client, in hexadecimal notation in the format HHHH.HHHH.HHHH

Mode DHCP Configuration

Usage Note that a network/mask must be configured using a **network** command before issuing a **host** command. Also note that a host address must match a network to add a static host address.

Examples To add the host at 192.168.1.5 with the MAC address 000a.451d.6e34 to DHCP pool 1, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool 1
awplus(dhcp-config)# network 192.168.1.0/24
awplus(dhcp-config)# host 192.168.1.5 000a.451d.6e34
```

To remove the host at 192.168.1.5 with the MAC address 000a.451d.6e34 from DHCP pool 1, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool 1
awplus(dhcp-config)# no host 192.168.1.5 000a.451d.6e34
```

Related Commands **lease**

range

show ip dhcp pool

host client-id

Overview Use this command to add a static host address reservation to the DHCP address pool you are configuring for the DHCP client with the given client identifier.

Use the **no** variant of this command to remove the specified host address reservation from the DHCP pool. Use the **no host all** command to remove all static host addresses from the DHCP pool.

Syntax

```
host <ip-address> client-id <client-identifier>
no host <ip-address>
```

Parameter	Description
<ip-address>	IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D
<client-identifier>	An alphanumeric string to be used as a client identifier. This is from 1 to 63 characters in length. This string can also contain special characters '#', '-', '_' and '.'.

Default No host static IP address reservations are defined for a pool.

Mode DHCP Configuration

Usage notes The client with the matching client-id is permanently assigned this IP address. No other clients can request it. If a subscriber identifier for a client identifier substitution is enabled for a remote pool, the DHCP server will expect to see the subscriber identifier sub-option being included in the relay agent information option on the relay client packet. And the subscriber-id is matched against the static host reservation with the matching client identifier.

A network/mask must be configured using the **network** command before issuing a host command. Also note that a host address must match a network to add a static host address.

Example To add a static host address for client-id 'office-pc-21' to a pool, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Campus-1
awplus(dhcp-config)# host 192.168.2.5 client-id office-pc-21
```

Output The following shows typical output.

Example output from `show ip dhcp binding`

```
awplus#show ip dhcp binding Campus-1

Pool Campus-1 Network 192.168.2.0/24
DHCP Client Entries
IP Address      ClientId                          Type    Expiry

```

Related commands **network (DHCP)**

Command changes Version 5.5.2-0.1: command added

ip address dhcp

Overview This command activates the DHCP client on the interface you are configuring. This allows the interface to use the DHCP client to obtain its IP configuration details from a DHCP server on its connected network.

The **client-id** and **hostname** parameters are identifiers that you may want to set in order to interoperate with your existing DHCP infrastructure. If neither option is needed, then the DHCP server uses the MAC address field of the request to identify the host.

The DHCP client supports the following IP configuration options:

- Option 1– the subnet mask for your device.
- Option 3– a list of default routers.
- Option 6 – a list of DNS servers. This list appends the DNS servers set on your device with the **ip name-server** command.
- Option 15–a domain name used to resolve host names. This option replaces the domain name set with the **ip domain-name** command. Your device ignores this domain name if it has a domain list set using the **ip domain-list** command.
- Option 51–lease expiration time.

The **no** variant of this command stops the interface from obtaining IP configuration details from a DHCP server.

Syntax

```
ip address dhcp [client-id <interface>] [hostname <hostname>]
no ip address dhcp
```

Parameter	Description
client-id *<interface>*	The name of the interface you are activating the DHCP client on. If you specify this, then the MAC address associated with the specified interface is sent to the DHCP server in the optional identifier field. Default: no default
hostname *<hostname>*	The hostname for the DHCP client on this interface. Typically this name is provided by the ISP. Default: no default

Mode Interface Configuration for VLAN interfaces.

Examples

To set the interface vlan2 to use DHCP to obtain an IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip address dhcp
```

To stop the interface vlan2 from using DHCP to obtain its IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip address dhcp
```

Related commands

ip address (IP Addressing and Protocol)

show ip interface

show running-config

ip dhcp bootp ignore

Overview This command configures the DHCP server to ignore any BOOTP requests it receives. The DHCP server accepts BOOTP requests by default.

The **no** variant of this command configures the DHCP server to accept BOOTP requests. This is the default setting.

Syntax

```
ip dhcp bootp ignore
no ip dhcp bootp ignore
```

Mode Global Configuration

Examples To configure the DHCP server to ignore BOOTP requests, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp bootp ignore
```

To configure the DHCP server to respond to BOOTP requests, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp bootp ignore
```

Related commands **show ip dhcp server summary**

ip dhcp globally-authoritative

Overview Use this command to make the DHCP server globally authoritative. When the DHCP server is globally authoritative, it responds to all DHCP requests and inform messages, even if it has no DHCP pool for the request's subnet. If the server doesn't have an applicable DHCP pool, it can't assign an IP address, so it immediately responds with a NACK message.

Use the **no** variant of this command to stop the server from being globally authoritative. If you do that, the server will not respond to the above messages. This means the client will need to time out if it has sent one of the above messages, as it will not receive a reply.

Note that the server will:

- always be authoritative for DHCP requests and inform messages if it has a DHCP pool for the relevant subnet
- never be globally authoritative if the server is also configured as a relay agent, even if this command is enabled. In that case, it will only reply if the server has a DHCP pool for the relevant subnet. Otherwise, the server could respond to a message that was intended for the other server at the end of the relay agent.

Syntax
```
ip dhcp globally-authoritative
no ip dhcp globally-authoritative
```

Default Enabled

Mode Global Configuration

Example To stop the server from being globally authoritative, use the commands:
```
awplus# configure terminal
awplus(config)# no ip dhcp globally-authoritative
```

Related commands **show ip dhcp server summary**

Command changes Version 5.5.5-1.1: command added

ip dhcp leasequery enable

Overview Use this command to enable the DHCP server to respond to DHCPLEASEQUERY packets. Enabling the DHCP leasequery feature allows a DHCP Relay Agent to obtain IP address information directly from the DHCP server using DHCPLEASEQUERY messages.

Use the **no** variant of this command to disable the support of DHCPLEASEQUERY packets.

For more information, see the **DHCP Feature Overview and Configuration Guide**.

Syntax

```
ip dhcp leasequery enable
no ip dhcp leasequery enable
```

Default DHCP leasequery support is disabled by default.

Mode Global Configuration

Examples To enable DHCP leasequery support, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp leasequery enable
```

To disable DHCP leasequery support, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp leasequery enable
```

Related commands

show counter dhcp-server

ip dhcp option

Overview This command creates a user-defined DHCP option. Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

You can use this option when configuring a DHCP pool, by using the **option** command.

The **no** variant of this command removes either the specified user-defined option, or removes all user-defined options. This also automatically removes the user-defined options from the associated DHCP address pools.

Syntax `ip dhcp option <1-254> [name <option-name>] [<option-type>]`

`no ip dhcp option [<1-254>|<option-name>]`

Parameter	Description	
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.	
<option-name>	Option name used to identify the option. You cannot use a number as the option name. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”. Default: no default	
<option-type>	The option value. You must specify a value that is appropriate to the option type:	
	`asci`	An ASCII text string
	`hex`	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.
	`ip`	An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually by using the option command multiple times.
	`integer`	A number from 0 to 4294967295.
	`flag`	A value that either sets (to 1) or unsets (to 0) a flag: **true**, **on**, or **enabled** will set the flag. **f alse**, **off** or **disabled** will unset the flag.

Mode Global Configuration

Examples

To define a user-defined ASCII string option as option 66, without a name, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp option 66 ascii
```

To define a user-defined hexadecimal string option as option 46, with the name tcpip-node-type, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option 46 name tcpip-node-type hex
```

To define a user-defined IP address option as option 175, with the name special-address, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option 175 name special-address ip
```

To remove the specific user-defined option with the option number 12, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option 12
```

To remove the specific user-defined option with the option name perform-router-discovery, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option perform-router-discovery
```

To remove all user-defined option definitions, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option
```

Related commands

ip dhcp pool

Overview This command will enter the configuration mode for the pool name specified. If the name specified is not associated with an existing pool, the device will create a new pool with this name, then enter the configuration mode for the new pool.

Once you have entered the DHCP configuration mode, all commands executed before the next **exit** command will apply to this pool.

You can create multiple DHCP pools on devices with multiple interfaces. This allows the device to act as a DHCP server on multiple interfaces to distribute different information to clients on the different networks.

The **no** variant of this command deletes the specific DHCP pool.

Syntax

```
ip dhcp pool <pool-name>
no ip dhcp pool <pool-name>
```

Parameter	Description
<pool-name>	Description used to identify this DHCP pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”.

Mode Global Configuration

Example To create the DHCP pool named P2 and enter DHCP Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)#
```

To delete the DHCP pool named P2, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp pool P2
```

Related commands **service dhcp-server**

ip dhcp-client default-route distance

Overview Use this command to specify an alternative Administrative Distance (AD) for the current default route (from DHCP) for an interface.

Use the **no** variant of this command to set the AD back to the default of 1.

Syntax

```
ip dhcp-client default-route distance [<1-255>]
no ip dhcp-client default-route distance
```

Parameter	Description
<1-255>	Administrative Distance (AD) from the range 1 though 255.

Default 1

Mode Interface Configuration for VLAN interfaces.

Usage notes DHCP client interfaces can automatically add a default route with an AD of 1 into the IP Routing Information Base (RIB).

Any pre-existing default route(s) via alternative interfaces (configured with a higher AD) will no longer be selected as the preferred forwarding path for traffic when the DHCP based default route is added to the IP routing table.

This can be problematic if the DHCP client is operating via an interface that is only intended to be used for back-up interface redundancy purposes, such as an interface with lower bandwidth or a particular role like the management interface.

Use this command to set the AD of the default route (via a specific DHCP client interface) to a non-default (higher cost) value, ensuring any pre-existing default route(s) via any other interface(s) continue to be selected as the preferred forwarding path for network traffic.

When the command is used, the static default route is deleted from the RIB, the distance value of the route is modified to the configured distance value, then it is reinstalled into the RIB.

Examples

To configure vlan10 as a DHCP client and to set the AD for the default route added by DHCP to 150, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# ip address dhcp
awplus(config-if)# ip dhcp-client default-route distance 150
```

To set the AD for the default route back to the default value of 1, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-client default-route distance
```

Related commands

show ip route

show ip route database

Command changes

Version 5.4.7-0.2 Command added.

ip dhcp-client request vendor-identifying-specific

Overview Use this command to add vendor-identifying vendor-specific information (option 125) requests to the DHCP discovery packets sent by an interface. This option, along with option 124, can be used to send vendor-specific information back to a DHCP client.

See RFC3925 for more information on Vendor-Identifying Vendor Options for DHCPv4.

Use the **no** variant of this command to remove the vendor-identifying-specific request from an interface.

Syntax
```
ip dhcp-client request vendor-identifying-specific
no ip dhcp-client request vendor-identifying-specific
```

Default The vendor-identifying-specific request is not configured by default.

Mode Interface Configuration for VLAN interfaces.

Usage notes The DHCP client must be activated on the interface, using the **ip address dhcp** command, so that DHCP discovery packets are sent.

Example To add the vendor-identifying-specific request on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-client request vendor-identifying-specific
```

To remove the vendor-identifying-specific request on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-client request vendor-identifying-specific
```

Related commands **ip address dhcp**

ip dhcp-client vendor-identifying-class

Command changes Version 5.4.7-2.1: command added

ip dhcp-client vendor-identifying-class

Overview Use this command to add a vendor-identifying vendor class (option 124) to the DHCP discovery packets sent by an interface. This option places the Allied Telesis Enterprise number (207) into the discovery packet. Option 124, along with option 125, can be used to send vendor-specific information back to a DHCP client.

See RFC3925 for more information on Vendor-Identifying Vendor Options for DHCPv4.

Use the **no** variant of this command to remove the vendor-identifying-class from an interface.

Syntax
```
ip dhcp-client vendor-identifying-class
no ip dhcp-client vendor-identifying-class
```

Default The vendor-identifying-class is not configured by default.

Mode Interface Configuration for VLAN interfaces.

Usage notes The DHCP client must be activated on the interface, using the **ip address dhcp** command, so that DHCP discovery packets are sent.

Example To remove the vendor-identifying-class on vlan2, use the commands:
```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-client vendor-identifying-class
```

Related commands **ip address dhcp**

ip dhcp-client request vendor-identifying-specific

Command changes Version 5.4.7-2.1: command added

ip dhcp-relay agent-option

Overview This command enables the DHCP Relay Agent to insert the DHCP Relay Agent Information Option (Option 82) into the client-request packets that it relays to its DHCP server. This allows the DHCP Relay Agent to pass on information to the server about the network location of the client device. The DHCP Relay Agent strips the DHCP Relay Agent Option 82 field out of the DHCP server's response, so that the DHCP client never sees this field.

When the DHCP Relay Agent appends its DHCP Relay Agent Option 82 data into the packet, it first overwrites any pad options present; then if necessary, it increases the packet length to accommodate the DHCP Relay Agent Option 82 data.

The **no** variant of this command stops the DHCP Relay Agent from appending the Option 82 field onto DHCP requests before forwarding it to the server.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the **DHCP Feature Overview and Configuration Guide**.

NOTE: ***ip dhcp-relay agent-optionip dhcp-relay information policy***

Syntax

```
ip dhcp-relay agent-option
no ip dhcp-relay agent-option
```

Default DHCP Relay Agent Information Option (Option 82) insertion is disabled by default.

Mode Interface Configuration for VLAN interfaces.

Usage notes Use this command to alter the DHCP Relay Agent Option 82 setting when your device is the first hop for the DHCP client. To limit the maximum length of the packet, use the **ip dhcp-relay max-message-length** command.

This command cannot be enabled if DHCP snooping is enabled on your device (**service dhcp-snooping**), and vice versa.

Examples

To make the DHCP Relay Agent listening on vlan2 append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the DHCP Relay Agent from appending the DHCP Relay Agent Option 82 field on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option
```

Related commands

ip dhcp-relay agent-option remote-id

ip dhcp-relay information policy

ip dhcp-relay max-message-length

service dhcp-relay

ip dhcp-relay agent-option checking

Overview This command enables the DHCP Relay Agent to check DHCP Relay Agent Information Option (Option 82) information in response packets returned from DHCP servers. If the information does not match the information it has for its own client (downstream) interface then the DHCP Relay Agent drops the packet. Note that **ip dhcp-relay agent-option** must be configured.

The DHCP Relay Agent Option 82 field is included in relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled (**ip dhcp-relay agent-option**), and
- DHCP Relay Agent is enabled on the device (**service dhcp-relay**)

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the **DHCP Feature Overview and Configuration Guide**.

Syntax

```
ip dhcp-relay agent-option checking
no ip dhcp-relay agent-option checking
```

Mode Interface Configuration for VLAN interfaces.

Examples To make the DHCP Relay Agent listening on vlan2 check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the DHCP Relay Agent on vlan2 from checking the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option checking
```

Related commands

ip dhcp-relay agent-option

ip dhcp-relay agent-option remote-id

ip dhcp-relay information policy

service dhcp-relay

ip dhcp-relay agent-option remote-id

Overview Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field the DHCP Relay Agent inserts into clients' request packets. The Remote ID identifies the device that is inserting the DHCP Relay Agent Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the device's MAC address.

Use the **no** variant of this command to return the Remote ID for an interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the **DHCP Feature Overview and Configuration Guide**.

Syntax

```
ip dhcp-relay agent-option remote-id <remote-id>
no ip dhcp-relay agent-option remote-id
```

Parameter	Description
<remote-id>	An alphanumeric (ASCII) string, 1 to 63 characters in length. Additional characters allowed are hyphen (-), underscore (_) and hash (#). Spaces are not allowed.

Default The Remote ID is set to the device's MAC address by default.

Mode Interface Configuration for VLAN interfaces.

Usage notes The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled (**ip dhcp-relay agent-option**), and
- DHCP Relay Agent is enabled on the device (**service dhcp-relay**)

Examples To set the Remote ID to myid for client DHCP packets received on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

Related commands

ip dhcp-relay agent-option

ip dhcp-relay agent-option checking

show ip dhcp-relay

ip dhcp-relay agent-option subscriber-id

Overview Use this command to set an ASCII string as a subscriber identifier for a port.

Use the **no** variant of this command to unset the string as a subscriber identifier for a port.

Syntax

```
ip dhcp-relay agent-option subscriber-id <subscriber-id>
no ip dhcp-relay agent-option subscriber-id
```

Parameter	Description
<subscriber-id>	An alphanumeric string to use as a client identifier. It is from 1 to 63 characters in length. This string may also contain special characters '#', '-', '_' and'.'.

Default No string is set.

Mode Interface Configuration

Usage notes The subscriber identifier is used by the relay agent to add a subscriber identifier sub-option to the relay-agent information option added by the relay-agent before forwarding the client packets coming from the switch port to the server. The agent option fields in responses sent from the servers to clients are stripped before forwarding such responses back to the client.

Example To set subscriber identifier 'office-1' to packets coming from the client directly connected to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# ip dhcp-relay agent-option subscriber-id
 office-1
```

Output The following shows typical output.

Example output from `show interface`

```
awplus#show interface port1.0.1
Interface port1.0.1

    output packets 0, bytes 0, multicast packets 0, broadcast packets 0
    input average rate : 30 seconds 0 bps, 5 minutes 0 bps
    output average rate: 30 seconds 0 bps, 5 minutes 0 bps
  Time since last state change: 0 days 17:51:00
```

Related commands **show interface**

Command changes Version 5.5.2-0.1: command added

ip dhcp-relay information policy

Overview This command sets the policy for how the DHCP relay deals with packets arriving from the client that contain DHCP Relay Agent Option 82 information.

If the command **`ip dhcp-relay agent-option`** has not been configured, then this command has no effect at all - no alteration is made to Option 82 information in packets arriving from the client side.

However, if the command **`ip dhcp-relay agent-option`** has been configured, this command modifies how the DHCP relay service deals with cases where the packet arriving from the client side already contains DHCP Relay Agent Option 82 information.

This command sets the action that the DHCP relay should take when a received DHCP client request contains DHCP Relay Agent Option 82 information.

By default, the DHCP Relay Agent replaces any existing DHCP Relay Agent Option 82 field with its own DHCP Relay Agent field. This is equivalent to the functionality of the **replace** parameter.

The **no** variant of this command returns the policy to the default behavior - i.e. replacing the existing DHCP Relay Agent Option 82 field.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the **DHCP Feature Overview and Configuration Guide**.

NOTE: ***ip dhcp-relay agent-optionip dhcp-relay information policy***

Syntax

```
ip dhcp-relay information policy {append|drop|keep|replace}
no ip dhcp-relay information policy
```

Parameter	Description
`append`	The DHCP Relay Agent appends the DHCP Relay Agent Option 82 field of the packet with its own DHCP Relay Agent Option 82 details.
`drop`	The DHCP Relay Agent discards the packet.
`keep`	The DHCP Relay Agent forwards the packet without altering the DHCP Relay Agent Option 82 field.
`replace`	The DHCP Relay Agent replaces the existing DHCP Relay Agent details in the DHCP Relay Agent Option 82 field with its own details before forwarding the packet.

Mode Interface Configuration for VLAN interfaces.

Examples

To make the DHCP Relay Agent listening on vlan2 drop any client requests that already contain DHCP Relay Agent Option 82 information, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay information policy drop
```

To reset the DHCP relay information policy to the default policy for interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay information policy
```

Related commands

ip dhcp-relay agent-option

ip dhcp-relay agent-option checking

service dhcp-server

ip dhcp-relay maxhops

Overview This command sets the hop count threshold for discarding BOOTP messages. When the hops field in a BOOTP message exceeds the threshold, the DHCP Relay Agent discards the BOOTP message. The hop count threshold is set to 10 hops by default.

Use the **no** variant of this command to reset the hop count to the default.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the **DHCP Feature Overview and Configuration Guide**.

Syntax

```
ip dhcp-relay maxhops <1-255>
no ip dhcp-relay maxhops
```

Parameter	Description
<1-255>	The maximum hop count value.

Default The default hop count threshold is 10 hops.

Mode Interface Configuration for VLAN interfaces.

Example To set the maximum number of hops to 5 for packets received on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay maxhops 5
```

Related commands **service dhcp-relay**

ip dhcp-relay max-message-length

Overview This command applies when the device is acting as a DHCP Relay Agent and DHCP Relay Agent Option 82 insertion is enabled. It sets the maximum DHCP message length (in bytes) for the DHCP packet with its DHCP Relay Agent Option 82 data inserted. From this value it calculates the maximum packet size that it will accept at its input. Packets that arrive greater than this value will be dropped.

The **no** variant of this command sets the maximum message length to its default of 1400 bytes.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the **DHCP Feature Overview and Configuration Guide**.

Syntax

```
ip dhcp-relay max-message-length <548-1472>
no ip dhcp-relay max-message-length
```

Parameter	Description
<548-1472>	The maximum DHCP message length (this is the message header plus the inserted DHCP option fields in bytes).

Default The default is 1400 bytes.

Mode Interface Configuration for VLAN interfaces.

Usage notes When a DHCP Relay Agent (that has DHCP Relay Agent Option 82 insertion enabled) receives a request packet from a DHCP client, it will append the DHCP Relay Agent Option 82 component data, and forward the packet to the DHCP server. The DHCP client will sometimes issue packets containing pad option fields that can be overwritten with Option 82 data.

Where there are insufficient pad option fields to contain all the DHCP Relay Agent Option 82 data, the DHCP Relay Agent will increase the packet size to accommodate the DHCP Relay Agent Option 82 data. If the new (increased) packet size exceeds that defined by the **maximum-message-length** parameter, then the DHCP Relay Agent will drop the packet.

NOTE: ***ip dhcp-relay agent-option***

Example To set the maximum DHCP message length to 1200 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay max-message-length 1200
```

To reset the maximum DHCP message length to the default of 1400 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay max-message-length
```

Related commands **service dhcp-relay**

ip dhcp-relay server-address

Overview

This command adds a DHCP server for the DHCP Relay Agent to forward client DHCP packets to on a particular interface. You can add up to five DHCP servers on each device interface that the DHCP Relay Agent is listening on.

The **no** variant of this command deletes the specified DHCP server from the list of servers available to the DHCP relay agent.

The **no ip dhcp-relay** command removes all DHCP relay settings from the interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the **DHCP Feature Overview and Configuration Guide**.

Syntax

```
ip dhcp-relay server-address {<ipv4-address>|<ipv6-address> <server-interface>}
no ip dhcp-relay server-address {<ipv4-address>|<ipv6-address> <server-interface>}
no ip dhcp-relay
```

Parameter	Description
<ipv4-address>	Specify the IPv4 address of the DHCP server for the DHCP Relay Agent to forward client DHCP packets to, in dotted decimal notation. The IPv4 address uses the format A.B.C.D.
<ipv6-address>	Specify the IPv6 address of the DHCPv6 server for the DHCPv6 Relay Agent to forward client DHCP packets to, in hexadecimal notation.
<server-interface>	Specify the interface name of the DHCPv6 server. It is only required for a DHCPv6 server with an IPv6 address.

Mode

Interface Configuration for VLAN interfaces.

Usage notes

For a DHCP server with an IPv6 address you must specify the interface for the DHCP server. See examples below for configuration differences between IPv4 and IPv6 DHCP relay servers.

See also the **service dhcp-relay** command to enable the DHCP Relay Agent on your device. The **ip dhcp-relay server-address** command defines a relay destination on an interface on the device, needed by the DHCP Relay Agent to relay DHCP client packets to a DHCP server.

Examples: DHCP for IPv4

To enable the DHCP Relay Agent to relay DHCP packets on interface vlan2 to the DHCP server with the IPv4 address 192.0.2.200, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay server-address 192.0.2.200
```

To remove the DHCP server with the IPv4 address 192.0.2.200 from the list of servers available to the DHCP Relay Agent on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay server-address 192.0.2.200
```

Examples: DHCPv6

To enable the DHCP Relay Agent on your device to relay DHCP packets on interface vlan10 to the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan10
awplus(config-if)# ip dhcp-relay server-address
 2001:0db8:010d::1 vlan20
```

To remove the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20 from the list of servers available to the DHCP Relay Agent on interface vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay server-address
 2001:0db8:010d::1 vlan20
```

Example: disabling DHCP relay

To disable DHCP relay on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay
```

Related commands

service dhcp-relay

ip dhcp-relay short-lease

Overview Use this command to reduce the amount of time an IP address is assigned to a client device.

Long lease times can cause issues in dynamic networks where client devices frequently move between segments, such as VLANs. These device may retain an outdated IP address from its previous VLAN, disrupting communication.

This command is particularly useful in networks with a high turnover of devices or in environments where IP addresses are scarce.

Use the **no** variant of this command to remove the short lease time configuration.

Syntax

```
ip dhcp-relay short-lease <20-3600>
no ip dhcp-relay short-lease
```

Parameter	Description
<20-3600>	The lease time for DHCP relay in seconds.

Default Not set

Mode Interface Configuration

Example To configure a DHCP Relay on interface vlan1 with a lease time of 200 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp-relay short-lease 200
```

Related commands **show ip dhcp-relay**

Command changes Version 5.5.4-2.1: command added

ip dhcp-relay use-client-side-address

Overview

Use this command to configure DHCP-Relay to use the client-side interface (that is the interface receiving the DHCP client packets) IP address as the source address of the relayed DHCP packets.

Use the **no** variant of this command to disable the use of the client-side interface IP address as the source IP address for relayed DHCP packets.

Syntax

```
ip dhcp-relay use-client-side-address
no ip dhcp-relay use-client-side-address
```

Parameter	Description
`use-client-side-address`	Use the client side interface IP address as the source IP address for relayed DHCP packets.

Default

By default, the server-side interface IP address is used as the source IP address of DHCP relayed packets.

Mode

Global Configuration

Usage notes

In most cases, there are filters placed between the DHCP relay and DHCP server which only allow DHCP packets from the client subnet to the server and back. This command allows you to configure the DHCP relay so that the relay will use the IP address of the interface **receiving** clients' DHCP requests to be used as the source IP address of the relayed DHCP packets.

Example

To configure the client-side IP address as the source IP address of DHCP relayed packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp-relay use-client-side-address
```

Output

The following shows typical output.

Example output from `show ip dhcp-relay`

```
awplus#sh ip dhcp-relay

DHCP Relay Service is enabled
Use of client side address as source address is enabled
...
```

The second line of the display output shows the status of the client-side address being enabled as the source IP address.

Related commands

ip dhcp-relay server-address

Command changes Version 5.4.9-0.7: command added

ip dhcp-relay use-dhcp-relay-ip

Overview Use this command to configure the device to use its own IP address in the "Server ID" option, when acting as a DHCP relay agent. By default, the device uses the address of the DHCP server instead.

You may find this command useful if the relay agent is configured to provide short lease times. This command can prevent the client from bypassing the relay agent and ending up with a longer lease from the server.

Use the **no** variant of this command to return to the default behavior.

Syntax
```
ip dhcp-relay use-dhcp-relay-ip
no ip dhcp-relay use-dhcp-relay-ip
```

Default Disabled

Mode Global Configuration

Example To use the device's own IP address as the server ID, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp-relay use-dhcp-relay-ip
```

To return to using the DHCP server's IP address as the server ID, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp-relay use-dhcp-relay-ip
```

Related commands **show ip dhcp-relay**

Command changes Version 5.5.5-0.1: command added

ip dhcp use-subscriber-id

Overview Use this command in Global Configuration mode to configure the DHCP server to use the subscriber identifier substitution for the client identifier on all DHCP packets coming from all switch ports.

Use this command in Interface Configuration mode to configure a DHCP server to use the subscriber identifier substitution for the client identifier on all DHCP packets coming from a DHCP client directly connected to an interface.

Use the **no** variant of this command to disable the configuration.

Syntax
```
ip dhcp use-subscriber-id
no ip dhcp use-subscriber-id
```

Default Disabled

Mode Global Configuration

Interface Configuration

Usage notes In Global Configuration mode, other DHCP packets coming from other interface types, for example Ethernet, are not affected by this command.

In Interface Configuration mode, the subscriber-id used in the substitution is derived from the port name of an interface. For example, for a DHCP packet coming in from a DHCP client directly attached to switchport port1.0.1, the subscriber-id is port1.0.1. This subscriber identifier for the client identifier substitution can only be applied to packets coming from switchport interfaces, consequently this command is only applicable to switchport interfaces.

Example 1 In Global Configuration mode, to configure the subscriber-id client-id substitution for the DHCP packets coming from all switch port interfaces, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp use-subscriber-id
```

Output The following shows typical output.

Example output from `show ip dhcp server summary`

```
awplus#show ip dhcp server summary

DHCP Server service is enabled
DHCP Server is running
BOOTP ignore is disabled
DHCP leasequery support is disabled
DHCP subscriber-id substition for client-id is enabled
Pool list: pool_direct pool_relay Campus-1
```

Example 2 In Interface Configuration mode, to configure subscriber identifier substitution for the client identifier on packets sent by a DHCP client directly attached to port port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# ip dhcp use-subscriber-id
```

Output The following shows typical output.

Example output from `show interface`

```
awplus#show interface port1.0.1
Interface port1.0.1
  Scope: both
  Link is DOWN, administrative state is UP
  Thrash-limiting
    Status Not Detected, Action learn-disable, Timeout 1(s)
  Hardware is Ethernet, address is e01a.ea60.087f
  index 5010 metric 1 mru 1500
  configured duplex auto, configured speed auto, configured
 polarity auto

  SNMP link-status traps: Disabled
  DHCP subscriber-id substitution for client-id is enabled
  DHCP subscriber-id is office-1
    input packets 0, bytes 0, dropped 0, multicast packets 0
    output packets 0, bytes 0, multicast packets 0, broadcast
 packets 0
    input average rate : 30 seconds 0 bps, 5 minutes 0 bps
    output average rate: 30 seconds 0 bps, 5 minutes 0 bps
  Time since last state change: 0 days 17:51:00
```

Related commands **show ip dhcp server summary**

show interface

Command changes Version 5.5.2-0.1: command added

lease

Overview This command sets the expiration time for a leased address for the DHCP address pool you are configuring. The time set by the days, hours, minutes and seconds is cumulative. The minimum total lease time that can be configured is 20 seconds. The maximum total lease time that can be configured is 120 days.

Note that if you add a user-defined option 51 using the **option** command, then you will override any settings created with this command. Option 51 specifies a lease time of 1 day.

Use the **infinite** parameter to set the lease expiry time to infinite (leases never expire).

Use the **no** variant of this command to return the lease expiration time back to the default of one day.

Syntax

```
lease <days> <hours> <minutes> [<seconds>]
lease infinite
no lease
```

Parameter	Description
<days>	The number of days, from 0 to 120, that the lease expiry time is configured for. Default: 1
<hours>	The number of hours, from 0 to 24, that the lease expiry time is configured for. Default: 0
<minutes>	The number of minutes, from 0 to 60, the lease expiry time is configured for. Default: 0
<seconds>	The number of seconds, from 0 to 60, the lease expiry time is configured for.
`infinite`	The lease never expires.

Default The default lease time is 1 day.

Mode DHCP Configuration

Examples

To set the lease expiration time for address pool P2 to 35 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# lease 0 0 35
```

To set the lease expiration time for the address pool Nerv_Office to 1 day, 5 hours, and 30 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# lease 1 5 30
```

To set the lease expiration time for the address pool P3 to 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P3
awplus(dhcp-config)# lease 0 0 0 20
```

To set the lease expiration time for the pool to never expire, use the command:

```
awplus(dhcp-config)# lease infinite
```

To return the lease expiration time to the default of one day, use the command:

```
awplus(dhcp-config)# no lease
```

Related commands

option

service dhcp-server

short-lease-threshold

network (DHCP)

Overview This command sets the network (subnet) that the DHCP address pool applies to.

The **no** variant of this command removes the network (subnet) from the DHCP address pool.

Syntax

```
network {<ip-subnet-address/prefix-length>|<ip-subnet-address/mask>}
no network
```

Parameter	Description
<ip-subnet-address/prefix-length>	The IPv4 subnet address in dotted decimal notation followed by the prefix length in slash notation.
<ip-subnet-address/mask>	The IPv4 subnet address in dotted decimal notation followed by the subnet mask in dotted decimal notation.

Mode DHCP Configuration

Usage notes This command will fail if it would make existing ranges invalid. For example, if they do not lie within the new network you are configuring.

The **no** variant of this command will fail if ranges still exist in the pool. You must remove all ranges in the pool before issuing a **no network** command to remove a network from the pool.

Examples To configure a network for the address pool P2, where the subnet is 192.0.2.5 and the mask is 255.255.255.0, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# network 192.0.2.5/24
```

or you can use dotted decimal notation instead of slash notation for the subnet-mask:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# network 192.0.2.5 255.255.255.0
```

Related commands **service dhcp-server**

subnet-mask

next-server

Overview This command sets the next server address for a DHCP server pool. It is the address of the next server that the client should use in its bootstrap process.

The **no** variant of this command removes the next server address from the DHCP address pool.

Syntax

```
next-server <ip-address>
no next-server
```

Parameter	Description
<ip-address>	The server IP address, entered in dotted decimal notation.

Mode DHCP Configuration

Example To set the next-server address for the address pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# next-server 192.0.2.2
```

option

Overview This command adds a user-defined option to the DHCP address pool you are configuring. For the **hex**, **integer**, and **flag** option types, if the option already exists, the new option overwrites the existing option's value. Options with an **ip** type can hold a list of IP addresses or masks (i.e. entries that have the A.B.C.D address format), so if the option already exists in the pool, then the new IP address is added to the list of existing IP addresses.

Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

The **no** variant of this command removes the specified user-defined option from the DHCP pool, or all user-defined options from the DHCP pool.

Syntax

```
option [<1-254>|<option-name>] <option-value>
no option [<1-254>|<option-value>]
```

Parameter	Description	
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.	
<option-name>	Option name associated with the option.	
<option-value>	The option value. You must specify a value that is appropriate to the option type:	
	`hex`	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.
	`ip`	An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually using the option command multiple times.
	`integer`	A number from 0 to 4294967295.
	`flag`	A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.

Mode DHCP Configuration

Examples

To add the ASCII-type option named `tftp-server-name` to the pool `P2` and give the option the value `server1`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# option tftp-server-name server1
```

To add the hex-type option named `tcpip-node-type` to the pool `P2` and give the option the value `08af`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# option tcpip-node-type 08af
```

To add multiple IP addresses for the ip-type option `175`, use the command:

```
awplus(dhcp-config)# option 175 192.0.2.6
awplus(dhcp-config)# option 175 192.0.2.12
awplus(dhcp-config)# option 175 192.0.2.33
```

To add the option `179` to a pool, and give the option the value `123456`, use the command:

```
awplus(dhcp-config)# option 179 123456
```

To add a user-defined flag option with the name `perform-router-discovery`, use the command:

```
awplus(dhcp-config)# option perform-router-discovery yes
```

To clear all user-defined options from a DHCP address pool, use the command:

```
awplus(dhcp-config)# no option
```

To clear a user-defined option, named `tftp-server-name`, use the command:

```
awplus(dhcp-config)# no option tftp-server-name
```

show ip dhcp pool

probe enable

Overview Use this command to enable lease probing for a DHCP pool. Probing is used by the DHCP server to check if an IP address it wants to lease to a client is already being used by another host.

The **no** variant of this command disables probing for a DHCP pool.

Syntax
```
probe enable
no probe enable
```

Default Probing is enabled by default.

Mode DHCP Pool Configuration

Examples To enable probing for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe enable
```

To disable probing for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe enable
```

Related commands
ip dhcp pool
probe packets

show ip dhcp pool

probe packets

Overview Use this command to specify the number of packets sent for each lease probe. Lease probing is configured on a per-DHCP pool basis. When set to 0 probing is effectively disabled.

The **no** variant of this command sets the number of probe packets sent to the default of 5.

Syntax

```
probe packets <0-10>
no probe packets
```

Parameter	Description
<0-10>	The number of probe packets sent.

Default The default is 5.

Mode DHCP Pool Configuration

Examples To set the number of probe packets to 2 for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe packets 2
```

To set the number of probe packets to the default 5 for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe packets
```

Related commands

probe enable

probe timeout

probe type

show ip dhcp pool

probe timeout

Overview Use this command to set the timeout value in milliseconds that the server waits for a response after each probe packet is sent. Lease probing is configured on a per-DHCP pool basis.

The **no** variant of this command sets the probe timeout value to the default setting, 200 milliseconds.

Syntax

```
probe timeout <50-5000>
no probe timeout
```

Parameter	Description
<50-5000>	Timeout interval in milliseconds.

Default The default timeout interval is 200 milliseconds.

Mode DHCP Pool Configuration

Examples To set the probe timeout value to 500 milliseconds for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe timeout 500
```

To set the probe timeout value for pool P2 to the default, 200 milliseconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe timeout
```

Related commands

probe enable

probe packets

probe type

show ip dhcp pool

probe type

Overview Use this command to set the probe type for a DHCP pool. The probe type specifies how the DHCP server checks whether an IP address is being used by other hosts, referred to as lease probing. If **arp** is specified, the server sends an ARP request to determine if an address is in use. If **ping** is specified, the server will send an ICMP Echo Request (ping).

The **no** variant of this command sets the probe type to the default setting, ping.

Syntax

```
probe type {arp|ping}
no probe type
```

Parameter	Description
`arp`	Probe using ARP.
`ping`	Probe using ping.

Default The default probe type is ping.

Mode DHCP Pool Configuration

Examples To set the probe type to `arp` for the pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe type arp
```

To set the probe type for the pool `P2` to the default, `ping`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe type
```

Related commands

ip dhcp pool

show ip dhcp pool

range

Overview This command adds an address range to the DHCP address pool you are configuring. The DHCP server responds to client requests received from the pool's network. It assigns an IP addresses within the specified range. The IP address range must lie within the network. You can add multiple address ranges and individual IP addresses for a DHCP pool by using this command multiple times.

The **no** variant of this command removes an address range from the DHCP pool. Use the **no range all** command to remove all address ranges from the DHCP pool.

Syntax

```
range <ip-address> [<ip-address>]
no range <ip-address> [<ip-address>]
no range all
```

Parameter	Description
<ip-address>	IPv4 address range for DHCP clients, in dotted decimal notation. The first IP address is the low end of the range, the second IP address is the high end. Specify only one IP address to add an individual IP address to the address pool.

Mode DHCP Configuration

Examples To add an address range of 192.0.2.5 to 192.0.2.16 to the pool Nerv_Office, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# range 192.0.2.5 192.0.2.16
```

To add the individual IP address 192.0.2.2 to a pool, use the command:

```
awplus(dhcp-config)# range 192.0.2.2
```

To remove all address ranges from a pool, use the command:

```
awplus(dhcp-config)# no range all
```

Related commands

ip dhcp pool

service dhcp-server

show ip dhcp pool

route

Overview This command allows the DHCP server to provide static routes to clients.

Syntax

```
route A.B.C.D/M A.B.C.D {both|opt249|rfc3442}
```

Parameter	Description
A.B.C.D/M	Subnet for the route
A.B.C.D	Next hop for the route
both	opt249 and rft3442
opt249	Classless static route option for DHCP
rfc3442	Classless static route option for DHCP

Mode DHCP Configuration

Examples To distribute static routes for route 0.0.0.0/0 whose next hop is 192.16.1.1 to clients using both opt249 and rfc3442, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool pubic
awplus(dhcp-config)# route 0.0.0.0/0 192.16.1.1 both
```

Related commands **ip dhcp pool**

service dhcp-relay

Overview This command enables the DHCP Relay Agent on the device. However, on a given IP interface, no DHCP forwarding takes place until at least one DHCP server is specified to forward/relay all clients' DHCP packets to.

The **no** variant of this command disables the DHCP Relay Agent on the device for all interfaces.

Syntax
```
service dhcp-relay
no service dhcp-relay
```

Mode Global Configuration

Usage notes A maximum number of 400 DHCP Relay Agents (one per interface) can be configured on the device. Once this limit has been reached, any further attempts to configure DHCP Relay Agents will not be successful.

Default The DHCP-relay service is enabled by default.

Examples To enable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
```

To disable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-relay
```

Related commands

ip dhcp-relay agent-option

ip dhcp-relay agent-option checking

ip dhcp-relay information policy

ip dhcp-relay maxhops

ip dhcp-relay server-address

service dhcp-server

Overview This command enables the DHCP server on your device. The server then listens for DHCP requests on all IP interfaces. It will not run if there are no IP interfaces configured.

The **no** variant of this command disables the DHCP server.

Syntax
```
service dhcp-server
no service dhcp-server
```

Mode Global Configuration

Example To enable the DHCP server, use the commands:
```
awplus# configure terminal
awplus(config)# service dhcp-server
```

Related commands
ip dhcp pool
show ip dhcp server summary
subnet-mask

short-lease-threshold

Overview Use this command to configure a short lease threshold.

Use the **no** variant of this command to return the short lease threshold to the default of one minute.

Syntax

```
short-lease-threshold <hours> <minutes>
no short-lease-threshold
```

Parameter	Description
<hours>	The number of hours, from 0 to 24.
<minutes>	The number of minutes, from 0 to 60.

Default 1 minute.

Mode DHCP Configuration

Usage notes DHCP leases need to be backed up in NVS so that when the DHCP server reboots or goes through a power cycle it won't lose all the knowledge of these leases.

Some networks have a high number of mobile devices repeatedly requesting DHCP leases every few seconds before their existing lease expires. This can happen for example, when mobile devices move in and out of a Wi-Fi zone or when Wi-Fi signal strength changes. This means the same IP address can have multiple lease entries which can take up unnecessary backup file space.

The **short-lease-threshold** command allows you to configure the threshold for a short lease, from 1 minute to 24 hours. Any lease less than the threshold is deemed to be a short lease and will NOT be backed up to NVS.

This is useful if you have:

- limited backup file space, and
- you don’t need to restore leases after a device reboot or power cycle

Example To set the short lease threshold for address pool P2 to 40 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# short-lease-threshold 0 40
```

To set the short lease threshold for address pool Nerv_Office to 5 hours and 35 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# short-lease-threshold 5 35
```

To return the short lease threshold to the default of one minute, use the following commands:

```
awplus# configure terminal
awplus(config)# no short-lease-threshold
```

Command changes Version 5.4.8-2.1: command added

show counter dhcp-client

Overview This command shows counters for the DHCP client on your device.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Syntax
```
show counter dhcp-client
```

Mode User Exec and Privileged Exec

Example To display the message counters for the DHCP client on your device, use the command:

```
awplus# show counter dhcp-client
```

Output The following shows typical output.

Example output from the `show counter dhcp-client` command

```
show counter dhcp-client

DHCPDISCOVER out      ......... 10
DHCPREQUEST out       ......... 34
DHCPDECLINE out       ......... 4
DHCPRELEASE out       ......... 0
DHCPOFFER in          ......... 22
DHCPACK in            ......... 18
DHCPNAK in            ......... 0
```

Parameters in the output of the `show counter dhcp-client` command

Parameter	Description
`DHCPDISCOVER out`	The number of DHCP Discover messages sent by the client.
`DHCPREQUEST out`	The number of DHCP Request messages sent by the client.
`DHCPDECLINE out`	The number of DHCP Decline messages sent by the client.
`DHCPRELEASE out`	The number of DHCP Release messages sent by the client.
`DHCPOFFER in`	The number of DHCP Offer messages received by the client.
`DHCPACK in`	The number of DHCP Acknowledgement messages received by the client.
`DHCPNAK in`	The number of DHCP Negative Acknowledgement messages received by the client.

Related commands **ip address dhcp**

show counter dhcp-relay

Overview This command shows counters for the DHCP Relay Agent on your device.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Syntax

```
show counter dhcp-relay
```

Syntax (VRF-lite)

```
show counter dhcp-relay [vrf <vrf-name>|global]
```

Parameter	Description
`vrf`	Display the output for a VRF instance
<vrf-name>	The name of the specific VRF instance.
`global`	Display the output for the Global VRF instance

Mode User Exec and Privileged Exec

Examples To display counters for the DHCP Relay Agent on your device, use the following command:

```
awplus# show counter dhcp-relay
```

Output The following shows typical output.

Example output from the `show counter dhcp-relay` command

```
awplus#show counter dhcp-relay

DHCP relay counters
Requests In               ......... 4
Replies In                ......... 4

DHCPv6 Replies In         ......... 0
DHCPv6 Relayed to Server  ......... 0
DHCPv6 Relayed to Client  ......... 0
```

Example output from the `show counter dhcp-relay` command for VRF instance red

```
DHCP relay counters

[VRF red]
Requests In ....................... 4
Replies In ........................ 4
Relayed To Server ................. 4
Relayed To Client ................. 4
Out To Server Failed .............. 0
Out To Client Failed .............. 0
Invalid hlen ...................... 0
Bogus giaddr ...................... 0
Corrupt Agent Option .............. 0
Missing Agent Option .............. 0
Bad Circuit ID .................... 0
Missing Circuit ID ................ 0
Option Insert Failed .............. 0
```

Parameter	Description
`Requests In`	The number of DHCP Request messages received from clients.
`Replies In`	The number of DHCP Reply messages received from servers.
`Relayed To Server`	The number of DHCP Request messages relayed to servers.
`Relayed To Client`	The number of DHCP Reply messages relayed to clients.

Parameter	Description
`Out To Server Failed`	The number of failures when attempting to send request messages to servers. This is an internal debugging counter.
`Out To Client Failed`	The number of failures when attempting to send reply messages to clients. This is an internal debugging counter.
`Invalid hlen`	The number of incoming messages dropped due to an invalid hlen field.
`Bogus giaddr`	The number of incoming DHCP Reply messages dropped due to the bogus giaddr field.
`Corrupt Agent Option`	The number of incoming DHCP Reply messages dropped due to a corrupt relay agent information option field. Note that Agent Option counters only increment on errors occurring if the **ip dhcp-relay agent-option** command is configured for an interface. Messages generating the errors are only dropped if the **ip dhcp-relay agent-option checking** command is configured on the interface as well as the **ip dhcp-relay agent-option** command.
`Missing Agent Option`	The number of incoming DHCP Reply messages dropped due to a missing relay agent information option field. Note that Agent Option counters only increment on errors occurring if the **ip dhcp-relay agent-option** command is configured for an interface. Messages generating the errors are only dropped if the **ip dhcp-relay agent-option checking** command is configured on the interface as well as the **ip dhcp-relay agent-option** command.
`Bad Circuit ID`	The number of incoming DHCP Reply messages dropped due to a bad circuit ID. Note that Agent Option counters only increment on errors occurring if the **ip dhcp-relay agent-option** command is configured for an interface. Messages generating the errors are only dropped if the **ip dhcp-relay agent-option checking** command is configured on the interface as well as the **ip dhcp-relay agent-option** command
`Missing Circuit ID`	The number of incoming DHCP Reply messages dropped due to a missing circuit ID. Note that Agent Option counters only increment on errors occurring if the **ip dhcp-relay agent-option** command is configured for an interface.

Parameter	Description
	Messages generating the errors are only dropped if the **ip dhcp-relay agent-option checking** command is configured on the interface as well as the **ip dhcp-relay agent-option** command
`Bad Remote ID`	The number of incoming DHCP Reply messages dropped due to a bad remote ID. Note that Agent Option counters only increment on errors occurring if the **ip dhcp-relay agent-option** command is configured for an interface. Messages generating the errors are only dropped if the **ip dhcp-relay agent-option checking** command is configured on the interface as well as the **ip dhcp-relay agent-option** command
`Missing Remote ID`	The number of incoming DHCP Reply messages dropped due to a missing remote ID. Note that Agent Option counters only increment on errors occurring if the **ip dhcp-relay agent-option** command is configured for an interface. Messages generating the errors are only dropped if the **ip dhcp-relay agent-option checking** command is configured on the interface as well as the **ip dhcp-relay agent-option** command
`Option Insert Failed`	The number of incoming DHCP Request messages dropped due to an error adding the DHCP Relay Agent information (option-82). This counter increments when: • the DHCP Relay Agent is set to drop packets with the DHCP Relay Agent Option 82 field already filled by another DHCP Relay Agent. This policy is set with the **ip dhcp-relay information policy** command. • there is a packet error that stops the DHCP Relay Agent from being able to append the packet with its DHCP Relay Agent Information Option (Option 82) field.
Note that the following parameters are only used on the Global VRF instance when DHCPv6 is running	
`DHCPv6 Requests In`	The number of incoming DHCPv6 Request messages.
`DHCPv6 Replies In`	The number of incoming DHCPv6 Reply messages.
`DHCPv6 Relayed to Server`	The number of DHCPv6 messages relayed to the server.

Parameter	Description
`DHCPv6 Relayed to Client`	The number of DHCPv6 messages relayed to the client.

show counter dhcp-server

Overview This command shows counters for the DHCP server on your device.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Syntax

```
show counter dhcp-server
```

Syntax (VRF-lite)

```
show counter dhcp-server [vrf <vrf-name>]
```

Parameter	Description
`vrf`	Display the output for a VRF instance
`<vrf-name>`	The name of the specific VRF instance.

Mode User Exec and Privileged Exec

Example To display counters for the DHCP server on your device, use the command:

```
awplus# show counter dhcp-server
```

Output The following shows typical output.

Example output from the `show counter dhcp-server` command

```
DHCP server counters
DHCPDISCOVER in       ......... 20
DHCPREQUEST in        ......... 12
DHCPDECLINE in        ......... 1
DHCPRELEASE in        ......... 0
DHCPINFORM in         ......... 0
DHCPOFFER out         ......... 8
DHCPACK out           ......... 4
DHCPNAK out           ......... 0
BOOTREQUEST in        ......... 0
BOOTREPLY out         ......... 0
```

Example output from the `show counter dhcp-server` command with VRFs configured

```
DHCP server counters[VRF: RED]
DHCPDISCOVER in          ....... 0
DHCPREQUEST in           ....... 7
DHCPDECLINE in           ....... 0
DHCPRELEASE in           ....... 0
DHCPINFORM in            ....... 0
DHCPOFFER out            ....... 0
DHCPACK out              ....... 7
DHCPNAK out              ....... 0
BOOTREQUEST in           ....... 0
BOOTREPLY out            ....... 0
DHCPLEASEQUERY in        ....... 0
DHCPLEASEUNKNOWN out     ....... 0
DHCPLEASEACTIVE out      ....... 0
DHCPLEASEUNASSIGNED out ....... 0

[VRF: GREEN]
DHCPDISCOVER in          ....... 0
DHCPREQUEST in           ....... 7
DHCPDECLINE in           ....... 0
DHCPRELEASE in           ....... 0
DHCPINFORM in            ....... 0
DHCPOFFER out            ....... 0
DHCPACK out              ....... 7
DHCPNAK out              ....... 0
BOOTREQUEST in           ....... 0
BOOTREPLY out            ....... 0
DHCPLEASEQUERY in        ....... 0
DHCPLEASEUNKNOWN out     ....... 0
DHCPLEASEACTIVE out      ....... 0
DHCPLEASEUNASSIGNED out ....... 0
```

Parameters in the output of the `show counter dhcp-server` command

Parameter	Description
`DHCPDISCOVER in`	The number of Discover messages received by the DHCP server.
`DHCPREQUEST in`	The number of Request messages received by the DHCP server.
`DHCPDECLINE in`	The number of Decline messages received by the DHCP server.
`DHCPRELEASE in`	The number of Release messages received by the DHCP server.
`DHCPINFORM in`	The number of Inform messages received by the DHCP server.
`DHCPOFFER out`	The number of Offer messages sent by the DHCP server.
`DHCPACK out`	The number of Acknowledgement messages sent by the DHCP server.
`DHCPNAK out`	The number of Negative Acknowledgement messages sent by the DHCP server. The server sends these after receiving a request that it cannot fulfil because either there are no available IP addresses in the related address pool, or the request has come from a client that doesn't fit the network setting for an address pool.
`BOOTREQUEST in`	The number of bootp messages received by the DHCP server from bootp clients.
`BOOTREPLY out`	The number of bootp messages sent by the DHCP server to bootp clients.

show dhcp lease

Overview This command shows details about the leases that the DHCP client has acquired from a DHCP server for interfaces on the device.

For information on filtering and saving command output, see "Controlling "show" Command Output" in the **"Getting Started with AlliedWare_Plus" Feature Overview and Configuration Guide**.

Syntax

```
show dhcp lease [<interface>]
```

Parameter	Description
<interface>	Interface name to display DHCP lease details for.

Mode User Exec and Privileged Exec

Example To show the current lease expiry times for all interfaces, use the command:

```
awplus# show dhcp lease
```

To show the current lease for vlan2, use the command:

```
awplus# show dhcp lease vlan2
```

Output The following shows typical output.

Example output from the `show dhcp lease vlan1` command

```
Interface vlan1
-----------------------------------------------------------------
IP Address:                    192.168.22.4

Related commands **ip address dhcp**

show ip dhcp binding

Overview This command shows the lease bindings that the DHCP server has allocated clients.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Syntax
```
show ip dhcp binding [<ip-address>|<address-pool>]
```

Syntax (VRF-lite)
```
show ip dhcp binding [vrf <name>] [<ip-address>|<address-pool>]
```

Parameter	Description
`vrf`	Display the output for a VRF instance
<name>	The name of the specific VRF instance.
<ip-address>	IPv4 address of a leased IP address, in dotted decimal notation. This displays the lease information for the specified IP address.
<address-pool>	Name of an address pool. This displays the lease information for all clients within the address pool.

Mode User Exec and Privileged Exec

Examples To display all leases for every client in all address pools, use the command:

```
awplus# show ip dhcp binding
```

To display the details for the leased IP address 172.16.2.16, use the command:

```
awplus# show ip dhcp binding 172.16.2.16
```

To display the leases from the address pool MyPool, use the command:

```
awplus# show ip dhcp binding MyPool
```

Output The following shows typical output.

Example output from the `show ip dhcp binding` command

```
Pool 30_2_network Network 172.16.2.0/24

show ip dhcp pool

Overview This command displays the configuration details and system usage of the DHCP address pools configured on the device.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Syntax

```
show ip dhcp pool [<address-pool>]
```

Parameter	Description
<address-pool>	Name of a specific address pool. This displays the configuration of the specified address pool only.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip dhcp pool
```

Output The following shows typical output.

Example output from the `show ip dhcp pool` command

```
Pool p1 :
  network: 192.168.1.0/24
  address ranges:
    addr: 192.168.1.10 to 192.168.1.18
  static host addresses:
    addr: 192.168.1.12     MAC addr: 1111.2222.3333
  lease <days:hours:minutes:seconds> <1:0:0:0>
  subnet mask: 255.255.255.0 (pool's network mask)
  Probe:                        Default Values
    Status:       Enabled       [Enabled]
    Type:         ARP           [Ping]
    Packets:      2             [5]
    Timeout:      200 msecs     [200]
  Dynamic addresses:
    Total:        8
    Leased:       2
    Utilization:  25.0 %
  Static host addresses:
    Total:        1
    Leased:       1
```

Output The following shows typical output.

Example output from the `show ip dhcp pool` command with IP address 192.168.1.12 assigned to a VLAN interface on the device:

```
Pool p1 :
  network: 192.168.1.0/24
  address ranges:
    addr: 192.168.1.10 to 192.168.1.18
            (interface addr 192.168.1.12 excluded)
            (static host addr 192.168.1.12 excluded)
  static host addresses:
    addr: 192.168.1.12     MAC addr: 1111.2222.3333
            (= interface addr, so excluded)
  lease <days:hours:minutes:seconds> <1:0:0:0>
  subnet mask: 255.255.255.0 (pool's network mask)
  Probe:                        Default Values
    Status:       Enabled       [Enabled]
    Type:         ARP           [Ping]
    Packets:      2             [5]
    Timeout:      200 msecs     [200]
  Dynamic addresses:
    Total:        8
    Leased:       2
    Utilization:  25.0 %
  Static host addresses:
    Total:        1
    Leased:       1
```

Output The following shows typical output.

Example output from the `show ip dhcp pool` command when a host with MAC 0000.cd38.05f9 is registered as a static host by DHCP Framed IP Lease feature from AUTHD:

```
Pool p1 :
  network: 10.1.1.0/24
  address ranges:
    addr: 10.1.1.101 to 10.1.1.199
            (static host addr 10.1.1.122 excluded)
            (static host addr 10.1.1.111 excluded)
  static host addresses:
    addr: 10.1.1.122       MAC addr: 0000.1111.2222
    addr: 10.1.1.111       MAC addr: 0000.cd38.05f9
                           Netmask : 255.255.255.0
                           Gateway : 10.1.1.1
                           Lease   : 60 seconds
                           Added by AUTHD
  lease  <1:0:0:0>

```

Parameters in the output of `show ip dhcp pool`

Parameter	Description
`Pool`	Name of the pool.
`network`	Subnet and mask length of the pool.
`address ranges`	Individual IP addresses and address ranges configured for the pool. The DHCP server can offer clients an IP address from within the specified ranges only. Any of these addresses that match an interface address on the device, or a static host address configured in the pool, will be automatically excluded from the range, and a message to this effect will appear beneath the range entry.
`static host addresses`	The static host addresses configured on the pool. Each IP address is permanently assigned to the client with the matching MAC address. Any of these addresses that match an interface address on the device will be automatically excluded, and a message to this effect will appear beneath the static host entry.
`lease <days:hours:minutes>`	The lease duration for address allocated by this pool.
`domain`	The domain name sent by the pool to clients. This is the domain name that the client should use when resolving host names using DNS.
`subnet mask`	The subnet mask sent by the pool to clients.
`Probe - Status`	Whether lease probing is enabled or disabled.
`Probe - Type`	The lease probe type configured. Either ping or ARP.
`Probe - Packets`	The number of packets sent for each lease probe in the range 0 to 10.
`Probe - Timeout`	The timeout value in milliseconds to wait for a response after each probe packet is sent. In the range 50 to 5000.
`dns servers`	The DNS server addresses sent to by the pool to clients.
`default-router(s)`	The default router addresses sent by the pool to clients.

Parameter	Description
`user-defined options`	The list of user-defined options sent by the pool to clients.
`Dynamic addresses-Total`	The total number of IP addresses that have been configured in the pool for dynamic allocation to DHCP clients.
`Dynamic addresses-Leased`	The number of IP addresses in the pool that have been dynamically allocated (leased) to DHCP clients.
`Dynamic addresses -Utilization`	The percentage of IP addresses in the pool that are currently dynamically allocated to clients.
`Static host addresses-Total`	The number of static IP addresses configured in the pool for specific DHCP client hosts.
`Static host addresses -Leased`	The number of static IP addresses assigned to specific DHCP client hosts.

show ip dhcp-relay

Overview This command shows the configuration of the DHCP Relay Agent on each interface.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Syntax
```
show ip dhcp-relay [interface <interface-name>]
```

Syntax (VRF-lite)
```
show ip dhcp-relay [vrf <name>|global] [interface <interface-name>]
```

Parameter	Description
<interface-name>	Name of a specific interface. This displays the DHCP configuration for the specified interface only.
`vrf`	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.
`global`	The Global VRF instance.

Mode User Exec and Privileged Exec

Example To display the DHCP Relay Agent's configuration on the interface vlan2, use the command:

```
awplus# show ip dhcp-relay interface vlan2
```

Output The following shows typical output.

Example output from the `show ip dhcp-relay` command

```
DHCP Relay Service is enabled

vlan2 is up, line protocol is up
Maximum hop count is 10
Maximum DHCP message length is 1400
DHCP Relay short lease time for IPv4 is 200 seconds
DHCP Relay short lease time for IPv6 are 2000/1900 (valid/
preferred) seconds
Insertion of Relay Agent Option is disabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay information policy is to append new relay agent
information
List of servers :   192.168.1.200
```

Output (VRF-lite)

Example output from the `show ip dhcp-relay` command applied for VRF instance red

```
DHCP Relay Service is enabled

[VRF: red]
vlan2 is up, line protocol is up
Maximum hop count is 10
Maximum DHCP message length is 1400
Insertion of Relay Agent Option is enabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay Information policy is to replace existing relay agent
information
List of servers :   192.168.1.3
```

show ip dhcp server statistics

Overview This command shows statistics related to the DHCP server.

You can display the server counters using the **show counter dhcp-server** command as well as with this command.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Syntax

```
show ip dhcp server statistics
```

Syntax (VRF-lite)

```
show ip dhcp server statistics [vrf <name>]
```

Parameter	Description
`vrf`	Display the output for a VRF instance.
<name>	The name of the specific VRF instance.

Mode User Exec and Privileged Exec

Example To display the server statistics, use the command:

```
awplus# show ip dhcp server statistics
```

Output The following shows typical output.

Example output from the `show ip dhcp server statistics` command

```
DHCP server counters
DHCPDISCOVER in       ......... 20
DHCPREQUEST in        ......... 12
DHCPDECLINE in        ......... 1
DHCPRELEASE in        ......... 0
DHCPINFORM in         ......... 0
DHCPOFFER out         ......... 8
DHCPACK out           ......... 4
DHCPNAK out           ......... 0
BOOTREQUEST in        ......... 0
BOOTREPLY out         ......... 0
DHCPLEASEQUERY in       ....... 0
DHCPLEASEUNKNOWN out    ....... 0
DHCPLEASEACTIVE out     ....... 0
DHCPLEASEUNASSIGNED out ....... 0
```

Example output from the `show ip dhcp server statistics` command for VRF instance red

```
DHCP relay counters
[VRF: RED]
DHCPDISCOVER in         ....... 0
DHCPREQUEST in          ....... 7
DHCPDECLINE in          ....... 0
DHCPRELEASE in          ....... 0
DHCPINFORM in           ....... 0
DHCPOFFER out           ....... 0
DHCPACK out             ....... 7
DHCPNAK out             ....... 0
BOOTREQUEST in          ....... 0
BOOTREPLY out           ....... 0
DHCPLEASEQUERY in       ....... 0
DHCPLEASEUNKNOWN out    ....... 0
DHCPLEASEACTIVE out     ....... 0
DHCPLEASEUNASSIGNED out ....... 0
```

Parameter	Description
`DHCPDISCOVER in`	The number of Discover messages received by the DHCP server.
`DHCPREQUEST in`	The number of Request messages received by the DHCP server.
`DHCPDECLINE in`	The number of Decline messages received by the DHCP server.
`DHCPRELEASE in`	The number of Release messages received by the DHCP server.
`DHCPINFORM in`	The number of Inform messages received by the DHCP server.
`DHCPOFFER out`	The number of Offer messages sent by the DHCP server.

Parameter	Description
DHCPACK out	The number of Acknowledgement messages sent by the DHCP server.
DHCPNAK out	The number of Negative Acknowledgement messages sent by the DHCP server. The server sends these after receiving a request that it cannot fulfil because either there are no available IP addresses in the related address pool, or the request has come from a client that doesn't fit the network setting for an address pool.
BOOTREQUEST in	The number of bootp messages received by the DHCP server from bootp clients.
BOOTREPLY out	The number of bootp messages sent by the DHCP server to bootp clients.
DHCPLEASEQUERY in	The number of Lease Query messages received by the DHCP server from DHCP Relay Agents.
DHCPLEASEUNKNOWN out	The number of Lease Unknown messages sent by the DHCP server to DHCP Relay Agents.
DHCPLEASEACTIVE out	The number of Lease Active messages sent by the DHCP server to DHCP Relay Agents.
DHCPLEASEUNASSIGNED out	The number of Lease Unassigned messages sent by the DHCP server to DHCP Relay Agents.

Command changes

Version 5.5.1-1.1: **vrf <name>** parameter added

show ip dhcp server summary

Overview This command shows the current configuration of the DHCP server. This includes:

- whether the DHCP server is enabled
- whether the DHCP server is configured to ignore BOOTP requests
- whether the DHCP server is configured to support DHCP lease queries
- the details of any user-defined options
- a list of the names of all DHCP address pools currently configured

This show command does not include any configuration details of the address pools. You can display these using the **show ip dhcp pool** command.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Syntax

```
show ip dhcp server summary
```

Mode User Exec and Privileged Exec

Example To display the current configuration of the DHCP server, use the command:

```
awplus# show ip dhcp server summary
```

Output The following shows typical output.

Example output from the `show ip dhcp server summary` command

```
DHCP Server service is enabled
DHCP Server is running
BOOTP ignore is disabled
DHCP leasequery support is disabled
DHCP server is globally authoritative
DHCP subscriber-id substitution for client-id is not enabled
Pool list: p2
```

Related commands

ip dhcp leasequery enable

ip dhcp pool

service dhcp-server

subnet-mask

Overview This command sets the subnet mask option for a DHCP address pool you are configuring. Use this command to specify the client's subnet mask as defined in RFC 950. This sets the subnet details using the pre-defined option 1. Note that if you create a user-defined option 1 using the **option** command, then you will override any settings created with this command. If you do not specify a subnet mask using this command, then the pool's network mask (specified using the **next-server** command) is applied.

The **no** variant of this command removes a subnet mask option from a DHCP pool. The pool reverts to using the pool's network mask.

Syntax

```
subnet-mask <mask>
no subnet-mask
```

Parameter	Description
<mask>	Valid IPv4 subnet mask, in dotted decimal notation.

Mode DHCP Configuration

Examples To set the subnet mask option to `255.255.255.0` for DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# subnet-mask 255.255.255.0
```

To remove the subnet mask option from DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no subnet-mask
```

Related commands

default-router

domain-name

next-server

option

service dhcp-server

show ip dhcp pool

use-subscriber-id

Overview Use this command to configure a DHCP server to use a subscriber identifier substitution for a client identifier on all DHCP packets for a given remote address pool.

Use the **no** variant of this command to remove the subscriber identifier substitution for a client identifier.

Syntax

```
use-subscriber-id
no use-subscriber-id
```

Default Disabled

Mode DHCP Configuration

Usage notes If the subscriber identifier for the client identifier substitution is enabled for a remote pool, then all relayed packets destined for the poll must contain the relay agent information option. This includes the subscriber identifier sub-option.

If not, then the relayed packet will be silently ignored as the situation is considered as an invalid operation.

Example To set the subscriber-id and client-id substitution for the DHCP pool ‘Campus-1’, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Campus-1
awplus(dhcp-config)# use-subscriber-id
```

Output The following shows typical output.

Example output from `show ip dhcp pool Campus-1`

```
awplus#show ip dhcp pool Campus-1
Pool Campus-1 :
  subscriber-id substitution for client-id is enabled
  network: 192.168.2.0/24
  address ranges:
    addr: 192.168.2.50 to 192.168.2.100
  static host addresses:
    addr: 192.168.2.5      Client-id: office-pc-21
  lease  <1:0:0:0>
  subnet mask: 255.255.255.0 (pool's network mask)
  dns servers:  192.168.2.2
  default-router(s):  192.168.2.2
  Probe:                        Default Values
    Status:       Enabled       [Enabled]
    Type:         Ping          [Ping]
    Packets:      5             [5]
    Timeout:      200 msecs     [200]
  Dynamic addresses:
    Total:        51
    Leased:       0
    Utilization:  0.0 %
  Static host addresses:
    Total:        1
    Leased:       1
```

show ip dhcp pool

Command changes Version 5.5.2-0.1: command added

vrf

Overview Use this command to add a VRF name to a DHCP server's address pool. This enables the DHCP server to become VRF-aware and allocate IP addresses which are the same as other pools.

One of the benefits of using this command is that it allows you to share DHCP leases across multiple isolated networks.

Use the **no** variant of this command to remove a VRF name from the DHCP server pool.

Syntax

```
vrf <vrf-name>
no vrf
```

Parameter	Description
<vrf-name>	The name of the specific VRF instance.

Default Global VRF

Mode DHCP Configuration

Usage notes You need to enter this **vrf** command before entering the **network (DHCP)** and **range** address commands.

For more information, see the **DHCP Feature Overview and Configuration Guide**.

Example To add the VRF name 'red' to the DHCP pool named 'P1', use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P1
awplus(dhcp-config)# vrf red
```

To remove a VRF name from the DHCP pool named 'P1', use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P1
awplus(dhcp-config)# no vrf
```

Introduction

Overview

This chapter provides an alphabetical reference for commands used to configure DHCPv6. For more information, see the **DHCPv6 Feature Overview and Configuration Guide**.

DHCPv6 is a network protocol used to configure IPv6 hosts with IPv6 addresses and IPv6 prefixes for an IPv6 network. DHCPv6 is used instead of SLAAC (Stateless Address Autoconfiguration) at sites where centralized management of IPv6 hosts is needed. IPv6 routers require automatic configuration of IPv6 addresses and IPv6 prefixes.

DHCPv6 Prefix Delegation provides automatic configuration of IPv6 addresses and IPv6 prefixes.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

NOTE: *The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.*

address prefix

Overview Use this command in DHCPv6 Configuration mode to specify an address prefix for address assignment with DHCPv6 server pool configuration.

Use the **no** variant of this command to remove the address prefix from the DHCPv6 server pool.

Syntax

```
address prefix <ipv6-prefix/prefix-length> [lifetime {<valid-time>|infinite} {<preferred-time>|infinite}]
no address prefix <ipv6-prefix/prefix-length>
```

Parameter	Description
<ipv6-prefix/prefix-length>	Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
`lifetime`	Specify a time period for the hosts to remember router advertisements (RAs). If you specify the optional lifetime parameter with this command then you must also specify a *valid-time* and a *preferred-time* value. See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry.
<valid-time>	Specify a valid lifetime in seconds in the range <5-315360000>. The default valid lifetime is 2592000 seconds.
`infinite`	Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.
<preferred-time>	Specify a preferred lifetime in seconds in the range <5-315360000>. The default preferred lifetime is 604800 seconds.

Mode DHCPv6 Configuration

Default The default valid lifetime is 2592000 seconds and the default preferred lifetime is 604800 seconds.

Usage notes

This command creates a pool of prefixes from which addresses are assigned to clients on request, and allocates a network prefix from which the DHCPv6 Server leases addresses. This command is an alternative to using a range set using the **address range** command.

The DHCPv6 Server selects an IPv6 address from the range available allocated by the IPv6 prefix, randomly generating the suffix of the IPv6 address, with the specified preferred and valid lifetime leases. Leased IPv6 address are found in the DHCPv6 Server REPLY packet, which is located within the IANA (Identity Association for Non-temporary Addresses) IA address field in the **REPLY** message.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Examples

To add IPv6 address prefix `2001:0db8:1::/48` for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# address prefix 2001:0db8:1::/48
```

To remove a configured IPv6 address prefix for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# no address prefix 2001:0db8:1::/48
```

Related commands

address range

ipv6 dhcp pool

Validation Commands

show ipv6 dhcp binding

show ipv6 dhcp pool

address range

Overview Use this command in DHCPv6 Configuration mode to specify an address range for address assignment with DHCPv6 server pool configuration.

Use the **no** variant of this command to remove an address range from the DHCPv6 server pool.

Syntax

```
address range <first-ipv6-address> <last-ipv6-address>[lifetime
 {<valid-time>|infinite} {<preferred-time>|infinite}]
no address range <first-ipv6-address> <last-ipv6-address>
```

Parameter	Description
<first-ipv6-address>	Specify the first IPv6 address of the IPv6 address range, in hexadecimal notation in the format X:X::X:X.
<last-ipv6-address>	Specify the last IPv6 address of the IPv6 address range, in hexadecimal notation in the format X:X::X:X.
lifetime	Optional. Specify a time period for the hosts to remember router advertisements (RAs). If you specify this parameter then you must also specify a *valid-time* and a *preferred-time* value. See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry.
<valid-time>	Specify a valid lifetime in seconds in the range <5-31536000>. The default valid lifetime is 2592000 seconds.
infinite	Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.
<preferred-time>	Specify a preferred lifetime in seconds in the range <5-31536000>. The default preferred lifetime is 604800 seconds.

Default The default valid lifetime is 2592000 seconds and the default preferred lifetime is 604800 seconds.

Mode DHCPv6 Configuration

Usage

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Examples

To add the IPv6 address range `2001:0db8:1::1` to `2001:0db8:1fff::1` for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# address range 2001:0db8:1::1
 2001:0db8:1fff::1
```

To remove a configured IPv6 address range for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# no address range
```

Related commands

address prefix

Validation Commands

show ipv6 dhcp binding

show ipv6 dhcp pool

clear counter ipv6 dhcp-client

Overview Use this command in Privileged Exec mode to clear DHCPv6 client counters.

Syntax
```
clear counter ipv6 dhcp-client
```

Mode Privileged Exec

Example To clear DHCPv6 client counters, use the following command:
```
awplus# clear counter ipv6 dhcp-client
```

Related commands **show counter ipv6 dhcp-client**

clear counter ipv6 dhcp-server

Overview Use this command in Privileged Exec mode to clear DHCPv6 server counters.

Syntax
```
clear counter ipv6 dhcp-server
```

Mode Privileged Exec

Example To clear DHCPv6 server counters, use the following command:
```
awplus# clear counter ipv6 dhcp-server
```

Related commands **show counter ipv6 dhcp-server**

clear ipv6 dhcp binding

Overview Use this command in Privileged Exec mode to clear either a specific lease binding or the lease bindings as specified by the command parameters. The command will only take effect on dynamically allocated bindings, not statically configured bindings. This command clears binding entries on the DHCPv6 server binding table.

Syntax

```
clear ipv6 dhcp binding {ipv6 <prefix>|duid <DUID>|all|
pool <name>}
```

Parameter	Description
`ipv6 <prefix>`	Optional. Specify the IPv6 prefix of the DHCPv6 client, in hexadecimal notation in the format `X:X::X:X`.
`duid <DUID>`	Specify the DUID (DHCPv6 unique ID) of the DHCPv6 client.
`all`	All DHCPv6 bindings.
`pool <name>`	Description used to identify DHCPv6 server address pool. Valid characters are any printable character. If the name contains spaces then you must enclose these in “quotation marks”.

Mode Privileged Exec

Usage notes

A specific binding may be deleted by **ipv6** address or **duid** address, or several bindings may be deleted at once using **all** or **pool**.

Note that if you specify to clear the **ipv6** or **duid** address of what is actually a static DHCPv6 binding, an error message is displayed. If **all** or **pool** are specified and one or more static DHCPv6 bindings exist within those addresses, any dynamic entries within those addresses are cleared but any static entries are not cleared.

The clear ipv6 dhcp binding command is used as a server function. A binding table entry on the DHCPv6 server is automatically:

- Created whenever a prefix is delegated to a client from the configuration pool.
- Updated when the client renews, rebinds, or confirms the prefix delegation.
- Deleted when the client releases all the prefixes in the binding, all prefix lifetimes have expired, or when a user runs the clear ipv6 dhcp binding command.

If the **`clear ipv6 dhcp binding`** command is used with the optional IPv6 address parameter, only the binding for the specified client is deleted. If the **`clear ipv6 dhcp binding`** command is used without the optional IPv6 address parameter, then all automatic client bindings are deleted from the DHCPv6 bindings table.

Example

To clear all dynamic DHCPv6 server binding entries, use the command:

```
awplus# clear ipv6 dhcp binding all
```

Output

The following shows typical output.

Example output from the `clear ipv6 dhcp binding all` command

```
awplus#clear ipv6 dhcp binding all
% Deleted 1 entries
```

Related commands

show ipv6 dhcp binding

clear ipv6 dhcp client

Overview Use this command in Privileged Exec mode to restart a DHCPv6 client on an interface.

Syntax

```
clear ipv6 dhcp client <interface>
```

Parameter	Description
<interface>	Specify the interface name to restart a DHCPv6 client on.

Mode Privileged Exec

Example To restart a DHCPv6 client on interface vlan1, use the following command:

```
awplus# clear ipv6 dhcp client vlan1
```

Related commands **show ipv6 dhcp binding**

dns-server (DHCPv6)

Overview Use this command to add a Domain Name System (DNS) server to the DHCPv6 address pool you are configuring. You can use this command multiple times to create a list of DNS name servers available to the client. This sets the DNS server details using the pre-defined option 6. Note that if you add a user-defined option 6 using the **option (DHCPv6)**, then you will override any settings created with this command.

Use the **no** variant of this command to remove either the specified DNS server or all DNS servers from the DHCPv6 pool.

Syntax

```
dns-server <ipv6-address>
no dns-server [<ipv6-address>]
```

Parameter	Description
<ipv6-address>	Specify an IPv6 address of the DNS server, in hexadecimal notation in the format `X:X::X:X`. This parameter is required when adding a DNS server to the DHCPv6 address pool. All DNS servers are removed from the DHCPv6 pool if you enter the no dns-server command without this parameter.

Mode DHCPv6 Configuration

Examples To add the DNS server with the assigned IPv6 address `2001:0db8:3000:3000::32` to the DHCPv6 server pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# dns-server 2001:0db8:3000:3000::32
```

To remove the DNS server with the assigned IPv6 address `2001:0db8:3000:3000::32` from the DHCPv6 server pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no dns-server 2001:0db8:3000:3000::32
```

To remove all DNS servers from the DHCPv6 server pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no dns-server
```

Related commands

ipv6 dhcp pool

option (DHCPv6)

show ipv6 dhcp pool

domain-name (DHCPv6)

Overview Use this command in DHCPv6 Configuration mode to add a domain name to the DHCPv6 server address pool you are configuring.

Use the **no** variant of this command to remove a domain name from the address pool.

Syntax

```
domain-name <domain-name>
no domain-name
```

Parameter	Description
<domain-name>	Specify the domain name you wish to assign the DHCPv6 server address pool. Valid characters are printable characters. If the name contains spaces then you must enclose it in “quotation marks”.

Mode DHCPv6 Configuration

Usage This command specifies the domain name that a client should use when resolving host names using the Domain Name System, and sets the domain name details using the pre- defined option 15. Note that if you add a user-defined option 15 using the **option (DHCPv6)**, then you will override any settings created with this command.

Examples To add the domain name `Engineering` to DHCPv6 server pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# domain-name Engineering
```

To remove the domain name `Engineering` from DHCPv6 server pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no domain-name Engineering
```

dns-server (DHCPv6)

option (DHCPv6)

show ipv6 dhcp pool

ip dhcp-relay agent-option

Overview This command enables the DHCP Relay Agent to insert the DHCP Relay Agent Information Option (Option 82) into the client-request packets that it relays to its DHCP server. This allows the DHCP Relay Agent to pass on information to the server about the network location of the client device. The DHCP Relay Agent strips the DHCP Relay Agent Option 82 field out of the DHCP server's response, so that the DHCP client never sees this field.

When the DHCP Relay Agent appends its DHCP Relay Agent Option 82 data into the packet, it first overwrites any pad options present; then if necessary, it increases the packet length to accommodate the DHCP Relay Agent Option 82 data.

The **no** variant of this command stops the DHCP Relay Agent from appending the Option 82 field onto DHCP requests before forwarding it to the server.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the **DHCP Feature Overview and Configuration Guide**.

NOTE: ***ip dhcp-relay agent-optionip dhcp-relay information policy***

Syntax

```
ip dhcp-relay agent-option
no ip dhcp-relay agent-option
```

Default DHCP Relay Agent Information Option (Option 82) insertion is disabled by default.

Mode Interface Configuration for VLAN interfaces.

Usage notes Use this command to alter the DHCP Relay Agent Option 82 setting when your device is the first hop for the DHCP client. To limit the maximum length of the packet, use the **ip dhcp-relay max-message-length** command.

This command cannot be enabled if DHCP snooping is enabled on your device (**service dhcp-snooping**), and vice versa.

Examples

To make the DHCP Relay Agent listening on vlan2 append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the DHCP Relay Agent from appending the DHCP Relay Agent Option 82 field on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option
```

Related commands

ip dhcp-relay agent-option remote-id

ip dhcp-relay information policy

ip dhcp-relay max-message-length

service dhcp-relay

ip dhcp-relay agent-option subscriber-id-auto-mac

Overview This command causes the relay agent to insert the requesting clients' MAC address into a subscriber ID field in the relay header. A suitably-configured server can then use this subscriber ID option to assign the same IPv6 address to that requesting client every time it requires an address.

Use the no form of this command to disable this feature.

Syntax
```
ip dhcp-relay agent-option subscriber-id-auto-mac
no ip dhcp-relay agent-option subscriber-id-auto-mac
```

Default Disabled

Usage notes By default, DHCPv6 uses a DUID-LLT client identifier instead of a MAC address. This is generated by the operating system when DHCP first starts. If the OS is reinstalled the DUID-LLT can change, and any multiple operating systems on the machine will all have different DUIDs.

Configuring the subscriber-id-auto-mac option causes the relay agent to insert the requesting client's MAC address into a subscriber ID field in the relay header. A suitably-configured server can then use this subscriber ID to assign the same IPv6 address to that requesting client every time it connects.

The client must be in the same L2 network as the relay. If there are multiple relays between the client and the server, only the first relay will add a subscriber ID option.

Example To enable this feature on VLAN1, use the following commands:

```
awplus(config)#int vlan1
awplus(config-if)#ip dhcp-relay agent-option subscriber-id-auto-mac
```

For an example of how to configure a relay agent and server, see the document "How to use DHCPv6 to assign specific IPv6 addresses to specific devices", available from www.alliedtelesis.com.

ip dhcp-relay agent-option checking

Overview This command enables the DHCP Relay Agent to check DHCP Relay Agent Information Option (Option 82) information in response packets returned from DHCP servers. If the information does not match the information it has for its own client (downstream) interface then the DHCP Relay Agent drops the packet. Note that **ip dhcp-relay agent-option** must be configured.

The DHCP Relay Agent Option 82 field is included in relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled (**ip dhcp-relay agent-option**), and
- DHCP Relay Agent is enabled on the device (**service dhcp-relay**)

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the **DHCP Feature Overview and Configuration Guide**.

Syntax

```
ip dhcp-relay agent-option checking
no ip dhcp-relay agent-option checking
```

Mode Interface Configuration for VLAN interfaces.

Examples To make the DHCP Relay Agent listening on vlan2 check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the DHCP Relay Agent on vlan2 from checking the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option checking
```

Related commands

ip dhcp-relay agent-option

ip dhcp-relay agent-option remote-id

ip dhcp-relay information policy

service dhcp-relay

ip dhcp-relay agent-option remote-id

Overview Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field the DHCP Relay Agent inserts into clients' request packets. The Remote ID identifies the device that is inserting the DHCP Relay Agent Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the device's MAC address.

Use the **no** variant of this command to return the Remote ID for an interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the **DHCP Feature Overview and Configuration Guide**.

Syntax

```
ip dhcp-relay agent-option remote-id <remote-id>
no ip dhcp-relay agent-option remote-id
```

Parameter	Description
<remote-id>	An alphanumeric (ASCII) string, 1 to 63 characters in length. Additional characters allowed are hyphen (-), underscore (_) and hash (#). Spaces are not allowed.

Default The Remote ID is set to the device's MAC address by default.

Mode Interface Configuration for VLAN interfaces.

Usage notes The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled (**ip dhcp-relay agent-option**), and
- DHCP Relay Agent is enabled on the device (**service dhcp-relay**)

Examples To set the Remote ID to myid for client DHCP packets received on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

Related commands

ip dhcp-relay agent-option

ip dhcp-relay agent-option checking

show ip dhcp-relay

ip dhcp-relay information policy

Overview

This command sets the policy for how the DHCP relay deals with packets arriving from the client that contain DHCP Relay Agent Option 82 information.

If the command **ip dhcp-relay agent-option** has not been configured, then this command has no effect at all - no alteration is made to Option 82 information in packets arriving from the client side.

However, if the command **ip dhcp-relay agent-option** has been configured, this command modifies how the DHCP relay service deals with cases where the packet arriving from the client side already contains DHCP Relay Agent Option 82 information.

This command sets the action that the DHCP relay should take when a received DHCP client request contains DHCP Relay Agent Option 82 information.

By default, the DHCP Relay Agent replaces any existing DHCP Relay Agent Option 82 field with its own DHCP Relay Agent field. This is equivalent to the functionality of the **replace** parameter.

The **no** variant of this command returns the policy to the default behavior - i.e. replacing the existing DHCP Relay Agent Option 82 field.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the **DHCP Feature Overview and Configuration Guide**.

NOTE: ***ip dhcp-relay agent-optionip dhcp-relay information policy***

Syntax

```
ip dhcp-relay information policy {append|drop|keep|replace}
no ip dhcp-relay information policy
```

Parameter	Description
`append`	The DHCP Relay Agent appends the DHCP Relay Agent Option 82 field of the packet with its own DHCP Relay Agent Option 82 details.
`drop`	The DHCP Relay Agent discards the packet.
`keep`	The DHCP Relay Agent forwards the packet without altering the DHCP Relay Agent Option 82 field.
`replace`	The DHCP Relay Agent replaces the existing DHCP Relay Agent details in the DHCP Relay Agent Option 82 field with its own details before forwarding the packet.

Mode

Interface Configuration for VLAN interfaces.

Examples To make the DHCP Relay Agent listening on vlan2 drop any client requests that already contain DHCP Relay Agent Option 82 information, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay information policy drop
```

To reset the DHCP relay information policy to the default policy for interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay information policy
```

Related commands

ip dhcp-relay agent-option

ip dhcp-relay agent-option checking

service dhcp-server

ip dhcp-relay maxhops

Overview This command sets the hop count threshold for discarding BOOTP messages. When the hops field in a BOOTP message exceeds the threshold, the DHCP Relay Agent discards the BOOTP message. The hop count threshold is set to 10 hops by default.

Use the **no** variant of this command to reset the hop count to the default.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the **DHCP Feature Overview and Configuration Guide**.

Syntax

```
ip dhcp-relay maxhops <1-255>
no ip dhcp-relay maxhops
```

Parameter	Description
<1-255>	The maximum hop count value.

Default The default hop count threshold is 10 hops.

Mode Interface Configuration for VLAN interfaces.

Example To set the maximum number of hops to 5 for packets received on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay maxhops 5
```

Related commands **service dhcp-relay**

ip dhcp-relay max-message-length

Overview This command applies when the device is acting as a DHCP Relay Agent and DHCP Relay Agent Option 82 insertion is enabled. It sets the maximum DHCP message length (in bytes) for the DHCP packet with its DHCP Relay Agent Option 82 data inserted. From this value it calculates the maximum packet size that it will accept at its input. Packets that arrive greater than this value will be dropped.

The **no** variant of this command sets the maximum message length to its default of 1400 bytes.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the **DHCP Feature Overview and Configuration Guide**.

Syntax

```
ip dhcp-relay max-message-length <548-1472>
no ip dhcp-relay max-message-length
```

Parameter	Description
<548-1472>	The maximum DHCP message length (this is the message header plus the inserted DHCP option fields in bytes).

Default The default is 1400 bytes.

Mode Interface Configuration for VLAN interfaces.

Usage notes When a DHCP Relay Agent (that has DHCP Relay Agent Option 82 insertion enabled) receives a request packet from a DHCP client, it will append the DHCP Relay Agent Option 82 component data, and forward the packet to the DHCP server. The DHCP client will sometimes issue packets containing pad option fields that can be overwritten with Option 82 data.

Where there are insufficient pad option fields to contain all the DHCP Relay Agent Option 82 data, the DHCP Relay Agent will increase the packet size to accommodate the DHCP Relay Agent Option 82 data. If the new (increased) packet size exceeds that defined by the **maximum-message-length** parameter, then the DHCP Relay Agent will drop the packet.

NOTE: ***ip dhcp-relay agent-option***

Example To set the maximum DHCP message length to 1200 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay max-message-length 1200
```

To reset the maximum DHCP message length to the default of 1400 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay max-message-length
```

Related commands **service dhcp-relay**

ip dhcp-relay server-address

Overview

This command adds a DHCP server for the DHCP Relay Agent to forward client DHCP packets to on a particular interface. You can add up to five DHCP servers on each device interface that the DHCP Relay Agent is listening on.

The **no** variant of this command deletes the specified DHCP server from the list of servers available to the DHCP relay agent.

The **no ip dhcp-relay** command removes all DHCP relay settings from the interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the **DHCP Feature Overview and Configuration Guide**.

Syntax

```
ip dhcp-relay server-address {<ipv4-address>|<ipv6-address> <server-interface>}
no ip dhcp-relay server-address {<ipv4-address>|<ipv6-address> <server-interface>}
no ip dhcp-relay
```

Parameter	Description
<ipv4-address>	Specify the IPv4 address of the DHCP server for the DHCP Relay Agent to forward client DHCP packets to, in dotted decimal notation. The IPv4 address uses the format A.B.C.D.
<ipv6-address>	Specify the IPv6 address of the DHCPv6 server for the DHCPv6 Relay Agent to forward client DHCP packets to, in hexadecimal notation.
<server-interface>	Specify the interface name of the DHCPv6 server. It is only required for a DHCPv6 server with an IPv6 address.

Mode

Interface Configuration for VLAN interfaces.

Usage notes

For a DHCP server with an IPv6 address you must specify the interface for the DHCP server. See examples below for configuration differences between IPv4 and IPv6 DHCP relay servers.

See also the **service dhcp-relay** command to enable the DHCP Relay Agent on your device. The **ip dhcp-relay server-address** command defines a relay destination on an interface on the device, needed by the DHCP Relay Agent to relay DHCP client packets to a DHCP server.

Examples: DHCP for IPv4

To enable the DHCP Relay Agent to relay DHCP packets on interface vlan2 to the DHCP server with the IPv4 address 192.0.2.200, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay server-address 192.0.2.200
```

To remove the DHCP server with the IPv4 address 192.0.2.200 from the list of servers available to the DHCP Relay Agent on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay server-address 192.0.2.200
```

Examples: DHCPv6

To enable the DHCP Relay Agent on your device to relay DHCP packets on interface vlan10 to the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan10
awplus(config-if)# ip dhcp-relay server-address
 2001:0db8:010d::1 vlan20
```

To remove the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20 from the list of servers available to the DHCP Relay Agent on interface vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay server-address
 2001:0db8:010d::1 vlan20
```

Example: disabling DHCP relay

To disable DHCP relay on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay
```

Related commands

service dhcp-relay

ip dhcp-relay short-lease-ipv6

Overview Use this command to reduce the amount of time an IPv6 address is assigned to a client device.

Long lease times can cause issues in dynamic networks where client devices frequently move between segments, such as VLANs. These device may retain an outdated IP address from its previous VLAN, disrupting communication.

This command is particularly useful in networks with a high turnover of devices or in environments where IP addresses are scarce.

Use the **no** variant of this command to remove the short lease time configuration.

Syntax

```
ip dhcp-relay short-lease-ipv6 [<20-3600> <20-3600>]
no ip dhcp-relay short-lease-ipv6
```

Parameter	Description
<20-3600>	The valid lease time for IPv6 DHCP relay in seconds.
<20-3600>	The preferred lease time for IPv6 DHCP relay in seconds.

Default Not set

Mode Interface Configuration

Usage notes The preferred lease time (the second parameter) must be less than the valid lease time (the first parameter).

- **Preferred lease time**: Indicates when preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.
- **Valid lease time**: Indicates when IPv6 addresses or prefixes must be abandoned. An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires.

Example To configure a DHCP Relay on interface vlan1 with a valid lease time of 2000 seconds, and a preferred lease time of 1000 seconds for IPv6, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp-relay short-lease-ipv6 2000 1000
```

Related commands **show ip dhcp-relay**

Command changes Version 5.5.4-2.1: command added

ipv6 address (DHCPv6 PD)

Overview

Use this command to append an IPv6 address suffix to the IPv6 prefix provided by a DHCPv6 Prefix Delegation (PD) server.

Use the **no** variant of this command to remove the IPv6 address assigned and disable IPv6. Note that if no global addresses are left after removing the IPv6 address then IPv6 is disabled.

Syntax

```
ipv6 address [<ipv6-prefix-name>] <ipv6-addr/prefix-length> [eui64]
no ipv6 address [<ipv6-prefix-name>] <ipv6-addr/prefix-length> [eui64]
```

Parameter	Description
<ipv6-prefix-name>	The IPv6 prefix name advertised on the router advertisement message sent from the device. The IPv6 prefix name is delegated from the DHCPv6 Server configured for DHCPv6 Prefix-Delegation.
<ipv6-addr/prefix-length>	Specifies the IPv6 address to be set, for example ::1/ 64. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
eui64	EUI-64 is a method of automatically deriving the lower 64 bits of an IPv6 address, based on the switch's MAC address.

Mode

Interface Configuration for VLAN interfaces.

Usage notes

When specifying the **eui64** parameter, the interface identifier of the IPv6 address is derived from the MAC address of the device.

For more information about EUI64, see the **IPv6 Feature Overview and Configuration Guide**.

Examples

To assign the IPv6 address 2001:0db8::a2/48 to the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::a2/48
```

To remove the IPv6 address 2001:0db8::a2/48 from the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::a2/48
```

To assign the **eui64** derived address in the prefix 2001:0db8::/64 to VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::/64 eui64
```

To remove the **eui64** derived address in the prefix 2001:0db8::/64 from VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::/64 eui64
```

To configure a PD prefix named ‘prefix1’ on interface vlan2 and then add an IPv6 address, use the following commands. In this example, the prefix will be assigned from the pool on the PD client. The host portion or suffix will be ::1 for the last 64 bits:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 address prefix1::1/64
```

Related commands

ipv6 local pool

ipv6 nd prefix (DHCPv6)

prefix-delegation pool

show ipv6 dhcp binding

show ipv6 interface

show ipv6 route

show running-config

ipv6 address dhcp

Overview Use this command to activate the DHCPv6 client on the interface that you are configuring. This allows the interface to use the DHCPv6 client to obtain its IPv6 configuration details from a DHCPv6 server on its connected network.

The command also enables IPv6 on the interface, which creates an EUI-64 link-local address as well as enabling RA processing and SLAAC.

Use the **no** variant of this command to stop the interface from obtaining IPv6 configuration details from a DHCPv6 server.

The DHCPv6 client supports the following IP configuration options:

- Option 1—the subnet mask for your device.
- Option 3—a list of default routers.
- Option 6 —a list of DNS servers. This list appends the DNS servers set on your device with the **dns-server (DHCPv6)** command.
- Option 15—a domain name used to resolve host names. This option replaces any domain name that you have set with the **domain-name (DHCPv6)** command.
- Option 51—lease expiration time.

Syntax

```
ipv6 address dhcp [default-route-to-server]
no ipv6 address dhcp
```

Parameter	Description
`default-route-to-server`	Allow the automatic configuration of a default route to the DHCPv6 server. This option is not enabled by default when you enable the DHCP client on an interface.

Mode Interface Configuration for VLAN interfaces.

Usage notes Use the **default-route-to-server** option to allow the automatic configuration of a default route to the DHCPv6 server. Note that this option is not enabled by default when you enable the DHCP client on an interface.

Examples

To set the interface vlan2 to use DHCPv6 to obtain an IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 address dhcp
```

To stop the interface vlan2 from using DHCPv6 to obtain its IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address dhcp
```

Related commands

clear ipv6 dhcp client

ipv6 address

ipv6 address (DHCPv6 PD)

show ipv6 dhcp interface

show running-config

ipv6 dhcp client pd

Overview Use this command in Interface Configuration mode to enable the DHCPv6 client process and enable requests for prefix delegation through the interface that you are configuring.

Use the **no** variant of this command to disable requests for prefix delegation. This is the default setting.

For further information about DHCPv6 Prefix Delegation, which is used to automate the process of assigning prefixes, see the **DHCPv6 Feature Overview and Configuration Guide**.

Syntax

```
ipv6 dhcp client pd <prefix-name> <default-route-to-server>
no ipv6 dhcp client pd
```

Parameter	Description
<prefix-name>	Specify an IPv6 general prefix name. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”.
<default-route-to-server>	Specify the default route to the DHCP server

Mode Interface Configuration for VLAN interfaces.

Default Prefix delegation is disabled by default on an interface.

Usage notes Entering the **ipv6 dhcp client pd** command starts the DHCPv6 client process if not already running, and enables requests for prefix delegation through the interface on which the command is configured.

When prefix delegation is enabled and a prefix is acquired, the prefix is stored in the IPv6 prefix pool with an internal name defined by the required <*prefix-name*> placeholder parameter. The **ipv6 address** command can then refer to the prefixes stored in the IPv6 prefix pool.

Examples

To enable prefix delegation with the prefix name my-prefix-name on the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd my-prefix-name
```

To disable prefix delegation on the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 dhcp client pd
```

Related commands

ipv6 enable

clear ipv6 dhcp client

ipv6 address (DHCPv6 PD)

ipv6 nd prefix (DHCPv6)

show ipv6 dhcp binding

show ipv6 dhcp interface

ipv6 dhcp option

Overview Use this command in Global Configuration mode to create a user-defined DHCPv6 option. You can then use this option when configuring a DHCPv6 server address pool, by using the **option (DHCPv6)** command.

Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

Use the **no** variant of this command to remove either the specified user-defined option. This also removes user-defined options from the associated DHCPv6 server address pools.

Syntax `ipv6 dhcp option <1-254> [name <option-name>] [<option-type>]`

`no ipv6 dhcp option <1-254>|<option-name>`

Parameter	Description	
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.	
<option-name>	Option name used to identify the option. You cannot use a number as the option name. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”. Default: no default	
<option-type>	The option value. You must specify a value that is appropriate to the option type:	
	`asci`	An ASCII text string
	`hex`	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.
	`ipv6`	An IPv6 address or prefix that has hexadecimal notation in the format `HHHH:HHHH::HHHH:HHHH`. To create a list of IPv6 addresses, you must add each IPv6 address individually by using the option command multiple times.
	`integer`	A number from 0 to 4294967295.
	`flag`	A value that either sets (to 1) or unsets (to 0) a flag: **true**, **on**, or **enabled** will set the flag. **f alse**, **off** or **disabled** will unset the flag.

Mode Global Configuration

Examples

To define a user-defined ASCII string option as option 66, without a name, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 66 ascii
```

To define a user-defined hexadecimal string option as option 46, with the name “tcpip- node-type”, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 46 name tcpip-node-type hex
```

To define a user-defined IP address option as option 175, with the name `special-address`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 175 name special-address ip
```

To remove the specific user-defined option with the option number 12, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp option 12
```

To remove the specific user-defined option with the option name `perform-router-discovery`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp option perform-router-discovery
```

show ipv6 dhcp

ipv6 dhcp pool

Overview Use this command in Global Configuration mode to enter the DHCPv6 Configuration mode for the DHCPv6 server pool name as specified in the required command parameter. If the name specified is not associated with an existing pool, the device will create a new pool with this name, then enter the configuration mode for the new pool.

Once you have entered the DHCPv6 configuration mode, all commands executed before the next **exit** command will apply to this pool.

You can create multiple DHCPv6 server pools on devices with multiple interfaces. This allows the device to act as a DHCPv6 server on multiple interfaces to distribute different information to clients on the different networks.

Use the **no** variant of this command to delete the specific DHCPv6 pool.

Syntax

```
ipv6 dhcp pool <DHCPv6-poolname>
no ipv6 dhcp pool <DHCPv6-poolname>
```

Parameter	Description
<DHCPv6-poolname>	Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”.

Mode Global Configuration

Usage All DHCPv6 prefix pool names must be unique. IPv6 prefix pools have a similar function to IPv4 address pools. Contrary to IPv4, a block of IPv6 addresses (an IPv6 address prefix) are assigned and not single IPv6 addresses. IPv6 prefix pools are not allowed to overlap.

Once a pool is configured, it cannot be changed. To change the configuration, you must remove then recreate a IPv6 prefix pool. All IPv6 prefixes already allocated are also freed.

Examples To create the DHCPv6 pool named P2 and enter DHCPv6 configuration mode, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)#
```

To delete the DHCPv6 pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp pool P2
```

ipv6 dhcp server

Overview Use this command in Interface Configuration mode to enable DHCPv6 server for the current IPv6 configured interface to use the specified DHCPv6 server pool name.

The DHCPv6 server service listens for DHCPv6 requests on the IPv6 configured interface. The DHCPv6 server service does not run on interfaces without IPv6 configured on them.

Use the **no** variant of this command to disable the DHCPv6 server.

Syntax

```
ipv6 dhcp-server [<DHCPv6-poolname>]
no ipv6 dhcp-server
```

Parameter	Description
<DHCPv6-poolname>	Specify a named DHCPv6 server pool as defined with the **ipv6 dhcp pool** command. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”.

Mode Interface Configuration for VLAN interfaces.

Usage notes The **ipv6 dhcp server** command enables the DHCPv6 service on a specified interface using the pool for prefix delegation and configuration through the specified interface.

Note that DHCPv6 client, DHCPv6 server and DHCPv6 relay are mutually exclusive on an interface. When one of the DHCPv6 functions is enabled on an interface then another DHCPv6 function cannot be enabled on the same interface.

Examples To enable the DHCPv6 server service and use the DHCPv6 pool named P2 on VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 dhcp server P2
```

To disable the DHCPv6 server on VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 dhcp server
```

ipv6 local pool

Overview Use this command in Global Configuration mode to configure a local DHCPv6 server prefix delegation pool specifying a poolname and a prefix/prefix length. You can optionally exclude the locally assigned prefix from the pool with the **exclude-local-prefix** keyword.

Use the **no** variant of this command to remove a local DHCPv6 server prefix delegation pool specifying the poolname.

Syntax

```
ipv6 local pool <DHCPv6-poolname> <delegated-prefix-name> <ipv6-prefix/prefix-length> <assigned-length> [exclude-local-prefix]
no ipv6 local pool
```

Parameter	Description
<DHCPv6-poolname>	Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”.
<delegated-prefix-name>	Description used to identify the delegated prefix name from the parent PD (Prefix Delegation) server. If the name contains spaces then you must enclose it in “quotation marks”.
<ipv6-prefix/prefix-length>	Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
<assigned-length>	Specify an IPv6 prefix length assigned to the user from the pool in the range <1-128>. Note that the value of the *assigned-length* parameter entered cannot be less than or equal to the *prefix-length* parameter value entered. An assigned length must be longer than a prefix length.
exclude-local-prefix	Specify this keyword to exclude the locally assigned prefix from the pool.

Default No DHCPv6 server prefix delegation pool is configured by default.

Mode Global Configuration

Usage notes

All IPv6 prefix pool names must be unique. IPv6 prefix pools have a similar function to IPv4 address pools. Contrary to IPv4, a block of IPv6 addresses (an IPv6 address prefix) are assigned and not single IPv6 addresses. IPv6 prefix pools are not allowed to overlap.

Once a pool is configured, it cannot be changed. To change the configuration, you must remove then recreate a IPv6 prefix pool. All IPv6 prefixes already allocated are also freed.

Examples

To create a local DHCPv6 local pool named P2 with the IPv6 prefix and prefix length 2001:0db8::/32 with an assigned length of 64, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 local pool P2 2001:0db8::/32 64
```

To remove a configured DHCPv6 local pool, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 local pool
```

Related commands

ipv6 dhcp pool

show ipv6 dhcp pool

ipv6 nd prefix (DHCPv6)

Overview Use this command to specify IPv6 RA (Router Advertisement) prefix information generated from the DHCPv6 server for DHCPv6 prefix-delegation for an interface.

Use the **no** variant of this command to remove IPv6 RA prefix information from the DHCPv6 Server for DHCPv6 Prefix-Delegation for the interface. Use the **all** parameter with the **no** variant of this command to remove all prefix names and all prefixes for an interface.

Syntax `ipv6 nd prefix <ipv6-prefix-name> <ipv6-prefix/length>{<valid-lifetime>|infinite} {<preferred-lifetime>|infinite} {off-link|no-autoconfig}`

`no ipv6 nd prefix {<ipv6-prefix-name>|<ipv6-prefix/length>|all}`

Parameter	Description
<ipv6-prefix-name>	The IPv6 prefix name advertised on the router advertisement message sent from the device. The IPv6 prefix name is delegated from the DHCPv6 Server configured for DHCPv6 Prefix-Delegation.
<ipv6-prefix/length>	The IPv6 prefix and prefix length advertised on the router advertisement message sent from the device. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
<valid-lifetime>	The the period during which the specified IPv6 address prefix is valid. This can be set to a value between 5 and 315360000 seconds. Note that this period should be set to a value greater than that set for the prefix preferred-lifetime. See the Usage notes after this parameter table for a description of valid lifetime and how it determines invalid IPv6 addresses upon expiry.
`infinite`	Specifying this keyword instead of entering a value for the *<valid-lifetime>* parameter applies an infinite valid lifetime.
<preferred-lifetime>	Specifies the IPv6 prefix preferred lifetime. This is the period during which the IPv6 address prefix is considered current. Set this to a value between 0 and 315360000 seconds. Note that this period should be set to a value less than that set for the prefix valid-lifetime. See the Usage notes after this parameter table for a description of preferred lifetime and how it determines deprecated IPv6 addresses upon expiry.
`infinite`	Specifying this keyword instead of entering a value for the *<preferred-lifetime>* parameter applies an infinite valid lifetime.
`off-link`	Specify the IPv6 prefix off-link flag.
`no-autoconfig`	Specify the IPv6 prefix no autoconfiguration flag. Setting this flag indicates that the prefix is not to be used for autoconfiguration.
`all`	Specify all prefix names and all prefixes are removed when used with the no variant of this command.

Mode Interface Configuration for VLAN interfaces.

Usage notes This command specifies the IPv6 prefix flags that are advertised by the router advertisement message.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Examples The following example configures the device to issue RAs (Router Advertisements) on the VLAN interface vlan2, and advertises the DHCPv6 prefix name prefix1 and the IPv6 address prefix of 2001:0db8::/32.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 nd prefix prefix1 2001:0db8::/32
```

The following example resets router advertisements on the VLAN interface vlan2, so the address prefix of 2001:0db8::/32 is not advertised from the device.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd prefix 2001:0db8::/32
```

The following example removes all prefix names and prefixes from VLAN interface vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd prefix all
```

link-address

Overview Use this command in DHCPv6 Configuration mode to specify a link-address prefix within a DHCPv6 Server pool.

Note that you can only configure one link address per DHCPv6 pool. Configuring another link address in the same DHCPv6 pool overwrites the previously configured link address.

Use the **no** variant of this command to remove the link-address prefix from the DHCPv6 Server pool.

Syntax

```
link-address <ipv6-prefix/prefix-length>
no link-address
```

Parameter	Description
<ipv6-prefix/prefix-length>	Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.

Default No DHCPv6 Server pool configuration link address prefix is configured by default.

Mode DHCPv6 Configuration

Usage notes

Link addresses are configured in DHCPv6 Server address pools when there are remote clients that communicate via intermediate relay(s).

RELAY-FORW and RELAY-REPL relay packets contain the requesting link address source.

This command is used to match incoming requests from PD (Prefix Delegation) clients (received via an intermediate relay) to a configured delegation pool.

When an address on the incoming interface of the DHCPv6 server or a link address set in the incoming delegation request packet from the prefix delegation client matches the link-address prefix configured in the delegation pool, the DHCPv6 server is able to match and use the appropriate delegation pool for relayed delegation request messages.

If there is no match between incoming delegation request packets from the prefix delegation client and the link-address prefix configured in the delegation pool, the DHCPv6 Server does not delegate an IPv6 prefix to the requesting device.

The link address should be set to the network prefix where the prefix delegation client resides. The prefix delegation server will also need a forwarding path (IPv6 route) back to the network prefix where the prefix delegation client resides.

For more information, see the **DHCPv6 Feature Overview and Configuration Guide**.

Examples

To configure the IPv6 prefix and prefix length 2001:0db8:1::/48 as the link address for pool P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# address prefix 2001:0db8:2::/48
awplus(config-dhcp6)# link-address 2001:0db8:1::/48
```

To remove the link address, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# no link-address
```

Related commands

ipv6 dhcp pool

show ipv6 dhcp pool

option (DHCPv6)

Overview Use this command in DHCPv6 Configuration mode to add a user-defined option to the DHCPv6 prefix pool you are configuring. For the **hex**, **integer**, and **flag** option types, if the option already exists, the new option overwrites the existing option's value.

Use the **no** variant of this command to remove the specified user-defined option from the DHCPv6 server pool, or to remove all user-defined options from the DHCPv6 server pool.

Syntax

```
option [<1-254>|<option-name>] <option-value>
no option [<1-254>|<option-value>]
```

Parameter	Description	
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.	
<option-name>	Option name associated with the option.	
<option-value>	The option value. You must specify a value that is appropriate to the option type:	
	`hex`	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.
	`ipv6`	An IPv6 prefix that has the hexadecimal `X:X::X:X` notation. To create a list of IPv6 prefixes, you must add each IPv6 prefix individually using this command multiple times.
	`integer`	A number from 0 to 4294967295.
	`flag`	A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.

Mode DHCPv6 Configuration

Usage You must define a DHCPv6 option using the **ipv6 dhcp option** command before using the **option (DHCPv6)** command.

Note that options with an **ipv6** type can hold a list of IPv6 prefix (i.e. entries that have the `X:X::X:X` address format), so if the option already exists in the pool, then the new IP address is added to the list of existing IPv6 prefixes. Also note options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

Examples To add the IPv6 type option named `sntp-server-addr` to the pool `P2` and give the option the value `ipv6`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 22 name sntp_server_addr ipv6
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option sntp_server_addr ipv6
```

To add the ASCII-type option named `tftp-server-name` to the pool `P2` and give the option the value `server1`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option tftp-server-name server1
```

To add the hex-type option named `tcpip-node-type` to the pool `P2` and give the option the value `08af`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option tcpip-node-type 08af
```

To add multiple IP addresses for the ip-type option `175`, use the following commands:

```
awplus(config-dhcp6)# option 175 2001:0db8:3001::/64
awplus(config-dhcp6)# option 175 2001:0db8:3002::/64
awplus(config-dhcp6)# option 175 2001:0db8:3003::/64
```

To add the option `179` to a pool, and give the option the value `123456`, use the following command:

```
awplus(config-dhcp6)# option 179 123456
```

To add a user-defined flag option with the name `perform-router-discovery`, use the following command:

```
awplus(config-dhcp6)# option perform-router-discovery yes
```

To clear all user-defined options from a DHCP address pool, use the following command:

```
awplus(config-dhcp6)# no option
```

To clear a user-defined option, named `tftp-server-name`, use the following command:

```
awplus(config-dhcp6)# no option tftp-server-name
```

Related commands

prefix-delegation pool

Overview Use this command in DHCPv6 Configuration mode to add a DHCPv6 server prefix-delegation pool entry to the current DHCPv6 pool configuration. You must define a DHCPv6 server prefix-delegation pool using the **ipv6 dhcp pool** command before using this command.

Use the **no** variant of this command to remove a DHCPv6 server prefix-delegation pool from the current DHCPv6 pool configuration.

Syntax

```
prefix-delegation pool <DHCPv6-poolname> [lifetime {<valid-time>|infinite} {<preferred-time>|infinite}]
no prefix-delegation pool <DHCPv6-poolname>
```

Parameter	Description
<DHCPv6-poolname>	Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”.
`lifetime`	Optional. Specify a time period for the hosts to remember router advertisements (RAs). If you specify this parameter then you must also specify a *valid-time* and a *preferred-time* value. See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry.
<valid-time>	Specify a valid lifetime in seconds in the range <5-315360000>.
`infinite`	Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.
<preferred-time>	Specify a valid lifetime in seconds in the range <5-315360000>.

Default No IPv6 local prefix pool is specified by default.

Mode DHCPv6 Configuration

Usage notes

The DHCPv6 server assigns prefixes dynamically from an IPv6 local prefix pool, which is configured using the **ipv6 local pool** command and is associated with a DHCPv6 configuration pool using this command. When the server receives a prefix request from a client, it attempts to obtain unassigned prefixes from the pool. After the client releases the previously assigned prefixes, the server returns the prefixes to the pool for reassignment.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Example

This example adds DHCPv6 Prefix Delegation pool pd_pool1 to DHCPv6 pool pool1:

```
awplus# configure terminal
awplus(config)# ipv6 local pool pd_pool1 2001:0db8::/48 56
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# prefix-delegation pool pd_pool1
```

Related commands

show ipv6 dhcp pool

service dhcp-relay

Overview This command enables the DHCP Relay Agent on the device. However, on a given IP interface, no DHCP forwarding takes place until at least one DHCP server is specified to forward/relay all clients' DHCP packets to.

The **no** variant of this command disables the DHCP Relay Agent on the device for all interfaces.

Syntax
```
service dhcp-relay
no service dhcp-relay
```

Mode Global Configuration

Usage notes A maximum number of 400 DHCP Relay Agents (one per interface) can be configured on the device. Once this limit has been reached, any further attempts to configure DHCP Relay Agents will not be successful.

Default The DHCP-relay service is enabled by default.

Examples To enable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
```

To disable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-relay
```

show counter dhcp-relay

Overview This command shows counters for the DHCP Relay Agent on your device.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Syntax

```
show counter dhcp-relay
```

Syntax (VRF-lite)

```
show counter dhcp-relay [vrf <vrf-name>|global]
```

Parameter	Description
`vrf`	Display the output for a VRF instance
<vrf-name>	The name of the specific VRF instance.
`global`	Display the output for the Global VRF instance

Mode User Exec and Privileged Exec

Examples To display counters for the DHCP Relay Agent on your device, use the following command:

```
awplus# show counter dhcp-relay
```

Output The following shows typical output.

Example output from the `show counter dhcp-relay` command

```
awplus#show counter dhcp-relay

DHCP relay counters
Requests In               ......... 4
Replies In                ......... 4
Relayed To Server         ......... 4
Relayed To Client         ......... 4

```

Example output from the `show counter dhcp-relay` command for VRF instance red

```
DHCP relay counters

[VRF red]
Requests In ....................... 4
Replies In ........................ 4
Relayed To Server ................. 4
Relayed To Client ................. 4
Out To Server Failed .............. 0
Out To Client Failed .............. 0
Invalid hlen ...................... 0
Bogus giaddr ...................... 0
Corrupt Agent Option .............. 0
Missing Agent Option .............. 0
Bad Circuit ID .................... 0
Missing Circuit ID ................ 0
Option Insert Failed .............. 0
```

Parameter	Description
`Requests In`	The number of DHCP Request messages received from clients.
`Replies In`	The number of DHCP Reply messages received from servers.
`Relayed To Server`	The number of DHCP Request messages relayed to servers.
`Relayed To Client`	The number of DHCP Reply messages relayed to clients.

Parameter	Description
`Out To Server Failed`	The number of failures when attempting to send request messages to servers. This is an internal debugging counter.
`Out To Client Failed`	The number of failures when attempting to send reply messages to clients. This is an internal debugging counter.
`Invalid hlen`	The number of incoming messages dropped due to an invalid hlen field.
`Bogus giaddr`	The number of incoming DHCP Reply messages dropped due to the bogus giaddr field.
`Corrupt Agent Option`	The number of incoming DHCP Reply messages dropped due to a corrupt relay agent information option field. Note that Agent Option counters only increment on errors occurring if the **ip dhcp-relay agent-option** command is configured for an interface. Messages generating the errors are only dropped if the **ip dhcp-relay agent-option checking** command is configured on the interface as well as the **ip dhcp-relay agent-option** command.
`Missing Agent Option`	The number of incoming DHCP Reply messages dropped due to a missing relay agent information option field. Note that Agent Option counters only increment on errors occurring if the **ip dhcp-relay agent-option** command is configured for an interface. Messages generating the errors are only dropped if the **ip dhcp-relay agent-option checking** command is configured on the interface as well as the **ip dhcp-relay agent-option** command.
`Bad Circuit ID`	The number of incoming DHCP Reply messages dropped due to a bad circuit ID. Note that Agent Option counters only increment on errors occurring if the **ip dhcp-relay agent-option** command is configured for an interface. Messages generating the errors are only dropped if the **ip dhcp-relay agent-option checking** command is configured on the interface as well as the **ip dhcp-relay agent-option** command
`Missing Circuit ID`	The number of incoming DHCP Reply messages dropped due to a missing circuit ID. Note that Agent Option counters only increment on errors occurring if the **ip dhcp-relay agent-option** command is configured for an interface.

Parameter	Description
	Messages generating the errors are only dropped if the **ip dhcp-relay agent-option checking** command is configured on the interface as well as the **ip dhcp-relay agent-option** command
`Bad Remote ID`	The number of incoming DHCP Reply messages dropped due to a bad remote ID. Note that Agent Option counters only increment on errors occurring if the **ip dhcp-relay agent-option** command is configured for an interface. Messages generating the errors are only dropped if the **ip dhcp-relay agent-option checking** command is configured on the interface as well as the **ip dhcp-relay agent-option** command
`Missing Remote ID`	The number of incoming DHCP Reply messages dropped due to a missing remote ID. Note that Agent Option counters only increment on errors occurring if the **ip dhcp-relay agent-option** command is configured for an interface. Messages generating the errors are only dropped if the **ip dhcp-relay agent-option checking** command is configured on the interface as well as the **ip dhcp-relay agent-option** command
`Option Insert Failed`	The number of incoming DHCP Request messages dropped due to an error adding the DHCP Relay Agent information (option-82). This counter increments when: • the DHCP Relay Agent is set to drop packets with the DHCP Relay Agent Option 82 field already filled by another DHCP Relay Agent. This policy is set with the **ip dhcp-relay information policy** command. • there is a packet error that stops the DHCP Relay Agent from being able to append the packet with its DHCP Relay Agent Information Option (Option 82) field.
Note that the following parameters are only used on the Global VRF instance when DHCPv6 is running	
`DHCPv6 Requests In`	The number of incoming DHCPv6 Request messages.
`DHCPv6 Replies In`	The number of incoming DHCPv6 Reply messages.
`DHCPv6 Relayed to Server`	The number of DHCPv6 messages relayed to the server.

Parameter	Description
`DHCPv6 Relayed to Client`	The number of DHCPv6 messages relayed to the client.

show counter ipv6 dhcp-client

Overview Use this command in User Exec or Privilege Exec mode to show DHCPv6 client counter information. See **show counter ipv6 dhcp-server** for DHCPv6 server information.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Syntax

```
show counter ipv6 dhcp-client
```

Mode User Exec and Privileged Exec

Example To display the DHCPv6 client counter information, use the command:

```
awplus# show counter ipv6 dhcp-client
```

Output The following shows typical output.

Example output from the `show counter ipv6 dhcp-client` command

```
awplus#show counter ipv6 dhcp-client
SOLICIT out              ......... 20
ADVERTISE in             ......... 12
REQUEST out              ......... 1
CONFIRM out              ......... 0
RENEW out                ......... 0
REBIND out               ......... 0
REPLY in                 ......... 0
RELEASE out              ......... 0
DECLINE out              ......... 0
INFORMATION-REQUEST out  ......... 0
```

Parameters in the output of the `show counter ipv6 dhcp-client` command

Parameter	Description
`SOLICIT out`	Displays the count of SOLICIT messages sent by the DHCPv6 client.
`ADVERTISE in`	Displays the count of ADVERTISE messages received by the DHCPv6 client.
`REQUEST out`	Displays the count of REQUEST messages sent by the DHCPv6 client.
`CONFIRM out`	Displays the count of CONFIRM messages sent by the DHCPv6 client.
`RENEW out`	Displays the count of RENEW messages sent by the DHCPv6 client.
`REBIND out`	Displays the count of REBIND messages sent by the DHCPv6 client.
`REPLY in`	Displays the count of REPLY messages received by the DHCPv6 client.
`RELEASE out`	Displays the count of RELEASE messages sent by the DHCPv6 client.
`DECLINE out`	Displays the count of DECLINE messages sent by the DHCPv6 client.
`INFORMATION-REQUEST out`	Displays the count of INFORMATION-REQUEST messages sent by the DHCPv6 client.

Related commands **show counter ipv6 dhcp-server**

show counter ipv6 dhcp-server

Overview Use this command in User Exec or Privileged Exec mode to show DHCPv6 server counter information. See **show counter ipv6 dhcp-client** for DHCPv6 client information.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Syntax

```
show counter ipv6 dhcp-server
```

Mode User Exec and Privileged Exec

Example To display the DHCPv6 server counter information, use the command:

```
awplus# show counter ipv6 dhcp-server
```

Output The following shows typical output.

Example output from the `show counter ipv6 dhcp-server` command

```
awplus#show counter ipv6 dhcp-server
SOLICIT in              ......... 20
ADVERTISE out           ......... 12
REQUEST in              ......... 1
CONFIRM in              ......... 0
RENEW in                ......... 0
REBIND in               ......... 0
REPLY out               ......... 0
RELEASE in              ......... 0
DECLINE in              ......... 0
INFORMATION-REQUEST in  ......... 0
RELAY FORWARD in        ......... 0
LEASEQUERY in           ......... 0
DHCPv4 QUERY in         ......... 0
```

Parameters in the output of the `show counter ipv6 dhcp-server` command

Parameter	Description
`SOLICIT in`	Displays the count of SOLICIT messages received by the DHCPv6 server.
`ADVERTISE out`	Displays the count of ADVERTISE messages sent by the DHCPv6 server.
`REQUEST in`	Displays the count of REQUEST messages received by the DHCPv6 server.
`CONFIRM in`	Displays the count of CONFIRM messages received by the DHCPv6 server.
`RENEW in`	Displays the count of RENEW messages received by the DHCPv6 server.
`REBIND in`	Displays the count of REBIND messages received by the DHCPv6 server.
`REPLY out`	Displays the count of REPLY messages sent by the DHCPv6 server.
`RELEASE in`	Displays the count of RELEASE messages received by the DHCPv6 server.
`DECLINE in`	Displays the count of DECLINE messages received by the DHCPv6 server.
`INFORMATION-REQUEST in`	Displays the count of INFORMATION-REQUEST messages received by the DHCPv6 server
`RELAY FORWARD in`	Displays the count of Relay forward in messages received by the DHCPv6 server

Parameter	Description
`LEASEQUERY in`	Displays the count of LEASE QUERY messages received by the DHCPv6 server
`DHCPv4 QUERY in`	Displays the count of DHCPv4 QUERY messages received by the DHCPv6 server

Related commands **show counter ipv6 dhcp-client**

show ip dhcp-relay

Overview This command shows the configuration of the DHCP Relay Agent on each interface.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Syntax
```
show ip dhcp-relay [interface <interface-name>]
```

Syntax (VRF-lite)
```
show ip dhcp-relay [vrf <name>|global] [interface <interface-name>]
```

Parameter	Description
<interface-name>	Name of a specific interface. This displays the DHCP configuration for the specified interface only.
`vrf`	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.
`global`	The Global VRF instance.

Mode User Exec and Privileged Exec

Example To display the DHCP Relay Agent's configuration on the interface vlan2, use the command:

```
awplus# show ip dhcp-relay interface vlan2
```

Output The following shows typical output.

Example output from the `show ip dhcp-relay` command

```
DHCP Relay Service is enabled

vlan2 is up, line protocol is up
Maximum hop count is 10
Maximum DHCP message length is 1400
DHCP Relay short lease time for IPv4 is 200 seconds
DHCP Relay short lease time for IPv6 are 2000/1900 (valid/
preferred) seconds
Insertion of Relay Agent Option is disabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay information policy is to append new relay agent
information
List of servers :   192.168.1.200
```

Output (VRF-lite)

Example output from the `show ip dhcp-relay` command applied for VRF instance red

```
DHCP Relay Service is enabled

[VRF: red]
vlan2 is up, line protocol is up
Maximum hop count is 10
Maximum DHCP message length is 1400
Insertion of Relay Agent Option is enabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay Information policy is to replace existing relay agent
information
List of servers :   192.168.1.3
```

ip dhcp-relay information policy

ip dhcp-relay maxhops

ip dhcp-relay server-address

show ipv6 dhcp

Overview Use this command in User Exec or Privileged Exec mode to show the DHCPv6 unique identifier (DUID) configured on your device.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Syntax

```
show ipv6 dhcp
```

Mode User Exec and Privileged Exec

Usage notes The DUID is based on the link-layer address for both DHCPv6 client and DHCPv6 server identifiers. The device uses the MAC address from the lowest interface number for the DUID.

The DUID is used by a DHCPv6 client to obtain an IPv6 address from a DHCPv6 server. A DHCPv6 server compares the DUID with its database of DUIDs and sends configuration data for an IPv6 address plus the preferred and valid lease time values to a DHCPv6 client.

Example To display the DUID configured on your device, use the command:

```
awplus# show ipv6 dhcp
```

Output The following shows typical output.

Example output from the `show ipv6 dhcp` command

```
awplus#show ipv6 dhcp
DHCPv6 Server DUID: 0001000117ab6876001577f7ba23
```

Related commands **ipv6 address dhcp**

show ipv6 dhcp binding

Overview Use this command in User Exec or Privileged Exec mode to show the IPv6 address entries that the DHCPv6 server leases to DHCPv6 clients. Note that applying this command with the optional *summary* keyword parameter displays the number of addresses per pool, but not the address or prefix entries per pool.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Syntax

```
show ipv6 dhcp binding [summary]
```

Parameter	Description
`summary`	Optional. Specify the **summary** keyword to display summarized information for DHCPv6 server leases to client nodes, displaying the number of address entries per pool, not the addresses or prefixes.

Mode User Exec and Privileged Exec

Example 1 To display the total DHCPv6 leasing address entries for all pools, use the command:

```
awplus# show ipv6 dhcp binding summary
```

Output The following shows typical output.

Example output from the `show ipv6 dhcp binding summary` command

```
awplus# show ipv6 dhcp binding summary
Pool Name                Number of Leased Addresses
-------------------------------------------------
ia-na1                   3
ia-pd1                   5

Total in all Pools:      8
```

Parameters in the output of the `show ipv6 dhcp binding summary` command

Parameter	Description
`Pool Name`	Displays a list of all the pool names.
`Number of Leased Addresses`	Displays the number of leased address entries for the pool.
`Total in all Pools`	Displays the total number of leased address entries for all pools.

Example 2 To display addresses, prefixes, and lifetimes for all DHCPv6 leasing entries by pool, enter:

```
awplus# show ipv6 dhcp binding
```

Output The following shows typical output.

Example output from the `show ipv6 dhcp binding` command

```
awplus#show ipv6 dhcp binding
Pool ia-na1
 Address 2002:0:3c0::1
         client IAID 77f7ba23, DUID 0001000117c4bbb4001577f7ba23
         preferred lifetime 604800, valid lifetime 2592000
         starts  at 20 Aug 2012 18:38:29
         expires at 19 Sep 2012 18:38:29
Pool ia-pd1
 Prefix  2002:0:3c0::/42
         client IAID 77f7ba23, DUID 0001000117c4bbb4001577f7ba23
         preferred lifetime 604800, valid lifetime 2592000
         starts  at 20 Aug 2012 18:38:29
         expires at 19 Sep 2012 18:38:29
```

Parameters in the output of the `show ipv6 dhcp binding` command

Parameter	Description
`Address`	Address delegated to the indicated IAID and DUID. See the IAID and DUID descriptions below for further information.
`Prefix`	Prefix delegated to the indicated IAID and DUID. See the IAID and DUID descriptions below for further information.
`DUID`	DHCPv6 unique identifier (DUID) (see RFC 3315). Each DHCPv6 client has as DUID. DHCPv6 servers use DUIDs to identify clients for the association of IAs (Identity Associations) with DHCPv6 clients. DHCPv6 clients use DUIDs to identify a DHCPv6 server.
`IAID`	Identify Association Identifier (IAID) (see RFC 3315). IAIDs are identifiers for IAs (Identity Associations), where an IA is a collection of IPv6 addresses assigned to a DHCPv6 client. Each IA has an associated IAD. Each DHCPv6 client may have more than one IA assigned to it. Each IA holds one type of address.
`preferred lifetime`	The preferred lifetime setting in seconds for the specified IAID and DUID. Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires. Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.
`valid lifetime`	The valid lifetime setting in seconds for the specified IAID and DUID.

Parameter	Description
	An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.
`starts at`	The date and time at which the valid lifetime expires.
`expires at`	The date and time at which the valid lifetime expires.

Related commands

clear ipv6 dhcp binding

ipv6 dhcp pool

show ipv6 dhcp pool

show ipv6 dhcp interface

Overview Use this command in User Exec or Privileged Exec mode to display DHCPv6 information for a specified interface, or all interfaces when entered without the interface parameter.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Syntax `show ipv6 dhcp interface [<interface-name>]`

Parameter	Description
<interface-name>	Optional. Specify the name of the interface to show DHCPv6 information about. Omit this optional parameter to display DHCPv6 information for all interfaces DHCPv6 is configured on.

Mode User Exec and Privileged Exec

Example To display DHCPv6 information for all interfaces DHCPv6 is configured on, use the command:

```
awplus# show ipv6 dhcp interface
```

To display DHCPv6 information for interface vlan2, use the command:

```
awplus# show ipv6 dhcp interface vlan2
```

Output The following shows typical output.

Example output from the `show ipv6 dhcp interface` command

```
awplus# show ipv6 dhcp interface
vlan1 is in client mode
 Address 1001::3c0:1
         preferred lifetime 9000, valid lifetime 5000
         starts  at 20 Jan 2021 09:21:35
         expires at 20 Jan 2021 10:25:32
vlan2 is in client (Prefix-Delegation) mode
 Prefix name pd1
         prefix 2002:0:3c0::/42
         preferred lifetime 604800, valid lifetime 2592000
         starts  at 20 Aug 2021 09:21:33
         expires at 19 Sep 2021 09:21:33
vlan3 is in server mode
 Using pool  : pool-1; Preference:0
```

Example output from the `show ipv6 dhcp interface` command for a specific interface

```
awplus# show ipv6 dhcp interface vlan2
vlan2 is in client (Prefix-Delegation) mode
 Prefix name pd1
         prefix 2002:0:3c0::/42
         preferred lifetime 604800, valid lifetime 2592000
         starts  at 20 Aug 2021 09:21:33
         expires at 19 Sep 2021 09:21:33
```

Parameters in the output of the `show counter dhcp-client` command

Parameter	Description
`<interface> is in server/client/(Prefix-Delegation) mode`	Displays whether the specified interface is in server or client mode and whether prefix-delegation is applied to an interface.
`Address`	Displays the address of the DHCPv6 server on the interface.
`Prefix name`	Displays the IPv6 general prefix pool name, where prefixes are stored for the interface.
`Using pool`	Displays the name of the pool used by the interface.
`Preference`	Displays the preference value for the DHCPv6 server.

Related commands **ipv6 dhcp client pd**

show ipv6 dhcp pool

Overview Use this command in User Exec or Privileged Exec mode to display the configuration details and system usage of the DHCPv6 address pools configured on the device.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

Syntax

```
show ipv6 dhcp pool [<DHCPv6-address-pool-name>]
```

Parameter	Description
<DHCPv6-address-pool-name>	Name of a specific DHCPv6 address pool. This displays the configuration of the specified DHCPv6 address pool only.

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 dhcp pool
```

Output The following shows typical output.

Example output from the `show ipv6 dhcp pool` command

```
awplus# show ipv6 dhcp pool
DHCPv6 Pool: ia-na
 Address Prefix  : 1001::/64
         Lifetime: 2592000(valid), 604800(preferred)
 DNS Server: 2001::1
 DNS Server: 2001::2
 Domain Name: example.com
 Domain Name: example.co.jp
 SNTP Server: 2001::5
 SNTP Server: 2001::6
 Option Code : 150
        Value: [ASCII] test-test
DHCPv6 Pool: ia-pd
 PD Pool Name: pd1
    Prefix   : 2002::/38-42
    Lifetime : 2592000(valid), 604800(preferred)
```

Parameters in the output of the `show ipv6dhcp pool` command

Parameter	Description
`DHCPv6 Pool`	Name of the DHCPv6 pool.
`Address Prefix`	Address prefix to the DHCPv6 pool.
`Address Lifetime`	Valid and preferred lifetimes to the DHCPv6 pool. Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires. Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected. An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.
`DNS Server`	IPv6 address of the DNS Server
`Domain name`	URL for the domain name.
`SNTP Server`	IPv6 address of the SNTP (Simple Network Time Protocol) Server.
`Option Code`	DHCP Option code (see RFC 2132).
`Option Value`	DHCP Option value type (see RFC 2132).

Related commands **ipv6 dhcp pool**

sntp address

Overview Use this command in DHCPv6 Configuration mode to add an SNTP Server IPv6 address to a DHCPv6 Server pool. SNTP is Simple Network Time Protocol.

Use the **no** variant of this command to remove an SNTP Server IPv6 address from a DHCPv6 Server pool.

Syntax

```
sntp address {<ipv6-address>|interface <server-interface>}
no sntp address {<ipv6-address>|interface <server-interface>}
```

Parameter	Description
<ipv6-address>	Specify an SNTP Server IPv6 address, in hexadecimal notation in the format X:X::X:X.
interface *<server-interface>*	Source the IPv6 address from an interface.

Mode DHCPv6 Configuration

Examples To add an SNTP Server IPv6 address of 2001:0db8::/32 to the DHCPv6 pool named P2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# sntp address 2001:0db8::/32
```

To remove an SNTP Server IPv6 address of 2001:0db8::/32 from the DHCPv6 pool named P2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# no sntp address 2001:0db8::/32
```

To add the SNTP Server that has a dynamic address source of vlan10 to the DHCPv6 pool named P2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# sntp address interface vlan10
```

Introduction

Overview This chapter provides an alphabetical reference for commands used to configure the Network Time Protocol (NTP). For more information, see the **NTP Feature Overview and_Configuration Guide**.

The device can act as an NTP client to receive time from one or more NTP servers, and as an NTP server.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare_Plus" Feature Overview and Configuration Guide**.

ntp authentication-key

Overview This command defines each of the authentication keys. Each key has a key number, a type (MD5 or SHA1), and a value.

The **no** variant of this disables the authentication key.

Syntax

```
ntp authentication-key <keynumber> md5 <key-string> [trusted]
ntp authentication-key <keynumber> sha1 <key-string> [trusted]
```

When in secure mode, MD5 is not available and the syntax in config files will be:

```
ntp authentication-key <keynumber> sha1-encrypted <encrypted-key-string> [trusted]
no ntp authentication-key <keynumber>
```

Parameter	Description
<keynumber>	*<1-4294967295>* An identification number for the key.
md5	Define an MD5 key.
sha1	Define an SHA1 key.
<key-string>	The authentication key. For SHA1, this is a 20 hexadecimal character string. For MD5, this is a string of up to 31 ASCII characters.
sha1-encrypted	This parameter indicates in running config that the key is in its encrypted form instead of in plaintext. If secure mode is enabled and you enter a SHA1 key, the running config will display this sha1-encrypted parameter instead of sha1, and will display the key in encrypted form. Do not enter a key using the sha1-encrypted parameter. Instead, enter sha1 and the unencrypted key string.
<encrypted-key-string>	The encrypted authentication key.
trusted	Add this key to the list of authentication keys that this server trusts.

Mode Global Configuration

Examples

To define an MD5 authentication key number 134343 and a key value ‘mystring’, use the commands:

```
awplus# configure terminal
awplus(config)# ntp authentication-key 134343 md5 mystring
```

To disable the authentication key number 134343 with the key value ‘mystring’, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp authentication-key 134343
```

Command changes

Version 5.4.9-2.1 sha1-encrypted parameter added.

ntp broadcastdelay

Overview Use this command to set the estimated round-trip delay for broadcast packets.

Use the **no** variant of this command to reset the round-trip delay for broadcast packets to the default offset of `0` microseconds.

Syntax

```
ntp broadcastdelay <delay>
no ntp broadcastdelay
```

Parameter	Description
<delay>	*<1-999999>* The broadcast delay in microseconds.

Default `0` microsecond offset, which can only be applied with the **no** variant of this command.

Mode Global Configuration

Examples To set the estimated round-trip delay to 23464 microseconds for broadcast packets, use these commands:

```
awplus# configure terminal
awplus(config)# ntp broadcastdelay 23464
```

To reset the estimated round-trip delay for broadcast packets to the default setting (`0` microseconds), use these commands:

```
awplus# configure terminal
awplus(config)# no ntp broadcastdelay
```

ntp master

Overview Use this command to make the device to be an authoritative NTP server, even if the system is not synchronized to an outside time source.

Use the **no** variant of this command to stop the device being the designated NTP server.

Syntax

```
ntp master [<stratum>]
no ntp master
```

Parameter	Description
<stratum>	*<1-15>* The stratum number defines the configured level that is set for this master within the NTP hierarchy. The default stratum number is 12.

Mode Global Configuration

Usage notes The stratum levels define the distance from the reference clock and exist to prevent cycles in the hierarchy. Stratum 1 is used to indicate time servers, which are more accurate than Stratum 2 servers. For more information on the Network Time Protocol go to: **www.ntp.org**

Examples To stop the device from being the designated NTP server, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp master
```

To make the device the designated NTP server with stratum number 2, use the commands:

```
awplus# configure terminal
awplus(config)# ntp master 2
```

ntp peer

Overview Use this command to configure an NTP peer association. An NTP association is a peer association if this system is willing to either synchronize to the other system, or allow the other system to synchronize to it.

Use the **no** variant of this command to remove the configured NTP peer association.

Syntax

```
ntp peer {<peeraddress>|<peername>} [prefer] [key <key>]
 [version <version>]
no ntp peer {<peeraddress>|<peername>}
```

Syntax (VRF-lite)

```
ntp peer {<peeraddress>} [vrf <vrf-name>] [prefer] [key <key>]
 [version <version>]
no ntp peer {<peeraddress>}
```

Parameter	Description
<peeraddress>	Specify the IP address of the peer, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X:X for an IPv6 address.
<peername>	Specify the peer hostname. The peer hostname can resolve to an IPv4 and an IPv6 address.
`prefer`	Prefer this peer when possible.
`vrf` *<vrf-name>*	Specify the VRF the peer runs in. Note: this does not work when a hostname is used. It only works if an IP address is specified.
`key` *<key>*	*<1-4294967295>* Configure the peer authentication key.
`version` *<version>*	*<1-4>* Configure for this NTP version.

Mode Global Configuration

Examples

To set an NTP peer association for this peer with an IPv4 address of 192.0.2.23, use the commands:

```
awplus# configure terminal
awplus(config)# ntp peer 192.0.2.23
```

To remove an NTP peer association for this peer with an IPv4 address of 192.0.2.23, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 192.0.2.23
```

To set an NTP peer association for this peer with an IPv6 address of 2001:0db8:010d::1, use the commands:

```
awplus# configure terminal
awplus(config)# ntp peer 2001:0db8:010d::1
```

To remove an NTP peer association for this peer with an IPv6 address of 2001:0db8:010d::1, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 2001:0db8:010d::1
```

To set the preferred peer to be IPv4 192.0.2.23 and the version to 4, with the authentication key '1234', use the commands:

```
awplus# configure terminal
awplus(config)# ntp peer 192.0.2.23 prefer version 4 key 1234
```

Examples (VRF-lite)

To configure an NTP peer association for the peer with IP address 192.0.5.27, on the VRF 'red', use the commands:

```
awplus# configure terminal
awplus(config)# ntp peer 192.0.5.27 vrf red
```

To remove an NTP peer association for the peer with IP address 192.0.5.27, on the VRF 'red', use the commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 192.0.5.27
```

ntp source

Command changes

Version 5.5.2-2.1: VRF parameter added

ntp rate-limit

Overview Use this command to enable NTP server response rate-limiting. Limiting NTP server responses can reduce network traffic when occurrences such as misconfigured or broken NTP clients poll the NTP server too frequently. Excessive polling can lead to network overload.

Use the **no** variant of this command to remove the rate-limit configuration.

Syntax

```
ntp rate-limit {interval<1-4096>|burst <1-255>|leak <2-16>}
no ntp rate-limit
```

Parameter	Description
`interval`	The minimum interval between responses configured in seconds. The default interval is 8 seconds.
`burst`	The maximum number of responses that can be sent in a burst, temporarily exceeding the limit specified by the interval option. The default burst is 8 responses.
`leak`	The rate at which responses are randomly allowed even if the limits specified by the interval and burst options are exceeded. The default leak is 4, i.e. on average, every fourth request has a response.

Mode Global Configuration

Default Interval - 8 seconds.

Burst - 8 responses.

Leak - 4.

Example To configure an NTP rate-limiting interval of 30 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# ntp rate-limit interval 30
```

Related commands **ntp restrict**

Command changes Version 5.4.8-1.1: command added

ntp restrict

Overview Use this command to configure a restriction (allow or deny) on NTP packets or NTP functionality for a specific host/network or all hosts of a given IP family.

This means you can control host access to NTP service and NTP server status queries.

Use the **no** variant of this command to remove a restriction from one or more hosts.

Syntax

```
ntp restrict {default-v4|default-v6|<host-address>|<host-subnet>}
{allow|deny}
ntp restrict {default-v4|default-v6|<host-address>|<host-subnet>} query {allow|deny}
ntp restrict {default-v4|default-v6|<host-address>|<host-subnet>} serve {allow|deny}
no ntp restrict {default-v4|default-v6|<host-address>|<host-subnet>}
```

Parameter	Description
`default-v4`	Apply this restriction to all IPv4 hosts.
`default-v6`	Apply this restriction to all IPv6 hosts.
<host-address>	Apply this restriction to the specified IPv4 or IPv6 host. Enter an IPv4 address in the format A.B.C.D. Enter an IPv6 address in the format X:X::X:X.
<host-subnet>	Apply this restriction to the specified IPv4 subnet or IPv6 prefix. Enter an IPv4 subnet in the format A.B.C.D/M. Enter an IPv6 prefix in the format X:X::X:X/X.
`query`	Control NTP server status queries to matching hosts.
`serve`	Control NTP time service to matching hosts.
`allow`	Allow the configured restriction.
`deny`	Deny the configured restriction.

Default By default, time service is allowed to all hosts, and NTP server status querying is denied to all hosts.

Mode Global Configuration

Example To prevent all IPv4 hosts from accessing a device for NTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict default-v4 deny
```

To prevent the host 192.168.1.1 from accessing a device for NTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict 198.168.1.1 deny
```

To allow all hosts in the 10.10.10.0/24 subnet to access a device for NTP server status, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict 10.10.10.0/24 query allow
```

Related commands **ntp rate-limit**

Command changes Version 5.4.8-1.1: command added

ntp server

Overview Use this command to configure an NTP server. This means that this system will synchronize to the other system, and not vice versa. You can configure an NTP server association by hostname or IP address.

Use the **no** variant of this command to remove the configured NTP server.

Syntax

```
ntp server {<serveraddress>|<servername>} [prefer] [key <key>]
 [version <version>]
no ntp server {<serveraddress>|<servername>}
```

Syntax (VRF-lite)

```
ntp server <serveraddress> [vrf <vrf-name>] [prefer] [key <key>]
 [version <version>]
no ntp server <serveraddress>
```

Parameter	Description
<serveraddress>	Specify the IP address of the peer, entered in the form `A.B.C.D` for an IPv4 address, or in the form `X:X::X.X` for an IPv6 address.
<servername>	Specify the server hostname. The server hostname can resolve to an IPv4 and an IPv6 address.
`prefer`	Prefer this server when possible.
`key` *<key>*	Configure the server authentication key from the range 1 to 4294967295.
`version` *<version>*	Configure for this NTP version from the range 1 to 4.
`vrf` *<vrf-name>*	Specify a VRF for the server to run in. Note that this does not work when a hostname is used. It only works if an IP address is specified.

Mode Global Configuration

Examples

To obtain the time by synchronizing with the server at 192.0.1.23, use the commands:

```
awplus# configure terminal
awplus(config)# ntp server 192.0.1.23
```

To obtain the time by synchronizing with the server at 192.0.1.23, and specify that this is the best server to use, use the commands:

```
awplus# configure terminal
awplus(config)# ntp server 192.0.1.23 prefer
```

To obtain the time by synchronizing with the server at 2001:0db8:010e::2, use the commands:

```
awplus# configure terminal
awplus(config)# ntp server 2001:0db8:010e::2
```

To obtain the time by synchronizing with the server at 2001:0db8:010e::2, and specify that this is the best server to use, use the commands:

```
awplus# configure terminal
awplus(config)# ntp server 2001:0db8:010e::2 prefer
```

To stop using the time server at 2001:0db8:010e::2, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp server 2001:0db8:010e::2
```

Examples (VRF-lite)

To configure an NTP server association for the server with IP address 192.0.5.27, on the VRF red, use the commands:

```
awplus# configure terminal
awplus(config)# ntp server 192.0.5.27 vrf red
```

To remove an NTP server association for the server with an IPv4 address of 192.0.5.27, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp server 192.0.5.27
```

Related commands

ntp peer

ntp source

Command changes

Version 5.5.2-2.1: VRF parameter added

ntp source

Overview Use this command to configure an IPv4 or an IPv6 address for the NTP source interface. This command defines the socket used for NTP messages, and only applies to NTP client behavior.

Note that you cannot use this command when using AMF (Allied Telesis Management Framework) or VCStack.

Use the **no** variant of this command to remove the configured IPv4 or IPv6 address from the NTP source interface.

Syntax

```
ntp source <source-address>
no ntp source
```

Parameter	Description
<source-address>	Specify the IP address of the NTP source interface, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X.X for an IPv6 address.

Default An IP address is selected based on the most appropriate egress interface used to reach the NTP peer if a configured NTP client source IP address is unavailable or invalid.

Mode Global Configuration

Usage notes Adding an IPv4 or an IPv6 address allows you to select which source interface NTP uses for peering. The IPv4 or IPv6 address configured using this command is matched to the interface.

When selecting a source IP address to use for NTP messages to the peer, if the configured NTP client source IP address is unavailable then default behavior will apply, and an alternative source IP address is automatically selected. This IP address is based on the most appropriate egress interface used to reach the NTP peer. The configured NTP client source IP may be unavailable if the interface is down, or an invalid IP address is configured that does not reside on the device.

Note that this command only applies to NTP client behavior. The egress interface that the NTP messages use to reach the NTP server is determined by the **ntp peer** and **ntp server** commands.

Examples

To configure the NTP source interface with the IPv4 address 192.0.2.23, enter the commands:

```
awplus# configure terminal
awplus(config)# ntp source 192.0.2.23
```

To configure the NTP source interface with the IPv6 address 2001:0db8:010e::2, enter the commands:

```
awplus# configure terminal
awplus(config)# ntp source 2001:0db8:010e::2
```

To remove a configured address for the NTP source interface, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp source
```

Related commands

ntp peer

ntp server

show ntp associations

Overview Use this command to display the status of NTP associations.

Syntax
```
show ntp associations
```

Mode User Exec and Privileged Exec

Example To display the status of NTP associations, use the command:
```
awplus# show ntp associations
```

Output The following shows typical output.

Output from `show ntp associations`

```
awplus#show ntp associations
 remote           refid            st t when poll reach    delay   offset  disp
------------------------------------------------------------------------------
*server1.example.com
                 192.0.2.2        4 u   47   64   377    0.177    0.021   0.001
+192.168.1.10    10.32.16.80      5 u   46   64   377    0.241   -0.045   0.000
* system peer, # backup, + candidate, - outlier, x false ticker
```

Parameters in the output from `show ntp associations`

Parameter	Description
`* system peer`	The peer that NTP uses to calculate variables like the offset and root dispersion of this AlliedWare Plus device. NTP passes these variables to the clients using this AlliedWare Plus device.
`# backup`	Peers that are usable, but are not among the first six peers sorted by synchronization distance. These peers may not be used.
`+ candidate`	Peers that the NTP algorithm has determined can be used, along with the system peer, to discipline the clock (i.e. to set the time on the AlliedWare Plus device).
`- outlier`	Peers that are not used because their time is significantly different from the other peers.
`x false ticker`	Peers that are not used because they are not consider trustworthy.
`space`	Peers that are not used because they are, for example, unreachable.
`remote`	The peer IP address
`refid`	The IP address of the reference clock, or an abbreviation indicating the type of clock (e.g. GPS indicates that the server uses GPS for the reference clock). INIT indicates that the reference clock is initializing, so it is not operational.
`st`	The stratum, which is the number of hops between the server and the accurate time source such as an atomic clock.
`t`	Type, one of: u: unicast or manycast client b: broadcast or multicast clientl: local reference clock s: symmetric peer A: manycast server B: broadcast server M: multicast server

Parameter	Description
`when`	When last polled (seconds ago, h hours ago, or d days ago).
`poll`	Time between NTP requests from the device to the server.
`reach`	An indication of whether or not the NTP server is responding to requests. 0 indicates there has never been a successful poll; 1 indicates that the last poll was successful; 3 indicates that the last two polls were successful; 377 indicates that the last 8 polls were successful.
`delay`	The round trip communication delay to the remote peer or server, in milliseconds.
`offset`	The mean offset (phase) in the times reported between this local host and the remote peer or server (root mean square, milliseconds).
`disp`	The amount of clock error (in milliseconds) of the server due to clock resolution, network congestion, etc.

show ntp counters

Overview This command displays packet counters for NTP.

Syntax
```
show ntp counters
```

Mode Privileged Exec

Example To display counters for NTP use the command:

```
awplus# show ntp counters
```

```
awplus#show ntp counters
Server Received           4
Server Dropped            0
Client Sent               90
Client Received           76
Client Valid Received     76
```

Parameters in the output from `show ntp counters`

Parameter	Description
`Server Received`	Number of NTP packets received from NTP clients.
`Server Dropped`	Number of NTP packets received from NTP clients but dropped.
`Client Sent`	Number of NTP packets sent to servers.
`Client Received`	Number of NTP packets received from servers
`Client Valid Received`	Number of valid NTP packets received from servers.

show ntp counters associations

Overview Use this command to display NTP packet counters for individual servers and peers.

Syntax

```
show ntp counters associations
```

Mode Privileged Exec

Examples To display packet counters for each NTP server and peer that is associated with a device, use the command:

```
awplus# show ntp counters associations
```

Output The following shows typical output.

Example output from `show ntp counters associations`

```
awplus#show ntp counters associations
Peer 2001::1
 sent:          -
 received:      -
Peer 10.37.219.100
 sent:          7
 received:      7
```

Parameters in the output from `show ntp counters associations`

Parameter	Description
`Peer`	An NTP peer or server that the device is associated with.
`sent`	The number of NTP packets that this device sent to the peer.
`received`	The number of NTP packets that this device received from the peer.

Related commands **ntp restrict**

show ntp status

Overview Use this command to display the status of the Network Time Protocol (NTP).

Syntax

```
show ntp status
```

Mode User Exec and Privileged Exec

Example To see information about NTP status, use the command:

```
awplus# show ntp status
```

For information about the output displayed by this command, see **ntp.org**.

Example output from `show ntp status`

```
awplus#show ntp status
Reference ID    : C0A8010A (192.168.1.10)
Stratum         : 4
Ref time (UTC)  : Fri Jun 15 05:32:38 2018
System time     : 0.000002004 seconds fast of NTP time
Last offset     : -0.002578615 seconds
RMS offset      : 0.000928071 seconds
Frequency       : 5.099 ppm slow
Residual freq   : -9.120 ppm
Skew            : 17.486 ppm
Precision       : -21 (0.000000477 seconds)
Root delay      : 0.031749818 seconds
Root dispersion : 0.133974627 seconds
Update interval : 65.3 seconds
Leap status     : Normal

Introduction

Overview This chapter provides an alphabetical reference of commands used to configure Precision Time Protocol (PTP) and Transparent Clock.

PTP and Transparent clock is supported on x530L Series switches, not on x530 or x530DP Series switches.

For more information, see the **Precision Time Protocol (PTP) and Transparent Clock Feature Overview and Configuration Guide**.

clock-enable

Overview Use this command to enable the PTP Clock currently being configured. Once the PTP Clock is enabled, it can then be added to an interface using the **clock-port** command.

Use the **no** variant of this command to change the current PTP Clock configuration.

Syntax
```
clock-enable
no clock-enable
```

Mode PTP Clock Configuration Mode

Example To enable the PTP Clock with Ethernet transport, peer to peer delay mechanism, and two-step step type, use the commands:

```
awplus# configure terminal
awplus(config)# ptp clock clock1
awplus(config-ptp-clock)# transport-type ethernet
awplus(config-ptp-clock)# delay-mechanism p2p
awplus(config-ptp-clock)# step-type twostep
awplus(config-ptp-clock)# clock-enable
awplus(config-ptp-clock)#
```

Related commands
- **ptp clock**
- **transport-type**
- **step-type**
- **show ptp clock**

Command changes Version 5.5.5-2.1: command added

clock-port

Overview Use this command to assign a PTP clock to an interface. The specified clock must already exist and be enabled using the `clock-enable` command.

If no clock name is provided, the migrated PTP clock named 'migrated_inst' (created when running the deprecated 'ptp-clk' command) will be added to the interface.

Use the **no** variant of this command to remove the currently assigned PTP clock.

Syntax

```
clock-port [<clock-name>]
no clock-port
```

Parameter	Description
<clock-name>	Enter the name of the PTP clock to assign to the interface. Ensure the clock already exists and is enabled using the `clock-enable` command.

Mode Interface Configuration

Example To assign PTP Clock 'clock1' to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# clock-port clock1
```

To remove PTP Clock 'clock1' from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no clock-port
```

clock-enable

Command changes Version 5.5.5-2.1: command added

debug ptp

Overview Use this command to enable debugging for PTP.

Use the **no** variant of this command to stop PTP debug.

Syntax

```
debug ptp [ptp41|all]
no debug ptp [ptp41|all]
```

Parameter	Description
`all`	Enable all debug options for PTP.
`ptp41`	Show debug for ptp41. This includes device discovery and clock selection at startup, and continuous timing information.

Mode Privileged Exec

Example To display all PTP debug output, use the command:

```
awplus# debug ptp all
```

Output Example output from **`debug ptp all`**

```
awplus#debug ptp all
08:28:37 awplus ptp4l: [129.923] port 1 (port1.0.1): peer port id
 set to 00900b.fffe.2bd9ea-1

```

Related commands **show ptp counters**

Command changes Version 5.5.5-2.1: command added

delay-mechanism

Overview Use this command to set the delay mechanism of a PTP Clock. You can select either e2e (End-to-End) or p2p (Peer-to-Peer).

End-to-End transparent clocks measure path delay by observing timing messages between master and secondary clocks, while Peer-to-Peer transparent clocks measure delay between directly connected devices using peer delay messages.

Use the **no** variant of this command to remove the delay mechanism from a PTP Clock.

Syntax

```
delay-mechanism {e2e|p2p}
no delay-mechanism
```

Parameter	Description
e2e	Use the End-to-End delay mechanism.
p2p	Use the Peer-to-Peer delay mechanism.

Default Not set.

Mode PTP Clock Configuration Mode

Usage notes This command sets the delay mechanism for a PTP clock to either E2E (End-to-End) or P2P (Peer-to-Peer). Before **clock-enable** is configured, either option can be set. Once clock-enable is applied, the system validates whether the selected delay mechanism is compatible with other configuration settings.

Example To set the Peer-to-Peer delay mechanism for PTP Clock 'clock1', use the commands:

```
awplus# configure terminal
awplus(config)# ptp clock clock1
awplus(config-ptp-clock)# delay-mechanism p2p
awplus(config-ptp-clock)#
```

Related commands

step-type

show ptp clock

Command changes Version 5.5.5-2.1: command added

ptp clock

Overview Use this command to create a new PTP clock and enter configuration mode. Once in configuration mode, you can configure the transport type, delay mechanism, and step type. The system validates the configuration when you add 'clock-enable' to the PTP clock..

Use the **no** variant of this command to remove the corresponding PTP clock.

Syntax

```
ptp clock <clock-name>
no ptp clock <clock-name>
```

Parameter	Description
<clock-name>	The name of the PTP clock.

Mode Global Configuration

Example To add a PTP clock named 'clock1', use the commands:

```
awplus# configure terminal
awplus(config)# ptp clock clock1
awplus(config-ptp-clock)#
```

Related commands

transport-type

step-type

show ptp clock

Command changes Version 5.5.5-2.1: command added

ptp global

Overview Use this command to enable 1588v2 based timing support on the device.

Use the **no** variant of this command to disable the timing support.

Syntax
```
ptp global
no ptp global
```

Default Disabled

Mode Global Configuration

Example To enable 1588v2 timing support on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# ptp global
```

To disable 1588v2 timing support on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# no ptp global
```

Version 5.5.4-0.1: supported with VCStack on x930 Series

Version 5.5.3-2.1: supported with VCStack on SBx908 GEN2, x950, x550, and x530L Series

Version 5.5.3-1.1: added to x530L, x950, SBx908 GEN2 Series

Version 5.4.8-0.2: added to x230, x550 Series

Version 5.4.7-0.1: command added

show ptp clock

Overview Use this command to show the currently configured PTP clocks. If no clock name is supplied, then all currently configured clocks are displayed.

Syntax

```
show ptp clock [<clock-name>]
```

Parameter	Description
<clock-name>	The name of the PTP clock to display.

Mode Privileged Exec

Example To show the PTP clock named 'clock1', use the command:

```
awplus# show ptp clock clock1
```

Output Example output from **show ptp clock clock1**

```
awplus#show ptp clock clock1
PTP Clocks

Abbreviations:
  (A) = Active
  E2E = End to End
  P2P = Peer To Peer

Clock Name                          Parameter          Configuration
-------------------------------------------------------------------------------
clock1 (A)                          Clock Type         Transparent

Command changes Version 5.5.5-2.1: command added

show ptp counters

Overview Use this command to display the software maintained counters for PTP packet processing. This information is available only when the active clock is operating in E2E two-step mode or when the P2P delay mechanism is in use. If neither condition is met, the system outputs the message *"This information is not available for the current PTP configuration"*.

Syntax `show ptp counters [<port-list>]`

Parameter	Description
<port-list>	An interface range. For example, port1.0.23-port1.0.25. If not specified, the command will print all information for all valid ports.

Mode Privileged Exec

Example To show the port counters for all valid PTP ports, use the command:

```
awplus# show ptp counters
```

Output Example output from **show ptp counters**

```
awplus#show ptp counters

port1.0.23 packet counters

Version 5.5.5-2.1: command added

show ptp identities

Overview Use this command to display the mapping between front panel port numbers and the PTP port identity. The PTP port identity is derived from the device's MAC address.

This information is available only when the active clock is operating in E2E two-step mode or when the P2P delay mechanism is in use. If neither condition is met, the system outputs the message *"This information is not available for the current PTP configuration."*

Syntax

```
show ptp identities [<port-list>]
```

Parameter	Description
<port-list>	An interface range. For example, port1.0.23-port1.0.25. If not specified, the command will display all mapping information for all valid ports.

Mode Privileged Exec

Example To display the mapping for all ports and their PTP port identities, use the command:

```
awplus# show ptp identities
```

Output Example output from **show ptp identities**

```
awplus#show ptp identities
PTP Port Identities

Port         Identity
-------------------------------------
port1.0.1    e01aea.fffe.89d901-1
port1.0.2    e01aea.fffe.89d901-2

show ptp statistics

Overview Use this command to display the PTP service statistics.

This information is available only when the active clock is operating in E2E two-step mode or when the P2P delay mechanism is in use. If neither condition is met, the system outputs the message *"This information is not available for the current PTP configuration."*

Syntax

```
show ptp statistics [<port-list>]
```

Parameter	Description
<port-list>	An interface range. For example, port1.0.23-port1.0.25. If not specified, the command will display information for all valid PTP ports.

Mode Privileged Exec

Example To display the statistic information for all PTP ports, use the command:

```
awplus# show ptp statistics
```

Output Example output from **show ptp statistics**

```
awplus#show ptp statistics
PTP Port Statistics

port1.0.23 service statistics

```

Related commands ptp clock

Command changes Version 5.5.5-2.1: command added

show running-config ptp (PTP Clock)

Overview Use this command to display the applied PTP Clock configuration, as seen in the running-config.

Syntax
```
show running-config ptp
```

Mode Privileged Exec

Example To show the current PTP clock configurations, use the command:
```
awplus# show running-config ptp
```

Output Example output from **show running-config ptp**

```
awplus#show running-config ptp

ptp clock clock1
 transport-type ethernet

Command changes Version 5.5.5-2.1: command added

step-type

Overview Use this command to set the step-type of a PTP Clock.

Step-type refers to how the timestamp correction is applied by the clock when forwarding timing messages: One Step embeds the correction directly in the Sync message, while Two Step sends a separate Follow_Up message with the correction.

Use the **no** variant of this command to remove the step-type from the PTP Clock.

Syntax

```
step-type [onestep|twostep]
no step-type
```

Parameter	Description
onestep	Use the One Step step type.
twostep	Use the Two Step step type.

Default Not set.

Mode PTP Clock Configuration Mode

Example To set the step type to One Step for PTP clock 'clock1', use the commands:

```
awplus# configure terminal
awplus(config)# ptp clock clock1
awplus(config-ptp-clock)# step-type onestep
awplus(config-ptp-clock)#
```

show ptp data transparent

Overview Use this command to display configuration information for the PTP transparent clock.

Syntax

```
show ptp data transparent
```

Mode Privileged Exec

Example To display configuration for PTP transparent clock, use the following command:

```
awplus# show ptp data transparent
```

Output The following shows typical output.

Example output from `show ptp data transparent`

```
awplus#show ptp data transparent
CLOCK(Transparent)
Global Enable        :  Enabled
Clock Identity       :  00:0c:25:ff:fe:03:92:47
Number Of Ports      :  2
Transport Type       :  Ethernet
Delay Mechanism      :  End To End
Primary Domain       :  0
Step-type            :  One Step
```

Version 5.4.7-0.1: command added

show ptp port

Overview Use this command to display the configuration and status information of the individual port or ports that have been associated with the PTP clock.

In the output, the information shown under 'PTP daemon port information' is displayed only when the active clock is E2E two-step or when the clock uses the P2P delay mechanism.

Syntax

```
show ptp port [<port-list>]
```

Parameter	Description
<port-list>	An interface range. If not specified, the command will print all valid ports.

Mode Privileged Exec

Example To display configuration and status information of the individual ports associated with the clock, use the command:

```
awplus# show ptp port
```

Output The following shows typical output.

Example output from `show ptp port`

```
awplus#show ptp port
PTP Ports

Abbreviations:
  (A) = Active
  E2E = End to End
  P2P = Peer To Peer

                                                Delay

Version 5.4.8-0.2: added to x230, x550 Series

Version 5.4.7-0.1: command added

transport-type

Overview Use this command to set the transport type of a PTP clock.

Use the **no** variant of this command to remove a transport type from the PTP clock.

Syntax

```
transport-type ethernet
transport-type udp {v4|v6}
no transport-type ethernet
no transport-type udp {v4|v6}
```

Parameter	Description
ethernet	Timing protocol forwarded in Ethernet frames.
udp	Use the UDP transport type.
v4	Use the UDP transport type with IPv4.
v6	Use the UDP transport type with IPv6.

Default Not set.

Mode PTP Clock Configuration Mode

Usage notes This command specifies the transport type used by a PTP clock. You can configure multiple transport types (Ethernet, UDPv4, and UDPv6) before the clock is enabled. However, once the **clock-enable** setting is applied, the system will validate the configuration. The only supported transport types are:

- Ethernet
- UDPv4
- UDPv6
- UDPv4 and UDPv6

Example To add UDPv4 and UDPv6 to the PTP clock named 'clock1', use the commands:

```
awplus# configure terminal
awplus(config)# ptp clock clock1
awplus(config-ptp-clock)# transport-type udp v4
awplus(config-ptp-clock)# transport-type udp v6
```

Introduction

Overview This chapter provides an alphabetical reference for commands used to configure SNMP. For more information, see:

- the **Support for Allied Telesis Enterprise MIBs in AlliedWare Plus**, for information about which MIB objects are supported.
- the **SNMP Feature Overview and Configuration Guide**.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

alias (interface)

Overview Use this command to set an alias name for a port, as returned by the SNMP ifMIB in OID 1.3.6.1.2.1.31.1.1.1.18.

Use the **no** variant of this command to remove an alias name from a port.

Syntax

```
alias <ifAlias>
no alias
```

Parameter	Description
<ifAlias>	64 character name for an interface in a network management system. All printable characters are valid.

Default Not set.

Mode Interface Configuration

Usage notes The interface alias can also be set via SNMP.

Third-party management systems often use standard MIBs to access device information. Network managers can specify an alias interface name to provide a non-volatile way to access the interface.

Example To configure the alias interface name ‘uplink_a’ for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# alias uplink_a
```

To remove an alias interface name from port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no alias
```

Command changes Version 5.4.8-2.1: command added

clear mac address-table notification mac-change

Overview Use this command to clear the MAC address table change history and counters. This command clears the change history and resets the counters to zero.

Syntax
```
clear mac address-table notification mac-change
```

Mode User Exec

Example To clear the MAC address table change history and counters, use the command:
```
awplus# clear mac address-table notification mac-change
```

Related commands
- **mac address-table notification mac-change interval**
- **mac address-table notification mac-change history-size**
- **show mac address-table notification mac-change**
- **snmp trap mac-change**

Command changes Version 5.5.1-2.1: command added

debug snmp

Overview This command enables SNMP debugging.

The **no** variant of this command disables SNMP debugging.

Syntax

```
debug snmp [all|detail|error-string|process|receive|send|xdump]
no debug snmp [all|detail|error-string|process|receive|send|
xdump]
```

Parameter	Description
`all`	Enable or disable the display of all SNMP debugging information.
`detail`	Enable or disable the display of detailed SNMP debugging information.
`error-string`	Enable or disable the display of debugging information for SNMP error strings.
`process`	Enable or disable the display of debugging information for processed SNMP packets.
`receive`	Enable or disable the display of debugging information for received SNMP packets.
`send`	Enable or disable the display of debugging information for sent SNMP packets.
`xdump`	Enable or disable the display of hexadecimal dump debugging information for SNMP packets.

Mode Privileged Exec and Global Configuration

Example To start SNMP debugging, use the command:

```
awplus# debug snmp
```

To start SNMP debugging, showing detailed SNMP debugging information, use the command:

```
awplus# debug snmp detail
```

To start SNMP debugging, showing all SNMP debugging information, use the command:

```
awplus# debug snmp all
```

Related commands

show debugging snmp

terminal monitor

undebug snmp

mac address-table notification mac-change

Overview Use this command to enable the mac-change history table. You also need to use the command **snmp trap mac-change** to set up the trap and **snmp-server enable trap** to enable the trap for transmission.

Use the **no** variant of this command to disable the mac-change history table.

Syntax
```
mac address-table notification mac-change
no mac address-table notification mac-change
```

Default Disabled

Mode Global Configuration

Usage notes To set up the mac-change trap use the command:

- **snmp trap mac-change**

To enable transmission of the mac-change trap, specify the parameter **mac-change**, use the command:

- **snmp-server enable trap**

Example To enable the mac-change history table, use the commands:
```
awplus# configure terminal
awplus(config)# mac address-table notification mac-change
```

Related commands
clear mac address-table notification mac-change
mac address-table notification mac-change history-size
mac address-table notification mac-change interval
mac address-table notification mac-threshold
show mac address-table notification mac-change
snmp-server enable trap
snmp trap mac-change

Command changes Version 5.5.1-2.1: command added

mac address-table notification mac-change history-size

Overview Use this command to set the MAC address table history size to an upper limit on the number of entries that the SNMP table may contain.

Use the **no** variant of this command to set the history size back to the default (1).

Syntax

```
mac address-table notification mac-change history-size <0-500>
no mac address-table notification mac-change history-size
```

Parameter	Description
<0-500>	Set the upper limit on the number of entries that the SNMP MAC address table may contain.

Default Table size is set at 1 entry.

Mode Global Configuration

Usage notes If the mac-change history table is not enabled, then the history size is stored for when it is enabled.

To enable the mac-change history table, use the command:

- **mac address-table notification mac-change**

Example To configure the size of the MAC change history table to 40, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table notification mac-change
 history-size 40
```

Related commands

mac address-table notification mac-threshold

show mac address-table notification mac-change

snmp trap mac-change

Command changes Version 5.5.1-2.1: command added

mac address-table notification mac-change interval

Overview Use this command to set the maximum time that a MAC change SNMP notification is delayed in the MAC address table.

Use the **no** variant of this command to set the interval back to the default (1).

Syntax

```
mac address-table notification mac-change interval
 <0-2147483647>
no mac address-table notification mac-change interval
```

Parameter	Description
<0-2147483647>	Set the interval in seconds.

Default Interval is set at 1 second.

Mode Global Configuration

Usage notes If the mac-change history table is not enabled, then the interval is stored for when it is enabled.

To enable the mac-change history table, use the command:

- **mac address-table notification mac-change**

Example To configure an interval of 5 seconds for the time between two MAC change SNMP notifications being sent, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table notification mac-change
 interval 5
```

Related commands

clear mac address-table notification mac-change

mac address-table notification mac-change

mac address-table notification mac-change history-size

mac address-table notification mac-threshold

show mac address-table notification mac-change

snmp trap mac-change

Command changes Version 5.5.1-2.1: command added

mac address-table notification mac-threshold

Overview Use this command to change the default interval and threshold values for storing and sending Layer 2 forwarding database (FDB) utilization information. These settings are stored in the running configuration.

Use the **no** variant of this command to set the threshold configuration back to the default.

Syntax

```
mac address-table notification mac-threshold {interval
 <120-214783647>|limit <0-100>}
no mac address-table notification mac-threshold
```

Parameter	Description
`interval`	Change the default interval value. The interval value controls the interval between utilization checks.
<120-214783647>	Set the interval in seconds.
`limit`	Change the limit value. When this limit is reached, an SNMP trap is sent.
<0-100>	Set the limit as a percentage.

Default Interval default is 120 seconds and the limit default is 50 percent.

Mode Global Configuration

Usage notes To enable transmission of the mac-threshold trap, specify the parameter **mac-threshold**, use the command:

- **snmp-server enable trap**

Example To configure the MAC threshold notifications to be sent if the L2 FDB table utilization is more than or equal to 70%, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table notification mac-threshold
 limit 70
```

To set the MAC threshold notifications interval and limit back to default values, use the commands:

```
awplus# configure terminal
awplus(config)# no mac address-table notification mac-threshold
```

show counter snmp-server

Overview This command displays counters for SNMP messages received by the SNMP agent.

Syntax
```
show counter snmp-server
```

Mode User Exec and Privileged Exec

Example To display the counters for the SNMP agent, use the command:
```
awplus# show counter snmp-server
```

Output The following shows typical output.

Example output from the `show counter snmp-server` command

```
SNMP-SERVER counters
inPkts                ......... 11

```

Parameters in the output of the `show counter snmp-server` command

Parameter	Meaning
`inPkts`	The total number of SNMP messages received by the SNMP agent.
`inBadVersions`	The number of messages received by the SNMP agent for an unsupported SNMP version. It drops these messages.The SNMP agent on your device supports versions 1, 2C, and 3.
`inBadCommunityNames`	The number of messages received by the SNMP agent with an unrecognized SNMP community name. It drops these messages.
`inBadCommunityUses`	The number of messages received by the SNMP agent where the requested SNMP operation is not

Parameter	Meaning
	permitted from SNMP managers using the SNMP community named in the message.
inASNParseErrs	The number of ASN.1 or BER errors that the SNMP agent has encountered when decoding received SNMP Messages.
inTooBigs	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'tooBig'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.
inNoSuchNames	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'noSuchName'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.
inBadValues	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'badValue'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.
inReadOnlys	The number of valid SNMP PDUs received by the SNMP agent where the value of the error-status field is 'readOnly'. The SNMP manager should not generate a PDU which contains the value 'readOnly' in the error- status field. This indicates that there is an incorrect implementations of the SNMP.
inGenErrs	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'genErr'.
inTotalReqVars	The number of MIB objects that the SNMP agent has successfully retrieved after receiving valid SNMP Get-Request and Get-Next PDUs.
inTotalSetVars	The number of MIB objects that the SNMP agent has successfully altered after receiving valid SNMP Set- Request PDUs.
inGetRequests	The number of SNMP Get-Request PDUs that the SNMP agent has accepted and processed.
inGetNexts	The number of SNMP Get-Next PDUs that the SNMP agent has accepted and processed.
inSetRequests	The number of SNMP Set-Request PDUs that the SNMP agent has accepted and processed.

Parameter	Meaning
inGetResponses	The number of SNMP Get-Response PDUs that the SNMP agent has accepted and processed.
inTraps	The number of SNMP Trap PDUs that the SNMP agent has accepted and processed.
outPkts	The number of SNMP Messages that the SNMP agent has sent.
outTooBigs	The number of SNMP PDUs that the SNMP agent has generated with the value 'tooBig' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outNoSuchNames	The number of SNMP PDUs that the SNMP agent has generated with the value `noSuchName' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outBadValues	The number of SNMP PDUs that the SNMP agent has generated with the value 'badValue' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outGenErrs	The number of SNMP PDUs that the SNMP agent has generated with the value 'genErr' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outGetRequests	The number of SNMP Get-Request PDUs that the SNMP agent has generated.
outGetNexts	The number of SNMP Get-Next PDUs that the SNMP agent has generated.
outSetRequests	The number of SNMP Set-Request PDUs that the SNMP agent has generated.
outGetResponses	The number of SNMP Get-Response PDUs that the SNMP agent has generated.
outTraps	The number of SNMP Trap PDUs that the SNMP agent has generated.
UnSupportedSecLevels	The number of received packets that the SNMP agent has dropped because they requested a securityLevel unknown or not available to the SNMP agent.
NotInTimeWindows	The number of received packets that the SNMP agent has dropped because they appeared

Parameter	Meaning
	outside of the authoritative SNMP agent's window.
`UnknownUserNames`	The number of received packets that the SNMP agent has dropped because they referenced an unknown user.
`UnknownEngineIDs`	The number of received packets that the SNMP agent has dropped because they referenced an unknown snmpEngineID.
`WrongDigest`	The number of received packets that the SNMP agent has dropped because they didn't contain the expected digest value.
`DecryptionErrors`	The number of received packets that the SNMP agent has dropped because they could not be decrypted.
`UnknownSecModels`	The number of messages received that contain a security model that is not supported by the server. Valid for SNMPv3 messages only.
`InvalidMsgs`	The number of messages received where the security model is supported but the authentication fails. Valid for SNMPv3 messages only.
`UnknownPDUHandlers`	The number of times the SNMP handler has failed to process a PDU. This is a system debugging counter.

Related commands **show snmp-server**

show debugging snmp

Overview This command displays whether SNMP debugging is enabled or disabled.

Syntax
```
show debugging snmp
```

Mode User Exec and Privileged Exec

Example To display the status of SNMP debugging, use the command:
```
awplus# show debugging snmp
```

Output The following shows typical output.

Example output from the `show debugging snmp` command

```
Snmp (SMUX) debugging status:
  Snmp debugging is on
```

Related commands **debug snmp**

show mac address-table notification mac-change

Overview Use this command to show the MAC change configuration. It includes the MAC change history.

Syntax
```
show mac address-table notification mac-change
```

Mode User Exec

Example To show the MAC change configuration and history, use the command:
```
awplus# show mac address-table notification mac-change
```

Output The following shows typical output.

Example output from `show mac address-table notification mac-change`

```
awplus#show mac address-table notification mac-change
MAC Change Feature: Enabled
MAC Change Notification Traps: Enabled
Wait time for MAC Change Notification Traps: 1 seconds
Number of MAC Address Add events: 1
Number of MAC Address Remove events: 0
Number of MAC Change Notification Traps sent: 1
Maximum Number of entries configured in History Table: 1
Number of entries currently in History Table: 1
History Table contents
----------------------
History Index 1, Timestamp(uptime) 0 days 00:39:25 (236500)
MAC Change message:
  Operation: Added   Vlan: 2     MAC Addr: 000d.b950.0c26
 Dot1dBasePort: 2
```

Parameters in the output from `show mac address-table notification mac-change`

Parameter	Description
MAC Change Feature	Displays if the feature is enabled or not. If this is disabled, then no more MAC change events will be generated, no events are added to the history, and no traps are logged.
MAC Change Notification Traps	Displays if MAC change traps are sent when MAC change events are generated. This only affects traps, (MAC change history is not affected).
Wait time for MAC Change Notification Traps	The maximum time a MAC change event waits before a MAC change trap is sent. This is also the maximum time a MAC change event waits before being added to the MAC change history. The time is in seconds.
Number of MAC Address Add events	The number of MAC-added events processed by the feature.
Number of MAC Address Remove events	The number of MAC-removed events processed by the feature.
Number of MAC Change Notification Traps sent	The number of MAC notification traps sent by the feature.
Maximum Number of entries configured in History Table	The maximum number of entries present in the MAC change table.

show running-config snmp

Overview This command displays the current configuration of SNMP on your device.

Syntax
```
show running-config snmp
```

Mode Privileged Exec

Example To display the current configuration of SNMP on your device, use the command:

```
awplus# show running-config snmp
```

Output The following shows typical output.

Example output from the `show running-config snmp` command

```
snmp-server contact AlliedTelesis
snmp-server location Philippines
snmp-server group grou1 auth read view1 write view1 notify view1
snmp-server view view1 1 included
snmp-server community public
snmp-server user user1 group1 auth md5 password priv des

```

Mode Privileged Exec

Example To display the SNMP server views configured on the device, use the command:

```
awplus# show snmp-server view
```

Output The following shows typical output.

Example output from the `show snmp-server view` command

```
SNMP view information:
  View Name ............... view1
    OID ................... 1
    Type .................. included
```

Related commands **show snmp-server**

snmp-server view

snmp trap link-status

Overview Use this command to enable SNMP to send link status notifications (traps) for the interfaces when an interface goes up (linkUp) or down (linkDown).

Use the **no** variant of this command to disable the sending of link status notifications.

Syntax

```
snmp trap link-status [enterprise]
no snmp trap link-status
```

Parameter	Description
`enterprise`	Send an Allied Telesis enterprise type of link trap.

Default Disabled

Mode Interface Configuration

Usage notes The link status notifications can be enabled for the following interface types:

- switch port (e.g. port1.0.1)
- VLAN (e.g. vlan2)
- static and dynamic link aggregation (e.g. sa2, po2)

To specify where notifications are sent, use the **snmp-server host** command. To configure the device globally to send other notifications, use the **snmp-server enable trap** command.

Examples To enable SNMP to send link status notifications for port1.0.1 to port1.0.3 use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.3
awplus(config-if)# snmp trap link-status
```

To disable the sending of link status notifications for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no snmp trap link-status
```

Related commands

show interface

snmp trap link-status suppress

snmp-server enable trap

snmp-server host

snmp trap link-status suppress

Overview Use this command to enable the suppression of link status notifications (traps) for the interfaces beyond the specified threshold, in the specified interval.

Use the **no** variant of this command to disable the suppression of link status notifications for the ports.

Syntax

```
snmp trap link-status suppress {time {<1-60>|default}|threshold
 {<1-20>|default}}
no snmp trap link-status suppress
```

Parameter	Description
`time`	Set the suppression timer for link status notifications.
<1-60>	The suppress time in seconds.
`default`	The default suppress time in seconds (60).
`threshold`	Set the suppression threshold for link status notifications. This is the number of link status notifications after which to suppress further notifications within the suppression timer interval.
<1-20>	The number of link status notifications.
`default`	The default number of link status notifications (20).

Default By default, if link status notifications are enabled (they are enabled by default), the suppression of link status notifications is enabled: notifications that exceed the notification threshold (default 20) within the notification timer interval (default 60 seconds) are not sent.

Mode Interface Configuration

Usage notes An unstable network can generate many link status notifications. When notification suppression is enabled, a suppression timer is started when the first link status notification of a particular type (linkUp or linkDown) is sent for an interface.

If the threshold number of notifications of this type is sent before the timer reaches the suppress time, any further notifications of this type generated for the interface during the interval are not sent. At the end of the interval, the sending of link status notifications resumes, until the threshold is reached in the next interval.

Examples

To suppress link status notifications for port1.0.1 to port1.0.3 after 10 notifications in 40 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.3
awplus(config-if)# snmp trap link-status suppress time 40
 threshold 10
```

To stop suppressing link status notifications for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no snmp trap link-status suppress
```

Related commands

show interface

snmp trap link-status

snmp trap mac-change

Overview Use this command to enable the MAC notification feature to apply mac-change notifications via the mac-change trap. This command configures the trap so that you are notified when MAC addresses are added or removed from the forwarding database (FDB). This is applied to interfaces via a specified port or a range of ports.

Use the **no** variant of this command to disable the MAC notification feature.

Syntax

```
snmp trap mac-change {[add] [remove]}
no snmp trap mac-change [add] [remove]
```

Parameter	Description
`add`	Enable SNMP mac-change traps when a MAC address is added.
`remove`	Enable SNMP mac-change traps when a MAC address is removed.

Default Disabled

Mode Interface Configuration

Usage notes To enable transmission of the mac-change trap, specify the parameter **mac-change**, use the command:

- **snmp-server enable trap**

To enable the mac-change history table, use the command:

- **mac address-table notification mac-change**

Example To get mac-change notifications whenever a MAC address associated with port1.0.1 is added or removed from the FDB table, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# snmp trap mac-change add remove
```

Related commands

snmp-server enable trap

Command changes Version 5.5.1-2.1: command added

snmp-server

Overview Use this command to enable the SNMP agent (server) on the device. The SNMP agent receives and processes SNMP packets sent to the device, and generates notifications (traps) that have been enabled by the **snmp-server enable trap**.

Use the **no** variant of this command to disable the SNMP agent on the device. When SNMP is disabled, SNMP packets received by the device are discarded, and no notifications are generated. This does not remove any existing SNMP configuration.

Syntax

```
snmp-server [ip|ipv6]
no snmp-server [ip|ipv6]
```

Parameter	Description
ip	Enable or disable the SNMP agent for IPv4.
ipv6	Enable or disable the SNMP agent for IPv6.

Default By default, the SNMP agent is enabled for both IPv4 and IPv6. If neither the **ip** parameter nor the **ipv6** parameter is specified for this command, then SNMP is enabled or disabled for both IPv4 and IPv6.

Mode Global Configuration

Examples To enable SNMP on the device for both IPv4 and IPv6, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server
```

To enable the SNMP agent for IPv4 on the device, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server ip
```

To disable the SNMP agent for both IPv4 and IPv6 on the device, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-server
```

To disable the SNMP agent for IPv4, use the commands:

```
awplus(config)# no snmp-server ipv4
```

- **snmp-server host**
- **snmp-server location**
- **snmp-server view**

snmp-server community

Overview This command creates an SNMP community, optionally setting the access mode for the community. The default access mode is read-only. If the view parameter is not specified, the community allows access to all the MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used when operating SNMPv3.

The **no** variant of this command removes an SNMP community. The specified community must already exist on the device.

Syntax

```
snmp-server community <community-name> [view <view-name>|ro|
rw|<access-list>]
no snmp-server community <community-name>
```

Parameter	Description
<community-name>	Community name. The community name is a case sensitive string of up to 20 characters.
`view`	Configure SNMP view. If view is not specified, the community allows access to all the MIB objects.
<view-name>	View name. The view name is a string up to 20 characters long and is case sensitive.
`ro`	Read-only community.
`rw`	Read-write community.
<access-list>	*<1-99>* Access list number. Warning: Do not use an ACL with deny rules. This is because only permit rules are applied.

Default The default access mode is Read-only.

Mode Global Configuration

Example Use the following commands to create an SNMP community called 'public' with read-only access to all MIB variables from any management station:

```
awplus# configure terminal
awplus(config)# snmp-server community public ro
```

Use the following commands to remove an SNMP community called 'public'

```
awplus# configure terminal
awplus(config)# no snmp-server community public
```

Related commands

show snmp-server

show snmp-server community

snmp-server view

snmp-server contact

Overview This command sets the contact information for the system. The contact name is:

- displayed in the output of the **show system** command
- stored in the MIB object sysContact

The **no** variant of this command removes the contact information from the system.

Syntax

```
snmp-server contact <contact-info>
no snmp-server contact
```

Parameter	Description
<contact-info>	The contact information for the system, from 0 to 255 characters long. Valid characters are any printable character and spaces.

Mode Global Configuration

Example To set the system contact information to “example@example.com”, use the command:

```
awplus# configure terminal
awplus(config)# snmp-server contact example@example.com
```

Related commands

show system

snmp-server location

snmp-server system-name

snmp-server group

snmp-server enable trap

Overview Use this command to enable the transmission of the specified notifications (traps) on your device.

Note that the Environmental Monitoring traps defined in the AT-ENVMONv2-MIB are enabled by default.

Use the **no** variant of this command to disable the transmission of the specified notifications.

Syntax `snmp-server enable trap <trap-list>`

`no snmp-server enable trap <trap-list>`

Depending on your device model, you can enable some or all of the traps in the following table:

Parameter	Description
`atmf`	AMF traps.
`atmfguestnode`	AMF guest node traps.
`atmflink`	AMF link traps.
`atmfnode`	AMF node traps.
`atmfrr`	AMF reboot-rolling traps.
`auth`	Authentication failure.
`bgp`	BGP traps.
`chassis`	Chassis traps.
`cwmap`	Access Point traps with the AWC wireless manager.
`dhcpsnooping`	DHCP snooping and ARP security traps. These notifications must also be set using the **`ip dhcp snooping violation`** command, and/or the **`arp security violation`** command.
`epsr`	EPSR traps.
`g8032`	G.8032 ERP traps.
`lldp`	Link Layer Discovery Protocol (LLDP) traps. These notifications must also be enabled using the **`lldp notifications`** command, and/or the **`lldp med-notifications`** command.
`loopprot`	Loop Protection traps.
`low-memory`	Traps that are generated when available memory drops beneath low, very low, and critical thresholds, and when it returns to normal. The traps are: • 1.3.6.1.4.1.207.8.4.4.3.7.0 memoryTraps • 1.3.6.1.4.1.207.8.4.4.3.7.0.1 memoryLowTrap • 1.3.6.1.4.1.207.8.4.4.3.7.0.2 memoryVeryLowTrap • 1.3.6.1.4.1.207.8.4.4.3.7.0.3 memoryCriticalTrap (However, note that when the system reaches the critical memory threshold, it reboots before a trap can be sent.) • 1.3.6.1.4.1.207.8.4.4.3.7.0.4 memoryReturnToNormalTrap

Parameter	Description
	• 1.3.6.1.4.1.207.8.4.4.3.7.0.5 vcstackId
`mac-change`	MAC address changed.
`mac-move`	MAC address moved between interface.
`mac-threshold`	MAC address table reaches a threshold limit.
`mstp`	MSTP traps.
`nsm`	NSM traps.
`ospf`	OSPF traps.
`pim`	PIM traps.
`power-inline`	Power-inline traps (Power Ethernet MIB RFC 3621).
`qsp`	QoS Storm Protection.
`rmon`	RMON traps.
`thrash-limit`	MAC address Thrash Limiting traps.
`vcs`	VCS traps. Note that to see VCS resiliency link traps, you have to use the **vcs-resiliency-link** parameter too, as shown below.
`vcs vcs-resiliency-link`	VCS resiliency link traps. You will only see these traps if you enter both **vcs** and **vcs-resiliency-link**.
`vrrp`	Virtual Router Redundancy (VRRP) traps.
`ufo`	Upstream Forwarding Only (UFO) traps.

Default Disabled

Mode Global Configuration

Usage notes This command cannot be used to enable link status notifications globally. To enable link status notifications for particular interfaces, use the **snmp trap link-status** command.

To specify where notifications are sent, use the **snmp-server host** command.

Note that you can enable (or disable) multiple traps with a single command, by specifying a space-separated list of traps.

Examples

To enable the device to send a notification if an AMF node changes its status, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap atmfnode
```

To enable the device to send PoE related traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap power-inline
```

To disable PoE traps being sent out by the device, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap power-inline
```

To enable the device to send MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap thrash-limit
```

To disable the device from sending MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap thrash-limit
```

To enable the device to send OSPF and VRRP-related traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap ospf vrrp
```

To disable OSPF traps being sent out by the device, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap ospf
```

Version 5.4.7-2.1: **ufo** parameter added

snmp-server engineID local

Overview Use this command to configure the SNMPv3 engine ID. The SNMPv3 engine ID is used to uniquely identify the SNMPv3 agent on a device when communicating with SNMP management clients. Once an SNMPv3 engine ID is assigned, this engine ID is permanently associated with the device until you change it.

Use the **no** variant of this command to set the user defined SNMPv3 engine ID to a system generated pseudo-random value by resetting the SNMPv3 engine. The **no snmp-server engineID local** command has the same effect as the **snmp-server engineID local default** command.

Note that the **snmp-server engineID local reset** command is used to force the system to generate a new engine ID when the current engine ID is also system generated.

Syntax

```
snmp-server engineID local {<engine-id>|default}
no snmp-server engineID local
```

Parameter	Description
<engine-id>	Specify SNMPv3 Engine ID value, a string of up to 27 characters.
default	Set SNMPv3 engine ID to a system generated value by resetting the SNMPv3 engine, provided the current engine ID is user defined. If the current engine ID is system generated, use the **snmp-server engineID local reset** command to force the system to generate a new engine ID.

Mode Global Configuration

Usage notes All devices must have a unique engine ID which is permanently set unless it is configured by the user.

In a stacked environment, if the same engine ID was automatically generated for all members of the stack, conflicts would occur if the stack was dismantled. Therefore, each member of the stack will generate its own engine ID and the stack master's ID is used when transmitting SNMPv3 packets. Should a master failover occur, a different engine ID is transmitted. You can modify this behavior by manually assigning all stack members the same engine ID using the **snmp-server engineID local** command. However, should you decide to separate the stack and use the devices individually, you must remember to change or remove this configuration to prevent conflicts.

Example To set the SNMPv3 engine ID to 800000cf030000cd123456, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local
 800000cf030000cd123456
```

To set a user defined SNMPv3 engine ID back to a system generated value, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server engineID local
```

Output The following example shows the engine ID values after configuration:

```
awplus(config)#snmp-server engineid local asdgdfh231234d
awplus(config)#exit
awplus#show snmp-server

SNMP Server ......................... Enabled
IP Protocol ......................... IPv4
SNMPv3 Engine ID (configured name) ... asdgdfh231234d
SNMPv3 Engine ID (actual) ............ 0x80001f888029af52e149198483

awplus(config)#no snmp-server engineid local
awplus(config)#exit
awplus#show snmp-server

SNMP Server ......................... Enabled
IP Protocol ......................... IPv4
SNMPv3 Engine ID (configured name) ... Not set
SNMPv3 Engine ID (actual) ............ 0x80001f888029af52e149198483
```

Related commands

show snmp-server

snmp-server engineID local reset

snmp-server group

snmp-server engineID local reset

Overview Use this command to force the device to generate a new pseudo-random SNMPv3 engine ID by resetting the SNMPv3 engine. If the current engine ID is user defined, use the **snmp-server engineID local** command to set SNMPv3 engine ID to a system generated value.

Syntax

```
snmp-server engineID local reset
```

Mode Global Configuration

Example To force the SNMPv3 engine ID to be reset to a system generated value, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local reset
```

Related commands

snmp-server engineID local

show snmp-server

snmp-server group

Overview This command is used with SNMP version 3 only, and adds an SNMP group, optionally setting the security level and view access modes for the group. The security and access views defined for the group represent the minimum required of its users in order to gain access.

The **no** variant of this command deletes an SNMP group, and is used with SNMPv3 only. The group with the specified authentication/encryption parameters must already exist.

Syntax

```
snmp-server group <groupname> {auth|noauth|priv} [read
 <readname>|write <writename>|notify <notifyname>]
no snmp-server group <groupname>
```

Parameter	Description
<groupname>	Group name. The group name is a string up to 20 characters long and is case sensitive.
`auth`	Authentication.
`noauth`	No authentication and no encryption.
`priv`	Authentication and encryption.
`read`	Configure read view.
<readname>	Read view name.
`write`	Configure write view.
<writename>	Write view name. The view name is a string up to 20 characters long and is case sensitive.
`notify`	Configure notify view.
<notifyname>	Notify view name. The view name is a string up to 20 characters long and is case sensitive.

Mode Global Configuration

Examples To add SNMP group, for ordinary users, user the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server group usergroup noauth read
 useraccess write useraccess
```

To delete the SNMP group called ‘usergroup’, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server group usergroup
```

snmp-server host

Overview

This command specifies an SNMP trap host destination to which Trap or Inform messages generated by the device are sent.

For SNMP version 1 and 2c you must specify the community name parameter. For SNMP version 3, specify the authentication/encryption parameters and the user name. If the version is not specified, the default is SNMP version 1. Inform messages can be sent instead of traps for SNMP version 2c and 3.

Use the **no** variant of this command to remove an SNMP trap host. The trap host must already exist.

The trap host is uniquely identified by:

- host IP address (IPv4 or IPv6)
- inform or trap messages
- community name (SNMPv1 or SNMP v2c) or the authentication/ encryption parameters and user name (SNMP v3).

When VRF-lite is configured, you can apply this command to a specific VRF instance.

Syntax

```
snmp-server host {<ipv4-address>|<ipv6-address>} [traps]
 [version 1] <community-name>
snmp-server host {<ipv4-address>|<ipv6-address>} [informs|traps]
 version 2c <community-name>
snmp-server host {<ipv4-address>|<ipv6-address>} [informs|traps]
 version 3 {auth|noauth|priv} <user-name>
no snmp-server host {<ipv4-address>|<ipv6-address>} [traps]
 [version 1] <community-name>
no snmp-server host {<ipv4-address>|<ipv6-address>} [informs|
traps] version 2c <community-name>
no snmp-server host {<ipv4-address>|<ipv6-address>} [informs|
traps] version 3 {auth|noauth|priv} <user-name>
```

Syntax (VRF-Lite)

```
snmp-server host {<ipv4-address>|<ipv6-address>} [vrf <vrf-
name>] [informs|traps] version {1|2c|3} {auth|noauth|priv}
 {<community-name>|<user-name>}
no snmp-server host {<ipv4-address>|<ipv6-address>} [vrf <vrf-
name>] [informs|traps] version {1|2c|3} {auth|noauth|priv}
 {<community-name>|<user-name>}
```

Parameter	Description
<ipv4-address>	IPv4 trap host address in the format A.B.C.D, for example, 192.0.2.2.
<ipv6-address>	IPv6 trap host address in the format x:x::x:x for example, 2001:db8::8a2e:7334.
`vrf` *<vrf-name>*	Specify the VRF instance to use. If you do not specify an instance it will use the global VRF.
`informs`	Send Inform messages to this host.
`traps`	Send Trap messages to this host (default).
`version`	SNMP version to use for notification messages. Default: version 1.
`1`	Use SNMPv1 (default).
`2c`	Use SNMPv2c.
`3`	Use SNMPv3.
`auth`	Authentication.
`noauth`	No authentication.
`priv`	Encryption.
<community-name>	The SNMPv1 or SNMPv2c community name.
<user-name>	SNMPv3 user name.

Default No host is defined.

Mode Global Configuration

Usage notes You can test connectivity to the host by using the command **test snmp trap snmp**.

Examples

To configure the device to send generated traps to the IPv4 host destination 192.0.2.5 with the SNMPv2c community name 'public', use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server host 192.0.2.5 version 2c public
```

To configure the device to send generated traps to the IPv6 host destination 2001:db8::8a2e:7334 with the SNMPv2c community name 'private', use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server host 2001:db8::8a2e:7334 version 2c
 private
```

To remove a configured trap host of 192.0.2.5 with the SNMPv2c community name 'public', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server host 192.0.2.5 version 2c public
```

To configure the device to send generated traps to an IPv4 host destination 192.168.1.2 with the SNMPv2c community name 'public' and on a VRF named 'red', use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server host 192.0.1.2 vrf red version 2c
 public
```

Command changes

Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

snmp-server legacy-ifadminstatus

Overview Use this command to set the ifAdminStatus to reflect the operational state of the interface, rather than the administrative state.

The **no** variant of this command sets the ifAdminStatus to reflect the administrative state of the interface.

Syntax
```
snmp-server legacy-ifadminstatus
no snmp-server legacy-ifadminstatus
```

Default Legacy ifAdminStatus is turned off by default, so by default the SNMP ifAdminStatus reflects the administrative state of the interface.

Mode Global Configuration

Usage notes Note that if you enable Legacy ifAdminStatus, the ifAdminStatus will report a link's status as Down when the link has been blocked by a process such as loop protection.

Example To turn on Legacy ifAdminStatus, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server legacy-ifadminstatus
```

Related commands **show interface**

snmp-server location

Overview This command sets the location of the system. The location is:

- displayed in the output of the **show system** command
- stored in the MIB object sysLocation

The **no** variant of this command removes the configured location from the system.

Syntax

```
snmp-server location <location-name>
no snmp-server location
```

Parameter	Description
<location-name>	The location of the system, from 0 to 255 characters long. Valid characters are any printable character and spaces.

Mode Global Configuration

Example To set the location to “server room 523”, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server location server room 523
```

Related commands

show snmp-server

show system

snmp-server contact

snmp-server system-name

snmp-server source-interface

Overview Use this command to specify the originating interface for SNMP traps or informs. An interface specified by this command must already have an IP address assigned to it.

Use the **no** variant of this command to reset the interface to its default value (the originating egress interface).

Syntax

```
snmp-server source-interface {traps|informs} <interface-name>
no snmp-server source-interface {traps|informs}
```

Parameter	Description
`traps`	SNMP traps.
`informs`	SNMP informs.
<interface-name>	Interface name (must already have an IP address assigned).

Default The originating egress interface of the traps and informs messages

Mode Global Configuration

Usage notes When an SNMP server sends an SNMP trap or inform message, the message carries the notification IP address of its originating interface. Use this command to assign this interface.

Example The following commands set vlan2 to be the interface whose IP address is used as the originating address in SNMP informs packets.

```
awplus# configure terminal
awplus(config)# snmp-server source-interface informs vlan2
```

The following commands reset the originating source interface for SNMP trap messages to be the default interface (the originating egress interface):

```
awplus# configure terminal
awplus(config)# no snmp-server source-interface traps
```

Validation Commands **show running-config**

snmp-server startup-trap-delay

Overview Use this command to set the time in seconds after following completion of the device startup sequence before the device sends any SNMP traps (or SNMP notifications).

Use the no variant of this command to restore the default startup delay of 30 seconds.

Syntax

```
snmp-server startup-trap-delay <delay-time>
no snmp-server startup-trap-delay
```

Parameter	Description
<delay-time>	Specify an SNMP trap delay time in seconds in the range of 30 to 600 seconds.

Default The SNMP server trap delay time is 30 seconds. The no variant restores the default.

Mode Global Configuration

Example To delay the device sending SNMP traps until 60 seconds after device startup, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server startup-trap-delay 60
```

To restore the sending of SNMP traps to the default of 30 seconds after device startup, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server startup-trap-delay
```

Validation Commands **show snmp-server**

snmp-server system-name

Overview Use this command to set the name of the system. The name is stored in the MIB object sysName.

Note that this command does not set the hostname or change the name in the command prompt. Use the **hostname** command to do that.

Use the **no** variant of this command to remove the system name.

Syntax

```
snmp-server system-name <name>
no snmp-server system-name
```

Parameter	Description
<name>	The name of the system, from 0 to 255 characters long. Valid characters are any printable character and spaces.

Default None

Mode Global Configuration

Example To set the system name to ExampleDevice, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server system-name ExampleDevice
```

Related commands

hostname

show snmp-server

Command changes Version 5.5.5-2.1: command added

snmp-server user

Overview Use this command to create or move users as members of specified groups. This command is used with SNMPv3 only.

The **no** variant of this command removes an SNMPv3 user. The specified user must already exist.

Syntax

```
snmp-server user <username> <groupname> [encrypted]
 [auth {md5|sha|sha-256} <auth-password>] [priv {des|aes}
 <privacy-password>]
```

```
no snmp-server user <username>
```

Parameter	Description
<username>	User name. The user name is a string up to 20 characters long and is case sensitive.
<groupname>	Group name. The group name is a string up to 20 characters long and is case sensitive.
`encrypted`	Use the encrypted parameter when you want to enter encrypted passwords.
`auth`	Authentication protocol.
`md5`	MD5 Message Digest Algorithms.
`sha`	SHA Secure Hash Algorithm.
`sha-256`	SHA-256 Secure Hash Algorithm. Note: SHA-256 authentication is required in crypto secure-mode.
<auth-password>	Authentication password. The password is a string of 8 to 20 characters long and is case sensitive.
`priv`	Privacy protocol.
`des`	DES: Data Encryption Standard. DES is not available if you enable **crypto secure-mode**.
`aes`	AES: Advanced Encryption Standards.
<privacy-password>	Privacy password. The password is a string of 8 to 20 characters long and is case sensitive.

Mode Global Configuration

Usage notes Additionally this command provides the option of selecting an authentication protocol and (where appropriate) an associated password. Similarly, options are offered for selecting a privacy protocol and password.

- Note that each SNMP user must be configured on both the manager and agent entities. Where passwords are used, these passwords must be the same for both entities.
- Use the **encrypted** parameter when you want to enter already encrypted passwords in encrypted form as displayed in the running and startup configs stored on the device. For example, you may need to move a user from one group to another group and keep the same passwords for the user instead of removing the user to apply new passwords.
- User passwords are entered using plaintext without the **encrypted** parameter and are encrypted according to the authentication and privacy protocols selected.
- User passwords are viewed as encrypted passwords in running and startup configs shown from **`show running-config`** and **`show startup-config`** commands respectively. Copy and paste encrypted passwords from running-configs or startup-configs to avoid entry errors.

Examples To add SNMP user authuser as a member of group 'usergroup', with authentication protocol MD5, authentication password 'Authpass', privacy protocol AES and privacy password 'Privpass' use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server user authuser usergroup auth md5
 Authpass priv aes Privpass
```

Validate the user is assigned to the group using the **show snmp-server user** command:

```
awplus#show snmp-server user
Name                Group name          Auth        Privacy
-------             -------------       -------     ----------
authuser            usergroup           md5         aes
```

To enter existing SNMP user 'authuser' with existing passwords as a member of group 'newusergroup' with authentication protocol MD5 with the encrypted authentication password 0x1c74b9c22118291b0ce0cd883f8dab6b74, and privacy protocol AES with the encrypted privacy password 0x0e0133db5453ebd03822b004eeacb6608f, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server user authuser newusergroup encrypted
 auth md5 0x1c74b9c22118291b0ce0cd883f8dab6b74 priv aes
 0x0e0133db5453ebd03822b004eeacb6608f
```

NOTE: *Copy and paste the encrypted passwords from the or the displayed, using the and commands respectively, into the command line to avoid key stroke errors issuing this command.*

Validate the user has been moved from the first group using the **show snmp-server user** command:

```
awplus#show snmp-server user
Name                Group name          Auth        Privacy
-------             -------------       -------     ----------
authuser            newusergroup        md5         aes
```

To delete SNMP user 'authuser', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server user authuser
```

Related commands **show snmp-server user**

snmp-server view

snmp-server view

Overview Use this command to create an SNMP view that specifies a sub-tree of the MIB. Further sub-trees can then be added by specifying a new OID to an existing view. Views can be used in SNMP communities or groups to control the remote manager's access.

NOTE: *The object identifier must be specified in a sequence of integers separated by decimal points.*

The **no** variant of this command removes the specified view on the device. The view must already exist.

Syntax

```
snmp-server view <view-name> <mib-name> {included|excluded}
no snmp-server view <view-name>
```

Parameter	Description
<view-name>	SNMP server view name. The view name is a string up to 20 characters long and is case sensitive.
<mib-name>	Object identifier of the MIB.
`included`	Include this OID in the view.
`excluded`	Exclude this OID in the view.

Mode Global Configuration

Examples The following command creates a view called "loc" that includes the system location MIB sub-tree.

```
awplus(config)# snmp-server view loc 1.3.6.1.2.1.1.6.0 included
```

To remove the view "loc" use the following command

```
awplus(config)# no snmp-server view loc
```

Related commands

show snmp-server view

snmp-server community

snmp-server vrf

Overview Use this command to isolate the SNMP Agent to operate within a previously configured non-global named VRF. This means the SNMP Agent can only respond to requests from SNMP Managers operating within the same VRF.

Use the **no** variant of this command to revert the SNMP Agent to operating within the default global VRF.

Syntax

```
snmp-server vrf <vrf-name>
no snmp-server vrf
```

Parameter	Description
`vrf`	The VRF instance to operate within.
<vrf-name>	The VRF instance name.

Default Global VRF

Mode Global Configuration

Examples To configure the SNMP Agent to operate within the VRF instance named 'red', use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server vrf red
```

To revert the SNMP Agent to operating within the default global VRF, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-server vrf
```

Related commands **show snmp-server**

snmp-server

Command changes Version 5.5.2-2.1: command added

test snmp trap snmp

Overview Use this command to test connectivity between the AlliedWare Plus device and an SNMP manager. The command tests the connectivity by sending a one-off coldStart or warmStart trap.

It does not matter whether you send a coldStart or warmStart trap; either trap lets you test the connectivity.

Syntax

```
test snmp trap snmp coldstart
test snmp trap snmp warmstart
```

Parameter	Description
`coldstart`	Send a one-off coldStart trap. This trap indicates that the SNMP agent is restarting with a configuration change.
`warmstart`	Send a one-off warmStart trap. This trap indicates that the SNMP agent is restarting without a configuration change.

Default n/a

Mode Privileged Exec

Example To send a one-off coldStart trap to the SNMP manager configured on the device, use the command:

```
awplus# test snmp trap snmp coldstart
```

Related commands **snmp-server host**

Command changes Version 5.5.4-2.3: command added

undebug snmp

Overview This command applies the functionality of the no **debug snmp** command.

71 NETCONF Commands

- **show netconf counters** on page 4519
- **show netconf session** on page 4520
- **ssh server netconf** on page 4522

Introduction

Overview This chapter provides an alphabetical reference of commands used to configure NETCONF (Network Configuration Protocol) and RESTCONF (RESTful Network Configuration Protocol) network management protocols.

NETCONF and RESTCONF make managing networks easier and more reliable. They use a clear and consistent method for configuring and controlling network devices, which helps with automation and integration.

NETCONF is ideal for complex configuration tasks and managing devices that require a structured approach.

RESTCONF is well-suited for simpler management tasks and integrating network devices with other systems using web technologies.

You can access the Allied Telesis YANG repository here: **https://github.com/alliedtelesis/yang**

YANG (Yet Another Next Generation) is a data modeling language used to describe:

- Configuration data
- State data
- RPC (Remote Procure Calls)
- Notifications

For more information, see the **NETCONF Feature Overview and Configuration Guide**.

clear netconf session

Overview Use this command to force termination of a NETCONF session. This could be required in the event that management applications create NETCONF sessions that they don't relinquish.

Syntax

```
clear netconf session <ID>
```

Parameter	Description
<ID>	The session ID of the NETCONF session to be terminated.

Mode User Exec

Usage notes You can look at the output of the **show netconf sessions** command to identify sessions that need to be terminated (by reference to the host address, username, and login time).

Example To clear a NETCONF session whose ID is 3943, use the command:

```
awplus# clear netconf session 3943
```

Related commands **show netconf session**

Command changes Version 5.5.3-2.1: command added

netconf allow-users

Overview Use this command to add a username pattern to the Allow list of the NETCONF server. If the pattern matches the user of an incoming NETCONF session, the system accepts the session.

Use the **no** variant of this command to delete a username pattern from the NETCONF server Allow list.

Syntax

```
netconf allow-users <username-pattern> [<hostname-pattern>]
no netconf allow-users <username-pattern> [<hostname-pattern>]
```

Parameter	Description
<username-pattern>	The username pattern that users can match to. An asterisk acts as a wildcard character that matches any string of characters.
<hostname-pattern>	The hostname pattern that hosts can match to. If specified, the server allows the user to connect only from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters.

Mode Global Configuration

Usage notes When there are no registered users in the server's database of allowed users, the NETCONF server does not accept NETCONF sessions even when enabled. The NETCONF server also maintains the Deny list. The server checks the user in the Deny list first. If a user is listed in the Deny list, then the user access is denied even if the user is also listed in the Allow list.

Example To allow the user 'john' to create a NETCONF session from any host, use the commands:

```
awplus# configure terminal
awplus(config)# netconf allow-users john
```

To allow the user 'john' to create a NETCONF session from a range of IP addresses (from 192.168.1.1 to 192.168.1.255, use the commands:

```
awplus# configure terminal
awplus(config)# netconf allow-users john 192.168.1.*
```

To allow the user 'john' to create a NETCONF session from 'a-company.com' domain, use the commands:

```
awplus# configure terminal
awplus(config)# netconf allow-users john *.a-company.com
```

To delete the existing user entry 'john 192.168.1.*' in the Allow list, use the commands:

```
awplus# configure terminal
awplus(config)# no netconf allow-users john 192.168.1.*
```

Related commands **netconf deny-users**

Command changes Version 5.5.3-2.1: command added

netconf deny-users

Overview Use this command to add a username pattern to the Deny list of the NETCONF server. If the pattern matches the user of an incoming NETCONF session, the system rejects the session.

Use the **no** variant of this command to delete a username pattern from the Deny list of the NETCONF server. To delete an entry from the Deny list, the username and hostname pattern should match exactly with the existing entry.

Syntax

```
netconf deny-users <username-pattern> [<hostname-pattern>]
no netconf deny-users <username-pattern> [<hostname-pattern>]
```

Parameter	Description
<username-pattern>	The username pattern that users can match to. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen, full stop, and asterisk symbols An asterisk acts as a wildcard character that matches any string of characters.
<hostname-pattern>	The hostname pattern that hosts can match to. If specified, the server denies the user only when they connect from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters.

Mode Global Configuration

Usage notes The NETCONF server also maintains the Allow list. The server checks the user in the Deny list first. If a user is listed in the Deny list, then the user access is denied even if the user is listed also in the Allow list.

If a hostname pattern is specified, the user is denied from the hosts matching the pattern.

Example To deny the user 'john' to access a NETCONF login from any host, use the commands:

```
awplus# configure terminal
awplus(config)# netconf deny-users john
```

To deny the user 'john' to access a NETCONF login from a range of IP addresses (from 192.168.2.1 to 192.168.2.255), use the commands:

```
awplus# configure terminal
awplus(config)# netconf allow-users john 192.168.2.*
```

To deny the user 'john' to access a NETCONF login from 'b-company.com' domain, use the commands:

```
awplus# configure terminal
awplus(config)# netconf deny-users john *.b-company.com
```

To delete the existing user entry 'john 192.168.2.*' in the Deny list, use the commands:

```
awplus# configure terminal
awplus(config)# no netconf deny-users john 192.168.2.*
```

Related commands **netconf allow-users**

Command changes Version 5.5.3-2.1: command added

netconf log

Overview Use this command to configure the logging options for the NETCONF service.

You can turn on or off individual options to control the logging of different types of NETCONF messages. If a given option is turned on, messages of that type will be logged when they are received.

Only one option can be turned on or off at a time. To enable multiple options run this command multiple times.

Use the **no** variant of this command to turn off a logging option.

Syntax

```
netconf log [close-session|edit-config|get|get-config|kill-session|lock|unlock]
```

```
no netconf log [close-session|edit-config|get|get-config|kill-session|lock|unlock]
```

Parameter	Description
`close-session`	Log when a NETCONF session is closed
`edit-config`	Log edit-config requests
`get`	Log get requests
`get-config`	Log get-config requests
`kill-session`	Log kill-session requests
`lock`	Log lock requests
`unlock`	Log unlock requests

Default All options are turned off.

Mode Global Configuration

Example To enable logging for lock and unlock requests, use the commands:

```
awplus# configure terminal
awplus(config)# netconf log lock
awplus(config)# netconf log unlock
```

Related commands **show netconf session**

Command changes Version 5.5.4-2.1: **close-session** parameter added

Version 5.5.3-1.3: command added

netconf max-sessions

Overview Use this command to set the number of simultaneous active NETCONF sessions allowed on a device. The system terminates sessions that exceed this limit immediately after the connection.

Use the **no** variant of this command to reset the maximum number back to the default of 4.

Syntax

```
netconf max-sessions <1-10>
no netconf max-sessions
```

Parameter	Description
<1-10>	The number of maximum simultaneous active NETCONF sessions.

Default The default maximum number of simultaneous sessions is 4.

Mode Global Configuration

Example To set the number of allowed NETCONF sessions to 7, use the commands:

```
awplus# configure terminal
awplus(config)# netconf max-sessions 7
```

To set the number of allowed NETCONF sessions to 4, use the commands:

```
awplus# configure terminal
awplus(config)# no netconf max-sessions
```

Command changes Version 5.5.3-2.1: command added

Related commands **service netconf**

netconf resolve-hosts

Overview Use this command to resolve an IP address from a hostname using a DNS server for NETCONF client host authentication.

Use the **no** variant of this command to disable the feature.

Syntax
```
netconf resolve-hosts
no netconf resolve-hosts
```

Mode Global Configuration

Usage notes Your device has a DNS client enabled automatically when you add a DNS server to your device. Use the **ip name-server** command to add a DNS server to the list of servers that the device queries.

Example To resolve hostnames using a DNS server, for NETCONF authentication, use the commands:

```
awplus# configure terminal
awplus(config)# netconf resolve-hosts
```

Related commands **ip name-server**

Command changes Version 5.5.3-2.1: command added

netconf vrf

Overview Use this command to allow the NETCONF server to operate within a previously configured non-global VRF.

Use the **no** variant of this command to revert the VRF configuration so that the NETCONF server will return to operating within the global VRF.

Syntax

```
netconf vrf <vrf-name>
no netconf vrf
```

Parameter	Description
<vrf-name>	The VRF instance name

Default By default, the NETCONF server operates in the default global VRF.

Mode Global Configuration

Example To configure the NETCONF server to operate within the VRF instance named 'red', use the commands:

```
awplus# configure terminal
awplus(config)# netconf vrf red
```

To revert the NETCONF server to operating within the default global VRF, use the commands:

```
awplus# configure terminal
awplus(config)# no netconf vrf
```

Related commands **service netconf**

Command changes Version 5.5.3-2.1: command added

service netconf

Overview Use this command to enable the NETCONF (Network Configuration Protocol), service on the SSH server. Once enabled, the server accepts NETCONF requests from remote clients. Optionally, the device can be configured to use IPv4, IPv6, or both.

NETCONF, is a standardized network management protocol used for configuring, managing, and monitoring network devices.

Use the **no** variant of this command to disable NETCONF service on the SSH server. Once disabled, NETCONF requests from remote clients are rejected.

Syntax

```
service netconf [ip|ipv6]
no service netconf
```

Parameter	Description
`ip`	Allow connections to use IPv4 only
`ipv6`	Allow connections to use IPv6 only
`(blank)`	Allow connections to use IPv4 and IPv6

Default Disabled.

Mode Global Configuration

Example To enable the NETCONF service on both IPv4 and IPv6, use the commands:

```
awplus# configure terminal
awplus(config)# service netconf
```

To disable the NETCONF service, use the commands:

```
awplus# configure terminal
awplus(config)# no service netconf
```

Related commands **show running-config ssh**

show ssh server

Command changes Version 5.5.3-2.1: command added

service restconf (deprecated)

Overview This command has been deprecated in version 5.5.4-2.1. The RESTCONF service is now enabled as part of the HTTP service.

show netconf counters

Overview Use this command to display NETCONF counters. The counters displayed are per session, as well as global and aggregated counters.

Syntax
```
show netconf counters
```

Mode User Exec and Privileged Exec

Example To display NETCONF counters, use the command:
```
awplus# show netconf counters
```

Output The following shows typical output.

Example output from `show netconf counters`

```
Netconf counters
Global counters
-----------------------------------------------
 Netconf start time: 2023-08-07T20:53:04Z+00:00
 In bad Hellos:                0
 Sessions started:            23
 Dropped sessions:             3
 In RPCs:                    123
 In bad RPCs:                  2
 Out RPC errors:              23
 Out Notifications:            3
-----------------------------------------------
Session counters:
ID        Username     Login time (UTC)            Remote address

```

Related commands **netconf log**

Command changes Version 5.5.3-2.1: command added

show netconf session

Overview Use this command to display active sessions on the NETCONF server. These are connections from remote clients using SSH to run the NETCONF protocol. Use the information in the output of this command to identify the remote client.

Syntax
```
show netconf session
```

Mode User Exec and Privileged Exec

Usage notes Each session has a unique ID and this can be used to reset the session.

Example To display the current NETCONF sessions, use the command:
```
awplus# show netconf session
```

Output The following shows typical output.

Example output from `show netconf session`

```
Netconf sessions
ID        Username     Lock  Login time (UTC)           Remote address
-------------------------------------------------------------------------------
4941      netconf      -     2023-08-04T01:54:27Z+00:00  10.33.22.13:45318
4942      netconf      -     2023-08-04T01:54:29Z+00:00  10.33.22.13:33544
4943      netconf      -     2023-08-04T01:54:31Z+00:00  10.33.22.13:33550
4944      netconf      -     2023-08-04T01:54:33Z+00:00  10.33.22.13:33556
4945      netconf      -     2023-08-04T01:54:35Z+00:00  10.33.22.13:33572
4946      netconf      -     2023-08-04T01:54:37Z+00:00  10.33.22.13:33586
4947      netconf      -     2023-08-04T01:54:39Z+00:00  10.33.22.13:54424
4948      netconf      -     2023-08-04T01:54:41Z+00:00  10.33.22.13:54426
-------------------------------------------------------------------------------
```

Parameters in the output from `show netconf session`

Parameter	Description
`ID`	NETCONF session ID.
`Username`	The username with which the client authenticated the SSH connection underlying the NETCONF session.
`Lock`	The database lock held by the session. The only supported lock is “R” (Running).
`Login time (UTC)`	The time in UTC at which the session was established.
`Remote address`	IP (or IPv6) address and TCP port of the remote client for this session.

Related commands **service netconf**

Command changes Version 5.5.3-2.1: command added

ssh server netconf

Overview Use this command to enable the Netconf service on the SSH server. Once enabled, the server will start accepting Netconf requests from remote clients.

You must enable the SSH server as well as this service before the device accepts Netconf connections. The Netconf service is disabled by default when the SSH server is enabled. If the SSH server is disabled, Netconf service is unavailable.

Use the **no** variant of this command to disable Netconf service on the SSH server. Once disabled, Netconf requests from remote clients are rejected.

Syntax

```
ssh server netconf
no ssh server netconf
```

Default Disabled.

Mode Global Configuration

Example To enable the Netconf service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server netconf
```

To disable the Netconf service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server netconf
```

Related commands **show running-config ssh**

show ssh server

Introduction

Overview This chapter provides an alphabetical reference of commands used to configure IPFIX (IP Flow Information Export), a network management protocol.

IPFIX is an IETF protocol defined in RFC 7011 that provides a standard for exporting IP flow data from a network for analysis. Network administrators analyze the IP flow data, and make decisions, such as applying QoS policies or maybe adding more bandwidth to network areas that need it.

For more information, see the **IPFIX Feature Overview and Configuration Guide**

description (flow exporter)

Overview Use this command to add a description to a configured flow exporter.

Use the **no** variant of this command to remove a description for a flow exporter.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	Text describing the flow exporter. Valid characters are any printable character and spaces, up to a maximum of 200 characters.

Mode Flow Exporter Configuration

Usage notes Flow exporters, monitors, and records are components used by the IPFIX (IP Flow Information Export) protocol to match, collect, and transmit data about IP traffic flows. A flow exporter collects data on each flow, aggregates it, and periodically sends the flow records to the monitor.

Example To set a description for a flow exporter, use the commands:

```
awplus# configure terminal
awplus(config)# flow exporter EXPORTER
awplus(config-flow-exporter)# description My exporter
```

To remove a description for a flow exporter, use the commands:

```
awplus# configure terminal
awplus(config)# flow exporter EXPORTER
awplus(config-flow-exporter)# no description
```

Related commands **flow exporter**

flow record

Command changes Version 5.5.4-1.1: command added

description (flow monitor)

Overview Use this command to add a description to a configured flow monitor.

Use the **no** variant of this command to remove a description for a flow monitor.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	Text describing the flow monitor. Valid characters are any printable character and spaces, up to a maximum of 200 characters.

Mode Flow Monitor Configuration

Example To set a description for a flow monitor, use the commands:

```
awplus# configure terminal
awplus(config)# flow monitor MONITOR
awplus(config-flow-monitor)# description My monitor
```

To remove a description for a flow monitor, use the commands:

```
awplus# configure terminal
awplus(config)# flow monitor MONITOR
awplus(config-flow-monitor)# no description
```

Related commands **flow monitor**

show flow monitor

Command changes Version 5.5.4-1.1: command added

destination (flow exporter)

Overview Use this command to set the destination IP or host-name for a flow collector.

Use the **no** variant of this command to remove the destination IP or host-name for a flow collector.

Syntax

```
destination {<ip-address>|<ipv6-address>|<host-name>}
no destination [<ip-address>|<ipv6-address>|<host-name>]
```

Parameter	Description
<ip-address>	The IPv4 address, using the format A.B.C.D.
<ipv6-address>	The IPv6 address, using the format X:X::X:X
<host-name>	The URL string of the host name.

Mode Flow Exporter Configuration

Example To configure the flow collector IPv4 address, use the commands:

```
awplus# configure terminal
awplus(config)# flow exporter EXPORTER
awplus(config-flow-exporter)# destination 192.168.1.2
```

To remove the flow collector IPv4 address, use the commands:

```
awplus# configure terminal
awplus(config)# flow exporter EXPORTER
awplus(config-flow-exporter)# no destination
```

Related commands **flow exporter**

show flow

Command changes Version 5.5.4-1.1: command added

exporter (flow monitor)

Overview Use this command to set a flow exporter to a flow monitor.

Use the **no** variant of this command to unset a flow exporter on a flow monitor.

Syntax

```
exporter <name>
no exporter
```

Parameter	Description
<name>	Exporter name. Valid characters are any printable character and spaces, up to a maximum of 64 characters.

Mode Flow Monitor Configuration

Example To set a flow exporter on a flow monitor, use the commands:

```
awplus# configure terminal
awplus(config)# flow monitor MONITOR
awplus(config-flow-monitor)# exporter EXPORTER
```

To remove the flow exporter from a flow monitor, use the commands:

```
awplus# configure terminal
awplus(config)# flow monitor MONITOR
awplus(config-flow-monitor)# no exporter
```

Related commands **flow exporter**

flow monitor

Command changes Version 5.5.4-1.1: command added

flow exporter

Overview Use this command to create a flow exporter. The flow exporter defines the configuration that allows it to connect with an IPFIX collector and send flow records.

Use the **no** variant of this command to remove a flow exporter.

Syntax

```
flow exporter <exporter-name>
no flow exporter <exporter-name>
```

Parameter	Description
<exporter-name>	Exporter name. Valid characters are any printable character and spaces, up to a maximum of 64 characters.

Mode Global Configuration

Example To create a flow exporter, use the commands:

```
awplus# configure terminal
awplus(config)# flow exporter EXPORTER
```

To remove a flow exporter, use the commands:

```
awplus# configure terminal
awplus(config)# no flow exporter EXPORTER
```

Related commands

description (flow exporter)

service flow

destination (flow exporter)

show flow exporter

transport (flow exporter)

Command changes Version 5.5.4-1.1: command added

flow monitor

Overview Use this command to create a flow monitor.

A flow monitor with IPFIX functionality is responsible for collecting, storing, configuring, preparing, and exporting key network flow information.

Use the **no** variant of this command to remove a flow monitor.

Syntax

```
flow monitor <monitor-name>
no flow monitor <monitor-name>
```

Parameter	Description
<monitor-name>	Monitor name. Valid characters are any printable character and spaces, up to a maximum of 64 characters.

Mode Global Configuration

Example To create a flow monitor, use the commands:

```
awplus# configure terminal
awplus(config)# flow monitor MONITOR
```

To remove a flow monitor, use the commands:

```
awplus# configure terminal
awplus(config)# no flow monitor MONITOR
```

Related commands

description (flow exporter)

service flow

flow monitor-map

Command changes Version 5.5.4-1.1: command added

flow monitor-map

Overview Use this command to start flow (IPFIX) monitoring on an interface.

Use the **no** variant of this command to disable flow monitoring on an interface.

Syntax

```
flow monitor-map <map-name>
no flow monitor-map
```

Parameter	Description
<map-name>	Map name. Valid characters are any printable character and spaces, up to a maximum of 64 characters.

Mode Interface Configuration

Example To set a flow monitor and enable flow monitoring on an interface, use the commands:

```
awplus# configure terminal
awplus(config)# int port1.0.1
awplus(config-if)# flow monitor-map MONITOR
```

To remove the flow monitor and disable flow monitoring on an interface, use the commands:

```
awplus# configure terminal
awplus(config)# int port1.0.1
awplus(config-if)# no flow monitor-map
```

Related commands **flow monitor**

Command changes Version 5.5.4-1.1: command added

flow record

Overview Use this command to define a flow record. A flow record holds a set of match fields that incoming traffic can be matched on for counting.

Use the **no** variant of this command to remove a flow record.

Syntax

```
flow record <record-name>
no flow record <record-name>
```

Parameter	Description
<record-name>	Record name. Valid characters are any printable character and spaces, up to a maximum of 64 characters.

Mode Global Configuration

Example To create a flow record called RECORD_IP, use the commands:

```
awplus# configure terminal
awplus(config)# flow record RECORD_IP
```

To remove flow record RECORD_IP, use the commands:

```
awplus# configure terminal
awplus(config)# no flow record RECORD_IP
```

Related commands

match ipv4 (flow record)

service flow

match transport (flow record)

Command changes Version 5.5.4-1.1: command added

match ipv4 (flow record)

Overview Use this command to define the IPv4 fields that will match incoming IP packets to identify unique flows. Flows are identified by common attributes such as IP addresses, port numbers, and protocol type, and they are stored in a flow record.

Use the **no** variant of this command to remove an IPv4 match field.

Syntax

```
match ipv4 {dscp|protocol|source-address|destination-address}
no match ipv4 {dscp|protocol|source-address|destination-address}
```

Parameter	Description
`dscp`	DSCP field in IPv4 header
`protocol`	Protocol field in IPv4 header
`source-address`	Source address field in IPv4 header
`destination-address`	Destination address field in IPv4 header

Mode Flow Record Configuration

Example To match on source address of the incoming IPv4 packet, use the commands:

```
awplus# configure terminal
awplus(config)# flow record RECORD_IP
awplus(config-flow-record)# match ipv4 source-address
```

To stop matching on source address of the incoming IPv4 packet, use the commands:

```
awplus# configure terminal
awplus(config)# flow record RECORD_IP
awplus(config-flow-record)# no match ipv4 source-address
```

Related commands **flow record**

Command changes Version 5.5.4-1.1: command added

match ipv6

Overview Use this command to define the IPv6 fields that incoming IPv6 packets will be matched against to identify unique flows.

Use the **no** variant of this command to unset the match field(s).

Syntax

```
match ipv6 [dscp|protocol|source-address|destination-address]
no match ipv6 [dscp|protocol|source-address|destination-address]
```

Parameter	Description
`dscp`	DSCP field in IPv6 header
`protocol`	Protocol field in IPv6 header
`source-address`	Source address in IPv6 header
`destination-address`	Destination address in IPv6 header

Mode Flow Record Configuration

Example To match on the source address of incoming IPv6 packets, use the commands:

```
awplus# configure terminal
awplus(config)# flow record RECORD_IPv6
awplus(config-flow-record)# match ipv6 source-address
```

To stop matching on the source address of incoming IPv6 packets, use the commands:

```
awplus# configure terminal
awplus(config)# flow record RECORD_IPv6
awplus(config-flow-record)# no match ipv6 source-address
```

Related commands **flow record**

match ipv4 (flow record)

Command changes Version 5.5.4-2.3: command added

match transport (flow record)

Overview Use this command to define the Transport Layer 4 fields that match incoming IP packets to identify unique flows. Flows are identified by common attributes such as IP addresses, port numbers, and protocol types, and they are stored as flow records.

Use the **no** variant of this command to remove an IPv4 match field.

Syntax

```
match transport {source-port|destination-port}
no match transport {source-port|destination-port}
```

Parameter	Description
`source-port`	Source port field in transport header
`destination-port`	Destination port field in transport header

Mode Flow Record Configuration

Example To match on the destination port of the incoming IPv4 packet, use the commands:

```
awplus# configure terminal
awplus(config)# flow record RECORD_IP
awplus(config-flow-record)# match transport destination-port
```

To stop matching on the destination port of the incoming IPv4 packet, use the commands:

```
awplus# configure terminal
awplus(config)# flow record RECORD_IP
awplus(config-flow-record)# no match transport destination-port
```

Related commands **flow record**

show flow record

Command changes Version 5.5.4-1.1: command added

record (flow monitor)

Overview

Use this command to set a flow record on a flow monitor. Flows are identified by common attributes such as IP addresses, port numbers, and protocol types, and these records are stored as flow data.

Use the **no** variant of this command to unset a flow record on a flow monitor.

Syntax

```
record <record-name>
no record
record ipv6 <record-name>
no record ipv6
```

Parameter	Description
<record-name>	Record name. Valid characters are any printable character and spaces, up to a maximum of 64 characters.
ipv6	Create a record to monitor IPv6 traffic.

Mode

Flow Monitor Configuration

Example

To set an IPv4 flow record named RECORD_IP on a flow monitor named MONITOR, use the commands:

```
awplus# configure terminal
awplus(config)# flow monitor MONITOR
awplus(config-flow-monitor)# record RECORD_IP
```

To remove an IPv4 flow record from flow monitor named MONITOR, use the commands:

```
awplus# configure terminal
awplus(config)# flow monitor MONITOR
awplus(config-flow-monitor)# no record
```

To set an IPv6 flow record named RECORD_IPV6 on a flow monitor named MONITOR, use the commands:

```
awplus# configure terminal
awplus(config)# flow monitor MONITOR
awplus(config-flow-monitor)# record ipv6 RECORD_IPV6
```

To remove an IPv6 flow record from a flow monitor named MONITOR, use the commands:

```
awplus# configure terminal
awplus(config)# flow monitor MONITOR
awplus(config-flow-monitor)# no record ipv6
```

Related commands

flow record

Command changes

Version 5.5.4-2.3: **ipv6** parameter added

Version 5.5.4-1.1: command added

service flow

Overview Use this command to enable IPFIX flow functionality on a device. Once enabled, the device will allow IPFIX flow-based counting and information export.

Use the **no** variant of this command to disable IPFIX flow functionality on a device.

Syntax
```
service flow
no service flow
```

Default Disabled.

Mode Global Configuration

Example To enable IPFIX flow functionality, use the commands:
```
awplus# configure terminal
awplus(config)# service flow
```
To disable IPFIX flow functionality, use the commands:
```
awplus# configure terminal
awplus(config)# no service flow
```

Related commands
flow record
flow exporter
flow monitor
show flow record
show flow exporter
show flow monitor

Command changes Version 5.5.4-1.1: command added

show flow

Overview Use this command to display IPFIX flow information in brief format.

Syntax

```
show flow
```

Mode Privileged Exec

Example To display the FLOW brief information, use the command:

```
awplus# show flow
```

Output The following shows typical output.

Example output from `show flow`

```
awplus#show flow

FLOW Brief Information:
Status                  :Enabled
Records configured      :2
Monitors configured     :
Exporters configured    :1
Interfaces monitored    :3
Total number of flows   :10
```

Related commands service flow

Command changes Version 5.5.4-1.1: command added

show flow exporter

Overview Use this command to display IPFIX flow exporter information.

Syntax

```
show flow exporter
```

Mode Privileged Exec

Example To display the information for all configured flow exporters, use the command:

```
awplus# show flow exporter
```

Output The following shows typical output.

Example output from `show flow exporter`

```
awplus#show flow exporter

Number of exporters: 1

Exporter EXPORTER:
 Description            : IPFIXCOL-PC
 Destination address    : 192.168.1.2
 Transport type         : udp
 Transport port         : 4739
 Observation Domain Id  : 3738442430
```

Related commands service flow

Command changes Version 5.5.4-1.1: command added

show flow monitor

Overview Use this command to display IPFIX flow monitor information.

Syntax

```
show flow monitor [<name>]
```

Parameter	Description
<name>	Monitor name. Valid characters are any printable character and spaces, up to a maximum of 64 characters.

Mode Privileged Exec

Example To display all configured flow monitors, use the command:

```
awplus# show flow monitor
```

To display a specific flow monitor, use the command:

```
awplus# show flow monitor MON_1
```

Output The following shows typical output.

Example output from `show flow monitor`

```
awplus#show flow monitor

FLOW Monitor Information:

Number of monitors: 3
Monitor MON_1:
 Description            : -
 Record                 : -
 Exporter               : EXPORTER
 Interface              : port1.0.6
  State                 : Monitor record not set
  Number of flows       : 0

Monitor MON_2:
 Description            : My monitor
 Record                 : RECORD_1
 Exporter               : EXPORTER
 Interface              : port1.0.4
  State                 : OK
  Number of flows       : 22
 Interface              : port1.0.5
  State                 : OK
  Number of flows       : 10

Monitor MON_3:
 Description            : My monitor
 Record                 : RECORD_2
 Exporter               : EXPORTER
```

Example output from a specific flow monitor

```
awplus#show flow monitor MON_1

FLOW Monitor Information:

Monitor MON_1:
 Description            : -
 Record                 : -
 Exporter               : EXPORTER
 Interface              : port1.0.6
  State                 : Monitor record not set
  Number of flows       : 0
```

Related commands **service flow**

Command changes Version 5.5.4-1.1: command added

show flow record

Overview Use this command to display IPFIX flow exporter information.

Syntax

```
show flow record [<name>]
```

Parameter	Description
<name>	Record name. Valid characters are any printable character and spaces, up to a maximum of 64 characters.

Mode Privileged Exec

Example To display all configured flow records, use the command:

```
awplus# show flow record
```

To display a specific flow record, use the command:

```
awplus# show flow record RECORD_1
```

Output The following shows typical output.

Example output from `show flow record`

```
awplus#show flow record

FLOW Record Information:

Number of records: 2
Record RECORD_1:
 Match IPV4 fields      : (-SAADDR-)
 Match Transport fields : (-)

Record RECORD_2:
 Match IPV4 fields      : (-PROTOCOL-SAADDR-DAADDR-)
 Match Transport fields : (-SRCPORT-DESTPORT-)
```

Example output from `show flow record RECORD_1`

```
awplus#show flow record RECORD_1

FLOW Record Information:

Record RECORD_1:
 Match IPV4 fields      : (-PROTOCOL-SAADDR-DAADDR-)
 Match Transport fields : (-SRCPORT-DESTPORT-)
```

Related commands flow record

Command changes Version 5.5.4-1.1: command added

transport (flow exporter)

Overview Use this command to set an IPFIX flow collector's transport details.

Use the **no** variant of this command to return an IPFIX flow collector's transport details to their default settings.

Syntax

```
transport {udp|tcp} [port <1-65535>]
no transport
```

Parameter	Description
udp	UDP protocol
tcp	TCP protocol
<1-65535>	Port number

Default The default transport is TCP and the default port is 4739

Mode Flow Exporter Configuration

Example To set a flow collector's transport protocol and port, use the commands:

```
awplus# configure terminal
awplus(config)# flow exporter EXPORTER
awplus(config-flow-exporter)# transport udp port 2000
```

To unset a flow collector's transport protocol and port, use the commands:

```
awplus# configure terminal
awplus(config)# flow exporter EXPORTER
awplus(config-flow-exporter)# no transport
```

Introduction

Overview

LLDP and LLDP-MED can be configured using the commands in this chapter, or by using SNMP with the LLDP-MIB and LLDP-EXT-DOT1-MIB (see the **Support for Allied Telesis Enterprise MIBs in AlliedWare Plus**).

The Voice VLAN feature can be configured using commands in the **VLAN Commands** chapter.

For more information about LLDP, see the **LLDP Feature Overview and Configuration Guide**.

LLDP can transmit a lot of data about the network. Typically, the network information gathered using LLDP is transferred to a Network Management System by SNMP. For security reasons, we recommend using SNMPv3 for this purpose (see the **SNMP Feature Overview and Configuration Guide**).

LLDP operates over physical ports only. For example, it can be configured on switch ports that belong to static or dynamic channel groups, but not on the channel groups themselves.

clear lldp statistics

Overview This command clears all LLDP statistics (packet and event counters) associated with specified ports. If no port list is supplied, LLDP statistics for all ports are cleared.

Syntax

```
clear lldp statistics [interface <port-list>]
```

Parameter	Description
<port-list>	The ports for which the statistics are to be cleared.

Mode Privileged Exec

Examples To clear the LLDP statistics on port1.0.1 and port1.0.4 use the command:

```
awplus# clear lldp statistics interface port1.0.1,port1.0.4
```

To clear all LLDP statistics for all ports, use the command:

```
awplus# clear lldp statistics
```

Related commands

show lldp statistics

Command changes Version 5.5.3-1.1: Command added to AR1050V

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

clear lldp table

Overview This command clears the table of LLDP information received from neighbors through specified ports. If no port list is supplied, neighbor information is cleared for all ports.

Syntax

```
clear lldp table [interface <port-list>]
```

Parameter	Description
<port-list>	The ports for which the neighbor information table is to be cleared.

Mode Privileged Exec

Examples To clear the table of neighbor information received on port1.0.1 and port1.0.4, use the command:

```
awplus#clear lldp table interface port1.0.1,port1.0.4
```

To clear the entire table of neighbor information received through all ports, use the command:

```
awplus# clear lldp table
```

Related commands **show lldp neighbors**

Command changes Version 5.5.3-1.1: Command added to AR1050V

debug lldp

Overview This command enables specific LLDP debug for specified ports. When LLDP debugging is enabled, diagnostic messages are entered into the system log. If no port list is supplied, the specified debugging is enabled for all ports.

The **no** variant of this command disables specific LLDP debug for specified ports. If no port list is supplied, the specified debugging is disabled for all ports.

Syntax

```
debug lldp {[rx][rxpkt][tx][txpkt]} [interface [<port-list>]]
debug lldp operation
no debug lldp {[rx][rxpkt][tx][txpkt]} [interface [<port-list>]]
no debug lldp operation
no debug lldp all
```

Parameter	Description
`rx`	LLDP receive debug.
`rxpkt`	Raw LLDPDUs received in hex format.
`tx`	LLDP transmit debug.
`txpkt`	Raw Tx LLDPDUs transmitted in hex format.
<port-list>	The ports for which debug is to be configured.
`operation`	Debug for LLDP internal operation on the switch.
`all`	Disables all LLDP debugging for all ports.

Default By default no debug is enabled for any ports.

Mode Privileged Exec

Examples

To enable debugging of LLDP receive on port1.0.1 and port1.0.4, use the command:

```
awplus# debug lldp rx interface port1.0.1,port1.0.4
```

To enable debugging of LLDP transmit with packet dump on all ports, use the command:

```
awplus# debug lldp tx txpkt
```

To disable debugging of LLDP receive on port1.0.1 and port1.0.4, use the command:

```
awplus# no debug lldp rx interface port1.0.1,port1.0.4
```

To turn off all LLDP debugging on all ports, use the command:

```
awplus# no debug lldp all
```

Related commands

show running-config lldp

terminal monitor

Command changes

Version 5.5.3-1.1: Command added to AR1050V

lldp faststart-count

Overview Use this command to configure the fast start count for LLDP-MED. The fast start count determines the number of fast start advertisements a port sends when initiating LLDP-MED advertisements. This occurs, for example, when a new LLDP-MED capable device is detected.

The **no** variant of this command resets the LLDPD-MED fast start count to the default (3).

Syntax

```
lldp faststart-count <1-10>
no lldp faststart-count
```

Parameter	Description
<1-10>	The number of fast start advertisements to send.

Default The default fast start count is 3.

Mode Global Configuration

Examples To set the fast start count to 5, use the command:

```
awplus# configure terminal
awplus(config)# lldp faststart-count 5
```

To reset the fast start count to the default setting (3), use the command:

```
awplus# configure terminal
awplus(config)# no lldp faststart-count
```

Related commands **show lldp**

Command changes Version 5.5.3-1.1: Command added to AR1050V

lldp holdtime-multiplier

Overview This command sets the holdtime multiplier value. This value is multiplied by the transmit interval to determine the advertised Time To Live (TTL) value advertised to neighbors.

The **no** variant of this command sets the multiplier back to its default.

Syntax

```
lldp holdtime-multiplier <2-10>
no lldp holdtime-multiplier
```

Parameter	Description
<2-10>	The multiplier factor.

Default The default holdtime multiplier value is 4.

Mode Global Configuration

Usage The Time-To-Live (TTL) specifies how long the advertised information remains valid for neighbors. If the TTL expires before receiving an update, the neighbor removes the information from its database.

Examples To set the holdtime multiplier to 2, use the commands:

```
awplus# configure terminal
awplus(config)# lldp holdtime-multiplier 2
```

To set the holdtime multiplier back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp holdtime-multiplier 2
```

Related commands **show lldp**

Command changes Version 5.5.3-1.1: Command added to AR1050V

lldp management-address

Overview This command sets the IPv4 address to be advertised to neighbors (in the Management Address TLV) via the specified ports. This address will override the default address for these ports.

The **no** variant of this command clears the user-configured management IP address advertised to neighbors via the specified ports. The advertised address reverts to the default.

Syntax

```
lldp management-address <ipaddr>
no lldp management-address
```

Parameter	Description
<ipaddr>	The IPv4 address to be advertised to neighbors, in dotted decimal format. This must be one of the IP addresses already configured on the device.

Default The local loopback interface's primary IPv4 address, if configured. Alternatively, the primary IPv4 interface address of the lowest numbered VLAN that the port belongs to, or if no VLAN IP addresses are configured, the MAC address of the device's baseboard.

Mode Interface Configuration

Usage notes To see the management address that will be advertised, use the **show lldp interface** command or **show lldp local-info** command.

Examples To set the management address advertised by port1.0.1 and port1.0.2 to 192.168.1.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp management-address 192.168.1.6
```

To clear the user-configured management address advertised by port1.0.1 and port1.0.2, and revert to using the default address, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp management-address
```

Related commands **show lldp interface**

show lldp local-info

lldp med-notifications

Overview Use this command to enable LLDP to send LLDP-MED Topology Change Detected SNMP notifications relating to the specified ports. The switch sends an SNMP event notification when a new LLDP-MED compliant IP Telephony device is connected to or disconnected from a port on the switch.

Use the **no** variant of this command to disable the sending of LLDP-MED Topology Change Detected notifications relating to the specified ports.

Syntax

```
lldp med-notifications
no lldp med-notifications
```

Default The sending of LLDP-MED notifications is disabled by default.

Mode Interface Configuration

Examples To enable the sending of LLDP-MED Topology Change Detected notifications relating to ports port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp med-notifications
```

To disable the sending of LLDP-MED notifications relating to port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-notifications
```

Command changes Version 5.5.3-1.1: Command added to AR1050V

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

lldp med-tlv-select

Overview Use this command to enable LLDP-MED Organizationally Specific TLVs for transmission in LLDP advertisements via the specified ports. The LLDP-MED Capabilities TLV must be enabled before any of the other LLDP-MED Organizationally Specific TLVs are enabled.

Use the **no** variant of this command to disable the specified LLDP-MED Organizationally Specific TLVs for transmission in LLDP advertisements via these ports. In order to disable the LLDP-MED Capabilities TLV, you must also disable the rest of these TLVs. Disabling all these TLVs disables LLDP-MED advertisements.

Syntax

```
lldp med-tlv-select [capabilities] [network-policy] [location]
 [power-management-ext] [inventory-management]
lldp med-tlv-select all
no lldp med-tlv-select [capabilities] [network-policy]
 [location] [power-management-ext] [inventory-management]
no lldp med-tlv-select all
```

Parameter	Description
`capabilities`	LLDP-MED Capabilities TLV. When this is enabled, the MAC/PHY Configuration/Status TLV from IEEE 802.3 Organizationally Specific TLVs is also automatically included in LLDP-MED advertisements, whether or not it has been explicitly enabled by the **lldp tlv-select** command.
`network-policy`	Network Policy TLV. This TLV is transmitted if Voice VLAN parameters have been configured using the commands: • **switchport voice dscp** • **switchport voice vlan** • **switchport voice vlan priority**
`location`	Location Identification TLV. This TLV is transmitted if location information has been configured using the commands: • **location elin-location-id** • **location civic-location identifier** • **location civic-location configuration** • **location coord-location identifier** • **location coord-location configuration** • **location elin-location**
`power-management-ext`	Extended Power-via-MDI TLV. This TLV is transmitted if the port is PoE capable, and PoE is enabled (**power-inline enable**).
`inventory-management`	Inventory Management TLV Set, including the following TLVs: • Hardware Revision • Firmware Revision • Software Revision • Serial Number • Manufacturer Name • Model Name • Asset ID
`all`	All LLDP-MED Organizationally Specific TLVs.

Default By default, LLDP-MED Capabilities, Network Policy, Location Identification, and Extended Power-via-MDI TLVs are enabled. Therefore, if LLDP is enabled using the **lldp run** command, by default LLDP-MED advertisements are transmitted on ports that detect LLDP-MED neighbors connected to them.

Mode Interface Configuration

Usage notes LLDP-MED TLVs are only sent in advertisements via a port if there is an LLDP-MED-capable device connected to it. To see whether there are LLDP-MED capable devices connected to the ports, use the **show lldp neighbors** command.

Examples To enable inclusion of the Inventory TLV Set in advertisements transmitted via port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp med-tlv-select inventory-management
```

To exclude the Inventory TLV Set in advertisements transmitted via port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-tlv-select inventory-management
```

To disable LLDP-MED advertisements transmitted via port1.0.1 and port1.0.2, disable all these TLVs using the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-tlv-select all
```

Command changes

Version 5.5.3-1.1: Command added to AR1050V

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

lldp non-strict-med-tlv-order-check

Overview Use this command to enable non-strict order checking for LLDP-MED advertisements it receives. That is, use this command to enable LLDP to receive and store TLVs from LLDP-MED advertisements even if they do not use standard TLV order.

Use the **no** variant of this command to disable non-strict order checking for LLDP-MED advertisements, that is, to set strict TLV order checking, so that LLDP discards any LLDP-MED TLVs that occur before the LLDP-MED Capabilities TLV in an advertisement.

Syntax
```
lldp non-strict-med-tlv-order-check
no lldp non-strict-med-tlv-order-check
```

Default By default TLV non-strict order checking for LLDP-MED advertisements is disabled. That is, strict order checking is applied to LLDP-MED advertisements, according to ANSI/TIA-1057, and LLDP-MED TLVs in non-standard order are discarded.

Mode Global Configuration

Usage notes The ANSI/TIA-1057 specifies standard order for TLVs in LLDP-MED advertisements, and specifies that if LLDP receives LLDP advertisements with non-standard LLDP-MED TLV order, the TLVs in non-standard order should be discarded. This implementation of LLDP-MED follows the standard: it transmits TLVs in the standard order, and by default discards LLDP-MED TLVs that occur before the LLDP-MED Capabilities TLV in an advertisement. However, some implementations of LLDP transmit LLDP-MED advertisements with non-standard TLV order. To receive and store the data from these non-standard advertisements, enable non-strict order checking for LLDP-MED advertisements using this command.

Examples To enable strict TLV order checking, use the commands:

```
awplus# configure terminal
awplus(config)# lldp tlv-order-check
```

To disable strict TLV order checking, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp tlv-order-check
```

Related commands **show running-config** lldp

Command changes Version 5.5.3-1.1: Command added to AR1050V

lldp notification-interval

Overview This command sets the notification interval. This is the minimum interval between LLDP SNMP notifications (traps) of each kind (LLDP Remote Tables Change Notification and LLDP-MED Topology Change Notification).

The **no** variant of this command sets the notification interval back to its default.

Syntax

```
lldp notification-interval <5-3600>
no lldp notification-interval
```

Parameter	Description
<5-3600>	The interval in seconds.

Default The default notification interval is 5 seconds.

Mode Global Configuration

Examples To set the notification interval to 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp notification-interval 20
```

To set the notification interval back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp notification-interval
```

Related commands **lldp notifications**

show lldp

lldp notifications

Overview This command enables the sending of LLDP SNMP notifications (traps) relating to specified ports.

The **no** variant of this command disables the sending of LLDP SNMP notifications for specified ports.

Syntax
```
lldp notifications
no lldp notifications
```

Default The sending of LLDP SNMP notifications is disabled by default.

Mode Interface Configuration

Examples To enable sending of LLDP SNMP notifications for port1.0.1 and port1.0.2, use the commands:

```
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp notifications
```

To disable sending of LLDP SNMP notifications for port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp notifications
```

Related commands
lldp notification-interval
show lldp interface
snmp-server enable trap

lldp port-number-type

Overview This command sets the type of port identifier used to enumerate, that is to count, the LLDP MIB local port entries. The LLDP MIB (IEEE Standard 802.1AB-2005, Section 12, LLDP MIB Definitions.) requires the port number value to count LLDP local port entries.

This command also enables you to optionally set an interface index to enumerate the LLDP MIB local port entries, if required by your management system.

The **no** variant of this command resets the type of port identifier back to the default setting (number).

Syntax

```
lldp port-number-type [number|ifindex]
no lldp port-number-type
```

Parameter	Description
`number`	Set the type of port identifier to a port number to enumerate the LLDP MIB local port entries.
`ifindex`	Set the type of port identifier to an interface index to enumerate the LLDP MIB local port entries.

Default The default port identifier type is number. The no variant of this command sets the port identifier type to the default.

Mode Global Configuration

Examples To set the type of port identifier used to enumerate LLDP MIB local port entries to port numbers, use the commands:

```
awplus# configure terminal
awplus(config)# lldp port-number-type number
```

To set the type of port identifier used to enumerate LLDP MIB local port entries to interface indexes, use the commands:

```
awplus# configure terminal
awplus(config)# lldp port-number-type ifindex
```

To reset the type of port identifier used to enumerate LLDP MIB local port entries the default (port numbers), use the commands:

```
awplus# configure terminal
awplus(config)# no lldp port-number-type
```

Related commands **show lldp**

Command changes Version 5.5.3-1.1: Command added to AR1050V

lldp reinit

Overview This command sets the value of the reinitialization delay. This is the minimum time after disabling LLDP on a port before it can reinitialize.

The **no** variant of this command sets the reinitialization delay back to its default setting.

Syntax

```
lldp reinit <1-10>
no lldp reinit
```

Parameter	Description
<1-10>	The delay in seconds.

Default The default reinitialization delay is 2 seconds.

Mode Global Configuration

Examples To set the reinitialization delay to 3 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp reinit 3
```

To set the reinitialization delay back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp reinit
```

Related commands **show lldp**

Command changes Version 5.5.3-1.1: Command added to AR1050V

lldp run

Overview This command enables the operation of LLDP on the device.

The **no** variant of this command disables the operation of LLDP on the device. The LLDP configuration remains unchanged.

Syntax
```
lldp run
no lldp run
```

Default LLDP is disabled by default.

Mode Global Configuration

Examples To enable LLDP operation, use the commands:

```
awplus# configure terminal
awplus(config)# lldp run
```

To disable LLDP operation, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp run
```

Related commands **show lldp**

Command changes Version 5.5.3-1.1: Command added to AR1050V

lldp timer

Overview This command sets the value of the transmit interval. This is the interval between regular transmissions of LLDP advertisements.

The **no** variant of this command sets the transmit interval back to its default.

Syntax

```
lldp timer <5-32768>
no lldp timer
```

Parameter	Description
<5-32768>	The transmit interval in seconds. The transmit interval must be at least four times the transmission delay timer (**lldp tx-delay** command).

Default The default transmit interval is 30 seconds.

Mode Global Configuration

Examples To set the transmit interval to 90 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp timer 90
```

To set the transmit interval back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp timer
```

Related commands **lldp tx-delay**

show lldp

Command changes Version 5.5.3-1.1: Command added to AR1050V

lldp tlv-select

Overview This command enables one or more optional TLVs, or all TLVs, for transmission in LLDP advertisements via the specified ports. The TLVs can be specified in any order; they are placed in LLDP frames in a fixed order (as described in IEEE 802.1AB). The mandatory TLVs (Chassis ID, Port ID, Time To Live, End of LLDPDU) are always included in LLDP advertisements.

In LLDP-MED advertisements the MAC/PHY Configuration/Status TLV will be always be included regardless of whether it is selected by this command.

The **no** variant of this command disables the specified optional TLVs, or all optional TLVs, for transmission in LLDP advertisements via the specified ports.

Syntax

```
lldp tlv-select {[<tlv>]...}
lldp tlv-select all
no lldp tlv-select {[<tlv>]...}
no lldp tlv-select all
```

Parameter	Description
<tlv>	The TLV to transmit in LLDP advertisements. One of these keywords: • port-description (specified by the **description (interface)**) • system-name (specified by the **hostname**) • system-description • system-capabilities • management-address • port-vlan • port-and-protocol-vlans • vlan-names • protocol-ids • mac-phy-config • power-management (Power Via MDI TLV) • link-aggregation • max-frame-size
`all`	All TLVs.

Default By default, no optional TLVs are included in LLDP advertisements. The MAC/PHY Configuration/Status TLV (**`mac-phy-config`**) is included in LLDP-MED advertisements whether or not it is selected by this command.

Mode Interface Configuration

Examples

To include the management-address and system-name TLVs in advertisements transmitted via port1.0.1 and port1.0.4, use the commands:

```
awplus#configure terminal
awplus(config)# interface port1.0.1,port1.0.4
awplus(config-if)# lldp tlv-select management-address system-name
```

To include all optional TLVs in advertisements transmitted via port1.0.1 and port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.4
awplus(config-if)# lldp tlv-select all
```

To exclude the management-address and system-name TLVs from advertisements transmitted via port1.0.1 and port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.4
awplus(config-if)# no lldp tlv-select management-address system-name
```

To exclude all optional TLVs from advertisements transmitted via port1.0.1 and port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.4
awplus(config-if)# no lldp tlv-select all
```

lldp transmit receive

Overview This command enables transmission and/or reception of LLDP advertisements to or from neighbors through the specified ports.

The **no** variant of this command disables transmission and/or reception of LLDP advertisements through specified ports.

Syntax

```
lldp {[transmit] [receive]}
no lldp {[transmit] [receive]}
```

Parameter	Description
`transmit`	Enable or disable transmission of LLDP advertisements via this port or ports.
`receive`	Enable or disable reception of LLDP advertisements via this port or ports.

Default LLDP advertisement transmission and reception are enabled on all ports by default.

Mode Interface Configuration

Examples To enable transmission of LLDP advertisements on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp transmit
```

To enable LLDP advertisement transmission and reception on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp transmit receive
```

To disable LLDP advertisement transmission and reception on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp transmit receive
```

Related commands **show lldp interface**

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

lldp tx-delay

Overview This command sets the value of the transmission delay timer. This is the minimum time interval between transmitting LLDP advertisements due to a change in LLDP local information.

The **no** variant of this command sets the transmission delay timer back to its default setting.

Syntax

```
lldp tx-delay <1-8192>
no lldp tx-delay
```

Parameter	Description
<1-8192>	The transmission delay in seconds. The transmission delay cannot be greater than a quarter of the transmit interval (**lldp timer** command).

Default The default transmission delay timer is 2 seconds.

Mode Global Configuration

Examples To set the transmission delay timer to 12 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp tx-delay 12
```

To set the transmission delay timer back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp tx-delay
```

Related commands **lldp timer**

Command changes Version 5.5.3-1.1: Command added to AR1050V

location civic-location configuration

Overview Use these commands to configure a civic address location. The country parameter must be specified first, and at least one of the other parameters must be configured before the location can be assigned to a port.

Use the **no** variants of this command to delete civic address parameters from the location.

Syntax

```
country <country>
state <state>
no state
county <county>
no county
city <city>
no city
division <division>
no division
neighborhood <neighborhood>
no neighborhood
street-group <street-group>
no street-group
leading-street-direction <leading-street-direction>
no leading-street-direction
trailing-street-suffix <trailing-street-suffix>
no trailing-street-suffix
street-suffix <street-suffix>
no street-suffix
house-number <house-number>
no house-number
house-number-suffix <house-number-suffix>
no house-number-suffix
landmark <landmark>
no landmark
additional-information <additional-information>
no additional-information
```

Syntax (cont.)

```
name <name>
no name
postalcode <postalcode>
no postalcode
building <building>
no building
unit <unit>
no unit
floor <floor>
no floor
room <room>
no room
place-type <place-type>
no place-type
postal-community-name <postal-community-name>
no postal-community-name
post-office-box <post-office-box>
no post-office-box
additional-code <additional-code>
no additional-code
seat <seat>
no seat
primary-road-name <primary-road-name>
no primary-road-name
road-section <road-section>
no road-section
branch-road-name <branch-road-name>
no branch-road-name
sub-branch-road-name <sub-branch-road-name>
no sub-branch-road-name
street-name-pre-modifier <street-name-pre-modifier>
no street-name-pre-modifier
streetname-post-modifier <streetname-post-modifier>
no streetname-post-modifier
```

Parameter	Description
<country>	Upper-case two-letter country code, as specified in ISO 3166.
<state>	State (Civic Address (CA) Type 1): national subdivisions (state, canton, region).

Parameter	Description
<county>	County (CA Type 2): County, parish, gun (JP), district (IN).
<city>	City (CA Type 3): city, township, shi (JP).
<division>	City division (CA Type 4): City division, borough, city district, ward, chou (JP).
<neighborhood>	Neighborhood (CA Type 5): neighborhood, block.
<street-group>	Street group (CA Type 6): group of streets below the neighborhood level.
<leading-street-direction>	Leading street direction (CA Type 16).
<trailing-street-suffix>	Trailing street suffix (CA Type 17).
<street-suffix>	Street suffix (CA Type 18): street suffix or type.
<house-number>	House number (CA Type 19).
<house-number-suffix>	House number suffix (CA Type 20).
<landmark>	Landmark or vanity address (CA Type 21).
<additional-information>	Additional location information (CA Type 22).
<name>	Name (CA Type 23): residence and office occupant.
<postal-code>	Postal/zip code (CA Type 24).
<building>	Building (CA Type 25): structure.
<unit>	Unit (CA Type 26): apartment, suite.
<floor>	Floor (CA Type 27).
<room>	Room (CA Type 28).
<place-type>	Type of place (CA Type 29).
<postal-community-name>	Postal community name (CA Type 30).
<post-office-box>	Post office box (P.O. Box) (CA Type 31).
<additional-code>	Additional code (CA Type 32).

Parameter	Description
<seat>	Seat (CA Type 33): seat (desk, cubicle, workstation).
<primary-road-name>	Primary road name (CA Type 34).
<road-section>	Road section (CA Type 35).
<branch-road-name>	Branch road name (CA Type 36).
<sub-branch-road-name>	Sub-branch road name (CA Type 37).
<street-name-pre-modifier>	Street name pre-modifier (CA Type 38).
<street-name-post-modifier>	Street name post-modifier (CA Type 39).

Default By default no civic address location information is configured.

Mode Civic Address Location Configuration

Usage notes The **country** parameter must be configured before any other parameters can be configured; this creates the location. The country parameter cannot be deleted. One or more of the other parameters must be configured before the location can be assigned to a port. The country parameter must be entered as an upper-case two-letter country code, as specified in ISO 3166. All other parameters are entered as alpha-numeric strings. Do not configure all the civic address parameters (this would generate TLVs that are too long). Configure a subset of these parameters—enough to consistently and precisely identify the location of the device. If the location is to be used for Emergency Call Service (ECS), the particular ECS application may have guidelines for configuring the civic address location. For more information about civic address format, see the **LLDP Feature Overview and Configuration Guide**.

To specify the civic address location, use the **location civic-location identifier** command. To delete the civic address location, use the **no** variant of the **`location civic-location identifier`** command.

To assign the civic address location to particular ports, so that it can be advertised in TLVs from those ports, use the command **location civic-location-id** command.

Examples To configure civic address location 1 with location "27 Nazareth Avenue, Christchurch, New Zealand" in civic-address format, use the commands:

```
awplus# configure terminal
awplus(config)# location civic-location identifier 1
awplus(config-civic)# country NZ
awplus(config-civic)# city Christchurch
awplus(config-civic)# primary-road-name Nazareth
awplus(config-civic)# street-suffix Avenue
awplus(config-civic)# house-number 27
```

Command changes Version 5.5.3-1.1: Command added to AR1050V

location civic-location identifier

Overview Use this command to enter the Civic Address Location Configuration mode to configure the specified location.

Use the **no** variant of this command to delete a civic address location. This also removes the location from any ports it has been assigned to.

Syntax

```
location civic-location identifier <civic-loc-id>
no location civic-location identifier <civic-loc-id>
```

Parameter	Description
<civic-loc-id>	A unique civic address location ID, in the range 1 to 4095.

Default By default there are no civic address locations.

Mode Global Configuration

Usage notes To configure the location information for this civic address location identifier, use the **location civic-location configuration** command.

To associate this civic location identifier with particular ports, use the **location elin-location-id** command.

Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

Examples To enter Civic Address Location Configuration mode for the civic address location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# location civic-location identifier 1
awplus(config-civic)#
```

To delete the civic address location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location civic-location identifier 1
```

Related commands

Command changes Version 5.5.3-1.1: Command added to AR1050V

location civic-location-id

Overview Use this command to assign a civic address location identifier to the ports. The civic address location must already exist. This replaces any previous assignment of civic address location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location identifier from the ports.

Syntax

```
location civic-location-id <civic-loc-id>
no location civic-location-id [<civic-loc-id>]
```

Parameter	Description
<civic-loc-id>	Civic address location ID, in the range 1 to 4095.

Default By default no civic address location is assigned to ports.

Mode Interface Configuration

Usage notes The civic address location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, create the location using the following commands:

- **location civic-location identifier** command
- **location civic-location configuration** command

If a civic-address location is deleted using the **no** variant of the **location civic-location identifier** command, it is automatically removed from all ports.

Examples To assign the civic address location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location civic-location-id 1
```

To remove a civic address location from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location civic-location-id
```

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

location coord-location configuration

Overview Use this command to configure a coordinate-based location. All parameters must be configured before assigning this location identifier to a port.

Syntax

```
latitude <latitude>
lat-resolution <lat-resolution>
longitude <longitude>
long-resolution <long-resolution>
altitude <altitude> {meters|floor}
alt-resolution <alt-resolution>
datum {wgs84|nad83-navd|nad83-mllw}
```

Parameter	Description
<lat-resolution>	Latitude resolution, as a number of valid bits, in the range 0 to 34.
<latitude>	Latitude value in degrees in the range -90.0 to 90.0
<long-resolution>	Longitude resolution, as a number of valid bits, in the range 0 to 34.
<longitude>	Longitude value in degrees, in the range -180.0 to 180.0.
<alt-resolution>	Altitude resolution, as a number of valid bits, in the range 0 to 30. A resolution of 0 can be used to indicate an unknown value.
<altitude>	Altitude value, in meters or floors.
`meters`	The altitude value is in meters.
`floors`	The altitude value is in floors.
`datum`	The geodetic system (or datum) that the specified coordinate values are based on.
`wgs84`	World Geodetic System 1984.
`nad83-navd`	North American Datum 1983 - North American Vertical Datum.
`nad83-mllw`	North American Datum 1983 - Mean Lower Low Water vertical datum.

Default By default no coordinate location information is configured.

Mode Coordinate Configuration

Usage Latitude and longitude values are always stored internally, and advertised in the Location Identification TLV, as 34-bit fixed-point binary numbers, with a 25-bit fractional part, irrespective of the number of digits entered by the user. Likewise altitude is stored as a 30- bit fixed point binary number, with an 8-bit fractional part. Because the user-entered decimal values are stored as fixed point binary numbers, they cannot always be represented exactly—the stored binary number is converted to a decimal number for display in the output of the **show location** command. For example, a user-entered latitude value of "2.77" degrees is displayed as "2.76999998092651367187500000".

The **lat-resolution**, **long-resolution**, and **alt-resolution** parameters allow the user to specify the resolution of each coordinate element as the number of valid bits in the internally-stored binary representation of the value. These resolution values can be used by emergency services to define a search area.

To specify the coordinate identifier, use the **location coord-location identifier** command. To remove coordinate information, delete the coordinate location by using the **no** variant of that command.

To associate the coordinate location with particular ports, so that it can be advertised in TLVs from those ports, use the **location coord-location-id** command.

Example To configure the location for the White House in Washington DC, which has the coordinates based on the WGS84 datum of 38.89868 degrees North (with 22 bit resolution), 77.03723 degrees West (with 22 bit resolution), and 15 meters height (with 9 bit resolution), use the commands:

```
awplus# configure terminal
awplus(config)# location coord-location identifier 1
awplus(config-coord)# lat-resolution 22
awplus(config-coord)# latitude 38.89868
awplus(config-coord)# long-resolution 22
awplus(config-coord)# longitude -77.03723
awplus(config-coord)# alt-resolution 9
awplus(config-coord)# altitude 15 meters
awplus(config-coord)# datum wgs84
```

location coord-location identifier

Overview Use this command to enter Coordinate Location Configuration mode for this coordinate location.

Use the **no** variant of this command to delete a coordinate location. This also removes the location from any ports it has been assigned to.

Syntax

```
location coord-location identifier <coord-loc-id>
no location coord-location identifier <coord-loc-id>
```

Parameter	Description
<coord-loc-id>	A unique coordinate location identifier, in the range 1 to 4095.

Default By default there are no coordinate locations.

Mode Global Configuration

Usage Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

To configure this coordinate location, use the **location coord-location configuration** command.

To associate this coordinate location with particular ports, so that it can be advertised in TLVs from those ports, use the **location coord-location-id** command.

Examples To enter Coordinate Location Configuration mode to configure the coordinate location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# location coord-location identifier 1
awplus(config-coord)#
```

To delete coordinate location 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location coord-location identifier 1
```

location elin-location

Overview Use this command to create or modify an ELIN location.

Use the **no** variant of this command to delete an ELIN location, and remove it from any ports it has been assigned to.

Syntax

```
location elin-location <elin> identifier <elin-loc-id>
no location elin-location identifier <elin-loc-id>
```

Parameter	Description
<elin>	Emergency Location Identification Number (ELIN) for Emergency Call Service (ECS), in the range 10 to 25 digits long. In North America, ELINs are typically 10 digits long.
<elin-loc-id>	A unique ELIN location identifier, in the range 1 to 4095.

Default By default there are no ELIN location identifiers.

Mode Global Configuration

Usage Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

To assign this ELIN location to particular ports, so that it can be advertised in TLVs from those ports, use the **location elin-location-id** command.

Examples To create a new ELIN location with ID 1, and configure it with ELIN "1234567890", use the commands:

```
awplus# configure terminal
awplus(config)# location elin-location 1234567890 identifier 1
```

To delete existing ELIN location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location elin-location identifier 1
```

show debugging lldp

Overview This command displays LLDP debug settings for specified ports. If no port list is supplied, LLDP debug settings for all ports are displayed.

Syntax

```
show debugging lldp [interface <port-list>]
```

Parameter	Description
<port-list>	The ports for which the LLDP debug settings are shown.

Mode User Exec and Privileged Exec

Examples To display LLDP debug settings for all ports, use the command:

```
awplus# show debugging lldp
```

To display LLDP debug settings for port1.0.1 to port1.0.4, use the command:

```
awplus# show debugging lldp interface port1.0.1-port1.0.4
```

Output The following shows typical output.

Example output from the `show debugging lldp` command

```
LLDP Debug settings:
Debugging for LLDP internal operation is on
Port       Rx    RxPkt   Tx    TxPkt
-----------------------------------
1.0.1      Yes   Yes     No    No
1.0.2      Yes   No      No    No
1.0.3      No    No      No    No
1.0.4      Yes   Yes     Yes   No
```

Parameters in the output of the `show debugging lldp` command

Parameter	Description
`Port`	Port name.
`Rx`	Whether debugging of LLDP receive is enabled on the port.
`RxPkt`	Whether debugging of LLDP receive packet dump is enabled on the port.
`Rx`	Whether debugging of LLDP transmit is enabled on the port.
`RxPkt`	Whether debugging of LLDP transmit packet dump is enabled on the port.

Related commands debug lldp

Command changes Version 5.5.3-1.1: Command added to AR1050V

show lldp

Overview This command displays LLDP status and global configuration settings.

Syntax
```
show lldp
```

Mode User Exec and Privileged Exec

Example To display LLDP status and global configuration settings, use the command:

```
awplus# show lldp
```

Output The following shows typical output.

Example output from the `show lldp` command

```
awplus# show lldp

LLDP Global Configuration:              [Default Values]
LLDP Status ............... Enabled     [Disabled]
Notification Interval ..... 5 secs      [5]
Tx Timer Interval ......... 30 secs     [30]
Hold-time Multiplier ...... 4           [4]
(Computed TTL value ....... 120 secs)
Reinitialization Delay .... 2 secs      [2]
Tx Delay .................. 2 secs      [2]

Port Number Type........... Ifindex     [Port-Number]
Fast Start Count .......... 5           [3]

LLDP Global Status:
Total Neighbor Count ...... 47
Neighbors table last updated 0 hrs 0 mins 43 secs ago
```

Parameters in the output of the `show lldp` command

Parameter	Description
`LLDP Status`	Whether LLDP is enabled. Default is disabled.
`Notification Interval`	Minimum interval between LLDP notifications.
`Tx Timer Interval`	Transmit interval between regular transmissions of LLDP advertisements.
`Hold-time Multiplier`	The holdtime multiplier. The transmit interval is multiplied by the holdtime multiplier to give the Time To Live (TTL) value that is advertised to neighbors.
`Reinitialization Delay`	The reinitialization delay. This is the minimum time after disabling LLDP transmit on a port before it can reinitialize again.
`Tx Delay`	The transmission delay. This is the minimum time interval between transmitting advertisements due to a change in LLDP local information.
`Port Number Type`	The type of port identifier used to enumerate LLDP MIB local port entries, as set by the lldp port-number-type command.
`Fast Start Count`	The number of times fast start advertisements are sent for LLDP-MED.
`Total Neighbor Count`	Number of LLDP neighbors discovered on all ports.
`Neighbors table last updated`	The time since the LLDP neighbor table was last updated.

Parameters in the output of the `show lldp interface` command

Parameter	Description
`Port`	Port name.
`Rx`	Whether reception of LLDP advertisements is enabled on the port.
`Tx`	Whether transmission of LLDP advertisements is enabled on the port.
`Notif`	Whether sending SNMP notification for LLDP is enabled on the port: • RM = Remote Tables Change Notification • TP = LLDP-MED Topology Change Notification
`Management Addr`	Management address advertised to neighbors.
`Base TLVs Enabled for Tx`	List of optional Base TLVs enabled for transmission: • Pd = Port Description • Sn =System Name • Sd = System Description • Sc =System Capabilities • Ma = Management Address
`802.1 TLVs Enabled for Tx`	List of optional 802.1 TLVs enabled for transmission: • Pv = Port VLAN ID • Pp = Port And Protocol VLAN ID

Parameter	Description
	• Vn = VLAN Name • Pi =Protocol Identity
`802.3 TLVs Enabled for Tx`	List of optional 802.3 TLVs enabled for transmission: • Mp = MAC/PHY Configuration/Status • Po = Power Via MDI (PoE) • La = Link Aggregation • Mf = Maximum Frame Size
`MED TLVs Enabled for Tx`	List of optional LLDP-MED TLVs enabled for transmission: • Mc = LLDP-MED Capabilities • Np = Network Policy • Lo = Location Information, • Pe = Extended Power-Via-MDI • In = Inventory

Command changes

Version 5.5.3-1.1: Command added to AR1050V

show lldp local-info

Overview This command displays local LLDP information that can be transmitted through specified ports. If no port list is entered, local LLDP information for all ports is displayed.

Syntax

```
show lldp local-info [base] [dot1] [dot3] [med] [interface
 <port-list>]
```

Parameter	Description
`base`	Information for base TLVs.
`dot1`	Information for 802.1 TLVs.
`dot3`	Information for 802.3 TLVs.
`med`	Information for LLDP-MED TLVs.
<port-list>	The ports for which the local information is to be shown.

Mode User Exec and Privileged Exec

Usage notes Whether and which local information is transmitted in advertisements via a port depends on:

- whether the port is set to transmit LLDP advertisements (**lldp transmit receive** command)
- which TLVs it is configured to send (**lldp tlv-select** command, **lldp med-tlv-select** command)

Examples To display local information transmitted via port1.0.1, use the command:

```
awplus# show lldp local-info interface port1.0.1
```

To display local information transmitted via all ports, use the command:

```
awplus# show lldp local-info
```

Output The following shows typical output.

Example output from show `lldp local-info`

```
LLDP Local Information:

Local port1.0.1:
  Chassis ID Type ................... MAC address
  Chassis ID ........................ 0015.77c9.7453
  Port ID Type ...................... Interface alias
  Port ID ........................... port1.0.1
  TTL ............................... 120
  Port Description .................. [not configured]

  System Name ....................... awplus
  System Description ................ Allied Telesis router/switch, AW+
                                      v5.5.2
  System Capabilities - Supported .. Bridge, Router
                      - Enabled .... Bridge, Router
  Management Address ................ 192.168.1.6
  Port VLAN ID (PVID) ............... 1
  Port & Protocol VLAN - Supported . Yes
                       - Enabled ... No
                       - VIDs ...... 0
  VLAN Names ........................ default

```

Parameters in the output of `show lldp local-info`

Parameter	Description
`Chassis ID Type`	Type of the Chassis ID.
`Chassis ID`	Chassis ID that uniquely identifies the local device.
`Port ID Type`	Type of the Port ID.
`Port ID`	Port ID of the local port through which advertisements are sent.
`TTL`	Number of seconds that the information advertised by the local port remains valid.
`Port Description`	Port description of the local port, as specified by the **description (interface)**.
`System Name`	System name, as specified by the **hostname**.
`System Description`	System description.
`System Capabilities (Supported)`	Capabilities that the local port supports.
`System Capabilities (Enabled)`	Enabled capabilities on the local port.
`Management Addresses`	Management address associated with the local port. To change this, use the **lldp management-address** command.
`Port VLAN ID (PVID)`	VLAN identifier associated with untagged or priority tagged frames received via the local port.
`Port & Protocol VLAN (Supported)`	Whether Port & Protocol VLANs (PPV) is supported on the local port.
`Port & Protocol VLAN (Enabled)`	Whether the port is in one or more Port & Protocol VLANs.
`Port & Protocol VLAN (VIDs)`	List of identifiers for Port & Protocol VLANs that the port is in.
`VLAN Names`	List of VLAN names for VLANs that the local port is assigned to.
`Protocol IDs`	List of protocols that are accessible through the local port.
`MAC/PHY Auto-negotiation`	Auto-negotiation support and current status of the 802.3 LAN on the local port.

Parameter	Description
`Power Via MDI (PoE)`	PoE-capability and current status on the local port.
`Port Class`	Whether the device is a PSE (Power Sourcing Entity) or a PD (Powered Device).
`Pair Control Ability`	Whether power pair selection can be controlled.
`Power Pairs`	Which power pairs are selected for power ("Signal Pairs" or "Spare Pairs") if pair selection can be controlled.
`Power Class`	The power class of the PD device on the port (class 0, 1, 2, 3 or 4).
`Link Aggregation`	Whether the link is capable of being aggregated and it is currently in an aggregation.
`Aggregated Port-ID`	Aggregated port identifier.
`Maximum Frame Size`	The maximum frame size capability of the implemented MAC and PHY.
`LLDP-MED Device Type`	LLDP-MED device type.
`LLDP-MED Capabilities`	Capabilities LLDP-MED capabilities supported on the local port.
`Network Policy`	List of network policies configured on the local port.
`VLAN ID`	VLAN identifier for the port for the specified application type.
`Tagged Flag`	Whether the VLAN ID is to be used as tagged or untagged.
`Layer-2 Priority:`	Layer 2 User Priority (in the range 0 to 7).
`DSCP Value`	Diffserv codepoint (in the range 0 to 63).
`Location Identification`	Location configured on the local port.
`Extended Power Via MDI (PoE)`	PoE-capability and current status of the PoE parameters for Extended Power-Via-MDI TLV on the local port.
`Power Source`	The power source the switch currently uses; either primary power or backup power.

Parameter	Description
`Power Priority`	The power priority configured on the port; either critical, high or low.
`Power Value`	The total power the switch can source over a maximum length cable to a PD device on the port. The value shows the power value in Watts from the PD side.
`Inventory Management`	Inventory information for the device.

Command changes

Version 5.5.3-1.1: Command added to AR1050V

show lldp neighbors

Overview This command displays a summary of information received from neighbors via specified ports. If no port list is supplied, neighbor information for all ports is displayed.

Syntax

```
show lldp neighbors [interface <port-list>]
```

Parameter	Description
<port-list>	The ports for which the neighbor information is to be shown.

Mode User Exec and Privileged Exec

Examples To display neighbor information received via all ports, use the command:

```
awplus# show lldp neighbors
```

To display neighbor information received via port1.0.1 and port1.0.4 with LLDP-MED configuration, use the command:

```
awplus# show lldp neighbors interface port1.0.1,port1.0.4
```

Output The following shows typical output.

Example output from the `show lldp neighbors` command

```
LLDP Neighbor Information:

Total number of neighbors on these ports .... 4

  System Capability Codes:
    O = Other   P = Repeater   B = Bridge               W = WLAN Access Point
    R = Router  T = Telephone  C = DOCSIS Cable Device  S = Station Only
  LLDP-MED Device Type and Power Source Codes:
    1 = Class I   3 = Class III    PSE  = PoE    Both = PoE&Local   Prim = Primary
    2 = Class II  N = Network Con. Locl = Local  Unkn = Unknown     Back = Backup

Local   Neighbor        Neighbor        Neighbor                System      MED
Port    Chassis ID      Port ID         Sys Name                Cap.        Ty Pwr
-------------------------------------------------------------------------------

```

Parameters in the output of the `show lldp neighbors` command

Parameter	Description
`Local Port`	Local port on which the neighbor information was received.
`Neighbor Chassis ID`	Chassis ID that uniquely identifies the neighbor.
`Neighbor Port Name`	Port ID of the neighbor.
`Neighbor Sys Name`	System name of the LLDP neighbor.
`Neighbor Capability`	Capabilities that are supported and enabled on the neighbor.
`System Capability`	System Capabilities of the LLDP neighbor.
`MED Device Type`	LLDP-MED Device class (Class I, II, III or Network Connectivity)
`MED Power Source`	LLDP-MED Power Source

Related commands **show lldp neighbors detail**

Command changes Version 5.5.3-1.1: Command added to AR1050V

show lldp neighbors detail

Overview This command displays in detail the information received from neighbors via specified ports. If no port list is supplied, detailed neighbor information for all ports is displayed.

Syntax

```
show lldp neighbors detail [base] [dot1] [dot3] [med] [interface
 <port-list>]
```

Parameter	Description
`base`	Information for base TLVs.
`dot1`	Information for 802.1 TLVs.
`dot3`	Information for 803.1 TLVs.
`med`	Information for LLDP-MED TLVs.
<port-list>	The ports for which the neighbor information is to be shown.

Mode User Exec and Privileged Exec

Examples To display detailed neighbor information received via all ports, use the command:

```
awplus# show lldp neighbors detail
```

To display detailed neighbor information received via port1.0.1, use the command:

```
awplus# show lldp neighbors detail interface port1.0.1
```

Output The following shows typical output.

Example output from the `show lldp neighbors detail` command

```
awplus#show lldp neighbors detail interface port1.0.1

Parameters in the output of the `show lldp neighbors detail` command

Parameter	Description
`Chassis ID Type`	Type of the Chassis ID.
`Chassis ID`	Chassis ID that uniquely identifies the neighbor.
`Port ID Type`	Type of the Port ID.

Parameter	Description
Port ID	Port ID of the neighbor.
TTL	Number of seconds that the information advertised by the neighbor remains valid.
Port Description	Port description of the neighbor's port.
System Name	Neighbor's system name.
System Description	Neighbor's system description.
System Capabilities (Supported)	Capabilities that the neighbor supports.
System Capabilities (Enabled)	Capabilities that are enabled on the neighbor.
Management Addresses	List of neighbor's management addresses.
Port VLAN ID (PVID)	VLAN identifier associated with untagged or priority tagged frames for the neighbor port.
Port & Protocol VLAN (Supported)	Whether Port & Protocol VLAN is supported on the LLDP neighbor.
Port & Protocol VLAN (Enabled)	Whether Port & Protocol VLAN is enabled on the LLDP neighbor.
Port & Protocol VLAN (VIDs)	List of Port & Protocol VLAN identifiers.
VLAN Names	List of names of VLANs that the neighbor's port belongs to.
Protocol IDs	List of protocols that are accessible through the neighbor's port.
MAC/PHY Auto-negotiation	Auto-negotiation configuration and status
Power Via MDI (PoE)	PoE configuration and status of 802.3 Power- Via-MDI TLV
Link Aggregation	Link aggregation information
Maximum Frame Size	The maximum frame size capability
LLDP-MED Device Type	LLDP-MED Device type
LLDP-MED Capabilities	LLDP-MED capabilities supported

Parameter	Description
`Network Policy`	List of network policies
`Location Identification`	Location information
`Extended Power Via MDI (PoE)`	PoE-capability and current status
`Inventory Management`	Inventory information

Related commands **show lldp neighbors**

Command changes Version 5.5.3-1.1: Command added to AR1050V

show lldp statistics

Overview This command displays the global LLDP statistics (packet and event counters).

Syntax
```
show lldp statistics
```

Mode User Exec and Privileged Exec

Example To display global LLDP statistics information, use the command:
```
awplus# show lldp statistics
```

Output The following shows typical output.

Example output from the `show lldp statistics` command

```
awplus# show lldp statistics

Global LLDP Packet and Event counters:

  Frames:    Out ................... 345
             In .................... 423
             In Errored ............ 0
             In Dropped ............ 0
  TLVs:      Unrecognized .......... 0
             Discarded ............. 0
  Neighbors: New Entries ........... 20
             Deleted Entries ....... 20
             Dropped Entries ....... 0
             Entry Age-outs ........ 20
```

Parameters in the output of the `show lldp statistics` command

Parameter	Description
`Frames Out`	Number of LLDPDU frames transmitted.
`Frames In`	Number of LLDPDU frames received.
`Frames In Errored`	Number of invalid LLDPDU frames received.
`Frames In Dropped`	Number of LLDPDU frames received and discarded for any reason.
`TLVs Unrecognized`	Number of LLDP TLVs received that are not recognized but the TLV type is in the range of reserved TLV types.
`TLVs Discarded`	Number of LLDP TLVs discarded for any reason.
`Neighbors New Entries`	Number of times the information advertised by neighbors has been inserted into the neighbor table.
`Neighbors Deleted Entries`	Number of times the information advertised by neighbors has been removed from the neighbor table.
`Neighbors Dropped Entries`	Number of times the information advertised by neighbors could not be entered into the neighbor table because of insufficient resources.
`Neighbors Entry Age-outs Entries`	Number of times the information advertised by neighbors has been removed from the neighbor table because the information TTL interval has expired.

show lldp statistics

Command changes

Version 5.5.3-1.1: Command added to AR1050V

show location

Overview Use this command to display selected location information configured on the switch.

Syntax

```
show location {civic-location|coord-location|elin-location}
show location {civic-location|coord-location|elin-location}
 identifier {<civic-loc-id>|<coord-loc-id>|<elin-loc-id>}
show location {civic-location|coord-location|elin-location}
 interface <port-list>
```

Parameter	Description
`civic-location`	Display civic location information.
`coord-location`	Display coordinate location information.
`elin-location`	Display ELIN (Emergency Location Identifier Number) information.
<civic-loc-id>	Civic address location identifier, in the range 1 to 4095.
<coord-loc-id>	Coordinate location identifier, in the range 1 to 4095.
<elin-loc-id>	ELIN location identifier, in the range 1 to 4095.
<port-list>	Ports to display information about.

Mode User Exec and Privileged Exec

Examples To display a civic address location configured on port1.0.1, use the command:

```
awplus# show location civic-location interface port1.0.1
```

Example output from the `show location` command

```
awplus# show location civic-location interface port1.0.1
Port     ID   Element Type          Element Value
-------------------------------------------------------------
1.0.1    1    Country               NZ
              City                  Christchurch
              Street-suffix         Avenue
              House-number          27
              Primary-road-name     Nazareth
```

To display coordinate location information configured on the identifier 1, use the command:

```
awplus# show location coord-location identifier 1
```

Example output from the `show location` command

```
awplus# show location coord-location identifier 1
  ID  Element Type             Element Value
------------------------------------------------------------------
  1   Latitude Resolution      15 bits
      Latitude                 38.898648113012313842773437 5 degrees
      Longitude Resolution     15 bits
      Longitude                130.232323229312896728515625 0 degrees
      Altitude Resolution      10 bits
      Altitude                 2.50000000 meters
      Map Datum                WGS 84
```

The coordinate location information displayed may differ from the information entered because it is stored in binary format. For more information, see the **location coord-location configuration** command.

To display all ELIN location information configured on the switch, use the command:

```
awplus# show location elin-location
```

Example output from the `show location elin-location` command

```
awplus# show location elin-location
  ID  ELIN
----------------------------------
  1   1234567890
  2   5432154321
```

Introduction

Overview This chapter provides an alphabetical reference for commands used to configure mail. The mail feature uses Simple Mail Transfer Protocol (SMTP) to transfer mail from an internal email client operating within the AlliedWare Plus device. This feature is typically used to email event notifications to an external email server from the AlliedWare Plus device.

For information on using the mail feature, see the **Mail (SMTP) Feature Overview and Configuration Guide**.

debug mail

Overview This command turns on debugging for sending emails.

The **no** variant of this command turns off debugging for sending emails.

Syntax
```
debug mail
no debug mail
```

Mode Privileged Exec

Examples To turn on debugging for sending emails, use the command:

```
awplus# debug mail
```

To turn off debugging for sending emails, use the command:

```
awplus# no debug mail
```

Related commands

delete mail

mail

show mail

undebug mail

delete mail

Overview This command deletes mail from the queue.

You need the *mail-id* from the **show mail** command output to delete specific emails, or use the **all** parameter to clear all messages in the queue completely.

Syntax

```
delete mail [mail-id <mail-id>|all]
```

Parameter	Description	
`mail-id`	Deletes a single mail from the mail queue.	
	<mail-id>	A unique mail ID number. Use the **show mail** command to display this for an item of mail.
`all`	Delete all the mail in the queue.	

Mode Privileged Exec

Examples To delete the unique mail item “20060912142356.1234” from the queue, use the command:

```
awplus# delete mail 20060912142356.1234
```

To delete all mail from the queue, use the command:

```
awplus# delete mail all
```

Related commands

debug mail

mail

mail from

mail smtpserver

show mail

mail

Overview This command sends an email using the SMTP protocol. If you specify a file the text inside the file is sent in the message body.

If you do not specify the **to**, **file**, or **subject** parameters, the CLI prompts you for the missing information.

Before you can send mail using this command, you must specify the sending email address using the **mail from** command and a mail server using the **mail smtpserver** command.

Syntax `mail [to <to>] [subject <subject>] [file <filename>]`

Parameter	Description	
`to`	The email recipient.	
	<to>	Email address.
`subject`	Description of the subject of this email. Use quote marks when the subject text contains spaces.	
	<subject>	String.
`file`	File to insert as text into the message body.	
	<filename>	String.

Mode Privileged Exec

Usage notes

When you use the **mail** command you can use parameter substitutions in the subject field. The following table lists the parameters that can be substituted and their descriptions:

Parameter	Description
<%N>	When this parameter is specified, the %N is replaced by the host name of your device.
<%S>	When this parameter is specified, the %S is replaced by the serial number of your device.
<%D><%L><	When any of these parameters is specified, they are replaced by the current date and time (local time) on your device.
<%U>	When this parameter is specified, the %U is replaced by the current date and time (UTC time) on your device.

NOTE: *If no local time is configured, it will use UTC.*

Examples

To send an email to “admin@example.com” with the subject “test email” and with the message body inserted from the file “test.conf”, use the command:

```
awplus# mail to admin@example.com subject "test email" filename
 test.conf
```

To send an email using parameter substitutions for the host name, serial number and date, use the commands:

```
awplus# mail to admin@example.com subject "Sending email from
 Hostname:%N Serial Number:%S Date:%T"
```

show counter mail

show mail

mail from

Overview This command sets an email address as the sender. You must specify a sending email address with this command before you can send email.

Use the **no** variant of this command to remove the "mail from" address.

Syntax

```
mail from <from>
no mail from
```

Parameter	Description
<from>	The email address that the mail is sent from (also known as the hostname).

Mode Global Configuration

Example To set up your email address as the sender "kaji@nerv.com", use the command:

```
awplus(config)# mail from kaji@nerv.com
```

Related commands

debug mail

delete mail

mail

mail smtpserver

show counter mail

show mail

undebug mail

mail smtpserver

Overview This command specifies the IP address or domain name of the SMTP server that your device sends email to. You must specify a mail server with this command before you can send email.

Use the **no** variant of this command to remove the configured mail server.

Syntax

```
mail smtpserver {<ip-address>|<name>}
no mail smtpserver
```

Parameter	Description
<ip-address>	Internet Protocol (IP) address for the mail server.
<name>	Domain name (FQDN) for the mail server (also known as the host name).

Mode Global Configuration

Usage notes If you specify the server by specifying its domain name, you must also ensure that the DNS client on your device is enabled. It is enabled by default but if it has been disabled, you can re-enable it by using the **ip domain-lookup** command.

Examples To specify a mail server at “192.168.0.1”, use the command:

```
awplus(config)# mail smtpserver 192.168.0.1
```

To specify a mail server that has a host name of “smtp.example.com”, use the command:

```
awplus(config)# mail smtpserver smtp.example.com
```

To remove the configured mail server, use the command:

```
awplus(config)# no mail smtpserver
```

delete mail

mail

mail from

show counter mail

show mail

mail smtpserver authentication

Overview Use this command to configure SMTP mail server authentication.

Use the **no** variant of this command to remove the configured SMTP mail server authentication.

Syntax

```
mail smtpserver authentication {crammd5|login|plain} username
 <username> password [8] <password>
```

```
no mail smtpserver authentication
```

Parameter	Description
`crammd5`	This is a Challenge Request Authentication Mechanism based on the HMAC-MD5 mechanism and is the most secure option.
`login`	A BASE64 encryption method
`plain`	A BASE64 encryption method
<username>	Registered user name
`8`	The registered user password is presented in an already encrypted format. This is how the running configuration stores the plain text password and is not for general use.
<password>	Registered user password

Default No authentication option is set by default.

Mode Global Configuration

Usage notes You cannot change the IP address or Domain Name of the SMTP server if authentication is configured. If you attempt to change it when authentication is configured, the following error message is displayed:

```
% Error: authentication configuration still exists
```

Examples To configure the SMTP mail server authentication to crammd5, use the commands:

```
awplus# configure terminal
awplus(config)# mail smtpserver authentication crammd5 username
 admin password unguessablePassword
```

To remove SMTP mail server authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no mail smtpserver authentication
```

Output The following shows typical output.

Example output from `show mail`:

```
awplus#show mail
Mail Settings
-------------------------------------------------------------
State                               : Alive
SMTP Server                         : 1.2.3.4
Host Name                           : admin@example.com
Authentication                      : crammd5
Username                            : admin
Debug                               : Disabled

awplus#show running-config

show mail

Command changes Version 5.4.8-1.1: command added

mail smtpserver port

Overview Use this command to configure the SMTP mail client/server communication port.

Use the **no** variant of this command to remove the configured port and set it back to the default port.

Syntax

```
mail smtpserver port <port>
no mail smtpserver port
```

Parameter	Description
<port>	Port number from the range 1 to 65535

Default The default port value is 25 if TLS is not enabled for the SMTP server, 587 if TLS is enabled with STARTTLS, and 465 if TLS is enabled with SMTPS.

Mode Global Configuration

Examples To configure the mail server communication over port 587, use the commands:

```
awplus# configure terminal
awplus(config)# mail smtpserver port 587
```

To revert to the default SMTP mail server communication port, use the commands:

```
awplus# configure terminal
awplus(config)# no mail smtpserver port
```

Output The following shows typical output.

Example output from `show mail`:

```
awplus#show mail
Mail Settings
-------------------------------------------------------------
State                                : Alive
SMTP Server                          : 10.24.165.4
Host Name                            : admin@example.com
Authentication                       : plain
Username                             : admin
Port                                 : 587
Use TLS                              : STARTTLS
Debug                                : Disabled

awplus#show running-config
!
mail smtpserver port 587
!
```

Command changes

Version 5.4.8-1.1: command added

mail smtpserver tls

Overview Use this command to configure the device to send emails over a TLS connection to the SMTP server instead of sending in clear-text. If the SMTP server does not support receiving emails over a TLS connection, sending emails from the device will fail.

Use the **no** variant of this command to configure the device to send emails over an unencrypted TCP connection (clear text).

Syntax

```
mail smtpserver tls [starttls|smtps]
no mail smtpserver tls
```

Parameter	Description
`starttls`	The connection starts as clear-text SMTP first and then the client establishes a TLS connection using the STARTTLS extension.
`smtps`	Use a TLS connection from the start.

Default By default, TLS is disabled and the device sends emails in clear-text.

Mode Global Configuration

Examples To send emails to the SMTP server over a TLS connection that will be established by the STARTTLS method, use the commands:

```
awplus# configure terminal
awplus(config)# mail smtpserver tls starttls
```

To send emails to the SMTP server over a TLS connection from the beginning, use the commands:

```
awplus# configure terminal
awplus(config)# mail smtpserver tls smpts
```

To send emails to the SMTP server in clear text, use the commands:

```
awplus# configure terminal
awplus(config)# no mail smtpserver tls
```

Command changes Version 5.5.3-0.1: command added

show counter mail

Overview This command displays the mail counters.

Syntax
```
show counter mail
```

Mode User Exec and Privileged Exec

Example To show the emails in the queue use the command:
```
awplus# show counter mail
```

Output The following shows typical output.

Example output from the `show counter mail` command

```
Mail Client (SMTP) counters
Mails Sent            ......... 2
Mails Sent Fails      ......... 1
```

Parameters in the output of the `show counter mail` command

Parameter	Description
`Mails Sent`	The number of emails sent successfully since the last device restart.
`Mails Sent Fails`	The number of emails the device failed to send since the last device restart.

show mail

Overview This command displays the emails in the queue.

Syntax

```
show mail
```

Mode Privileged Exec

Example To display the emails in the queue use the command:

```
awplus# show mail
```

Output The following shows typical output.

Example output from the `show mail` command:

```
awplus#show mail
Mail Settings
-------------------------------------------------------------
State                               : Alive
SMTP Server                         : example.net
Host Name                           : test@example.com
Authentication                      : login
Username                            : admin
Port                                : 587
Use TLS                             : STARTTLS
Debug                               : Disabled

Messages

Introduction

Overview This chapter provides an alphabetical reference for commands used to configure Remote Monitoring (RMON).

For an introduction to RMON and an RMON configuration example, see the **RMON Feature Overview and Configuration Guide**.

RMON is disabled by default in AlliedWare Plus™. No RMON alarms or events are configured.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

rmon alarm

Overview Use this command to configure an RMON alarm to monitor the value of an SNMP object, and to trigger specified events when the monitored object crosses specified thresholds.

To specify the action taken when the alarm is triggered, use the event index of an event defined by the **rmon event** command.

Use the **no** variant of this command to remove the alarm configuration.

NOTE: *You can only configure alarms for switch port interfaces, not for VLANs.*

Syntax **User-defined alarm:**

```
rmon alarm <alarm-index> <oid.index> interval <1-2147483647>
 {delta|absolute} rising-threshold <1-2147483647> event <rising-
event-index> falling-threshold <1-2147483647> event <falling-
event-index> [alarmstartup {1|2|3}] [owner <owner>]
```

Eventwatch alarm, do not use (used by Vista Manager EX only):

```
rmon alarm <alarm-index> <oid.index> interval <1-4294967295>
 {delta|absolute} rising-threshold <1-2147483647> event
 eventwatch falling-threshold <1-2147483647> event eventwatch
 [owner <owner>]
```

```
no rmon alarm <alarm-index>
```

Parameter	Description
<alarm-index>	Alarm entry index value from the range 1 to 65535 seconds.
<oid.index>	The variable SNMP MIB Object Identifier (OID) name to be monitored, for either etherStats or etherHistory entries. The entries can be either of the following formats: - etherStatsEntry.*<field>.<stats-index>* or etherHistoryEntry.*<field>.<history-index>*, or - etherStatsFieldName.*<stats-index>* or etherHistoryFieldName.*<history-index>*. To define the *<stats-index>*, use the **rmon collection stats** command. To define the *<history-index>*, use the **rmon collection history** command.
`interval` *<1-2147483647>*	Polling interval in seconds from the range 1 to 2147483647.
`delta`	The RMON MIB alarmSampleType: the change in the monitored MIB object value between the beginning and end of the polling interval.
`absolute`	The RMON MIB alarmSampleType: the value of the monitored MIB object.
`rising-threshold` *<1-2147483647>*	Rising threshold value of the alarm entry in seconds from the range 1 to 2147483647.
<rising-event-index>	From the range 1 to 65535 seconds. The event to be triggered when the monitored object value reaches the rising threshold value. This is the event index of an event specified by the **rmon event** command.
`eventwatch`	The alarm triggers an eventwatch event. This mechanism is used by Vista Manager EX, the Allied Telesis network management and

Parameter	Description
	monitoring tool. Do not use this parameter; use the <*rising-event-index*> parameter instead.
`falling-threshold` <*1-2147483647*>	Falling threshold value of the alarm entry in seconds from the range 1 to 2147483647.
<*falling-event-index*>	From the range 1 to 65535 seconds. The event to be triggered when the monitored object value reaches the falling threshold value. This is an event index of an event specified by the **rmon event** command.
`eventwatch`	The alarm triggers an eventwatch event. This mechanism is used by Vista Manager EX, the Allied Telesis network management and monitoring tool. Do not use this parameter; use the <*rising-event-index*> parameter instead.
`alarmstartup {1|2|3}`	Whether RMON can trigger a falling alarm (1), a rising alarm (2) or either (3) when you first start monitoring. See the Usage section for more information. The default is setting 3 (either).
`owner` <*owner*>	Arbitrary owner name to identify the alarm entry.

Default By default, there are no alarms.

Mode Global Configuration

Usage notes RMON alarms have a rising and falling threshold. Once the alarm monitoring is operating, you cannot have a falling alarm unless there has been a rising alarm and vice versa.

However, when you start RMON alarm monitoring, an alarm must be generated without the other type of alarm having first been triggered. The **alarmstartup** parameter allows this. It is used to say whether RMON can generate a rising alarm (1), a falling alarm (2) or either alarm (3) as the first alarm.

Note that you specify the SNMP MIB Object Identifier (OID) as a dotted decimal value, using one of the following forms:

- etherStatsEntry.*<field>.<stats-index>* or etherHistoryEntry.*<field>.<history-index>*. For example, etherHistoryEntry.8.8
- or, etherStatsFieldName.*<stats-index>* or etherHistoryFieldName.*<history-index>*. For example, etherHistoryMulticastPkts.8

If you enter the first form (etherHistoryEntry.8.8), the device will save it as the second form (etherHistoryMulticastPkts.8) in the running-config.

Example To configure an alarm to:

- monitor the change per minute in the etherStatsPkt value for interface 22 (defined by stats-index 22 in the **rmon collection stats** command)
- and trigger event 2 (defined by the **rmon event** command) when the change reaches the rising threshold 400
- and trigger event 3 when it reaches the falling threshold 200
- and identify this alarm as belonging to the user with username Maria

use the following commands:

```
awplus# configure terminal
awplus(config)# rmon alarm 229 etherStatsEntry.22.5 interval 60
 delta rising-threshold 400 event 2 falling-threshold 200 event
 3 alarmstartup 3 owner maria
```

To configure an alarm that:

- every 10 seconds, checks the number of multicast packets
- in the latest history control table entry controlled by history-index 8
- to see if the number of packets has increased to 15 or dropped to 5
- and if it has, triggers event 10

use either of the following commands:

```
awplus(config)# rmon alarm 56 etherHistoryMulticastPkts.8
 interval 10 absolute rising-threshold 15 event 10 falling-
threshold 5 event 10
awplus(config)# rmon alarm 56 etherHistoryEntry.8.8 interval 10
 absolute rising-threshold 15 event 10 falling-threshold 5 event
 10
```

Related commands

rmon collection history

rmon collection stats

rmon event

rmon collection history

Overview Use this command to create a history statistics control group to store a specified number of snapshots (buckets) of the standard RMON statistics for the switch port, and to collect these statistics at specified intervals. If there is sufficient memory available, then the device will allocate memory for storing the set of buckets that comprise this history control.

Use the **no** variant of this command to remove the specified history control configuration.

NOTE: *A history can only be collected for switch port interfaces, not for VLANs.*

Syntax

```
rmon collection history <history-index> [buckets <1-65535>]
 [interval <1-3600>] [owner <owner>]
no rmon collection history <history-index>
```

Parameter	Description
`<history-index>`	A unique RMON history control entry index value from the range 1 to 65535.
`buckets <1-65535>`	Number of requested buckets to store snapshots from the range 1 to 65535. The default is 50 buckets.
`interval <1-3600>`	Polling interval in seconds. Default 1800 second polling interval from the range 1 to 3600.
`owner <owner>`	Owner name to identify the entry.

Default The default interval is 1800 seconds and the default number of buckets is 50.

Mode Interface Configuration

Example To create a history statistics control group with ID 200 to store 500 snapshots with an interval of 600 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# rmon collection history 200 buckets 500
 interval 600 owner herbert
```

To disable the history statistics control group, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no rmon collection history 200
```

Related commands

rmon alarm

rmon collection stats

rmon event

rmon collection stats

Overview Use this command to enable the collection of RMON statistics on a switch port, and assign an index number by which to access these collected statistics.

Use the **no** variant of this command to stop collecting RMON statistics on this switch port.

NOTE: *Statistics can only be collected for switch port interfaces, not for VLANs.*

Syntax

```
rmon collection stats <collection-index> [owner <owner>]
no rmon collection stats <collection-index>
```

Parameter	Description
<collection-index>	Give this collection of statistics an index number to uniquely identify it. This is the index to use to access the statistics collected for this switch port. Use a number in the range of 1 to 65535.
owner *<owner>*	An arbitrary owner name to identify this statistics collection entry.

Default RMON statistics are not enabled by default.

Mode Interface Configuration

Example To enable the collection of RMON statistics with a statistics index of 200, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# rmon collection stats 200 owner myrtle
```

To stop collecting RMON statistics, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no rmon collection stats 200
```

Related commands

rmon alarm

rmon collection history

rmon event

rmon event

Overview Use this command to create an event definition for a log or a trap or both. Then you can use this event index in the **rmon alarm** command to indicate whether to send an SNMP trap or log message (or both) when an alarm is triggered.

Use the **no** variant of this command to remove the event definition.

Syntax

```
rmon event <event-index> [description <description>|owner
 <owner>| trap <trap>]
rmon event <event-index> [log [description <description>|owner
 <owner>|trap <trap>] ]
rmon event <event-index> [log trap [description <description>|
owner <owner>] ]
no rmon event <event-index>
```

Parameter	Description
<event-index>	*<1-65535>* Unique event entry index value.
log	Log event type.
trap	Trap event type.
log trap	Log and trap event type.
description*<description>*	Event entry description.
owner *<owner>*	Owner name to identify the entry.

Default No event is configured by default.

Mode Global Configuration

Example To create an event definition with an index of 299 for a log, use this command:

```
awplus# configure terminal
awplus(config)# rmon event 299 log description cond3 owner
 alfred
```

To remove the event definition, use the command:

```
awplus# configure terminal
awplus(config)# no rmon event 299
```

Related commands **rmon alarm**

show rmon alarm

Overview Use this command to display the alarms and threshold configured for the RMON probe.

Syntax
```
show rmon alarm
```

Mode User Exec and Privileged Exec

Example To display the alarms and threshold, use this command:
```
awplus# show rmon alarm
```

Related commands **rmon alarm**

show rmon event

Overview Use this command to display the events configured for the RMON probe.

Syntax

```
show rmon event
```

Mode User Exec and Privileged Exec

Output The following shows typical output.

Example output from the `show rmon event` command

```
awplus#sh rmon event
 event Index = 787
       Description TRAP
        Event type log & trap
         Event community name gopher
       Last Time Sent = 0
       Owner  RMON_SNMP

 event Index = 990
       Description TRAP
        Event type trap
         Event community name teabo
       Last Time Sent = 0
       Owner  RMON_SNMP
```

NOTE: *The following etherStats counters are not currently available for Layer 3 interfaces:*

- etherStatsBroadcastPkts
- etherStatsCRCAlignErrors
- etherStatsUndersizePkts
- etherStatsOversizePkts
- etherStatsFragments
- etherStatsJabbers
- etherStatsCollisions
- etherStatsPkts64Octets
- etherStatsPkts65to127Octets
- etherStatsPkts128to255Octets
- etherStatsPkts256to511Octets
- etherStatsPkts512to1023Octets
- etherStatsPkts1024to1518Octets

Example To display the events configured for the RMON probe, use this command:

```
awplus# show rmon event
```

Related commands **rmon event**

show rmon history

Overview Use this command to display the parameters specified on all the currently defined RMON history collections on the device.

Syntax

```
show rmon history
```

Mode User Exec and Privileged Exec

Output The following shows typical output.

Example output from the `show rmon history` command

```
awplus#sh rmon history
 history index = 56
         data source ifindex = 4501
         buckets requested = 34
        buckets granted = 34
        Interval = 2000

Example To display the parameters specified on all the currently defined RMON history collections, us the commands:

```
awplus# show rmon history
```

Related commands rmon collection history

show rmon statistics

Overview Use this command to display the current values of the statistics for all the RMON statistics collections currently defined on the device.

Syntax
```
show rmon statistics
```

Mode User Exec and Privileged Exec

Example To display the current values of the statistics for all the RMON statistics collections, us the commands:

```
awplus# show rmon statistics
```

Output The following shows typical output.

Example output from the `show rmon statistics` command

```
awplus#show rmon statistics
    rmon collection index 45
    stats->ifindex = 4501
    input packets 1279340, bytes 85858960, dropped 00, multicast packets 1272100
    output packets 7306090, bytes 268724, multicast packets 7305660 broadcast
packets 290
    rmon collection index 679
    stats->ifindex = 5013
    input packets 00, bytes 00, dropped 00, multicast packets 00
    output packets 8554550, bytes 26777324, multicast packets 8546690 broadcast
packets 7720
```

Introduction

Overview This chapter provides an alphabetical reference for commands used to configure Secure Shell (SSH). For more information, see the **SSH Feature Overview and Configuration Guide**.

banner login (SSH)

Overview This command configures a login banner on the SSH server. This displays a message on the remote terminal of the SSH client before the login prompt. SSH client version 1 does not support this banner.

To add a banner, first enter the command **banner login**, and hit [Enter]. Write your message. You can use any character and spaces. Use Ctrl +D at the end of your message to save the text and re-enter the normal command line mode.

The banner message is preserved if the device restarts.

The **no** variant of this command deletes the login banner from the device.

Syntax

```
banner login
no banner login
```

Default No banner is defined by default.

Mode Global Configuration

Examples To set a login banner message, use the commands:

```
awplus# configure terminal
awplus(config)# banner login
```

The screen will prompt you to enter the message:

```
Type CNTL/D to finish.
... banner message comes here ...
```

Enter the message. Use Ctrl+D to finish, like this:

```
^D
awplus(config)#
```

To remove the login banner message, use the commands:

```
awplus# configure terminal
awplus(config)# no banner login
```

Related commands **show banner login**

clear ssh

Overview This command deletes Secure Shell sessions currently active on the device. This includes both incoming and outgoing sessions. The deleted sessions are closed. You can only delete an SSH session if you are a system manager or the user who initiated the session. If **all** is specified then all active SSH sessions are deleted.

Syntax

```
clear ssh {<1-65535>|all}
```

Parameters	Description
<1-65535>	Specify a session ID in the range 1 to 65535 to delete a specific session.
`all`	Delete all SSH sessions.

Mode Privileged Exec

Examples To stop the current SSH session 123, use the command:

```
awplus# clear ssh 123
```

To stop all SSH sessions active on the device, use the command:

```
awplus# clear ssh all
```

Related commands **service ssh**

ssh

crypto key destroy hostkey

Overview This command deletes the existing public and private keys of the SSH server.

Syntax

```
crypto key destroy hostkey {dsa|ecdsa|ed25519|rsa|rsa1}
```

Parameters	Description
dsa	Deletes the existing DSA public and private keys.
ecdsa	Deletes the existing ECDSA public and private keys.
ed25519	Deletes the existing Ed25519 public and private keys.
rsa	Deletes the existing RSA public and private keys that were configured for SSH version 2 connections.
rsa1	Deletes the existing RSA public and private keys that were configured for SSH version 1 connections. From AlliedWare Plus version 5.5.1-1.1 onwards, SSH version 1 is not supported.

Mode Global Configuration

Example To destroy the RSA host key used for SSH version 2 connections, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy hostkey rsa
```

Related commands **crypto key generate hostkey**

service ssh

Command changes Version 5.5.2-2.1: **ed25519** parameter added

crypto key destroy userkey

Overview This command destroys the existing public and private keys of an SSH user configured on the device.

Syntax

```
crypto key destroy userkey <username> {dsa|ecdsa|ed25519|rsa|
rsa1}
```

Parameters	Description
<username>	Name of the user whose userkey you are destroying. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
`dsa`	Deletes the existing DSA userkey.
`ecdsa`	Deletes the existing ECDSA userkey.
`ed25519`	Deletes the existing Ed25519 userkey.
`rsa`	Deletes the existing RSA userkey that was configured for SSH version 2 connections.
`rsa1`	Deletes the existing RSA userkey that was configured for SSH version 1 connections. From AlliedWare Plus version 5.5.1-1.1 onwards, SSH version 1 is not supported.

Mode Global Configuration

Example To destroy the RSA user key for the SSH user `remoteuser`, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy userkey remoteuser rsa
```

Related commands

crypto key generate hostkey

crypto key generate userkey

show ssh

show crypto key hostkey

Command changes Version 5.5.2-2.1: **ed25519** parameter added

crypto key generate hostkey

Overview This command generates public and private keys for the SSH server.

When you enable the SSH server, if no host keys exist, the server automatically generates SSHv2 host key pairs using Ed25519 with a keysize of 256, ECDSA with a curve length of 384, and RSA with a 3072-bit key (unless in secure mode, when it only generates the ECDSA key).

If you need a key with different parameters than this, you can use this command to generate that key before you enable the SSH server. If a host key exists with the same cryptography algorithm, this command replaces the old host key with the new key.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

Syntax

```
crypto key generate hostkey rsa [<1024-16384>]
crypto key generate hostkey ecdsa [<256|384|521>]
crypto key generate hostkey ed25519
```

Parameters	Description
`rsa`	Creates an RSA hostkey.
`ecdsa`	Creates an ECDSA hostkey.
`ed25519`	Creates an Ed25519 hostkey with a keysize of 256.
<1024-16384>	The length in bits of the generated key.
<256|384|521>	The ECDSA key size in bits.

Default The default key length for RSA is 3072 bits.

The default key size for ECDSA is 384 bits.

Mode Global Configuration

Examples

To generate an RSA host key that is 4096 bits in length, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate hostkey rsa 4096
```

To generate an ECDSA host key with an elliptic curve size of 521 bits, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate hostkey ecdsa 521
```

To generate an Ed25519 host key with a keysize of 256, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate hostkey ed25519
```

Related commands

crypto key destroy hostkey

service ssh

show crypto key hostkey

Command changes

Version 5.5.5-1.1: default RSA key length increased to 3072

Version 5.5.2-2.1: **ed25519** parameter added

Version 5.5.2-0.1: changes to key length and key size ranges and defaults

Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

crypto key generate userkey

Overview This command generates public and private keys for an SSH user using an RSA, ECDSA, or ED25519 cryptography algorithm. To use public key authentication, copy the public key of the user onto the remote SSH server.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

Syntax

```
crypto key generate userkey <username> rsa [<1024-16384>]
crypto key generate userkey <username> ecdsa [<256|384|521>]
crypto key generate userkey <username> ed25519
```

Parameters	Description
<username>	Name of the user that the user key is generated for. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
`rsa`	Creates an RSA userkey.
`ecdsa`	Creates an ECDSA userkey.
`ed25519`	Creates an Ed25519 userkey with a keysize of 256.
<1024-16384>	The length in bits of the generated key. The default is 2048 bits.
<256|384|521>	The ECDSA key size in bits. The default is 384.

Default The default key length for RSA is 2048 bits.

The default key size for ECDSA is 384 bits.

Mode Global Configuration

Examples

To generate a 4096-bit RSA user key for SSH version 2 connections for the user ‘bob’, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey bob rsa 4096
```

To generate an ECDSA user key of key size 521 for the user ‘lapo’, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey lapo ecdsa 521
```

To generate an Ed25519 user key of key size 256 for the user ‘lapo’, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey lapo ed25519
```

Related commands

crypto key pubkey-chain userkey

show crypto key userkey

Command changes

Version 5.5.2-2.1: **ed25519** parameter added

Version 5.5.2-0.1: changes to key length and key size ranges and defaults

Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

crypto key pubkey-chain knownhosts

Overview

This command adds a public key of the specified SSH server to the known host database on your device. The SSH client on your device uses this public key to verify the remote SSH server.

The key is retrieved from the server. Before adding a key to this database, check that the key sent to you is correct.

If the server's key changes, or if your SSH client does not have the public key of the remote SSH server, then your SSH client will inform you that the public key of the server is unknown or altered.

The **no** variant of this command deletes the public key of the specified SSH server from the known host database on your device.

Syntax

```
crypto key pubkey-chain knownhosts [ip|ipv6] <hostname> [ecdsa|rsa]
no crypto key pubkey-chain knownhosts <1-65535>
```

Syntax (VRF-lite)

```
crypto key pubkey-chain knownhosts [vrf <vrf-name>] [ip|ipv6] <hostname> [ecdsa|rsa]
no crypto key pubkey-chain knownhosts [vrf <vrf-name>] <1-65535>
```

Parameter	Description
`vrf`	Apply this command to the specified VRF instance.
<vrf-name>	The VRF instance name
`ip`	Keyword used prior to specifying an IPv4 address
`ipv6`	Keyword used prior to specifying an IPv6 address
<hostname>	IPv4/IPv6 address or hostname of a remote server in the format `a.b.c.d` for an IPv4 address, or in the format `x:x::x:x` for an IPv6 address.
`ecdsa`	Specify the ECDSA public key of the server to be added to the known host database.
`rsa`	Specify the RSA public key of the server to be added to the known host database.
<1-65535>	Specify a key identifier when removing a key using the **no** parameter.

Default

If no cryptography algorithm is specified, then **rsa** is used as the default cryptography algorithm.

Mode Privilege Exec

Usage notes This command adds a public key of the specified SSH server to the known host database on the device. The key is retrieved from the server. The remote SSH server is verified by using this public key. The user is requested to check the key is correct before adding it to the database.

If the remote server's host key is changed, or if the device does not have the public key of the remote server, then SSH clients will inform the user that the public key of the server is altered or unknown.

Examples To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts 192.0.2.11
```

To delete the second entry in the known host database, use the command:

```
awplus# no crypto key pubkey-chain knownhosts 2
```

Examples (VRF-lite) To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 in VRF 'red' to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts vrf red 192.0.2.11
```

To delete the second entry in the known host database in VRF 'red', use the command:

```
awplus# no crypto key pubkey-chain knownhosts vrf red 2
```

Validation Commands **show crypto key pubkey-chain knownhosts**

crypto key pubkey-chain userkey

Overview This command adds a public key for an SSH user on the SSH server. This allows the SSH server to support public key authentication for the SSH user. When configured, the SSH user can access the SSH server without providing a password from the remote host.

The **no** variant of this command removes a public key for the specified SSH user that has been added to the public key chain. When a SSH user's public key is removed, the SSH user can no longer login using public key authentication.

Syntax

```
crypto key pubkey-chain userkey <username> [<filename>]
no crypto key pubkey-chain userkey <username> <1-65535>
```

Parameters	Description
<username>	Name of the user that the SSH server associates the key with. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. Default: no default
<filename>	Filename of a key saved in flash. Valid characters are any printable character. You can add a key as a hexadecimal string directly into the terminal if you do not specify a filename.
<1-65535>	The key ID number of the user's key. Specify the key ID to delete a key.

Mode Global Configuration

Usage notes You should import the public key file from the client node. The device can read the data from a file on the flash or user terminal.

Or you can add a key as text into the terminal. To add a key as text into the terminal, first enter the command **crypto key pubkey-chain userkey <*username*>**, and hit [Enter]. Enter the key as text. Note that the key you enter as text must be a valid SSH RSA key, not random ASCII text. Use [Ctrl]+D after entering it to save the text and re-enter the normal command line mode.

Note you can generate a valid SSH RSA key on the device first using the **crypto key generate host rsa** command. View the SSH RSA key generated on the device using the **show crypto hostkey rsa** command. Copy and paste the displayed SSH RSA key after entering the **crypto key pubkey-chain userkey <*username*>** command. Use [Ctrl]+D after entering it to save it.

Examples To generate a valid SSH RSA key on the device and add the key, use the following commands:

```
awplus# configure terminal
awplus(config)# crypto key generate host rsa
awplus(config)# exit
awplus# show crypto key hostkey
 rsaAAAAB3NzaC1yc2EAAAABIwAAAIEAr1s7SokW5aW2fcOw1TStpb9J20bWluhnUC768EoWhyP
+7jtjDcoGWHb2u4sFwRpXwJZcgYrXW16+6NvNbk+h+c/
pqGDijj4SvfZZfeITzvvyZW4/I4pbN8=
awplus# configure terminal
awplus(config)# crypto key pubkey-
chain userkey joeType CNTL/D to
 finish:AAAAB3NzaC1yc2EAAAABIwAAAIEAr1s7SokW5aW2fcOw1TStpb9J20bWluhnUC768Eo
+7jtjDcoGWHb2u4sFwRpXwJZcgYrXW16+6NvNbk+h+c/
pqGDijj4SvfZZfeITzvvyZW4/I4pbN8=control-D
awplus(config)#
```

To add a public key for the user `graydon` from the file `key.pub`, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey graydon key.pub
```

To add a public key for the user `tamara` from the terminal, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey tamara
```

and enter the key. Use Ctrl+D to finish.

To remove the first key entry from the public key chain of the user `john`, use the commands:

```
awplus# configure terminal
awplus(config)# no crypto key pubkey-chain userkey john 1
```

Related commands **show crypto key pubkey-chain userkey**

debug ssh client

Overview This command enables the SSH client debugging facility. When enabled, any SSH, SCP and SFTP client sessions send diagnostic messages to the login terminal.

The **no** variant of this command disables the SSH client debugging facility. This stops the SSH client from generating diagnostic debugging message.

Syntax

```
debug ssh client [brief|full]
no debug ssh client
```

Parameter	Description
`brief`	Enables brief debug mode.
`full`	Enables full debug mode.

Default SSH client debugging is disabled by default.

Mode Privileged Exec and Global Configuration

Examples To start SSH client debugging, use the command:

```
awplus# debug ssh client
```

To start SSH client debugging with extended output, use the command:

```
awplus# debug ssh client full
```

To disable SSH client debugging, use the command:

```
awplus# no debug ssh client
```

Related commands

debug ssh server

show ssh client

undebug ssh client

Command changes Version 5.5.3-1.1: added to AR1050V

debug ssh server

Overview This command enables the SSH server debugging facility. When enabled, the SSH server sends diagnostic messages to the system log. To display the debugging messages on the terminal, use the **`terminal monitor`** command.

The **no** variant of this command disables the SSH server debugging facility. This stops the SSH server from generating diagnostic debugging messages.

Syntax

```
debug ssh server [brief|full]
no debug ssh server
```

Parameter	Description
`brief`	Enables brief debug mode.
`full`	Enables full debug mode.

Default SSH server debugging is disabled by default.

Mode Privileged Exec and Global Configuration

Examples To start SSH server debugging, use the command:

```
awplus# debug ssh server
```

To start SSH server debugging with extended output, use the command:

```
awplus# debug ssh server full
```

To disable SSH server debugging, use the command:

```
awplus# no debug ssh server
```

Related commands

debug ssh client

show ssh server

undebug ssh server

service ssh

Overview Use this command to enable the Secure Shell server on the device. Once enabled, connections coming from SSH clients are accepted.

When you enable the SSH server, if no host keys exist, the server automatically generates SSHv2 host key pairs using ECDSA with a curve length of 384, and RSA with a 1024-bit key (unless in secure mode, when it only generates the ECDSA key).

If you need a key with different parameters than this, you can use the **crypto key generate hostkey** command to generate that key before you enable the SSH server.

Use the **no** variant of this command to disable the Secure Shell server. When the Secure Shell server is disabled, connections from SSH, SCP, and SFTP clients are not accepted. This command does not affect existing SSH sessions. To terminate existing sessions, use the **clear ssh** command.

Syntax

```
service ssh [ip|ipv6]
no service ssh [ip|ipv6]
```

Default The Secure Shell server is disabled by default. Both IPv4 and IPv6 Secure Shell server are enabled when you issue **service ssh** without specifying the optional **ip** or **ipv6** parameters.

The server supports SSH version 2 only (not SSH version 1).

Mode Global Configuration

Examples

To enable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh
```

To enable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ip
```

To enable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ipv6
```

To disable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh
```

To disable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh ip
```

To disable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh ipv6
```

Related commands

ssh server deny-users

Command changes

Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

show banner login

Overview This command displays the banner message configured on the device. The banner message is displayed to the remote user before user authentication starts.

Syntax
```
show banner login
```

Mode User Exec, Privileged Exec, Global Configuration, Interface Configuration, Line Configuration

Example To display the current login banner message, use the command:

```
awplus# show banner login
```

Related commands **banner login (SSH)**

show crypto key hostkey

Overview This command displays the public keys generated on the device for the SSH server.

When you enable the SSH server, if no host keys exist, the server automatically generates SSHv2 host key pairs using Ed25519 with a keysize of 256, ECDSA with a curve length of 384, and RSA with a 3072-bit key (unless in secure mode, when it only generates the ECDSA key).

The private key remains on the device secretly. The public key is copied to SSH clients to identify the server. This command displays the public key.

Syntax

```
show crypto key hostkey [ecdsa|ed25519|rsa]
```

Parameter	Description
ecdsa	Displays the ECDSA algorithm public key.
ed25519	Displays the Ed25519 algorithm public key.
rsa	Displays the RSA algorithm public key for SSH version 2 connections.

Mode User Exec, Privileged Exec and Global Configuration

Examples To show the public keys generated on the device for SSH server, use the command:

```
awplus# show crypto key hostkey
```

To display the RSA public key of the SSH server, use the command:

```
awplus# show crypto key hostkey rsa
```

Output The following shows typical output.

Example output from the `show crypto key hostkey` command

```
Type       Bits  Fingerprint
-----------------------------------------------------------

rsa        2048
 SHA256:K7hes31yK6uuNO4sprZtFcyX9sUuXP42goul10348n8
ecdsa       384
 SHA256:qhBXhkcUCC6FKwy3+pRlrRsONtZhibreqDv9vLs9tVQ
ed25519     256
 SHA256:S8e/9WjCZHsUTEAHMYkIKEoxusmrLOIGe2oSs34clbA
```

Parameters in output of the `show crypto key hostkey` command

Parameter	Description
`Type`	Algorithm used to generate the key.
`Bits`	Length in bits of the key.
`Fingerprint`	Checksum value for the public key.

Related commands

crypto key destroy hostkey

crypto key generate hostkey

show crypto key pubkey-chain knownhosts

Overview This command displays the list of public keys maintained in the known host database on the device.

Syntax
```
show crypto key pubkey-chain knownhosts [<1-65535>]
```

Syntax (VRF-lite)
```
show crypto key pubkey-chain knownhosts [vrf <vrf-name>|global]
 [<1-65535>]
```

Parameter	Description
`global`	When VRF-lite is configured, apply the command to the global routing and forwarding table.
`vrf`	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<1-65535>	Key identifier for a specific key. Displays the public key of the entry if specified.

Default Display all keys.

Mode User Exec, Privileged Exec and Global Configuration

Usage When VRF-lite is configured:

- If **vrf** is specified, this command displays the known host database from the specified VRF instance.
- If **global** is specified, this command displays the known host database from the global routing environment.
- If neither **vrf** nor **global** is specified, this command displays the known host database from the global routing environment and each configured VRF.

For more information about VRF, see the **VRF Lite Feature Overview and Configuration Guide**.

Examples To display public keys of known SSH servers, use the command:

```
awplus# show crypto key pubkey-chain knownhosts
```

To display the key data of the first entry in the known host data, use the command:

```
awplus# show crypto key pubkey-chain knownhosts 1
```

Output The following shows typical output.

Example output from the `show crypto key public-chain knownhosts` command

```
No    Hostname        Type Fingerprint
--------------------------------------------------------------------
1     172.16.23.1     rsa  c8:33:b1:fe:6f:d3:8c:81:4e:f7:2a:aa:a5:be:df:18
2     172.16.23.10    rsa  c4:79:86:65:ee:a0:1d:a5:6a:e8:fd:1d:d3:4e:37:bd
3     5ffe:1053:ac21:ff00:0101:bcdf:ffff:0001
                      rsa1 af:4e:b4:a2:26:24:6d:65:20:32:d9:6f:32:06:ba:57
```

Parameters in the output of the `show crypto key public-chain knownhosts` command

Parameter	Description
`No`	Number ID of the key.
`Hostname`	Host name of the known SSH server.
`Type`	The algorithm used to generate the key.
`Fingerprint`	Checksum value for the public key.

Related commands **crypto key pubkey-chain knownhosts**

Command changes Version 5.5.3-1.1: added to AR1050V

Version 5.4.6-2.1: VRF-lite support added for AR-Series devices

show crypto key pubkey-chain userkey

Overview This command displays the public keys registered with the SSH server for SSH users. These keys allow remote users to access the device using public key authentication. By using public key authentication, users can access the SSH server without providing password.

Syntax `show crypto key pubkey-chain userkey <username> [<1-65535>]`

Parameter	Description
<username>	User name of the remote SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
<1-65535>	Key identifier for a specific key.

Default Display all keys.

Mode User Exec, Privileged Exec and Global Configuration

Example To display the public keys for the user `manager` that are registered with the SSH server, use the command:

```
awplus# show crypto key pubkey-chain userkey manager
```

Output The following shows typical output.

Example output from the `show crypto key public-chain userkey` command

```
No Type Bits Fingerprint
----------------------------------------------------------------
1  dsa  1024 2b:cc:df:a8:f8:2e:8f:a4:a5:4f:32:ea:67:29:78:fd
2  rsa  2048 6a:ba:22:84:c1:26:42:57:2c:d7:85:c8:06:32:49:0e
```

Parameters in the output of the `show crypto key userkey` command

Parameter	Description
`No`	Number ID of the key.
`Type`	The algorithm used to generate the key.
`Bits`	Length in bits of the key.
`Fingerprint`	Checksum value for the key.

Related commands **crypto key pubkey-chain userkey**

show crypto key userkey

Overview This command displays the public keys created on this device for the specified SSH user.

Syntax

```
show crypto key userkey <username> [dsa|rsa|rsa1]
```

Parameter	Description
<username>	User name of the local SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
`dsa`	Displays the DSA public key.
`rsa`	Displays the RSA public key used for SSH version 2 connections.
`rsa1`	Displays the RSA key used for SSH version 1 connections.

Mode User Exec, Privileged Exec and Global Configuration

Examples To show the public key generated for the user, use the command:

```
awplus# show crypto key userkey manager
```

To store the RSA public key generated for the user manager to the file "user.pub", use the command:

```
awplus# show crypto key userkey manager rsa > manager-rsa.pub
```

Output The following shows typical output.

Example output from the `show crypto key userkey` command

```
Type Bits   Fingerprint
-----------------------------------------------------------
rsa  2048   e8:d6:1b:c0:f4:b6:e6:7d:02:2e:a9:d4:a1:ca:3b:11
rsa1 1024   12:25:60:95:64:08:8e:a1:8c:3c:45:1b:44:b9:33:9b
```

Parameters in the output of the `show crypto key userkey` command

Parameter	Description
`Type`	The algorithm used to generate the key.
`Bits`	Length in bits of the key.
`Fingerprint`	Checksum value for the key.

Related commands **crypto key generate userkey**

show running-config ssh

Overview This command displays the current running configuration of Secure Shell (SSH).

Syntax
```
show running-config ssh
```

Mode Privileged Exec and Global Configuration

Example To display the current configuration of SSH, use the command:
```
awplus# show running-config ssh
```

Output The following shows typical output.

Example output from the `show running-config ssh` command

```
!
ssh server session-timeout 600
ssh server login-timeout 30
ssh server allow-users manager 192.168.1.*
ssh server allow-users john
ssh server deny-user john*.a-company.com
ssh server
```

Parameters in the output of the `show running-config ssh` command

Parameter	Description
`ssh server`	SSH server is enabled.
`ssh server v2`	SSH server is enabled and only support SSHv2.
`ssh server<port>`	SSH server is enabled and listening on the specified TCP port.
`no ssh server scp`	SCP service is disabled.
`no ssh server sftp`	SFTP service is disabled.
`ssh server session-timeout`	Configure the server session timeout.
`ssh server login-timeout`	Configure the server login timeout.
`ssh server max-startups`	Configure the maximum number of concurrent sessions waiting authentication.
`no ssh server authentication password`	Password authentication is disabled.
`no ssh server authentication publickey`	Public key authentication is disabled.
`ssh server allow-users`	Add the user (and hostname) to the allow list.
`ssh server deny-users`	Add the user (and hostname) to the deny list.

Related commands **service ssh**

show ssh server

show ssh

Overview This command displays the active SSH sessions on the device, both incoming and outgoing.

Syntax
```
show ssh
```

Mode User Exec, Privileged Exec and Global Configuration

Example To display the current SSH sessions on the device, use the command:
```
awplus# show ssh
```

Output The following shows typical output.

Example output from the `show ssh` command

```
Secure Shell Sessions:
ID  Type Mode   Peer Host    Username   State       Filename
------------------------------------------------------------------
414 ssh  server 172.16.23.1  root       open
456 ssh  client 172.16.23.10 manager    user-auth
459 scp  client 172.16.23.12 root       download    example.awd
463 ssh  client 5ffe:33fe:5632:ffbb:bc35:ddee:0101:ac51
                             manager    user-auth
```

Parameters in the output of the `show ssh` command

Parameter	Description	
`ID`	Unique identifier for each SSH session.	
`Type`	Session type; either SSH, SCP, or SFTP.	
`Mode`	Whether the device is acting as an SSH client (client) or SSH server (server) for the specified session.	
`Peer Host`	The hostname or IP address of the remote server or client.	
`Username`	Login user name of the server.	
`State`	The current state of the SSH session. One of:	
	`connecting`	The device is looking for a remote server.
	`connected`	The device is connected to the remote server.
	`accepted`	The device has accepted a new session.
	`host-auth`	host-to-host authentication is in progress.
	`user-auth`	User authentication is in progress.
	`authenticated`	User authentication is complete.
	`open`	The session is in progress.
	`download`	The user is downloading a file from the device.
	`upload`	The user is uploading a file from the device.
	`closing`	The user is terminating the session.
	`closed`	The session is closed.

Parameter	Description
`Filename`	Local filename of the file that the user is downloading or uploading.

Related commands clear ssh

show ssh client

Overview This command displays the current configuration of the Secure Shell client.

Syntax

```
show ssh client
```

Mode User Exec, Privileged Exec and Global Configuration

Example To display the current configuration for SSH clients on the login shell, use the command:

```
awplus# show ssh client
```

Output The following shows typical output.

Example output from the `show ssh client` command

```
Secure Shell Client Configuration
-----------------------------------------------------------------
Port                              : 22
Version                           : 2,1
Connect Timeout                   : 30 seconds
Session Timeout                   : 0 (off)
Debug                             : NONE
```

Parameters in the output of the `show ssh client` command

Parameter	Description
`Port`	SSH server TCP port where the SSH client connects to. The default is port 22.
`Version`	SSH server version, either “2” or “2,1”. From AlliedWare Plus 5.5.1-1.1 onwards, SSH version 1 is not supported.
`Connect Timeout`	Time in seconds that the SSH client waits for an SSH session to establish. If the value is 0, the connection is terminated when it reaches the TCP timeout.
`Debug`	Whether debugging is active on the client.

Related commands show ssh server

Command changes Version 5.5.3-1.1: added to AR1050V

show ssh server

Overview This command displays the current configuration of the Secure Shell server.

Note that changes to the SSH configuration affects only new SSH sessions coming from remote hosts, and does not affect existing sessions.

Syntax

```
show ssh server
```

Mode User Exec, Privileged Exec, and Global Configuration

Example To display the current configuration of the Secure Shell server, use the command:

```
awplus# show ssh server
```

Output The following shows typical output.

Example output from the `show ssh server` command

```
Secure Shell Server Configuration
------------------------------------------------------------------------------
SSH Server                          : Enabled
Protocol                            : IPv4,IPv6
Port                                : 22
Version                             : 2
Services                            : scp, sftp
User Authentication                 : publickey, password
Resolve Hosts                       : Disabled
Session Timeout                     : 0 (Off)
Login Timeout                       : 60 seconds
Maximum Authentication Tries        : 6
Maximum Startups                    : 10
Debug                               : NONE
Ciphers                             : aes128-cbc,aes128-ctr,aes192-ctr,aes256-ctr
KEX                                 : curve25519-sha256@libssh.org,
                                        ecdh-sha2-nistp256,ecdh-sha2-nistp384,
                                        ecdh-sha2-nistp521,
                                        diffie-hellman-group-exchange-sha256,
                                        diffie-hellman-group-exchange-sha1,
                                        diffie-hellman-group14-sha1
```

Parameters in the output of the `show ssh server` command

Parameter	Description
`SSH Server`	Whether the Secure Shell server is enabled or disabled.
`Port`	TCP port where the Secure Shell server listens for connections. The default is port 22.
`Version`	SSH server version; either '2' or '2,1'. From AlliedWare Plus 5.5.1-1.1 onwards, SSH version 1 is not supported.
`Services`	List of the available Secure Shell services; one or more of SHELL, SCP or SFTP.
`User Authentication`	List of available authentication methods.
`Login Timeout`	Time (in seconds) that the SSH server will wait the SSH session to establish. If the value is 0, the client login will be terminated when TCP timeout reaches.
`Idle Timeout`	Time (in seconds) that the SSH server will wait to receive data from the SSH client. The server disconnects if this timer limit is reached. If set at 0, the idle timer remains off.
`Maximum Startups`	The maximum number of concurrent connections that are waiting authentication. The default is 10.
`Debug`	Whether debugging is active on the server.

Parameter	Description
`Ciphers`	List of ciphers permitted.
KEX	List of available Key Exchange algorithms.

Related commands

show ssh

show ssh client

show ssh server allow-users

Overview This command displays the user entries in the allow list of the SSH server.

Syntax

```
show ssh server allow-users
```

Mode User Exec, Privileged Exec and Global Configuration

Example To display the user entries in the allow list of the SSH server, use the command:

```
awplus# show ssh server allow-users
```

Output The following shows typical output.

Example output from the `show ssh server allow-users` command

```
Username          Remote Hostname (pattern)
----------------- -------------------------------
awplus            192.168.*
john
manager           *.alliedtelesis.com
```

Parameters in the output of the `show ssh server allow-users` command

Parameter	Description
`Username`	User name that is allowed to access the SSH server.
`Remote Hostname (pattern)`	IP address or hostname pattern of the remote client. The user is allowed requests from a host that matches this pattern. If no hostname is specified, the user is allowed from all hosts.

Related commands **ssh server allow-users**

ssh server deny-users

show ssh server deny-users

Overview This command displays the user entries in the deny list of the SSH server. The user in the deny list is rejected to access the SSH server. If a user is not included in the access list of the SSH server, the user is also rejected.

Syntax

```
show ssh server deny-users
```

Mode User Exec, Privileged Exec and Global Configuration

Example To display the user entries in the deny list of the SSH server, use the command:

```
awplus# show ssh server deny-users
```

Output The following shows typical output.

Example output from the `show ssh server deny-users` command

```
Username          Remote Hostname (pattern)
----------------- ------------------------------
john              *.b-company.com
manager           192.168.2.*
```

Parameters in the output of the `show ssh server deny-user` command

Parameter	Description
`Username`	The user that this rule applies to.
`Remote Hostname (pattern)`	IP address or hostname pattern of the remote client. The user is denied requests from a host that matches this pattern. If no hostname is specified, the user is denied from all hosts.

Related commands

ssh server allow-users

ssh server deny-users

ssh

Overview Use this command to initiate a Secure Shell connection to a remote SSH server.

If the server requests a password to login, you need to type in the correct password at the “Password:” prompt.

An SSH client identifies the remote SSH server by its public key registered on the client device. If the server identification is changed, server verification fails. If the public key of the server has been changed, the public key of the server must be explicitly added to the known host database.

NOTE: *A hostname specified with SSH cannot begin with a hyphen (-) character.*

Syntax

```
ssh [ip|ipv6] [user <username>|port <1-65535>|version 2]
 <remote-device> [<command>]
```

Syntax in secure mode

```
ssh [cipher {aes128-cbc|aes256-cbc|aes128-ctr|aes192-ctr|aes256-
ctr}] [hmac {hmac-sha2-256}]
[public-key {ecdsa-sha2-nistp256|ecdsa-sha2-nistp384}] [key-
exchange {ecdh-sha2-nistp256|ecdh-sha2-nistp384}] [ip|ipv6]
 [user <username>|port <1-65535>|version 2] <remote-device>
 [<command>]
```

Syntax (VRF-lite)

```
ssh vrf <vrf-name> [ip|ipv6] [user <username>|port <1-65535>|
version 2] <remote-device> [<command>]
```

Parameter	Description
`cipher`	The supported cipher name. Select either: aes128-cbc or aes256-cbc.
`hmac`	The supported hmac name: hmac-sha2-256
`public-key`	The supported public-key name. Select either: ecdsa-sha2-nistp256 or ecdsa-sha2-nistp384
`key-exchange`	The supported key-exchange name. Select either: ecdsa-sha2-nistp256 or ecdsa-sha2-nistp384
`vrf`	Apply the command to the specified VRF instance. When using VRF, specifying a VRF name means the command will apply to that VRF instance, and not specifying a VRF name means the command will apply to the global VRF.
<vrf-name>	The name of the VRF instance.
`ip`	Specify IPv4 SSH.
`ipv6`	Specify IPv6 SSH.
`user`	Login user. If user is specified, the username is used for login to the remote SSH server when user authentication is required. Otherwise the current user name is used.
	<username> — User name to login on the remote server.
`port`	SSH server port. If port is specified, the SSH client connects to the remote SSH server with the specified TCP port. Other- wise, the client port configured by “ssh client” command or the default TCP port (22) is used.
	<1-65535> — TCP port.
`version`	SSH client version. From 5.5.1-1.1 onwards, SSH only supports version 2.
<remote-device>	IPv4/IPv6 address or hostname of a remote server. The address is in the format A.B.C.D for an IPv4 address, or in the format X:X::X:X for an IPv6 address. Note that a hostname specified with SSH cannot begin with a hyphen (-) character.

Parameter	Description
<command>	A command to execute on the remote server. If a command is specified, the command is executed on the remote SSH server and the session is disconnected when the remote command finishes.

Mode User Exec and Privileged Exec

Usage notes This command contains some additional security parameters (cipher, hmac, public-key, and key exchange). To access these parameters you must enable Secure Mode on the device by using the command: **crypto secure-mode**.

```
awplus(config)# crypto secure-mode
```

Examples To login to the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 as user 'manager', use the command:

```
awplus# ssh ip user manager 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 that is listening on TCP port 2000, use the command:

```
awplus# ssh port 2000 192.0.2.5
```

To login to the remote SSH server 'example_host' using an IPv6 session, use the command:

```
awplus# ssh ipv6 example_host
```

To run the **cmd** command on the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5 cmd
```

Example (VRF-lite) To login to the remote SSH server at 192.168.1.1 on VRF "red", use the command:

```
awplus# ssh vrf red 192.168.1.1
```

Version 5.5.1-1.1: support removed for SSH protocol v1

Version 5.4.8-2.1: secure mode syntax added for x950, SBx908 GEN2.

Version 5.4.8-1.2: secure mode syntax added for x220, x930, x550, XS900MX.

Version 5.4.6-2.1: VRF-lite support added for AR-Series devices.

ssh client

Overview

This command modifies the default configuration parameters of the Secure Shell (SSH) client. The configuration is used for any SSH client on the device to connect to remote SSH servers. Any parameters specified on SSH client explicitly override the default configuration parameters.

The change affects the current user shell only. When the user exits the login session, the configuration does not persist. This command does not affect existing SSH sessions.

The **no** variant of this command resets configuration parameters of the Secure Shell (SSH) client changed by the **ssh client** command, and restores the defaults.

This command does not affect the existing SSH sessions.

Syntax

```
ssh client {port <1-65535>|version 2|session-timeout <0-3600>|
connect-timeout <1-600>}
```

```
no ssh client {port|version|session-timeout|connect-timeout}
```

Syntax (VRF-lite)

```
ssh client {port <1-65535>|version 2|session-timeout <0-3600>|
connect-timeout <1-600>|vrf <vrf-name>}
```

```
no ssh client {port|version|session-timeout|connect-timeout|vrf}
```

Parameter	Description
`port`	The default TCP port of the remote SSH server. If an SSH client specifies an explicit port of the server, it overrides the default TCP port. Default: 22
	<1-65535> TCP port number.
`version`	The SSH version used by the client for SSH sessions. From 5.5.1-1.1 onwards, the SSH client supports only version 2
`session-timeout`	The global session timeout for SSH sessions. If the session timer lapses since the last time an SSH client received data from the remote server, the session is terminated. If the value is 0, then the client does not terminate the session. Instead, the connection is terminated when it reaches the TCP timeout. Default: 0 (session timer remains off)
	<0-3600> Timeout in seconds.
`connect-timeout`	The maximum time period that an SSH session can take to become established. The SSH client terminates the SSH session if this timeout expires and the session is still not established. Default: 30
	<1-600> Timeout in seconds.
`vrf <vrf-name>`	The VRF to use for SSH clients. Default: the global VRF.

Mode Privileged Exec

Examples To configure the default TCP port for SSH clients to 2200, and the session timer to 10 minutes, use the command:

```
awplus# ssh client port 2200 session-timeout 600
```

To configure the connect timeout of SSH client to 10 seconds, use the command:

```
awplus# ssh client connect-timeout 10
```

To restore the connect timeout to its default, use the command:

```
awplus# no ssh client connect-timeout
```

Example (VRF-lite) To configure SSH clients to use the VRF named 'red', use the command:

```
awplus# ssh client vrf red
```

Related commands

show ssh client

ssh

Command changes

Version 5.5.3-1.1: added to AR1050V

Version 5.5.2-1.1: **vrf** parameter added for products that support VRF

Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

ssh client allow-legacy-ssh-rsa

Overview Use this command to enable support for the legacy ssh-rsa algorithm on the SSH client. Support for this algorithm was removed in version 5.5.1-1.1 due to security concerns. Support for it is still disabled by default and you should only enable it if you cannot avoid using ssh-rsa. It cannot be enabled when the device is in Secure Mode.

Use the **no** variant of this command to disable support for the legacy ssh-rsa algorithm on the SSH client.

Syntax

```
ssh client allow-legacy-ssh-rsa
no ssh client allow-legacy-ssh-rsa
```

Default Disabled

Mode Global Configuration

Example To enable SSH client support for the legacy ssh-rsa algorithm, use the commands:

```
awplus# configure terminal
awplus(config)# ssh client allow-legacy-ssh-rsa
```

Related commands

show ssh client

ssh client

ssh server allow-legacy-ssh-rsa

Command changes Version 5.5.3-1.1: added to AR1050V

Version 5.5.3-0.1: command added

ssh client vrf

Overview Use this command to modify the configured VRF of the SSH client. Use this configuration for any SSH client on the device to connect to remote SSH servers.

Use the **no** variant of this command to restore the configured VRF to the default VRF (global VRF).

Syntax

```
ssh client vrf <vrf-name>
no client vrf
```

Parameter	Description
`vrf <vrf-name>`	The name of the VRF to use for SSH clients. This overrides the default.

Default Global VRF

Mode Global Configuration

Usage notes Any VRF parameter specified on the SSH client explicitly overrides the default configuration parameters. This also affects the copy commands that utilize SSH such as **`copy scp`** and **`copy sftp`**.

This change affects all new user shell sessions. Existing sessions will not be affected.

A user may override this on a per-session basis using the executive mode variant of this command.

Examples To configure the VRF named 'management' for SSH clients, use the commands:

```
awplus# configure terminal
awplus(config)# ssh client vrf management
```

To restore to the default, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh client vrf
```

Related commands **show ssh client**

ssh client

Command changes Version 5.5.2-2.1: command added

ssh server

Overview Use this command to modify the configuration of the SSH server. Changing these parameters affects new SSH sessions connecting to the device.

Use the **no** variant of this command to restore the configuration of a specified parameter to its default. The change affects the SSH server immediately if the server is running. Otherwise, the configuration is used when the server starts.

To enable the SSH server, use the **service ssh** command.

Syntax

```
ssh server <1-65535>
ssh server {[session-timeout <0-3600>] [login-timeout <1-600>]
 [max-startups <1-128>]}
no ssh server {[session-timeout] [login-timeout] [max-startups]}
```

Parameter	Description
<1-65535>	The TCP port number that the server listens to for incoming SSH sessions. Default: 22
`session-timeout`	The maximum time period that the server waits before deciding that a session is inactive and should be terminated. The server considers the session inactive when it has not received any data from the client, and when the client does not respond to keep alive messages. Default: 0 (session timer remains off).
	Enter a timeout between 0-3600 seconds.
`login-timeout`	The maximum time period the server waits before disconnecting an unauthenticated client. Default: 60
	Enter a timeout between 1- 600 seconds.
`max-startups`	The maximum number of concurrent unauthenticated connections the server accepts. When the number of SSH connections awaiting authentication reaches the limit, the server drops any additional connections until authentication succeeds or the login timer expires for a connection. Default: 10
	Enter a number of sessions in the range of 1-128.

Mode Global Configuration

Examples To set the session timer of the SSH server to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server session-timeout 600
```

To set the login timeout of the SSH server to 30 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server login-timeout 30
```

To limit the number of SSH client connections waiting for authentication from the SSH server to 3, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server max-startups 3
```

To return the limit on the number of waiting connections to the default of 10, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server max-startups
```

To support the SSH server with TCP port 2200, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server 2200
```

Related commands **show ssh server**

ssh client

ssh server vrf

Command changes Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

ssh server allow-legacy-ssh-rsa

Overview Use this command to enable support for the legacy ssh-rsa algorithm on the SSH server. Support for this algorithm was removed in version 5.5.1-1.1 due to security concerns. Support for it is still disabled by default and you should only enable it if you cannot avoid using ssh-rsa. It cannot be enabled when the device is in Secure Mode.

Use the **no** variant of this command to disable support for the legacy ssh-rsa algorithm on the SSH server.

Syntax

```
ssh server allow-legacy-ssh-rsa
no ssh server allow-legacy-ssh-rsa
```

Default Disabled

Mode Global Configuration

Example To enable SSH server support for the legacy ssh-rsa algorithm, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-legacy-ssh-rsa
```

Related commands

show ssh server

ssh server

ssh client allow-legacy-ssh-rsa

Command changes Version 5.5.3-0.1: command added

ssh server allow-users

Overview This command adds a username pattern to the allow list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is accepted.

When there are no registered users in the server's database of allowed users, the SSH server does not accept SSH sessions even when enabled.

SSH server also maintains the deny list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.

The **no** variant of this command deletes a username pattern from the allow list of the SSH server. To delete an entry from the allow list, the username and hostname pattern should match exactly with the existing entry.

Syntax

```
ssh server allow-users <username-pattern> [<hostname-pattern>]
no ssh server allow-users <username-pattern> [<hostname-pattern>]
```

Parameter	Description
<username-pattern>	The username pattern that users can match to. An asterisk acts as a wildcard character that matches any string of characters.
<hostname-pattern>	The host name pattern that hosts can match to. If specified, the server allows the user to connect only from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters.

Mode Global Configuration

Examples

To allow the user `john` to create an SSH session from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john
```

To allow the user `john` to create an SSH session from a range of IP address (from 192.168.1.1 to 192.168.1.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john 192.168.1.*
```

To allow the user `john` to create a SSH session from `a-company.com` domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john *.a-company.com
```

To delete the existing user entry `john 192.168.1.*` in the allow list, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server allow-users john 192.168.1.*
```

Related commands

show running-config ssh

show ssh server allow-users

ssh server deny-users

ssh server authentication

Overview This command enables RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **ssh server authentication** command to enable password authentication for users. Apply the **publickey** keyword with the **ssh server authentication** command to enable RSA public-key authentication for users.

Use the **no** variant of this command to disable RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **no ssh authentication** command to disable password authentication for users. Apply the required **publickey** keyword with the **no ssh authentication** command to disable RSA public-key authentication for users.

Syntax

```
ssh server authentication {password|publickey}
no ssh server authentication {password|publickey}
```

Parameter	Description
`password`	Specifies user password authentication for SSH server.
`publickey`	Specifies user publickey authentication for SSH server.

Default Both RSA public-key authentication and password authentication are enabled by default.

Mode Global Configuration

Usage For password authentication to authenticate a user, password authentication for a user must be registered in the local user database or on an external RADIUS server, before using the **ssh server authentication password** command.

For RSA public-key authentication to authenticate a user, a public key must be added for the user, before using the **ssh server authentication publickey** command.

Examples

To enable `password` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication password
```

To enable `publickey` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication publickey
```

To disable `password` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server authentication password
```

To disable `publickey` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server authentication publickey
```

Related commands

crypto key pubkey-chain userkey

service ssh

show ssh server

ssh server deny-users

Overview This command adds a username pattern to the deny list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is rejected.

SSH server also maintains the allow list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.

If a hostname pattern is specified, the user is denied from the hosts matching the pattern.

The **no** variant of this command deletes a username pattern from the deny list of the SSH server. To delete an entry from the deny list, the username and hostname pattern should match exactly with the existing entry.

Syntax

```
ssh server deny-users <username-pattern> [<hostname-pattern>]
no ssh server deny-users <username-pattern> [<hostname-pattern>]
```

Parameter	Description
<username-pattern>	The username pattern that users can match to. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen, full stop and asterisk symbols. An asterisk acts as a wildcard character that matches any string of characters.
<hostname-pattern>	The host name pattern that hosts can match to. If specified, the server denies the user only when they connect from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters.

Mode Global Configuration

Examples

To deny the user `john` to access SSH login from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john
```

To deny the user john to access SSH login from a range of IP address (from 192.168.2.1 to 192.168.2.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john 192.168.2.*
```

To deny the user `john` to access SSH login from `b-company.com` domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john*.b-company.com
```

To delete the existing user entry `john 192.168.2.*` in the deny list, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server deny-users john 192.168.2.*
```

Related commands

show running-config ssh

ssh server disallow-cbc-ciphers

Overview Use this command to disallow CBC mode ciphers on SSH servers. You can only use this command when your device is in Secure Mode (see the **crypto secure-mode** command).

Use the **no** variant of this command to allow CBC mode ciphers.

Syntax
```
ssh server disallow-cbc-ciphers
no ssh server disallow-cbc-ciphers
```

Default CBC mode ciphers are allowed by default.

Mode Global Configuration

Example To disallow CBC mode ciphers for SSH server in Secure Mode, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server disallow-cbc-ciphers
```

Related commands
crypto secure-mode
service ssh
ssh server

Command changes Version 5.5.1-2.1: command added

ssh server max-auth-tries

Overview Use this command to specify the maximum number of SSH authentication attempts that the device will allow.

Use the **no** variant of this command to return the maximum number of attempts to its default value of 6.

Syntax

```
ssh server max-auth-tries <1-32>
no ssh server max-auth-tries
```

Parameter	Description
	Maximum number of SSH authentication attempts the device will allow.

Default 6 attempts

Mode Global Configuration

Usage By default, users must wait one second after a failed login attempt before trying again. You can increase this gap by using the command **aaa login fail-delay**.

Example To set the maximum number of SSH authentication attempts to 3, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server max-auth-tries 3
```

Related commands **show ssh server**

ssh server netconf

Overview Use this command to enable the Netconf service on the SSH server. Once enabled, the server will start accepting Netconf requests from remote clients.

You must enable the SSH server as well as this service before the device accepts Netconf connections. The Netconf service is disabled by default when the SSH server is enabled. If the SSH server is disabled, Netconf service is unavailable.

Use the **no** variant of this command to disable Netconf service on the SSH server. Once disabled, Netconf requests from remote clients are rejected.

Syntax

```
ssh server netconf
no ssh server netconf
```

Default Disabled.

Mode Global Configuration

Example To enable the Netconf service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server netconf
```

To disable the Netconf service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server netconf
```

Related commands **show running-config ssh**

show ssh server

Command changes Version 5.5.3-1.1: command added

ssh server resolve-host

Overview This command enables resolving an IP address from a host name using a DNS server for client host authentication.

The **no** variant of this command disables this feature.

Syntax
```
ssh server resolve-hosts
no ssh server resolve-hosts
```

Default This feature is disabled by default.

Mode Global Configuration

Usage notes Your device has a DNS Client that is enabled automatically when you add a DNS server to your device. Use the **ip name-server** command to add a DNS server to the list of servers that the device queries.

Example To resolve a host name using a DNS server, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server resolve-hosts
```

Related commands

ip name-server

show ssh server

ssh server allow-users

ssh server deny-users

ssh server scp

Overview This command enables the Secure Copy (SCP) service on the SSH server. Once enabled, the server accepts SCP requests from remote clients.

You must enable the SSH server as well as this service before the device accepts SCP connections. The SCP service is enabled by default as soon as the SSH server is enabled.

The **no** variant of this command disables the SCP service on the SSH server. Once disabled, SCP requests from remote clients are rejected.

Syntax
```
ssh server scp
no ssh server scp
```

Mode Global Configuration

Examples To enable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server scp
```

To disable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server scp
```

Related commands **show running-config ssh**

show ssh server

ssh server secure-algs

Overview Use this command to force the SSH server to only use ciphers, key exchange algorithms and Message Authentication Code (MAC) algorithms that are currently considered best-practice.

This command is the same as using all of the commands **ssh server secure-ciphers**, **ssh server secure-hostkey**, **ssh server secure-mac**, and **ssh server secure-kex**. However, it does not include the optional **exclude-nist-curves** parameter of **ssh server secure-kex**.

Use the **no** variant of this command to stop forcing the SSH server to use this restricted set of algorithms.

Syntax

```
ssh server secure-algs
no ssh server secure-algs
```

Default Disabled.

Mode Global Configuration

Usage notes To see the list of algorithms, use the **show ssh server** command.

This command is not available in Secure Mode because Secure Mode already forces the device to use only FIPS-approved algorithms.

Example To force the SSH server to use best-practice algorithms, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-algs
```

Related commands

show ssh server

ssh server

ssh server secure-ciphers

ssh server secure-hostkey

ssh server secure-kex

ssh server secure-mac

Command changes Version 5.5.1-1.1: command added

ssh server secure-ciphers

Overview Use this command to force the SSH server to only negotiate ciphers regarded as current best-practice.

Use the **no** variant of this command to stop forcing the SSH server to use this restricted set of ciphers.

Syntax
```
ssh server secure-ciphers
no ssh server secure-ciphers
```

Default Not set

Mode Global Configuration

Usage notes To see the list of ciphers, use the **show ssh server** command.

This command is not available in Secure Mode because Secure Mode already forces the device to use only FIPS-approved algorithms.

Example To configure the SSH server to use best-practice ciphers, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-ciphers
```

Related commands

Command changes Version 5.5.0-1.1: command added

ssh server secure-hostkey

Overview Use this command to force the SSH server to only use hostkey algorithms that are currently considered best-practice. This excludes NIST curve-based hostkey algorithms.

Use the **no** variant of this command to stop forcing the SSH server to use this restricted set of hostkey algorithms.

Syntax
```
ssh server secure-hostkey
no ssh server secure-hostkey
```

Default Disabled

Mode Global Configuration

Usage notes Using this command may reduce compatibility with older SSH clients.

To see the list of hostkey algorithms, use the **show ssh server** command.

This command is not available in Secure Mode because Secure Mode already forces the device to use only FIPS-approved algorithms.

Example To force the SSH server to use best-practice hostkey algorithms, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-hostkey
```

Related commands
show ssh server
ssh server
ssh server secure-algs
ssh server secure-ciphers
ssh server secure-kex
ssh server secure-mac

Command changes Version 5.5.2-2.1: command added

ssh server secure-kex

Overview Use this command to force the SSH server to only use key exchange algorithms that are currently considered best-practice.

For example, using this command stops the device from using the diffie-hellman-group-exchange-sha1 key exchange algorithm.

Use the **no** variant of this command to stop forcing the SSH server to use this restricted set of key-exchange algorithms.

Syntax

```
ssh server secure-kex [exclude-nist-curves]
no ssh server secure-kex
```

Parameter	Description
`exclude-nist-curves`	Also exclude all NIST key exchange algorithms. Using this parameter may reduce compatibility with older SSH clients.

Default Disabled.

Mode Global Configuration

Usage notes To see the list of key exchange algorithms, use the **show ssh server** command.

This command is not available in Secure Mode because Secure Mode already forces the device to use only FIPS-approved algorithms.

Example To force the SSH server to use best-practice key-exchange algorithms, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-kex
```

Version 5.5.0-2.3: command added

ssh server secure-mac

Overview Use this command to force the SSH server to only use Message Authentication Code (MAC) algorithms that are currently considered best-practice.

Use the **no** variant of this command to stop forcing the SSH server to use this restricted set of MAC algorithms.

Syntax

```
ssh server secure-mac
no ssh server secure-mac
```

Default Disabled.

Mode Global Configuration

Usage notes To see the list of MAC algorithms, use the **show ssh server** command.

This command is not available in Secure Mode because Secure Mode already forces the device to use only FIPS-approved algorithms.

Example To force the SSH server to use best-practice MAC algorithms, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-mac
```

ssh server sftp

Overview This command enables the Secure FTP (SFTP) service on the SSH server. Once enabled, the server accepts SFTP requests from remote clients.

You must enable the SSH server as well as this service before the device accepts SFTP connections. The SFTP service is enabled by default as soon as the SSH server is enabled. If the SSH server is disabled, SFTP service is unavailable.

The **no** variant of this command disables SFTP service on the SSH server. Once disabled, SFTP requests from remote clients are rejected.

Syntax

```
ssh server sftp
no ssh server sftp
```

Mode Global Configuration

Examples To enable the SFTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server sftp
```

To disable the SFTP service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server sftp
```

Related commands **show running-config ssh**

ssh server tcpforwarding

Overview Use this command to enable TCP port forwarding on the SSH server. It is disabled by default, to enhance security.

Use the **no** variant of this command to disable TCP port forwarding again.

Syntax
```
ssh server tcpforwarding
no ssh server tcpforwarding
```

Default Disabled

Mode Global Configuration

Example To enable TCP port forwarding, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server tcpforwarding
```

To disable it again, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server tcpforwarding
```

Related commands **show ssh server**

Command changes Version 5.5.2-1.1: command added

ssh server vrf

Overview Use this command to specify a VRF for the SSH server to operate within.

Use the **no** variant of this command to return the SSH server to the default VRF.

Syntax

```
ssh server vrf [<vrf-name>]
no ssh server vrf
```

Parameter	Description
<vrf-name>	The name of the VRF instance

Default The global VRF

Mode Global Configuration

Example To configure the SSH server to operate within the VRF instance named 'red', use the command:

```
awplus# configure terminal
awplus(config)# ssh server vrf red
```

To return the SSH server to operating within the global VRF instance, use the command:

```
awplus# configure terminal
awplus(config)# no ssh server vrf
```

Introduction

Overview This chapter provides an alphabetical reference for commands used to configure Triggers. For more information, see the **Triggers Feature Overview and Configuration Guide**.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

active (trigger)

Overview This command enables a trigger. This allows the trigger to activate when its trigger conditions are met.

The **no** variant of this command disables a trigger. While in this state the trigger cannot activate when its trigger conditions are met.

Syntax
```
active
no active
```

Default Active, which means that triggers are enabled by default

Mode Trigger Configuration

Usage notes Configure a trigger first before you use this command to activate it.

For information about configuring a trigger, see the **Triggers_Feature Overview and Configuration Guide**.

Examples To enable trigger 172, so that it can activate when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 172
awplus(config-trigger)# active
```

To disable trigger 182, preventing it from activating when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 182
awplus(config-trigger)# no active
```

Related commands **show trigger**

trigger

trigger activate

day

Overview This command specifies the days or date that the trigger can activate on. You can specify one of:

- A specific date
- A specific day of the week
- A list of days of the week
- A day of any month of any year
- A day of a specific month in any year
- Every day

By default, the trigger can activate on any day.

Syntax

```
day every-day
day <1-31>
day <1-31> <month>
day <1-31> <month> <year>
day <weekday>
```

Parameter	Description
`every-day`	Sets the trigger so that it can activate on any day.
<1-31>	Day of the month the trigger is permitted to activate on.
<month>	Sets the month that the trigger is permitted to activate on. Valid keywords are: **`january`**, **`february`**, **`march`**, **`april`**, **`may`**, **`june`**, **`july`**, **`august`**, **`september`**, **`october`**, **`november`**, and **`december`**.
<year>	Sets the year that the trigger is permitted to activate in, between 2000 and 2035.
<weekday>	Sets the days of the week that the trigger can activate on. You can specify one or more week days in a space separated list. Valid keywords are: **`monday`**, **`tuesday`**, **`wednesday`**, **`thursday`**, **`friday`**, **`saturday`**, and **`sunday`**.

Default **every-day**, so by default, the trigger can activate on any day.

Mode Trigger Configuration

Usage notes For example trigger configurations that use the **day** command, see "Restrict Internet Access" and "Turn off Power to Port LEDs" in the **Triggers Feature Overview and Configuration Guide**.

Examples

To permit trigger 55 to activate on the 1 June 2019, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 55
awplus(config-trigger)# day 1 jun 2019
```

To permit trigger 12 to activate on Mondays, Wednesdays and Fridays, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# day monday wednesday friday
```

To permit trigger 17 to activate on the 5th day of any month, in any year, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 17
awplus(config-trigger)# day 5
```

To permit trigger 6 to activate on the 20th day of September, in any year, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 6
awplus(config-trigger)# day 20 september
```

To permit trigger 14 to activate on the 1st day of each month, in any year, at 11.00am, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 14
awplus(config-trigger)# day 1
awplus(config-trigger)# type time 11:00
```

Related commands

show trigger

type time

trigger

Command changes

Version 5.4.8-2.1: day of the month functionality added

debug trigger

Overview This command enables trigger debugging. This generates detailed messages about how your device is processing the trigger commands and activating the triggers.

The **no** variant of this command disables trigger debugging.

Syntax
```
debug trigger
no debug trigger
```

Mode Privileged Exec

Examples To start trigger debugging, use the command:

```
awplus# debug trigger
```

To stop trigger debugging, use the command:

```
awplus# no trigger
```

Related commands

show debugging trigger

show trigger

test

trigger

undebug trigger

description (trigger)

Overview This command adds an optional description to help you identify the trigger. This description is displayed in show command outputs and log messages.

The **no** variant of this command removes a trigger's description. The show command outputs and log messages stop displaying a description for this trigger.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	A word or phrase that uniquely identifies this trigger or its purpose. Valid characters are any printable character and spaces, up to a maximum of 40 characters.

Mode Trigger Configuration

Examples To give trigger 240 the description `daily status report`, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 240
awplus(config-trigger)# description daily status report
```

To remove the description from trigger 36, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 36
awplus(config-trigger)# no description
```

Related commands

show trigger

test

trigger

repeat

Overview This command specifies the number of times that a trigger is permitted to activate. This allows you to specify whether you want the trigger to activate:

- only the first time that the trigger conditions are met
- a limited number of times that the trigger conditions are met
- an unlimited number of times

Once the trigger has reached the limit set with this command, the trigger remains in your configuration but cannot be activated. Use the **repeat** command again to reset the trigger so that it is activated when its trigger conditions are met.

By default, triggers can activate an unlimited number of times. To reset a trigger to this default, specify either **yes** or **forever**.

Syntax `repeat {forever|no|once|yes|<1-4294967294>}`

Parameter	Description
`yes|forever`	The trigger repeats indefinitely, or until disabled.
`no|once`	The trigger activates only once.
<1-4292967294>	The trigger repeats the specified number of times.

Mode Trigger Configuration

Examples To allow trigger 21 to activate only once, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 21
awplus(config-trigger)# repeat no
```

To allow trigger 22 to activate an unlimited number of times whenever its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 22
awplus(config-trigger)# repeat forever
```

To allow trigger 23 to activate only the first 10 times the conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 23
awplus(config-trigger)# repeat 10
```

Related commands

show trigger

trigger

script

Overview This command specifies one or more scripts that are to be run when the trigger activates. You can add up to five scripts to a single trigger.

The sequence in which the trigger runs the scripts is specified by the number you set before the name of the script file. One script is executed completely before the next script begins.

Scripts may be either ASH shell scripts, indicated by a **.sh** filename extension suffix, or AlliedWare Plus scripts, indicated by a **.scp** filename extension suffix. AlliedWare Plus scripts only need to be readable. You can't use ASH scripts when the device is in Secure Mode.

The **no** variant of this command removes one or more scripts from the trigger's script list. The scripts are identified by either their name, or by specifying their position in the script list. The **all** parameter removes all scripts from the trigger.

Syntax

```
script <1-5> {<filename>}
no script {<1-5>|<filename>|all}
```

Parameter	Description
<1-5>	The position of the script in execution sequence. The trigger runs the lowest numbered script first.
<filename>	The path to the script file.

Mode Trigger Configuration

Examples

To configure trigger 71 to run the script flash:/cpu_trig.sh in position 3 when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# script 3 flash:/cpu_trig.sh
```

To configure trigger 99 to run the scripts flash:reconfig.scp, flash:cpu_trig.sh and flash:email.scp in positions 2, 3 and 5 when the trigger activates, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 99
awplus(config-trigger)# script 2 flash:/reconfig.scp 3 flash:/
cpu_trig.sh 5 flash:/email.scp
```

To remove the scripts 1, 3 and 4 from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script 1 3 4
```

To remove the script flash:/cpu_trig.sh from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script flash:/cpu_trig.sh
```

To remove all the scripts from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script all
```

Related commands

show trigger

trigger

show debugging trigger

Overview This command displays the current status for trigger utility debugging. Use this command to show when trigger debugging has been turned on or off from the **debug trigger** command.

Syntax

```
show debugging trigger
```

Mode User Exec and Privileged Exec

Example To display the current configuration of trigger debugging, use the command:

```
awplus# show debugging trigger
```

Output The following shows typical output.

Example output from the `show debugging trigger` command

```
awplus#debug trigger
awplus#show debugging trigger
Trigger debugging status:
  Trigger debugging is on

awplus#no debug trigger
awplus#show debugging trigger
Trigger debugging status:
  Trigger debugging is off
```

Related commands **debug trigger**

show running-config trigger

Overview This command displays the current running configuration of the trigger utility.

Syntax
```
show running-config trigger
```

Mode Privileged Exec

Example To display the current configuration of the trigger utility, use the command:

```
awplus# show running-config trigger
```

Output The following shows typical output.

Example output from the `show running-config trigger` command

```
 trigger 1
  type card in

type usb in
 trigger 2

type usb out
 !
```

Related commands **show trigger**

show trigger

Overview This command displays configuration and diagnostic information about the triggers configured on the device. Specify the **show trigger** command without any options to display a summary of the configuration of all triggers.

Syntax

```
show trigger [<1-250>|counter|full]
```

Parameter	Description
<1-250>	Displays detailed information about a specific trigger, identified by its trigger ID.
`counter`	Displays statistical information about all triggers.
`full`	Displays detailed information about all triggers.

Mode Privileged Exec

Example To get summary information about all triggers, use the following command:

```
awplus# show trigger
```

Example output from `show trigger`

```
awplus#show trigger
TR# Type & Details       Name                 Ac Te Repeat     #Scr Days/Date
-------------------------------------------------------------------------------
001 CPU (80% any)        Busy CPU             Y  N  5           1   smtwtfs
005 Periodic (30 min)    Regular status check Y  N  Continuous  1   -mtwtf-

013 Reboot                                    Y  N  Continuous  2   smtwtfs
019 Ping-poll (5 up)     Connection to svr1   Y  N  Continuous  1   smtwtfs
-------------------------------------------------------------------------------
```

Parameters in the output of `show trigger`

Parameter	Description
TR#	Trigger identifier (ID).
Type & Details	The trigger type, followed by the trigger details in brackets.
Name	Descriptive name of the trigger configured with the **description (trigger)** command.
Ac	Whether the trigger is active (Y), or inactive (N).
Te	Whether the trigger is in test mode (Y) or not (N).
Repeat	Whether the trigger repeats continuously, and if not, the configured repeat count for the trigger. To see the number of times a trigger has activated, use the **show trigger** <1-250> command.
#Scr	Number of scripts associated with the trigger.
Days/Date	Days or date when the trigger may be activated. For the days options, the days are shown as a seven character string representing Sunday to Saturday. A hyphen indicates days when the trigger cannot be activated.

To display detailed information about trigger 3, use the command:

```
awplus# show trigger 3
```

Example output from `show trigger` for a specific trigger

```
awplus#show trigger 1

Parameters in the output of `show trigger full` and `show trigger` for a specific trigger

Parameter	Description
`Trigger`	The ID of the trigger.

Parameter	Description
Name	Descriptive name of the trigger.
Type and details	The trigger type and its activation conditions.
Days	The days on which the trigger is permitted to activate.
Date	The date on which the trigger is permitted to activate. Only displayed if configured, in which case it replaces “Days”.
Active	Whether or not the trigger is permitted to activate.
Test	Whether or not the trigger is operating in diagnostic mode.
Trap	Whether or not the trigger is enabled to send SNMP traps.
Repeat	Whether the trigger repeats an unlimited number of times (Continuous) or for a set number of times. When the trigger can repeat only a set number of times, then the number of times the trigger has been activated is displayed in brackets.
Modified	The date and time of the last time that the trigger was modified.
Number of activations	Number of times the trigger has been activated since the last restart of the device.
Last activation	The date and time of the last time that the trigger was activated.
Number of scripts	How many scripts are associated with the trigger, followed by the names of the script files in the order in which they run.

To display counter information about all triggers use the command:

```
awplus# show trigger counter
```

Example output from `show trigger counter`

```
awplus# show trigger counter
Trigger Module Counters
-------------------------------------------------------
Trigger activations                              4
Last trigger activated                          55

Reboot triggers activated today                  0
Ping-poll triggers activated today               0
USB event triggers activated today               0
Stack master fail triggers activated today       0
```

```
Stack member triggers activated today            0
Stack link triggers activated today              0
ATMF node triggers activated today               0
ATMF guest triggers activated today              0
Log triggers activated today                     0
-------------------------------------------------------
```

Related commands

- **active (trigger)**
- **debug trigger**
- **script**
- **trigger**
- **trigger activate**

test

Overview This command puts the trigger into a diagnostic mode. In this mode the trigger may activate but when it does it will not run any of the trigger's scripts. A log message will be generated to indicate when the trigger has been activated.

The **no** variant of this command takes the trigger out of diagnostic mode, restoring normal operation. When the trigger activates, the scripts associated with the trigger will be run, as normal.

Syntax
```
test
no test
```

Mode Trigger Configuration

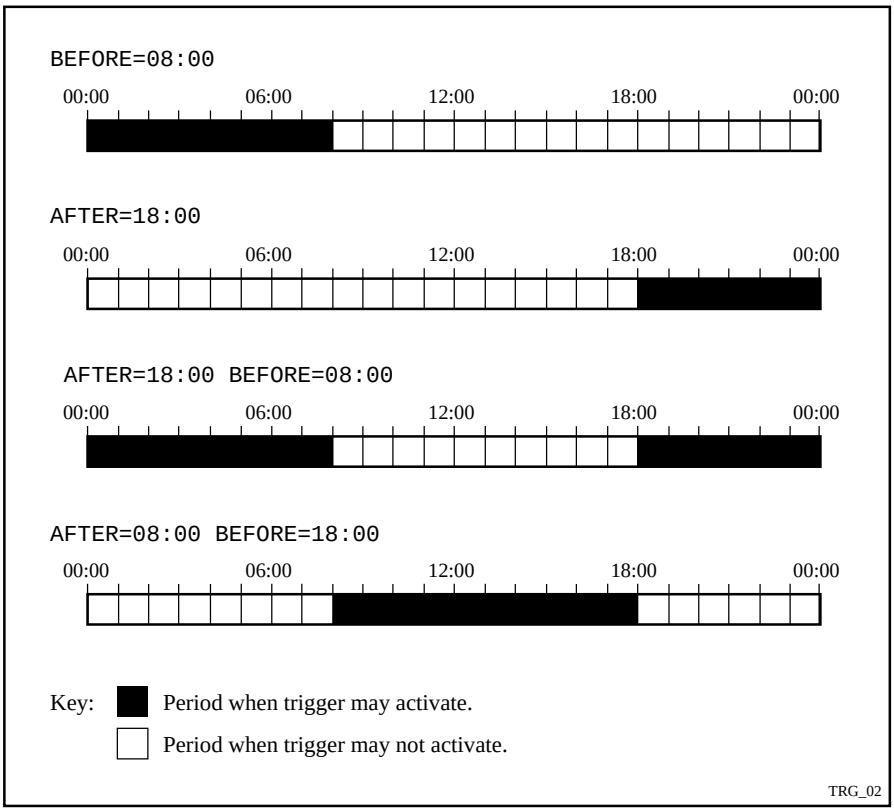
Usage notes Configure a trigger first before you use this command to diagnose it. For information about configuring a trigger, see the **Triggers_Feature Overview and Configuration Guide**.

Examples To put trigger 5 into diagnostic mode, where no scripts will be run when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# test
```

To take trigger 205 out of diagnostic mode, restoring normal operation, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no test
```



Related commands **show trigger**

trigger

time (trigger)

Overview This command specifies the time of day when the trigger is permitted to activate. The after parameter specifies the start of a time period that extends to midnight during which trigger may activate. By default the value of this parameter is 00:00:00 (am); that is, the trigger may activate at any time. The **before** parameter specifies the end of a time period beginning at midnight during which the trigger may activate. By default the value of this parameter is 23:59:59; that is, the trigger may activate at any time. If the value specified for **before** is later than the value specified for **after**, a time period from **"** after **"** to **"** before **"** is defined, during which the trigger may activate. This command is not applicable to time triggers (**`type time`**).

The following figure illustrates how the **before** and **after** parameters operate.

Syntax `time {[after <hh:mm:ss>] [before <hh:mm:ss>]}`

Parameter	Description
`after`*<hh:mm:ss>*	The earliest time of day when the trigger may be activated.
`before`*<hh:mm:ss>*	The latest time of day when the trigger may be activated.

Mode Trigger Configuration

Usage notes For example trigger configurations that use the **`time (trigger)`** command, see “Restrict Internet Access” and “Turn off Power to Port LEDs” in the **Triggers Feature Overview and Configuration Guide**.

Examples To allow trigger 63 to activate between midnight and 10:30am, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 63
awplus(config-trigger)# time before 10:30:00
```

To allow trigger 64 to activate between 3:45pm and midnight, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 64
awplus(config-trigger)# time after 15:45:00
```

To allow trigger 65 to activate between 10:30am and 8:15pm, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 65
awplus(config-trigger)# time after 10:30:00 before 20:15:00
```

Related commands **show trigger**

trigger

trap

Overview This command enables the specified trigger to send SNMP traps.

Use the **no** variant of this command to disable the sending of SNMP traps from the specified trigger.

Syntax

```
trap
no trap
```

Default SNMP traps are enabled by default for all defined triggers.

Mode Trigger Configuration

Usage notes You must configure SNMP before using traps with triggers. For more information, see:

- **Support for Allied Telesis Enterprise_MIBs_in AlliedWare Plus**, for information about which MIB objects are supported.
- the **SNMP Feature Overview and Configuration_Guide**.
- the **SNMP Commands** chapter.

Since SNMP traps are enabled by default for all defined triggers, a common usage will be for the **no** variant of this command to disable SNMP traps from a specified trap if the trap is only periodic. Refer in particular to AT-TRIGGER-MIB in the **Support for Allied Telesis Enterprise_MIBs_in AlliedWare Plus** for further information about the relevant SNMP MIB.

Examples To enable SNMP traps to be sent from trigger 5, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# trap
```

To disable SNMP traps being sent from trigger 205, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no trap
```

Related commands **trigger**

show trigger

trigger

Overview This command is used to access the Trigger Configuration mode for the specified trigger. Once Trigger Configuration mode has been entered the trigger type information can be configured and the trigger scripts and other operational parameters can be specified. At a minimum the trigger type information must be specified before the trigger can become active.

The **no** variant of this command removes a specified trigger and all configuration associated with it.

Syntax

```
trigger <1-250>
no trigger <1-250>
```

Parameter	Description
<1-250>	A trigger ID.

Mode Global Configuration

Examples To enter trigger configuration mode for trigger 12, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 12
```

To completely remove all configuration associated with trigger 12, use the commands:

```
awplus# configure terminal
awplus(config)# no trigger 12
```

Related commands

show trigger

trigger activate

trigger activate

Overview This command is used to manually activate a specified trigger from the Privileged Exec mode, which has been configured with the **trigger** command from the Global Configuration mode.

Syntax

```
trigger activate <1-250>
```

Parameter	Description
<1-250>	A trigger ID.

Mode Privileged Exec

Usage notes This command manually activates a trigger without the normal trigger conditions being met.

The trigger is activated even if it has been configured as inactive by using the command **no active**. The scripts associated with the trigger will be executed even if the trigger is in the diagnostic test mode.

Triggers activated manually do not have their repeat counts decremented or their 'last triggered' time updated, and do not result in updates to the '[type] triggers today' counters.

Example To manually activate trigger 12 use the command:

```
awplus# trigger activate 12
```

Related commands

active (trigger)

show trigger

trigger

type atmf guest

Overview This command configures a trigger to activate when an AMF guest node joins or leaves.

Syntax

```
type atmf guest {join|leave}
```

Parameter	Description
join	AMF guest node joins.
leave	AMF guest node leaves.

Mode Trigger Configuration

Example To configure trigger 86 to activate when an AMF guest node leaves, use the following commands:

```
awplus(config)# trigger 86
awplus(config-trigger)# type atmf guest leave
```

Related commands **show trigger**

Command changes Version 5.5.1-1.1: command added

type atmf node

Overview This command configures a trigger to activate when an AMF node joins or leaves.

Syntax

```
type atmf node {join|leave}
```

Parameter	Description
`join`	AMF node joins.
`leave`	AMF node leaves.

Mode Trigger Configuration

Example 1 To configure trigger 5 to activate when an AMF node leaves, use the following commands. In this example the command is entered on node-1:

```
node1(config)# trigger 5
node1(config-trigger)# type atmf node leave
```

Example 2 The following commands will configure trigger 5 to activate if an AMF node join event occurs on any node within the working set:

```
node1# atmf working-set group all
```

This command returns the following display:

```
====================
node1, node2, node3:
====================

Working set join
```

Note that the running the above command changes the prompt from the name of the local node, to the name of the AMF-Network followed, in square brackets, by the number of member nodes in the working set.

```
AMF-Net[3]# conf t
AMF-Net[3](config)# trigger 5
AMF-Net[3](config-trigger)# type atmf node leave
AMF-Net[3](config-trigger)# description “E-mail on AMF Exit”
AMF-Net[3](config-trigger)# active
```

Enter the name of the script to run at the trigger event.

```
AMF-Net[3](config-trigger)# script 1 email_me.scp
AMF-Net[3](config-trigger)# end
```

Display the trigger configurations

```
AMF-Net[3]# show trigger
```

This command returns the following display:

```
=======
node1:
=======

TR# Type & Details     Description          Ac Te Tr Repeat     #Scr Days/Date
-------------------------------------------------------------------------------

005 ATMF node (leave)  E-mail on ATMF Exit  Y  N  Y Continuous  1   smtwtfs
-------------------------------------------------------------------------------

==============
Node2, Node3,
==============

TR# Type & Details     Description          Ac Te Tr Repeat     #Scr Days/Date
-------------------------------------------------------------------------------
005 ATMF node (leave)  E-mail on ATMF Exit  Y  N  Y Continuous  1   smtwtfs
-------------------------------------------------------------------------------
```

Display the triggers configured on each of the nodes in the AMF Network.

```
AMF-Net[3]# show running-config trigger
```

This command returns the following display:

```
========
Node1:
```

```
========

trigger 1
 type periodic 2
 script 1 atmf.scp
trigger 5
 type atmf node leave
description “E-mail on ATMF Exit”
 script 1 email_me.scp
!

============
Node2, Node3:
============

trigger 5
 type atmf node leave
description “E-mail on ATMF Exit”
 script 1 email_me.scp
!
```

Related commands **show trigger**

type cpu

Overview This command configures a trigger to activate based on CPU usage level. Selecting the **up** option causes the trigger to activate when the CPU usage exceeds the specified usage level. Selecting the **down** option causes the trigger to activate when CPU usage drops below the specified usage level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

Syntax

```
type cpu <1-100> [up|down|any]
```

Parameter	Description
<1-100>	The percentage of CPU usage at which to trigger.
up	Activate when CPU usage exceeds the specified level.
down	Activate when CPU usage drops below the specified level
any	Activate when CPU usage passes the specified level in either direction

Mode Trigger Configuration

Usage notes For an example trigger configuration that uses the **type cpu** command, see “Capture Unusual CPU and RAM Activity” in the **Triggers Feature Overview and Configuration Guide**.

Examples To configure trigger 28 to be a CPU trigger that activates when CPU usage exceeds 80% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 28
awplus(config-trigger)# type cpu 80 up
```

To configure trigger 5 to be a CPU trigger that activates when CPU usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65
```

or

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65 any
```

Related commands

show trigger

trigger

type env-sensor

Overview

Use this command to create a trigger that will run a script when the device's environment sensors detect an event. Environment sensors are shown in the output of the command **show system environment**, and include things like device temperature, power settings and voltage.

Depending on the device and sensor, you can create a trigger to run when:

- the sensor's state changes, for example when a loss of power is detected for a power supply, or when power is restored, or both.
- the sensor's reading crosses a high or low threshold, for example when the device temperature becomes too high, or returns to normal, or both.

Syntax when a sensor changes state

```
type env-sensor [node <number>] resource <resource-id> sensor
 <sensor-id> state {true|false|any}
```

Parameter	Description
`node <number>`	The VCStack member ID that the sensor is on, for example, 3 for stack member 3. You can leave this parameter out on standalone devices.
`resource <resource-id>`	The 'Resource ID' for the device, as shown in output of the command **show system environment**.
`sensor <sensor-id>`	The 'ID' for the sensor, as shown in output of the command **show system environment**.
`state true`	The trigger will activate if this sensor reading changes to 'Yes' or 'Open' in the output of **show system environment**.
`state false`	The trigger will activate if this sensor reading changes to 'No' or 'Closed' in the output of **show system environment**.
`state any`	The trigger will activate if this sensor reading changes to any of 'Yes', 'Open', 'No', or 'Closed'.

Syntax when a sensor crosses a threshold

```
type env-sensor [node <number>] resource <resource-id> sensor
 <sensor-id> {low-limit|high-limit} {exceeded|cleared|any}
```

Parameter	Description
`node <number>`	The VCStack member ID that the sensor is on, for example, 3 for stack member 3. You can leave this parameter out on standalone devices.
`resource <resource-id>`	The 'Resource ID' for the device, as shown in output of the command **show system environment**.
`sensor <sensor-id>`	The 'ID' for the sensor, as shown in output of the command **show system environment**.
`low-limit`	The trigger will activate when the sensor reading falls below the 'Low Limit' alarm threshold shown in **show system environment**, or returns to an acceptable value after being too low, or both. The alarm threshold values are pre-defined within the device and cannot be changed.
`high-limit`	The trigger will activate when the sensor reading rises above the 'High Limit' alarm threshold shown in **show system environment**, or returns to an acceptable value after being too high, or both. The alarm threshold values are pre-defined within the device and cannot be changed.
`exceeded`	If you chose low-limit, the trigger will trigger if the sensor's reading falls below the low limit. If you chose high-limit, the trigger will trigger if the sensor's reading goes above the high limit.
`cleared`	If you chose low-limit, the trigger will trigger if the sensor's reading rises to above the low limit again. If you chose high-limit, the trigger will trigger if the sensor's reading falls below the high limit again. Some temperature sensors include a hysteresis value and will not clear until the temperature has changed significantly. For example, if a sensor has a high alarm threshold of 75 degrees Celsius, the hysteresis value may mean that the alarm clears when the temperature falls to 63 degrees Celsius.
`any`	The trigger will trigger if the low or high limit is either exceeded or cleared.

Mode

Trigger Configuration

Example To configure trigger 1, which will activate when the internal temperature becomes too high or drops to a low-enough value after being too high, use the following commands. This example monitors the internal temperature of stack member 2, and has a resource ID of 3 and a sensor ID of 8:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type env-sensor node 2 resource 3 sensor
 8 high-limit any
```

Related commands

show system environment

show trigger

trigger

Command changes Version 5.5.2-1.1: command added

type interface

Overview This command configures a trigger to activate based on the link status of an interface. The trigger can be activated when the interface becomes operational by using the **up** option, or when the interface closes by using the **down** option. The trigger can also be configured to activate when either one of these events occurs by using the **any** option.

Syntax

```
type interface <interface> {up|down|any}
```

Parameter	Description
<interface>	Interface name.
up	Activate when interface becomes operational.
down	Activate when the interface closes.
any	Activate when any interface link status event occurs.

Mode Trigger Configuration

Example To configure trigger 19 to be an interface trigger that activates when port1.0.1 becomes operational, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 19
awplus(config-trigger)# type interface port1.0.1 up
```

Related commands **show trigger**

trigger

type linkmon-probe

Overview Use this command to create a trigger that will run a script when a Link Health Monitoring probe reports that a link becomes “good”, “bad”, or “unreachable”.

Syntax

```
type linkmon-probe <probename> <profilename> {good|bad|
unreachable|any}
```

Parameter	Description
<probename>	The name of the Link Health Monitoring probe that will be used for executing the trigger.
<profilename>	The name of the Link Health Monitoring performance profile that will be used for determine if the Link Health Monitoring probe is good, bad, or unreachable.
`good`	If the Link Health Monitoring probe becomes 'good' according to the Link Health Monitoring performance profile then the trigger will be executed.
`bad`	If the Link Health Monitoring probe goes 'bad' according to the Link Health Monitoring performance profile then the trigger will be executed.
`unreachable`	If the Link Health Monitoring probe becomes 'unreachable' according to the Link Health Monitoring performance profile then the trigger will be executed.
`any`	If the Link Health Monitoring probe changes state according to the Link Health Monitoring performance profile then the trigger will be executed.

Mode Trigger Configuration

Example When the Link Health Monitoring probes sent to the “test-probe” destination no longer meet the performance profile “test-profile” the link will be deemed “bad”. To create a trigger that will run a script when a Link Health Monitoring probe is deemed “bad”, use the following commands:

```
awplus(config)# trigger 1
awplus(config-trigger)# script 1 link-bad.scp
awplus(config-trigger)# type linkmon-probe test-probe test-
profile bad
```

To create a trigger that will run a script when the link is deemed “good” again, use the following commands:

```
awplus(config)# trigger 2
awplus(config-trigger)# script 1 link-good.scp
awplus(config-trigger)# type linkmon-probe test-probe test-
profile good
```

Related commands trigger

Command changes Version 5.4.8-1.1: command added

type log

Overview Use this command to configure a trigger to activate based on the content of log messages matching a string or regular expression.

Syntax

```
type log <log-message-string>
```

Parameter	Description
<log-message-string>	A string or a regular expression (PCRE) to match a log message or part of a log message.

Default There is no type or log message string set by default.

Mode Trigger Configuration

Usage notes Log type triggers fully support regular expressions using PCRE (Perl-Compatible Regular Expression) syntax.

Only log messages of severity level notice or higher can activate a trigger.

Note that any command executed by the script will generate a log message with level notice, and will include '[SCRIPT]' before the command string. Therefore, if something in the script matches the configured log message trigger string, it will retrigger indefinitely.

Example To configure trigger 6 to activate when a log message of level notice or higher indicates that any port has 'failed', use the commands:

```
awplus# configure terminal
awplus(config)# trigger 6
awplus(config-trigger)# type log port.+ failed
```

Related commands **show trigger**

trigger

Command changes Version 5.4.7-2.1: command added

type main-pse

Overview Use this command to monitor the total Power over Ethernet (PoE) power usage on the switch. This trigger activates if the amount of power being drawn exceeds the switch's PoE budget, or if it falls back within the budget again.

Note that the switch will take corrective action when the budget is exceeded. This means the amount of power will drop soon after the fault occurs.

Syntax

```
type main-pse [member <stack-id>] {up|down|any}
```

Parameter	Description
`member <stack-id>`	Activate for PoE budget events for the specified VCStack member. Not using this option activates the trigger for any member.
`up`	Activate when the total power being drawn exceeds the PoE budget for the switch
`down`	Activate when the total power drawn falls back within the PoE budget for the switch
`any`	Activate both when the total power drawn exceeds the PoE budget for the switch and when it falls back within budget again

Mode Trigger Configuration

Example To configure trigger 1, which will activate if the switch's power usage exceeds the PoE budget, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type main-pse up
```

To configure trigger 2, which will activate if stack member 2's power usage exceeds the PoE budget or falls back within budget again, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 2
awplus(config-trigger)# type main-pse member 2 any
```

Related commands

script

show trigger

type pse-port

Command changes Version 5.5.3-1.1: command added

type memory

Overview This command configures a trigger to activate based on RAM usage level. Selecting the **up** option causes the trigger to activate when memory usage exceeds the specified level. Selecting the **down** option causes the trigger to activate when memory usage drops below the specified level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

Syntax

```
type memory <1-100> [up|down|any]
```

Parameter	Description
<1-100>	The percentage of memory usage at which to trigger.
up	Activate when memory usage exceeds the specified level.
down	Activate when memory usage drops below the specified level.
any	Activate when memory usage passes the specified level in either direction.

Mode Trigger Configuration

Examples To configure trigger 12 to be a memory trigger that activates when memory usage exceeds 50% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# type memory 50 up
```

To configure trigger 40 to be a memory trigger that activates when memory usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65
```

or

```
awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65 any
```

Related commands **show trigger**

trigger

type periodic

Overview This command configures a trigger to be activated at regular intervals. The time period between activations is specified in minutes.

Syntax

```
type periodic <1-1440>
```

Parameter	Description
<1-1440>	The number of minutes between activations.

Mode Trigger Configuration

Usage notes A combined limit of 10 triggers of the type periodic and time can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or
periodic
```

For an example trigger configuration that uses the **type periodic** command, see “See Daily Statistics” in the **Triggers_Feature Overview and Configuration Guide**.

Example To configure trigger 44 to activate periodically at 10 minute intervals use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 44
awplus(config-trigger)# type periodic 10
```

Related commands **show trigger**

trigger

type ping-poll

Overview This command configures a trigger that activates when Ping Polling identifies that a target device's status has changed. This allows you to run a configuration script when a device becomes reachable or unreachable.

Syntax

```
type ping-poll <1-100> {up|down}
```

Parameter	Description
<1-100>	The ping poll ID.
up	The trigger activates when ping polling detects that the target is reachable.
down	The trigger activates when ping polling detects that the target is unreachable.

Mode Trigger Configuration

Example To configure trigger 106 to activate when ping poll 12 detects that its target device is now unreachable, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 106
awplus(config-trigger)# type ping-poll 12 down
```

Related commands **show trigger**

trigger

type pse-port

Overview Use this command to monitor an individual Power over Ethernet (PoE) port. This trigger activates if the amount of power being drawn by a port exceeds the capabilities of the port, or if it falls back within the limit again. Note that the switch will take corrective action when the port limit is exceeded, such as shutting down the affected port. This means the amount of power will drop soon after the fault occurs.

Syntax

```
type pse-port <interface> {up|down|any}
```

Parameter	Description
<interface>	The name of a PoE port.
up	Activate when the power drawn from the PoE port starts to exceed the port's capability to supply power.
down	Activate when the power drawn from the PoE port stops exceeding the port's capability to supply power.
any	Activate both when the power drawn from the PoE port starts to exceed the port's capability to supply power, and when it drops to a low enough value again.

Mode Trigger Configuration

Example To configure trigger 1, which will activate if port1.0.1 draws too much power, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type pse-port port1.0.1 up
```

To configure trigger 1, which will activate if port1.0.1 draws too much power and also when it stops drawing too much power, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type pse-port port1.0.1 any
```

Related commands

script

show trigger

type main-pse

Command changes Version 5.5.3-1.1: command added

type reboot

Overview This command configures a trigger that activates when your device is rebooted.

Syntax
```
type reboot
```

Mode Trigger Configuration

Example To configure trigger 32 to activate when your device reboots, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 32
awplus(config-trigger)# type reboot
```

Related commands **show trigger**

trigger

type stack disabled-master

Overview This command (configured to the stack) configures a trigger to activate on a stack member if it becomes the disabled master.

A disabled master has the same configuration as the active master, but has all its links shutdown.

Although this command could activate any trigger script, the intention here is that the script will reactivate the links from their previously shutdown state, to enable the user to manage the device. An appropriate trigger script must already exist that will apply the **shutdown** command on the deactivated links.

CAUTION: *It is important that any ports that are configured as trunked ports across master and stack members are disabled at their stack member termination when operating in the fallback configuration. Otherwise, the trunked ports will not function correctly on the device that is connected downstream.*

If the **stack virtual-mac** command is enabled, the stack uses a virtual MAC address. The stack will always use this MAC address and the new elected master will still retain the originally configured virtual MAC address. If the **`stack virtual-mac`** command is disabled, the stack will use the MAC address of the current master. If the stack master fails, the stack MAC address changes to reflect the new master's MAC address. For more information about virtual MAC addresses, see the **VCStack Feature Overview and Configuration Guide**.

Syntax

```
type stack disabled-master
```

Mode Trigger Configuration

Examples To configure trigger 82 to activate on a device if it becomes the disabled master, use the following commands. These commands enter the Trigger Configuration mode for trigger 82, specify the trigger type, and then specify the script to run.

```
awplus# configure terminal
awplus(config)# trigger 82
awplus(config-trigger)# type stack disabled master
awplus(config-trigger)# script 1 flash:/disabled.scp
awplus(config-trigger)# exit
```

stack disabled-master-monitoring

trigger

type stack master-fail

type stack member

type stack link

type stack link

Overview This command (configured to the stack) initiates the action of a pre-configured trigger to occur when a stacking link is either activated or deactivated.

Syntax

```
type stack link {up|down}
```

Parameter	Description
up	Stack link up event
down	Stack link down event

Mode Trigger Configuration

Example To configure trigger 86 to activate when the stack link down event occurs, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type stack link down
```

Related commands

show trigger

trigger

type stack master-fail

type stack master-fail

Overview This command (configured to the stack) initiates the action of a pre-configured trigger to occur when the stack enters the fail-over state.

Syntax

```
type stack master-fail
```

Mode Trigger Configuration

Example To configure trigger 86 to activate when stack master fail-over event occurs, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type stack master-fail
```

Related commands

stack disabled-master-monitoring

trigger

type stack disabled-master

type stack member

type stack link

type stack member

Overview This command (configured to the stack) initiates the action of a pre-configured trigger to occur when a device either joins or leaves the stack.

Syntax

```
type stack member {join|leave}
```

Parameter	Description
`join`	Neighbor join event
`leave`	Neighbor leave event

Mode Trigger Configuration

Example To configure a pre-configured trigger number 86 to activate when a new device joins the stack.

Note that the number 86 has no particular significance: you can assign any (previously created) numbered trigger.

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type stack member join
```

Related commands

trigger

type stack master-fail

type stack link

type time

Overview This command configures a trigger that activates at a specified time of day.

Syntax `type time <hh:mm>`

Parameter	Description
<hh:mm>	The time to activate the trigger.

Mode Trigger Configuration

Usage A combined limit of 10 triggers of the type time and type periodic can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or
periodic
```

Example To configure trigger 86 to activate at 15:53, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type time 15:53
```

Related commands **show trigger**

trigger

type usb

Overview Use this command to configure a trigger that activates on either the removal or the insertion of a USB storage device.

Syntax

```
type usb {in|out}
```

Parameter	Description
in	Trigger activates on insertion of a USB storage device.
out	Trigger activates on removal of a USB storage device.

Mode Trigger Configuration

Usage notes USB triggers cannot execute script files from a USB storage device.

Examples To configure trigger 1 to activate on the insertion of a USB storage device, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type usb in
```

Introduction

Overview This chapter provides an alphabetical reference for commands used to configure Ping Polling. For more information, see the **Ping Polling Feature Overview and Configuration Guide**.

For information on filtering and saving command output, see the **"Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide**.

The following table lists the default values when configuring a ping poll

Default	Value
Critical-interval	1 second
Description	No description
Fail-count	5
Length	32 bytes
Normal-interval	30 seconds
Sample-size	5
Source-ip	The IP address of the interface from which the ping packets are transmitted
Time-out	1 second
Up-count	30

active (ping-polling)

Overview This command enables a ping-poll instance. The polling instance sends ICMP echo requests to the device with the IP address specified by the **ip (ping-polling)** command.

By default, polling instances are disabled. When a polling instance is enabled, it assumes that the device it is polling is unreachable.

The **no** variant of this command disables a ping-poll instance. The polling instance no longer sends ICMP echo requests to the polled device. This also resets all counters for this polling instance.

Syntax

```
active
no active
```

Mode Ping-Polling Configuration

Examples To activate the ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# active
```

To disable the ping-poll instance 43 and reset its counters, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no active
```

Related commands

debug ping-poll

ip (ping-polling)

ping-poll

show ping-poll

clear ping-poll

Overview This command resets the specified ping poll, or all ping poll instances. This clears the ping counters, and changes the status of polled devices to unreachable. The polling instance changes to the polling frequency specified with the **critical-interval** command. The device status changes to reachable once the device responses have reached the **up-count**.

Syntax

```
clear ping-poll {<1-100>|all}
```

Parameter	Description
<1-100>	A ping poll ID number. The specified ping poll instance has its counters cleared, and the status of the device it polls is changed to unreachable.
`all`	Clears the counters and changes the device status of all polling instances.

Mode Privileged Exec

Examples To reset the ping poll instance 12, use the command:

```
awplus# clear ping-poll 12
```

To reset all ping poll instances, use the command:

```
awplus# clear ping-poll all
```

Related commands

active (ping-polling)

ping-poll

show ping-poll

critical-interval

Overview This command specifies the time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable.

This command enables the device to quickly observe changes in state, and should be set to a much lower value than the **normal-interval** command.

The **no** variant of this command sets the critical interval to the default of one second.

Syntax

```
critical-interval <1-65536>
no critical-interval
```

Parameter	Description
<1-65536>	Time in seconds between pings, when the device has failed to a ping, or the device is unreachable.

Default The default is 1 second.

Mode Ping-Polling Configuration

Examples To set the critical interval to 2 seconds for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# critical-interval 2
```

To reset the critical interval to the default of one second for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# no critical-interval
```

timeout (ping polling)

up-count

debug ping-poll

Overview This command enables ping poll debugging for the specified ping-poll instance. This generates detailed messages about ping execution.

The **no** variant of this command disables ping-poll debugging for the specified ping-poll.

Syntax

```
debug ping-poll <1-100>
no debug ping-poll {<1-100>|all}
```

Parameter	Description
<1-100>	A unique ping poll ID number.
all	Turn off all ping-poll debugging.

Mode Privileged Exec

Examples To enable debugging for ping-poll instance 88, use the command:

```
awplus# debug ping-poll 88
```

To disable all ping poll debugging, use the command:

```
awplus# no debug ping-poll all
```

To disable debugging for ping-poll instance 88, use the command:

```
awplus# no debug ping-poll 88
```

Related commands

active (ping-polling)

clear ping-poll

ping-poll

show ping-poll

undebug ping-poll

description (ping-polling)

Overview

This command specifies a string to describe the ping-polling instance. This allows the ping-polling instance to be recognized easily in show commands. Setting this command is optional.

By default ping-poll instances do not have a description.

Use the **no** variant of this command to delete the description set.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	The description of the target. Valid characters are any printable character and spaces. There is no maximum character length.

Mode

Ping-Polling Configuration

Examples

To add the text “Primary Gateway” to describe the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# description Primary Gateway
```

To delete the description set for the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no description
```

Related commands

ping-poll

show ping-poll

fail-count

Overview This command specifies the number of pings that must be unanswered, within the total number of pings specified by the **sample-size** command, for the ping-polling instance to consider the device unreachable.

If the number set by the **sample-size** command and the **fail-count** commands are the same, then the unanswered pings must be consecutive. If the number set by the **sample-size** command is greater than the number set by the **fail-count** command, then a device that does not always reply to pings may be declared unreachable.

The **no** variant of this command resets the fail count to the default.

Syntax

```
fail-count <1-100>
no fail-count
```

Parameter	Description
<1-100>	The number of pings within the sample size that a reachable device must fail to respond to before it is classified as unreachable.

Default The default is 5.

Mode Ping-Polling Configuration

Examples To specify the number of pings that must fail within the sample size to determine that a device is unreachable for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# fail-count 5
```

To reset the fail-count to its default of 5 for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no fail-count
```

- **up-count**

ip (ping-polling)

Overview This command specifies the IPv4 address of the device you are polling.

Syntax `ip {<ip-address>|<ipv6-address>}`

Parameter	Description
<ip-address>	An IPv4 address in dotted decimal notation `A.B.C.D`
<ipv6-address>	An IPv6 address in hexadecimal notation `X:X::X:X`

Mode Ping-Polling Configuration

Examples To set ping-poll instance 5 to poll the device with the IP address `192.168.0.1`, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 5
awplus(config-ping-poll)# ip 192.168.0.1
```

To set ping-poll instance 10 to poll the device with the IPv6 address `2001:db8::`, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 10
awplus(config-ping-poll)# ip 2001:db8::
```

Related commands

ping-poll

source-ip

show ping-poll

length (ping-poll data)

Overview This command specifies the number of data bytes to include in the data portion of the ping packet. This allows you to set the ping packets to a larger size if you find that larger packet types in your network are not reaching the polled device, while smaller packets are getting through. This encourages the polling instance to change the device's status to unreachable when the network is dropping packets of the size you are interested in.

The **no** variant of this command resets the data bytes to the default of 32 bytes.

Syntax

```
length <4-1500>
no length
```

Parameter	Description
<4-1500>	The number of data bytes to include in the data portion of the ping packet.

Default The default is 32.

Mode Ping-Polling Configuration

Examples To specify that ping-poll instance 12 sends ping packet with a data portion of 56 bytes, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length 56
```

To reset the number of data bytes in the ping packet to the default of 32 bytes for ping- poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length
```

Related commands **ping-poll**

show ping-poll

normal-interval

Overview This command specifies the time period between pings when the device is reachable.

The **no** variant of this command resets the time period to the default of 30 seconds.

Syntax

```
normal-interval <1-65536>
no normal-interval
```

Parameter	Description
<1-65536>	Time in seconds between pings when the target is reachable.

Default The default is 30 seconds.

Mode Ping-Polling Configuration

Examples To specify a time period of 60 seconds between pings when the device is reachable for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# normal-interval 60
```

To reset the interval to the default of 30 seconds for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no normal-interval
```

timeout (ping polling)

up-count

ping-poll

Overview This command enters the ping-poll configuration mode. If a ping-poll exists with the specified number, then this command enters its configuration mode. If no-ping poll exists with the specified number, then this command creates a new ping poll with this ID number.

To configure a ping-poll, create a ping poll using this command, and use the **ip (ping-polling)** command to specify the device you want the polling instance to poll. It is not necessary to specify any further commands unless you want to change a command's default.

The **no** variant of this command deletes the specified ping poll.

Syntax

```
ping-poll <1-100>
no ping-poll <1-100>
```

Parameter	Description
<1-100>	A unique ping poll ID number.

Mode Global Configuration

Examples To create ping-poll instance 3 and enter ping-poll configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 3
awplus(config-ping-poll)#
```

To delete ping-poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# no ping-poll 3
```

Related commands

active (ping-polling)

clear ping-poll

debug ping-poll

description (ping-polling)

ip (ping-polling)

length (ping-poll data)

show ping-poll

source-ip

sample-size

Overview This command sets the total number of pings that the polling instance inspects when determining whether a device is unreachable. If the number of pings specified by the **fail-count** command go unanswered within the inspected sample, then the device is declared unreachable.

If the numbers set in this command and **fail-count** command are the same, the unanswered pings must be consecutive. If the number set by this command is greater than that set with the **fail-count** command, a device that does not always reply to pings may be declared unreachable.

You cannot set this command's value lower than the **fail-count** value.

The polling instance uses the number of pings specified by the **up-count** command to determine when a device is reachable.

The **no** variant of this command resets this command to the default.

Syntax

```
sample-size <1-100>
no sample size
```

Parameter	Description
<1-100>	Number of pings that determines critical and up counts.

Default The default is 5.

Mode Ping-Polling Configuration

Examples To set the sample-size to 50 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# sample-size 50
```

To reset sample-size to the default of 5 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no sample-size
```

show counter ping-poll

Overview This command displays the counters for ping polling.

Syntax

```
show counter ping-poll [<1-100>]
```

Parameter	Description
<1-100>	A unique ping poll ID number. This displays the counters for the specified ping poll only. If you do not specify a ping poll, then this command displays counters for all ping polls.

Mode User Exec and Privileged Exec

Example To display counters for the polling instances, use the command:

```
awplus# show counter ping-poll
```

Output The following shows typical output.

Example output from the `show counter ping-poll` command

```
Ping-polling counters
Ping-poll: 1
PingsSent              ......... 15
PingsFailedUpState     ......... 0
PingsFailedDownState   ......... 0
ErrorSendingPing       ......... 2
CurrentUpCount         ......... 13
CurrentFailCount       ......... 0
UpStateEntered         ......... 0
DownStateEntered       ......... 0

Ping-poll: 2
PingsSent              ......... 15
PingsFailedUpState     ......... 0
PingsFailedDownState   ......... 0

CurrentFailCount       ......... 0
UpStateEntered         ......... 0
DownStateEntered       ......... 0

Ping-poll: 5
PingsSent              ......... 13
PingsFailedUpState     ......... 0
PingsFailedDownState   ......... 2
ErrorSendingPing       ......... 2
CurrentUpCount         ......... 9
CurrentFailCount       ......... 0
UpStateEntered         ......... 0
DownStateEntered       ......... 0
```

Parameters in output of the `show counter ping-poll` command

Parameter	Description
`Ping-poll`	The ID number of the polling instance.
`PingsSent`	The total number of pings generated by the polling instance.
`PingsFailedUpState`	The number of unanswered pings while the target device is in the Up state. This is a cumulative counter for multiple occurrences of the Up state.
`PingsFailedDownState`	Number of unanswered pings while the target device is in the Down state. This is a cumulative counter for multiple occurrences of the Down state.
`ErrorSendingPing`	The number of pings that were not successfully sent to the target device. This error can occur when your device does not have a route to the destination.
`CurrentUpCount`	The current number of sequential ping replies.

Parameter	Description
`CurrentFailCount`	The number of ping requests that have not received a ping reply in the current sample-size window.
`UpStateEntered`	Number of times the target device has entered the Up state.
`DownStateEntered`	Number of times the target device has entered the Down state.

Related commands

debug ping-poll

ping-poll

show ping-poll

show ping-poll

Overview This command displays the settings and status of ping polls.

Syntax `show ping-poll [<1-100>|state {up|down}] [brief]`

Parameter	Description	
<1-100>	Displays settings and status for the specified polling instance.	
`state`	Displays polling instances based on whether the device they are polling is currently reachable or unreachable.	
	`up`	Displays polling instance where the device state is reachable.
	`down`	Displays polling instances where the device state is unreachable.
`brief`	Displays a summary of the state of ping polls, and the devices they are polling.	

Mode User Exec and Privileged Exec

Examples To display the ping poll settings and the status of all the polls, use the command:

```
awplus# show ping-poll
```

To display a summary of the ping poll settings, use the command:

```
awplus# show ping-poll brief
```

To display the settings for ping poll 6, use the command:

```
awplus# show ping-poll 6
```

To display a summary of the state of ping poll 6, use the command:

```
awplus# show ping-poll 6 brief
```

To display the settings of ping polls that have reachable devices, use the command:

```
awplus# show ping-poll state up
```

To display a summary of ping polls that have unreachable devices, use the command:

```
awplus# show ping-poll state down brief
```

Output The following shows typical output.

Example output from the `show ping-poll brief` command

```
Ping Poll Configuration
---------------------------------------------------------
Id Enabled State Destination
---------------------------------------------------------
1  Yes     Down  192.168.0.1
2  Yes     Up    192.168.0.100
```

Parameters in output of the `show ping-poll brief` command

Parameter	Meaning	
Id	The ID number of the polling instance, set when creating the polling instance with the **ping-poll** command.	
Enabled	Whether the polling instance is enabled or disabled.	
State	The current status of the device being polled:	
	`Up`	The device is reachable.
	`Down`	The device is unreachable.
	`Critical Up`	The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.
	`Critical Down`	The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up.
Destination	The IP address of the polled device, set with the **ip (ping-polling)** command.	

Example output from the `show ping-poll` command

```
Ping Poll Configuration
---------------------------------------------------------

Poll 1:
Description                         : Primary Gateway
Destination IP address              : 192.168.0.1
Status                              : Down
Enabled                             : Yes
Source IP address                   : 192.168.0.10
Critical interval                   : 1
Normal interval                     : 30
Fail count                          : 10
Up count                            : 5
Sample size                         : 50
Length                              : 32
Timeout                             : 1
Debugging                           : Enabled
```

```
Poll 2:
Description                          : Secondary Gateway
Destination IP address               : 192.168.0.100
Status                               : Up
Enabled                              : Yes
Source IP address                    : Default
Critical interval                    : 5
Normal interval                      : 60
Fail count                           : 20
Up count                             : 30
Sample size                          : 100
Length                               : 56
Timeout                              : 2
Debugging                            : Enabled
```

Parameters in output of the `show ping-poll` command

Parameter	Description	
`Description`	Optional description set for the polling instance with the **description (ping-polling)** command.	
`Destination IP address`	The IP address of the polled device, set with the **ip (ping-polling)** command.	
`Status`	The current status of the device being polled:	
	`Up`	The device is reachable.
	`Down`	The device is unreachable.
	`Critical Up`	The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.
	`Critical Down`	The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up.
`Enabled`	Whether the polling instance is enabled or disabled. The **active (ping-polling)** and **active (ping-polling)** commands enable and disable a polling instance.	
`Source IP address`	The source IP address sent in the ping packets. This is set using the **source-ip** command.	
`Critical interval`	The time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable. This is set with the **critical-interval** command.	
`Normal interval`	The time period between pings when the device is reachable. This is set with the **normal-interval** command.	

Parameter	Description
`Fail count`	The number of pings that must be unanswered, within the total number of pings specified by the **sample-size** command, for the polling instance to consider the device unreachable. This is set using the **fail-count** command.
`Up count`	The number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again. This is set using the **up-count** command.
`Sample size`	The total number of pings that the polling instance inspects when determining whether a device is unreachable. This is set using the **sample-size** command.
`Length`	The number of data bytes to include in the data portion of the ping packet. This is set using the **length (ping-poll data)** command.
`Timeout`	The time in seconds that the polling instance waits for a response to a ping packet. This is set using the **timeout (ping polling)** command.
`Debugging`	Indicates whether ping polling debugging is **Enabled** or **Disabled**. This is set using the **debug ping-poll** command.

Related commands

debug ping-poll

ping-poll

source-ip

Overview This command specifies the source IP address to use in ping packets.

By default, the polling instance uses the address of the interface through which it transmits the ping packets. It uses the device's local interface IP address when it is set. Otherwise, the IP address of the interface through which it transmits the ping packets is used.

The **no** variant of this command resets the source IP in the packets to the device's local interface IP address.

Syntax

```
source-ip {<ip-address>|<ipv6-address>}
no source-ip
```

Parameter	Description
<ip-address>	An IPv4 address in dotted decimal notation `A.B.C.D`
<ipv6-address>	An IPv6 address in hexadecimal notation `X:X::X:X`

Mode Ping-Polling Configuration

Examples To configure the ping-polling instance 43 to use the source IP address `192.168.0.1` in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 192.168.0.1
```

To configure the ping-polling instance 43 to use the source IPv6 address `2001:db8::` in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 2001:db8::
```

To reset the source IP address to the device's local interface IP address for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no source-ip
```

Related commands

timeout (ping polling)

Overview This command specifies the time in seconds that the polling instance waits for a response to a ping packet. You may find a higher time-out useful in networks where ping packets have a low priority.

The **no** variant of this command resets the set time out to the default of one second.

Syntax

```
timeout <1-30>
no timeout
```

Parameter	Description
<1-30>	Length of time, in seconds, that the polling instance waits for a response from the polled device.

Default The default is 1 second.

Mode Ping-Polling Configuration

Examples To specify the timeout as 5 seconds for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# timeout 5
```

To reset the timeout to its default of 1 second for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no timeout
```

show ping-poll

up-count

up-count

Overview This command sets the number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again.

The **no** variant of this command resets the up count to the default of 30.

Syntax

```
up-count <1-100>
no up-count
```

Parameter	Description
<1-100>	Number of replied pings before an unreachable device is classified as reachable.

Default The default is 30.

Mode Ping-Polling Configuration

Examples To set the upcount to 5 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# up-count 5
```

To reset the upcount to the default value of 30 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no up-count
```

Introduction

Overview This chapter provides an alphabetical reference for sFlow commands.

For more information, see the **sFlow Feature Overview and Configuration Guide**.

debug sflow

Overview This command enables sFlow® debug message logging, for sFlow sampling and polling activity on the specified ports. If no ports are specified, sampling and/or polling debug messages are enabled for all ports.

The **no** variant of this command disables sFlow sampling and or polling debug message logging on the ports selected. If no ports are specified, sampling and/or polling debug messages are disabled on all ports.

Syntax

```
debug sflow [interface <port-list>] [sampling][polling]
no debug sflow [interface <port-list>] [sampling][polling]
```

Parameter	Description
`interface`	Interface information.
`<port-list>`	The ports for which sFlow debug is to be enabled. The ports to display information about. The port list can be: • a switchport (e.g. port1.0.4) • a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4) • a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list.
`sampling`	Debug sFlow sampling for the specified port(s).
`polling`	Debug sFlow polling for the specified port(s).

Default The sFlow sampling and or polling debug is disabled.

Mode Privileged Exec

Examples To enable sFlow debug message logging for polling and sampling on port1.0.1 and port1.0.2, use the commands:

```
awplus# debug sflow interface port1.0.1,port1.0.2 sampling
 polling
```

To enable logging and polling of sFlow debug messages for polling and sampling on all ports, use the command:

```
awplus# debug sflow sampling polling
```

Related commands **show debugging sflow**

no debug all

debug sflow agent

Overview This command enables sFlow® debug message logging that is not specific to particular ports. For example, sending an sFlow datagram to the collector.

The **no** variant of this command applies the command default.

Syntax
```
debug sflow agent
no debug sflow agent
```

Default The sFlow agent debug message logging (that is not port specific) is disabled.

Mode Privileged Exec

Example To enable logging of sFlow agent debug messages, use the following command:

```
awplus# debug sflow agent
```

Related commands **show debugging sflow**

debug sflow

sflow agent

Overview This command sets the sFlow® agent IP address on the switch. This address is inserted into every sFlow datagram sent from the sFlow agent switch to the sFlow collector device. The sFlow collector can then uses this address to uniquely identify and to access the switch, such as for SNMP. We therefore recommend that you change this address as little as possible.

Although the agent address can be set to any valid IPv4 or IPv6 address; we recommended that you set the sFlow® agent IP address to be the **`local address`** that is configured on the switch. For information on local addresses and how to set them up, see the **interface (to configure)**. This ensures that the sFlow collector can maintain connectivity to the switch irrespective of the addition or deletion of interfaces (each of which will have its own specific IP address). Note that sFlow is rendered inactive whenever the agent address is not set.

The **no** variant of this command applies its default setting to remove a configured address.

Syntax

```
sflow agent {ip <ip-address>|ipv6 <ipv6-address>}
no sflow agent {ip|ipv6}
```

Parameter	Description
<ip-address>	The IPv4 address of the switch that is acting as the sFlow agent.
<ipv6-address>	The IPv6 address of the switch that is acting as the sFlow agent. The IPv6 address uses the format X:X::X:X.

Default The sFlow agent address is unset.

Mode Global Configuration

Examples To set the sFlow agent (IPv4) address to `192.0.2.23`, use the command:

```
awplus# configure terminal
awplus(config)# sflow agent ip 192.0.2.23
```

To remove the sFlow agent (IPv4) address, use the command:

```
awplus# configure terminal
awplus(config)# no sflow agent ip
```

To set the sFlow agent (IPv6) address to `2001:0db8::1`, use the command:

```
awplus# configure terminal
awplus(config)# sflow agent ipv6 2001:0db8::1
```

To remove the sFlow agent (IPv6) address, use the command:

```
awplus# configure terminal
awplus(config)# no sflow agent ipv6
```

Related commands **show running-config sflow**

show sflow

sflow collector

Overview This command has been deprecated. It has been replaced by the **sflow collector id** command.

This command sets the sFlow® agent's collector IP address and/or UDP port.

Command changes Version 5.5.1-1.1: command deprecated.

sflow collector id

Overview Use this command to set the sFlow® agent's collector IP address and optionally the port and maximum datagram size. This is the destination IP address and UDP port, for sFlow datagrams sent from the sFlow agent. The IP address can be any valid IPv4 or IPv6 address.

Use the **no** variant of this command to remove the configuration for that collector and render it inactive.

Syntax

```
sflow collector id <1-5> ip <ip-address> [port <1-65535>|max-datagram-size <200-1500>]
sflow collector id <1-5> ipv6 <ipv6-address> [port <1-65535>|max-datagram-size <200-1500>]
no sflow collector id <1-5>
```

Syntax (VRF-lite)

```
sflow collector id <1-5> ip <ip-address> [vrf <vrf-name>] [port <1-65535>|max-datagram-size <200-1500>]
no sflow collector id <1-5>
```

Parameter	Description
<ip-address>	IPv4 address of the remote sFlow collector.
<ipv6-address>	IPv6 address of remote sFlow collector. The IPv6 address uses the format X:X::X:X.
`vrf`	The VRF instance to operate within.
<vrf-name>	The VRF instance name.
`port`	Destination UDP port for sFlow datagrams sent to the collector.
<1-65535>	UDP port number (default: 6343).
`max-datagram-size`	The maximum number of bytes that can be sent in an sFlow datagram sent from the agent to the collector.
<200-1500>	The value set for the max-datagram-size.

Default By default the collector does not exist until configured with a valid IP address.

Default (VRF-lite) If no VRF is specified it will operate within the default global VRF.

Mode Global Configuration

Examples

To set the address of collector 1 to 192.168.1.36 with default port and max-datagram size, use the commands:

```
awplus# configure terminal
awplus(config)# sflow collector id 1 ip 192.168.1.36
```

To set the address of collector 2 to 12ae::213d::213d::333f and use UDP port 500, use the commands:

```
awplus# configure terminal
awplus(config)# sflow collector id 2 ipv6 12ae::213d::213d::333f
 port 500
```

To set the address of collector 5 to 10.42.2.70 and use UDP port 7777 and have a max-datagram-size of 800, use the commands:

```
awplus# configure terminal
awplus(config)# sflow collector id 5 ip 10.42.2.70 port 7777
 max-datagram-size 800
```

To delete collector 5, use the commands:

```
awplus# configure terminal
awplus(config)# no sflow collector id 5
```

Examples (VRF-lite)

To set the address of collector 4 to 10.0.0.1 with VRF 'red' and port 9000, use the commands:

```
awplus# configure terminal
awplus(config)# sflow collector id 4 ip 10.0.0.1 vrf red port
 9000
```

To delete collector 4, use the commands:

```
awplus# configure terminal
awplus(config)# no sflow collector id 4
```

Related commands

show running-config sflow

show sflow

Command changes

Version 5.5.1-1.1: command added.

Version 5.5.2-2.1: VRF parameter added.

sflow collector max-datagram-size

Overview This command has been deprecated. It has been replaced by the **sflow collector id** command.

This command sets the maximum size of the sFlow® datagrams sent to the collector.

Command changes Version 5.5.1-1.1: command deprecated

sflow enable

Overview This command enables sFlow® globally on the switch.

The **no** variant of this command disables sFlow globally on the switch.

Note that enabling sFlow does not automatically set its operational status to active. To activate sFlow the following conditions need to be met:

- sFlow is enabled.
- The sFlow agent address is set.
- The sFlow collector address is set to a valid (non zero) IPv4 or IPv6 address.
- Polling or sampling is enabled on the ports to be sampled or polled.

Syntax

```
sflow enable
no sflow enable
```

Default sFlow is disabled globally on the switch.

Mode Global Configuration

Example To enable sFlow operation, use the command:

```
awplus# configure terminal
awplus(config)# sflow enable
```

Related commands

show running-config sflow

show sflow

sflow max-header-size

Overview This command sets the maximum header size of the Ethernet frames sampled on a specified port. The maximum header size is measured in bytes, referenced from the first byte of the Ethernet destination address and excludes the Ethernet FCS fields.

If a sampled Ethernet frame is longer than the maximum header size set by this command, then the frame will be truncated to the first N bytes before being placed in the sFlow datagram, where N is the maximum header size set by this command.

The **no** variant of this command resets the max-header-size to its default.

Syntax

```
sflow max-header-size <14-200>
no sflow max-header-size
```

Parameter	Description
<14-200>	The maximum number of header bytes to be sampled.

Default The max-header-size is 128 bytes.

Mode Interface Configuration

Usage notes The header size is measured from the first byte of the Ethernet frame MAC Destination Address.

- For an environment using standard TCP IPv4 over Ethernet frames, consider the following basic protocol structure:

  Ethernet header (including the 4 byte 802.1Q header component) = 18 bytes

  IPv4 header = 24 bytes

  TCP header = 24 bytes

  Total = 66 bytes

  CAUTION: *For IPv4, any data existing between 66 bytes and the value set by this command will be included in the sFlow packet samples. For example, with the default of 128 applied, up to 128-66=62 bytes of user data could be included in the sFlow datagram samples sent between the Agent and the Collector.*

  For more information, see the **sFlow Feature Overview and Configuration Guide**.
- A similar consideration can be made for an environment using TCP IPv6 over Ethernet:

  Ethernet header (including the 4 byte 802.1Q header component) = 18 bytes

  IPv6 header = 40 bytes

  TCP header = 24 bytes

  Total = 82 bytes

  CAUTION: *For IPv6, any data existing between 82 bytes and the value set by this command will be included in the sFlow packet samples. For example, with the default of 128 applied, up to 128-82=46 bytes of user data could be included in the sFlow datagram samples sent between the Agent and the Collector.*

Note that the agent-to-collector datagrams contain their own UDP headers, which are outside this calculation.

Example To set the maximum header size to 160 bytes for port1.0.1 and port1.0.8, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.8
awplus(config-if)# sflow max-header-size 160
```

Related commands

show running-config sflow

show sflow interface

sflow max-header-size

sflow polling-interval

Overview This command sets the sFlow® counter polling interval (in seconds) for the specified ports. A value of 0 disables polling. A counter sample is taken every N seconds where N is the value set by this command.

The **no** variant of this command applies the default.

Syntax

```
sflow polling-interval {0|<1-16777215>}
no sflow polling-interval
```

Parameter	Description
`0`	Disable polling (the default).
<1-16777215>	The polling interval in seconds.

Default The polling-interval is 0 (polling disabled).

Mode Interface Configuration

Example To set the polling interval to 60 seconds for port1.0.1 and port1.0.4, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.4
awplus(config-if)# sflow polling-interval 60
```

Related commands

show running-config sflow

show sflow interface

sflow sampling-rate

Overview This command sets the mean sFlow® sampling rate for the specified ports. Sampling occurs every N frames (on average), where N is the rate value set via this command. The sampling rate applies to ingress and egress frames independently. For example, a value of 1000 will sample one frame in every 1000 frames received, i.e. one in every 1000 frames sent from the specified port. A value of 0 disables sampling on the specified port(s).

The **no** variant of this command applies the default.

Syntax

```
sflow sampling-rate <50-2147483647>
no sflow sampling-rate
```

Parameter	Description
<50-2147483647>	The sampling rate N, measured in Ethernet frames.

Default The sampling-rate is 0 (sampling disabled).

Mode Interface Configuration

Example To set the sampling rate to 500 for port1.0.1 and port1.0.3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.3
awplus(config-if)# sflow sampling-rate 500
```

Related commands **show running-config sflow**

show sflow interface

show debugging sflow

Overview This command displays sFlow® debug settings for agent operation, and for sampling and polling on specific interface ports. If no interface ports are specified, sampling and polling will be applied to all ports.

Syntax

```
show debugging sflow [interface <port-list>]
```

Parameter	Description
`interface`	The interface information.
`<port-list>`	The ports for which the sFlow debug settings are to be shown. The ports to display information about. The port list can be: • a switchport (e.g. port1.0.4) • a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4) • a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list.

Mode User Exec and Privileged Exec

Example To display sFlow debug settings for all ports, use the command:

```
awplus# show debugging sflow
```

To display sFlow debug settings on the agent, and for sampling and polling on port1.0.1 to port1.0.8, use the command:

```
awplus# show debugging sflow interface port1.0.1-port1.0.8
```

Output The following shows typical output.

Sample obtained for an sFlow agent

```
awplus# show debugging sflow interface port1.0.1-port1.0.8

sFlow Agent Debug:    Enabled

          Sampling      Polling
Port       Debug         Debug
------------------------------
port1.0.1     Enabled       Enabled
port1.0.2     Enabled          -
port1.0.3        -             -
port1.0.4        -             -
...
port1.0.8        -          Enabled
```

Related commands

show running-config sflow

show sflow interface

show running-config sflow

Overview This command displays the running system information specific to the sFlow feature.

Syntax
```
show running-config sflow
```

Mode Privileged Exec and Global Configuration

Example To display the sFlow running configuration information, use the command:
```
awplus# show running-config sflow
```

Output The following shows typical output.

Example output from the `show running-config sflow` command

```
awplus#sh run sflow
!
sflow agent ip 192.0.2.33
sflow collector ip 192.0.2.65
sflow collector max-datagram-size 1200
sflow enable
!
interface port1.0.1-port1.0.4
 sflow sampling-rate 512
```

Related commands **show running-config**

show sflow

Overview This command displays non-port-specific sFlow agent configuration and operational status.

Syntax
```
show sflow
```

Mode Privileged Exec

Example To display sFlow configuration and operational status, use the command:
```
awplus# show sflow
```

Output The following shows typical output.

Example output from the `show sflow` command

```
sFlow Agent Configuration:                    Default Values
  sFlow Admin Status ........ Disabled        [Disabled]
  sFlow Agent Address ....... [not set]       [not set]
  Collector Address ......... 0.0.0.0         [0.0.0.0]
  Collector UDP Port ........ 6343            [6343]
  Tx Max Datagram Size ...... 1200            [1400]

sFlow Agent Status:
  Polling/sampling/Tx ....... Inactive because:
                                - sFlow is disabled
                                - Agent Addr is not set
                                - Collector Addr is 0.0.0.0
                                - Polling & sampling disabled
                                  on all ports
```

Parameters in the output of the `show sflow` command

Output Parameter	Description
`sFlow Admin Status`	Whether sFlow agent operation is administratively enabled.
`sFlow Agent Address`	The sFlow agent IPv4 or IPv6 address for the device. sFlow is rendered inactive whenever the agent address is not set.
`Collector Address`	The IPv4 or IPv6 collector address to which sFlow datagrams are sent. sFlow is rendered inactive whenever the collector address is set to 0.0.0.0 or 0:0::0.0.
`Collector UDP Port`	The UDP port on the collector to which sFlow datagrams are sent.
`Tx Max Datagram Size`	The maximum size of the sFlow datagrams sent to the collector.
`Polling/sampling/Tx`	Whether sFlow sampling and/or polling (and hence sFlow datagram transmission) are active. If inactive the reasons are listed.

Related commands **show running-config sflow**

show sflow interface

show sflow interface

Overview This command displays sFlow agent sampling and polling configuration for all ports or a specified port.

Syntax `show sflow interface [<ifrange>]`

Parameter	Description
<ifrange>	• a switchport (e.g. port1.0.4) • a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4) • a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list.

Mode Privileged Exec

Example To display the sFlow sampling and polling configuration for port1.0.1, use the command:

```
awplus# show sflow interface port1.0.1
```

Output The following shows typical output.

Example output from the `show sflow interface` command

```
awplus#show sflow interface

sFlow Port Configuration:
  Default Values:
    Sampling Rate ........... 0 pkts (= disabled)
    Max Sample Header Size .. 128 bytes
    Polling Interval ........ 0 secs (= disabled)

               Sampling     Max Header     Polling
                 Rate          Size        Interval
Port         (1 in N pkts)    (bytes)      (secs)
-----------------------------------------------------
port1.0.1            0          128            0
port1.0.1            0          128            0
port1.0.1            0          128            0
...
```
